# ETSI TS 151 010-1 V4.6.0 (2001-12)

*Technical Specification*

**Digital cellular telecommunications system (Phase 2+);**
**Mobile Station (MS) conformance specification;**
**Part 1: Conformance specification**
**(3GPP TS 51.010-1 version 4.6.0 Release 4)**

# Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

# Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under www.etsi.org/key .

# Contents

Intellectual Property Rights ..... 2
Foreword ..... 2
Foreword ..... 44
1 Scope ..... 45
2 References ..... 45
3 Definitions, conventions, and applicability ..... 55
3.1 Mobile station definition and configurations ..... 55
3.2 Applicability ..... 56
3.2.1 Applicability of this specification ..... 56
3.2.1.1 MS equipped with a connector ..... 56
3.2.1.2 GPRS ..... 56
3.2.2 Applicability of the individual tests ..... 56
3.2.3 Applicability to terminal equipment ..... 56
3.3 Definitions ..... 56
3.4 Conventions for mathematical notations ..... 57
3.4.1 Mathematical signs ..... 57
3.4.2 Powers to the base 10 ..... 57
3.5 Conventions on electrical terms ..... 57
3.5.1 Radio Frequency (RF) input signal level ..... 57
3.5.2 Reference sensitivity level ..... 58
3.5.3 Power level of fading signal ..... 58
3.6 Terms on test conditions ..... 58
3.6.1 Radio test conditions ..... 58
4 Test Equipment ..... 59
4.1 Terms used to describe test equipment in this EN ..... 59
4.2 Functional requirements of test equipment ..... 60
5 Testing methodology in general (layers 1, 2, and 3) ..... 60
5.1 Testing of optional functions and procedures ..... 60
5.2 Test interfaces and facilities ..... 60
5.3 Different protocol layers ..... 61
5.4 Information to be provided by the apparatus supplier ..... 61
5.5 Definitions of transmit and receive times ..... 61
6 Reference test methods ..... 61
6.1 General ..... 61
6.2 Choice of frequencies in the frequency hopping mode ..... 61
6.3 "Ideal" radio conditions ..... 62
6.4 Standard test signals ..... 63
6.5 Power (control) levels ..... 63
7 Implicit testing ..... 63
8 Measurement uncertainty ..... 63
9 Format of tests ..... 63
10 Generic call set up procedures ..... 64
10.1 Generic call set-up procedure for mobile terminating speech calls ..... 64
10.2 Generic call set-up procedure for mobile originating speech calls ..... 69
10.3 Generic call set-up procedure for mobile terminating data calls ..... 72
10.4 Generic call set-up procedure for mobile originating data calls ..... 74
10.5 Generic call set-up procedure for mobile terminating multislot configuration, minimum number of timeslots allocated ..... 77
10.6 Generic call set-up procedure for mobile originating multislot configuration, minimum number of timeslots allocated ..... 80
10.7 Generic procedure for GPRS downlink data transfer ..... 83
10.8 Generic procedure for GPRS uplink data transfer ..... 84

11 General tests ..... 87
11.1 Verification of support and non-support of services (multiple numbering scheme or ISDN) ..... 87
11.1.1 Mobile Terminated (MT) calls ..... 87
11.1.2 Mobile Originated (MO) calls ..... 88
11.2 Verification of support of the single numbering scheme ..... 89
11.3 Verification of non-support of services (Advice of Charge Charging (AoCC)) ..... 90
11.4 Verification of non-support of services (call hold) ..... 92
11.5 Verification of non-support of services (multiparty) ..... 92
11.6 Verification of non-support of feature (Fixed Dialling Number (FDN)) ..... 93
11.7 IMEI Security ..... 94
11.8 Coding of the Bearer Capability information element ..... 95
11.8.1 Network to MS Direction ..... 96
11.8.1.1 BS 21 to 26 - Asynchronous Service ..... 96
11.8.1.1.1 BS 21 ..... 96
11.8.1.1.2 BS 22 ..... 100
11.8.1.1.3 BS 24 ..... 100
11.8.1.1.4 BS 25 ..... 100
11.8.1.1.5 BS 26 ..... 100
11.8.1.1.6 BS 23 ..... 100
11.8.1.2 BS 31 to 34 - Synchronous Service ..... 101
11.8.1.2.1 BS 32 ..... 101
11.8.1.2.2 BS 31 ..... 105
11.8.1.2.3 BS 33 ..... 106
11.8.1.2.4 BS 34 ..... 106
11.8.1.3 BS 61 - Alternate Speech / Data ..... 106
11.8.1.3.1 Speech/Asynchronous Data, Transparent ..... 107
11.8.1.3.2 Speech/Asynchronous Data, Non Transparent ..... 109
11.8.1.3.3 Speech/Synchronous Data ..... 111
11.8.1.4 BS 81 - Speech followed by Data ..... 112
11.8.1.4.1 Speech followed by Asynchronous Data ..... 112
11.8.1.4.2 Speech followed by Synchronous Data ..... 112
11.8.1.5 TS 61 - Alternate Speech / Facsimile group 3 ..... 112
11.8.1.5.1 TS 61 - Alternate Speech / Facsimile group 3, Transparent ..... 113
11.8.1.5.2 TS 61 - Alternate Speech / Facsimile group 3, Non-Transparent ..... 114
11.8.1.6 TS 62 - Automatic Facsimile group 3 ..... 115
11.8.2 MS to SS direction ..... 115
11.8.2.1 BS 21 to 26 - Asynchronous Service ..... 115
11.8.2.1.1 BS 21 ..... 116
11.8.2.1.2 BS 22 ..... 119
11.8.2.1.3 BS 24 ..... 120
11.8.2.1.4 BS 25 ..... 120
11.8.2.1.5 BS 26 ..... 120
11.8.2.1.6 BS 23 ..... 120
11.8.2.2 BS 31 to 34 - Synchronous Service ..... 121
11.8.2.2.1 BS 32 ..... 121
11.8.2.2.2 BS 31 ..... 125
11.8.2.2.3 BS 33 ..... 126
11.8.2.2.4 BS 34 ..... 126
11.8.2.3 BS 41 to 46 - PAD Access Asynchronous ..... 127
11.8.2.3.1 [2)] BS 41 ..... 127
11.8.2.3.2 BS 42 ..... 128
11.8.2.3.3 BS 44 ..... 129
11.8.2.3.4 BS 45 ..... 129
11.8.2.3.5 BS 46 ..... 129
11.8.2.3.6 BS 43 ..... 129
11.8.2.4 BS 51 to 53 - Packet Service Synchronous ..... 130
11.8.2.4.1 [2)] BS 51 ..... 130
11.8.2.4.2 BS 52 ..... 130
11.8.2.4.3 BS 53 ..... 130
11.8.2.5 BS 61 - Alternate Speech / Data ..... 131
11.8.2.5.1 Speech/Asynchronous Data, Transparent ..... 131
11.8.2.5.2 Speech/Asynchronous Data, Non Transparent ..... 134

11.8.2.5.3 Speech/Synchronous Data ..... 136
11.8.2.6 BS 81 - Speech followed by Data ..... 137
11.8.2.6.1 Speech followed by Asynchronous Data ..... 137
11.8.2.6.2 Speech followed by Synchronous Data ..... 137
11.8.2.7 TS 61 - Alternate Speech / Facsimile group 3 ..... 137
11.8.2.7.1 TS 61 - Alternate Speech / Facsimile group 3, Transparent ..... 138
11.8.2.7.2 TS 61 - Alternate Speech / Facsimile group 3, Non Transparent ..... 139
11.8.2.8 TS 62 - Automatic Facsimile group 3 ..... 140
11.8.2.9 TS 11 and TS 12- Speech ..... 140
11.8.2.9.1 Support of only full/half rate speech version 1 ..... 140
11.8.2.9.2 Support of speech full rate version 2 (Enhanced Full Rate) ..... 140
12 Transceiver ..... 142
12.1 Conducted spurious emissions ..... 142
12.1.1 MS allocated a channel ..... 142
12.1.2 MS in idle mode ..... 145
12.2 Radiated spurious emissions ..... 147
12.2.1 MS allocated a channel ..... 147
12.2.2 MS in idle mode ..... 149
12.3 Conducted spurious emissions for MS supporting the R-GSM frequency band ..... 151
12.3.1 MS allocated a channel ..... 151
12.3.2 MS in idle mode ..... 153
12.4 Radiated spurious emissions for MS supporting the R-GSM frequency band ..... 154
12.4.1 MS allocated a channel ..... 155
12.4.2 MS in idle mode ..... 157
13 Transmitter ..... 158
13.1 Frequency error and phase error ..... 158
13.2 Frequency error under multipath and interference conditions ..... 162
13.3 Transmitter output power and burst timing ..... 164
13.4 Output RF spectrum ..... 172
13.5 Void ..... 179
13.6 Frequency error and phase error in HSCSD multislot configurations ..... 179
13.7 Transmitter output power and burst timing in HSCSD configurations ..... 183
13.8 Output RF spectrum in HSCSD multislot configuration ..... 191
13.9 Output RF spectrum for MS supporting the R-GSM band ..... 198
13.10 (void) ..... 204
13.11 (void) ..... 204
13.12 (void) ..... 204
13.13 (void) ..... 204
13.14 (void) ..... 204
13.15 (void) ..... 204
13.16 GPRS transmitter tests ..... 204
13.16.1 Frequency error and phase error in GPRS multislot configuration ..... 204
13.16.2 Transmitter output power in GPRS multislot configuration ..... 207
13.16.3 Output RF spectrum in GPRS multislot configuration ..... 215
13.17 EGPRS transmitter tests ..... 223
13.17.1 Frequency error and Modulation accuracy in EGPRS Configuration ..... 223
13.17.2 Frequency error under multipath and interference conditions. ..... 227
13.17.3 EGPRS Transmitter output power ..... 229
13.17.4 Output RF spectrum in EGPRS configuration ..... 235
13.17.5 Void ..... 243
14 Receiver ..... 243
14.1 Bad frame indication ..... 249
14.1.1 Bad frame indication - TCH/FS ..... 249
14.1.1.1 Bad frame indication - TCH/FS - Random RF input ..... 249
14.1.1.2 Bad frame indication - TCH/FS - Frequency hopping and downlink DTX ..... 250
14.1.2 Bad frame indication - TCH/HS ..... 251
14.1.2.1 Bad frame indication - TCH/HS - Random RF input ..... 251
14.1.2.2 Bad frame indication - TCH/HS - Frequency hopping and downlink DTX ..... 252
14.1.3 Bad frame indication - TCH/FS - Frequency hopping and downlink DTX - Phase 2 MS in a phase 1 network ..... 253

14.1.4 Bad frame indication - TCH/HS - Frequency hopping and downlink DTX - Phase 2 MS in a phase 1 network ..... 255
14.1.5 Bad frame indication - TCH/AFS (Speech frame) ..... 257
14.1.5.1 Bad frame indication - TCH/AFS - Random RF input ..... 257
14.1.5.1.1 Definition and applicability ..... 257
14.1.5.1.2 Conformance requirement ..... 257
14.1.5.1.3 Test purpose ..... 258
14.1.5.1.4 Method of test ..... 258
14.1.5.1.5 Test requirements ..... 258
14.1.6 Bad frame indication - TCH/AHS ..... 258
14.1.6.1 Bad frame indication - TCH/AHS - Random RF input ..... 258
14.1.6.1.1 Definition and applicability ..... 258
14.1.6.1.2 Conformance requirement ..... 258
14.1.6.1.3 Test purpose ..... 258
14.1.6.1.4 Method of test ..... 259
14.1.6.1.5 Test requirements ..... 259
14.2 Reference sensitivity ..... 259
14.2.1 Reference sensitivity - TCH/FS ..... 259
14.2.2 Reference sensitivity - TCH/HS (Speech frames) ..... 261
14.2.3 Reference sensitivity - FACCH/F ..... 263
14.2.4 Reference sensitivity - FACCH/H ..... 264
14.2.5 Reference sensitivity - full rate data channels ..... 265
14.2.6 Reference sensitivity - half rate data channels ..... 266
14.2.7 Reference sensitivity - TCH/EFS ..... 267
14.2.8 Reference sensitivity - full rate data channels in multislot configuration ..... 269
14.2.9 Reference sensitivity - TCH/FS for MS supporting the R-GSM band ..... 271
14.3 Usable receiver input level range ..... 272
14.4 Co-channel rejection ..... 274
14.4.1 Co-channel rejection - TCH/FS ..... 274
14.4.2 Co-channel rejection - TCH/HS ..... 276
14.4.3 Co-channel rejection - TCH/HS (SID frames) ..... 278
14.4.4 Co-channel rejection - FACCH/F ..... 279
14.4.5 Co-channel rejection - FACCH/H ..... 280
14.4.6 Co-channel rejection - TCH/EFS ..... 281
14.4.7 Receiver performance in the case of frequency hopping and co-channel interference on one carrier ..... 283
14.5 Adjacent channel rejection ..... 284
14.5.1 Adjacent channel rejection - speech channels ..... 284
14.5.2 Adjacent channel rejection - control channels ..... 287
14.6 Intermodulation rejection ..... 289
14.6.1 Intermodulation rejection - speech channels ..... 289
14.6.2 Intermodulation rejection - control channels ..... 290
14.7 Blocking and spurious response ..... 292
14.7.1 Blocking and spurious response - speech channels ..... 292
14.7.2 Blocking and spurious response - control channels ..... 297
14.7.3 Blocking and spurious response - speech channels for MS supporting the R-GSM band ..... 302
14.7.4 Blocking and spurious response - control channels for MS supporting the R-GSM band ..... 305
14.8 AM suppression ..... 308
14.8.1 AM suppression - speech channels ..... 308
14.8.2 AM suppression - control channels ..... 309
14.9 Paging performance at high input levels ..... 311
14.10 (void) ..... 312
14.11 (void) ..... 312
14.12 (void) ..... 312
14.13 (void) ..... 312
14.14 (void) ..... 312
14.15 (void) ..... 312
14.16 GPRS receiver tests ..... 312
14.16.1 Minimum Input level for Reference Performance ..... 314
14.16.2 Co-channel rejection ..... 318
14.16.2.1 Co-channel rejection for packet channels ..... 318
14.18 EGPRS receiver tests ..... 321
14.18.1 Minimum Input level for Reference Performance ..... 323

14.18.2 Co-channel rejection ..... 328
14.18.3 Adjacent channel rejection ..... 332
14.18.4 Intermodulation rejection ..... 336
14.18.5 Blocking and spurious response ..... 339
14.18.6 EGPRS Usable receiver input level range ..... 346
14.18.7 Incremental Redundancy Performance ..... 348
14.18.7.1 Definition and applicability ..... 348
14.18.7.2 Conformance requirement ..... 349
14.18.7.3 Test purpose ..... 349
14.18.7.4 Method of test ..... 349
14.18.7.4.1 Initial conditions ..... 349
14.18.7.4.2 Procedure ..... 349
14.18.7.5 Test requirements ..... 350
15 Timing advance and absolute delay ..... 351
15.1 Definition and applicability ..... 351
15.2 Conformance requirement ..... 351
15.3 Test purpose ..... 351
15.4 Method of test ..... 351
15.5 Test requirement ..... 352
15.6 GPRS Timing advance and absolute delay ..... 352
15.7 ECSD Timing advance and absolute delay ..... 356
15.8 EGPRS timing advance and absolute delay ..... 358
16 Reception time tracking speed ..... 361
17 Access times during handover ..... 364
17.1 Intra cell channel change ..... 364
17.2 Inter cell handover ..... 366
18 Temporary reception gaps ..... 369
18.1 Temporary reception gaps, single slot ..... 369
18.2 Temporary reception gaps in HSCSD multislot configurations ..... 370
19 Channel release after unrecoverable errors ..... 372
19.1 Channel release after unrecoverable errors -1 ..... 372
19.2 Channel release after unrecoverable errors - 2 ..... 373
19.3 Channel release after unrecoverable errors - 3 ..... 374
20 Cell selection and reselection ..... 375
20.1 Cell selection ..... 378
20.2 Cell selection with varying signal strength values ..... 379
20.3 Basic cell reselection ..... 381
20.4 Cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters ..... 383
20.5 Cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages ..... 385
20.6 Cell reselection timings ..... 387
20.7 Priority of cells ..... 389
20.8 Cell reselection when C1 (serving cell) < 0 for 5 seconds ..... 390
20.9 Running average of the surrounding cell BCCH carrier signal levels ..... 392
20.10 Running average of the serving cell BCCH carrier signal level ..... 393
20.11 Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list ..... 394
20.12 Decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers ..... 395
20.13 Decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers ..... 396
20.14 Emergency calls ..... 397
20.15 Cell reselection due to MS rejection "LA not allowed" ..... 398
20.16 Downlink signalling failure ..... 400
20.17 Cell selection if no suitable cell found in 10 s ..... 401
20.18 Cell reselection due to MS rejection "Roaming not allowed in this LA" ..... 402
20.19 Cell selection on release of SDCCH and TCH ..... 403
20.20 Multiband cell selection and reselection ..... 405
20.20.1 Multiband cell selection and reselection / Cell Selection ..... 405
20.20.2 Multiband cell selection and reselection / Cell reselection ..... 407

20.21 R-GSM cell selection and reselection ....408
20.21.1 R-GSM cell selection ....410
20.21.2 R-GMS cell selection with varying signal strength values ....412
20.21.3 R-GSM basic cell reselection ....414
20.21.4 R-GSM cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters ....416
20.21.5 R-GSM cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages ....417
20.21.6 R-GSM cell reselection timings ....419
20.21.7 R-GSM priority of cells ....421
20.21.8 R-GSM cell reselection when C1 (serving cell) < 0 for 5 seconds ....422
20.21.9 R-GSM running average of the surrounding cell BCCH carrier signal levels ....423
20.21.10 R-GSM running average of the serving cell BCCH carrier signal level ....424
20.21.11 Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list ....425
20.21.12 R-GSM decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers ....426
20.21.13 R-GSM decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers ....427
20.21.14 R-GSM emergency calls ....428
20.21.15 R-GSM cell reselection due to MS rejection "LA not allowed" ....429
20.21.16 R-GSM downlink signalling failure ....431
20.21.17 R-GSM cell selection if no suitable cell found in 10 s ....432
20.21.18 R-GSM cell reselection due to MS rejection "Roaming not allowed in this LA" ....433
20.21.19 R-GSM cell selection on release of SDCCH and TCH ....435
20.22 GPRS Cell Selection and Reselection ....436
20.22.1 Cell selection ....438
20.22.2 Cell reselection in Packet Idle mode ....439
20.22.3 Priority of cells ....441
20.22.4 Cell re-selection with cells in different routing area ....442
20.22.5 Network controlled Cell re-selection in Transfer Mode ....444
20.22.6 Cell reselection timings ....445
20.22.7 Downlink signalling failure ....446
20.22.8 Cell selection when the best cell does not support GPRS ....447
20.22.9 Cell reselection when the best cell does not support GPRS ....449
20.22.10 Cell Selection-Search for Suitable Cell/ cell priority ....452
20.22.11 Cell Selection/No normal priority cell ....453
20.22.12 Cell Selection on “LA Not Allowed” ....454
20.22.13 Cell Reselection based on C32 quality ....455
20.22.14 Cell Reselection in case Cell reselection occurred in the previous 15 seconds ....456
20.22.15 Cell Reselection/ ready state / no reselection ....458
20.22.16 Cell Reselection/ ready state/ Reselection and Cell update procedure ....460
20.22.17 C2 reselection in another RA - no cell reselection ....461
20.22.18 C2 reselection in another Routing Area - Routing Area Update ....462
20.22.19 Borders between routing areas - reselection of a GPRS cell in a homogenous network ....464
20.22.20 Cell Reselection based on C32 - Cell Reselection on CCCH - PBCCH not present ....465
20.22.21 Cell Reselection based on C32/GCRH value - Cell Reselection on CCCH - PBCCH not present ....467
20.22.22 Cell Reselection with cells in different Routing area - Cell Reselection on CCCH - PBCCH not present ....469
20.22.23 Cell Reselection based on C32 - Cell Reselection on CCCH - PBCCH not supported ....471
20.22.24 Cell Reselection based on C32/cell of same priority/ Cell Reselection on CCCH - PBCCH not supported ....472
20.22.25 Cell Reselection based on C32/C31<0/ Cell Reselection on CCCH - PBCCH not supported ....474
20.22.26 Cell Reselection based on C32 quality / Cell Reselection on CCCH - PBCCH not supported ....476
20.22.27 Cell Reselection in standby state - new cell in same routing area/ Cell Reselection on CCCH - PBCCH not supported ....478
20.22.28 Cell Reselection/no suitable cell found/cell selection ....480
20.23 COMPACT Cell Selection and Reselection ....482
20.23.1 Cell selection ....484
20.23.2 Cell reselection in Packet Idle mode ....485
20.23.3 Priority of cells ....487
20.23.4 Cell re-selection with cells in different routing area ....488
20.23.5 Network controlled Cell re-selection in Transfer Mode ....490

20.23.6 Cell reselection timings ....491
20.23.7 Downlink signalling failure ....492
20.23.8 COMPACT Cell re-selection when target cell is BCCH supporting EGPRS and different routing area....493
20.23.9 Cell re-selection when target cell is COMPACT CPBCCH in different routing area ....495
20.24 SoLSA Cell Selection and Reselection ....496
20.24.1 SoLSA Cell Selection suitable cell ....504
20.24.2 SoLSA Cell (Re)Selection Emergency Call ....512
20.24.3 SoLSA Cell Reselection / idle mode support enabled ....514
20.24.3.1 General conformance requirement ....514
20.24.3.2 SoLSA Cell Reselection / idle mode support enabled / LSA Priority ....516
20.24.3.3 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / different location area ....518
20.24.3.4 SoLSA Cell Reselection / idle mode support enabled / Priority Threshold ....521
20.24.3.5 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / LSA_OFFSET ....525
20.24.3.6 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / cell combinations ....527
20.24.3.7 SoLSA Cell Reselection / roaming ....531
20.24.4 SoLSA Cell Reselection / idle mode support / any value ....532
20.24.5 SoLSA Cell Reselection / LSA indication for idle mode ....535
20.24.5.1 General definition and applicability ....535
20.24.5.2 General conformance requirement ....535
20.24.5.3 SoLSA Cell Reselection / LSA indication for idle mode / idle mode support enabled ....535
20.24.5.4 SoLSA Cell Reselection / LSA indication for idle mode / idle mode support disabled ....537
21 Received signal measurements ....540
21.1 Signal strength ....540
21.2 Signal strength selectivity ....544
21.3 Signal quality under static conditions ....546
21.3.1 Signal quality under static conditions - TCH/FS ....546
21.3.2 Signal quality under static conditions - TCH/HS ....548
21.4 Signal quality under TUhigh propagation conditions ....549
21.5 Received signal measurements in HSCSD multislot configuration ....551
21.5.1 Signal strength ....551
21.6 COMPACT Signal strength ....555
21.7 COMPACT Signal strength selectivity ....559
22 Transmit power control timing and confirmation ....562
22.1 Transmit power control timing and confirmation, single slot ....562
22.2 Transmit power control timing and confirmation in HSCSD multislot configurations ....564
22.3 GPRS Uplink Power Control – Use of α and $\Gamma_{CH}$ parameters ....565
22.4 GPRS Uplink Power Control – Independence of TS Power Control ....569
22.5 [Reserved for future GPRS test] ....570
22.6 Normal transmit power control timing and confirmation in ECSD ....570
22.7 ECSD Fast Power Control (FPC) timing and interworking with normal power control ....572
22.8 EGPRS Uplink Power Control – Use of α and $\Gamma_{CH}$ parameters ....575
22.9 EGPRS Uplink Power Control – Independence of TS Power Control ....579
22.10 [Reserved for future EGPRS test] ....580
23 Single frequency reference ....580
24 Tests of the layer 1 signalling functions ....580
25 Tests of the layer 2 signalling functions ....581
25.1 Introduction, objective and scope ....581
25.1.1 General ....581
25.1.2 Test configurations ....581
25.1.3 Pre-conditions ....581
25.1.4 Layer 2 test frames ....582
25.1.5 Establishment of the dedicated physical resource ....583
25.1.6 Release of the dedicated physical resource ....583
25.2 Test sequences ....583
25.2.1 Initialization ....584
25.2.1.1 Initialization when contention resolution required ....584
25.2.1.1.1 Normal initialization ....584
25.2.1.1.2 Initialization failure ....585

25.2.1.1.3 Initialization denial ..... 588
25.2.1.1.4 Total initialization failure ..... 589
25.2.1.2 Initialization, contention resolution not required ..... 590
25.2.1.2.1 Normal initialization without contention resolution ..... 590
25.2.1.2.2 Initialization failure ..... 591
25.2.1.2.3 Initialization denial ..... 592
25.2.1.2.4 Total initialization failure ..... 593
25.2.2 Normal information transfer ..... 594
25.2.2.1 Sequence counting and I frame acknowledgements ..... 594
25.2.2.2 Receipt of an I frame in the timer recovery state ..... 597
25.2.2.3 Segmentation and concatenation ..... 599
25.2.3 Normal layer 2 disconnection ..... 602
25.2.4 Test of link failure ..... 602
25.2.4.1 I frame loss (MS to SS) ..... 602
25.2.4.2 RR response frame loss (SS to MS) ..... 604
25.2.4.3 RR response frame loss (MS to SS) ..... 604
25.2.5 Test of frame transmission with incorrect C/R values ..... 605
25.2.5.1 I frame with C bit set to zero ..... 605
25.2.5.2 SABM frame with C bit set to zero ..... 606
25.2.6 Test of errors in the control field ..... 607
25.2.6.1 N(S) sequence error ..... 607
25.2.6.2 N(R) sequence error ..... 609
25.2.6.3 Improper F bit ..... 609
25.2.7 Test on receipt of invalid frames ..... 610

26 Testing of layer 3 functions ..... 615
26.1 Default conditions and structured sequence of tests ..... 615
26.1.1 Default test conditions during layer 3 tests ..... 615
26.1.2 Structured sequence of the tests ..... 620
26.1.3 General rules for message parameters ..... 620
26.1.4 General rules for layer 3 testing ..... 621
26.1.5 Format of layer 3 test descriptions ..... 621
26.2 Initial tests ..... 622
26.2.1 Channel request ..... 622
26.2.1.1 Channel request / initial time ..... 622
26.2.1.2 Channel request / repetition time ..... 623
26.2.1.3 Channel request / random reference ..... 625
26.2.2 IMSI detach and IMSI attach ..... 626
26.2.3 Sequenced MM / CM message transfer ..... 630
26.2.4 Establishment cause ..... 631
26.3 Test of MS functions in idle mode ..... 638
26.3.1 Initial conditions ..... 638
26.3.2 MS indication of available PLMNs ..... 644
26.3.3 MS will send only if BSS is "on air" ..... 644
26.3.4 Manual mode of PLMN selection ..... 645
26.4 Lower layer failures in layer 3 testing ..... 646
26.4.1 Introduction ..... 646
26.4.2 Layer 1 reception failures ..... 646
26.4.3 Data link layer failures ..... 646
26.4.4 Lower layer failures, used for the tests in clause 25 ..... 647
26.5 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions ..... 647
26.5.1 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown protocol discriminator ..... 647
26.5.2 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / TI and skip indicator ..... 648
26.5.2.1 TI and skip indicator / RR ..... 648
26.5.2.1.1 TI and skip indicator / RR / Idle Mode ..... 648
26.5.2.1.2 TI and skip indicator / RR / RR-Connection established ..... 649
26.5.2.2 TI and skip indicator / MM ..... 651
26.5.2.3 TI and skip indicator / CC ..... 652
26.5.3 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / undefined or unexpected message type ..... 654

26.5.3.1 Undefined or unexpected message type / undefined message type / CC....654
26.5.3.2 Undefined or unexpected message type / undefined message type / MM....655
26.5.3.3 Undefined or unexpected message type / undefined message type / RR....657
26.5.3.4 Undefined or unexpected message type / unexpected message type / CC....658
26.5.4 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unforeseen information elements in the non-imperative message part....659
26.5.4.1 Unforeseen information elements in the non-imperative message part / duplicated information elements....659
26.5.5 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / non-semantical mandatory IE errors....661
26.5.5.1 Non-semantical mandatory IE errors / RR....661
26.5.5.1.1 Non-semantical mandatory IE errors / RR / missing mandatory IE error....661
26.5.5.1.2 Non-semantical mandatory IE errors / RR / comprehension required....663
26.5.5.2 Non-semantical mandatory IE errors / MM....665
26.5.5.2.1 Non-semantical mandatory IE errors / MM / syntactically incorrect mandatory IE....665
26.5.5.2.2 Non-semantical mandatory IE errors / MM / syntactically incorrect mandatory IE....666
26.5.5.2.3 Non-semantical mandatory IE errors / MM / comprehension required....667
26.5.5.3 Non-semantical mandatory IE errors / CC....669
26.5.5.3.1 Non-semantical mandatory IE errors / CC / missing mandatory IE....669
26.5.5.3.2 Non-semantical mandatory IE errors / CC / comprehension required....671
26.5.6 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown IE, comprehension not required....672
26.5.6.1 Unknown information elements in the non-imperative message part / MM....672
26.5.6.1.1 Unknown IE, comprehension not required / MM / IE unknown in the protocol....672
26.5.6.1.2 Unknown IE, comprehension not required / MM / IE unknown in the message....674
26.5.6.2 Unknown information elements in the non-imperative message part / CC....675
26.5.6.2.1 Unknown information elements in the non-imperative message part / CC / Call establishment....675
26.5.6.2.2 Unknown information elements in the non-imperative message part / CC / disconnect....676
26.5.6.2.3 Unknown information elements in the non-imperative message part / CC / release....677
26.5.6.2.4 Unknown information elements in the non-imperative message part / CC / release complete....679
26.5.6.3 Unknown IE in the non-imperative message part, comprehension not required / RR....680
26.5.7 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / spare bits....682
26.5.7.1 Spare bits / RR....682
26.5.7.1.1 Spare bits / RR / paging channel....682
26.5.7.1.2 Spare bits / RR / BCCH....683
26.5.7.1.3 Spare bits / RR / AGCH....684
26.5.7.1.4 Spare bits / RR / Connected Mode....686
26.5.7.2 Spare bits / MM....689
26.5.7.3 Spare bits / CC....691
26.5.8 Default contents of messages....693
26.6 Test of the elementary procedures for radio resource management....695
26.6.1 Immediate assignment....695
26.6.1.1 Immediate assignment / SDCCH or TCH assignment....695
26.6.1.2 Immediate assignment / extended assignment....696
26.6.1.3 Immediate assignment / assignment rejection....698
26.6.1.4 Immediate assignment / ignore assignment....700
26.6.1.5 Immediate assignment after immediate assignment reject....702
26.6.2 Test of paging....703
26.6.2.1 Normal paging....703
26.6.2.1.1 Paging / normal / type 1....703
26.6.2.1.2 Paging / normal / type 2....706
26.6.2.1.3 Paging / normal / type 3....708
26.6.2.2 Paging / extended....709
26.6.2.3 Paging / reorganization....712
26.6.2.3.1 Paging / reorganization / procedure 1....712
26.6.2.3.2 Paging / reorganization / procedure 2....715
26.6.2.4 Paging / same as before....716
26.6.2.5 Paging / multislot CCCH....717
26.6.3 Test of measurement report....718
26.6.3.1 Measurement / no neighbours....718
26.6.3.2 Measurement / all neighbours present....725

26.6.3.3 Measurement / barred cells and non-permitted NCCs....735
26.6.3.4 Measurement / DTX....744
26.6.3.5 Measurement / Frequency Formats....756
26.6.3.6 Measurement / multiband environment....765
26.6.3.7 Measurement / new cell reporting....776
26.6.4 Test of the channel assignment procedure....793
26.6.4.1 Dedicated assignment / successful case....793
26.6.4.2 Dedicated assignment / failure....818
26.6.4.2.1 Dedicated assignment / failure / failure during active state....818
26.6.4.2.2 Dedicated assignment / failure / general case....819
26.6.5 Test of handover....821
26.6.5.1 Handover / successful / active call / non-synchronized....822
26.6.5.2 Handover / successful / call under establishment / non-synchronized....864
26.6.5.3 Handover / successful / active call / finely synchronized....920
26.6.5.4 Handover / successful / call under establishment / finely synchronized....934
26.6.5.5 Pre-synchronized handovers....966
26.6.5.5.1 Handover / successful / active call / pre-synchronized / Timing Advance IE not included....966
26.6.5.5.2 Handover / successful / call being established / pre-synchronized / timing advance IE is included / reporting of observed time difference requested....968
26.6.5.6 Handover / successful / active call / pseudo synchronized....970
26.6.5.7 Handover / successful / active call / non-synchronized / reporting of observed time difference requested....972
26.6.5.8 Handover / layer 3 failure....974
26.6.5.9 Handover / layer 1 failure....975
26.6.6 Test of frequency redefinition....976
26.6.6.1 Frequency redefinition....976
26.6.7 Test of the channel mode modify procedure....991
26.6.7.1 Test of the channel mode modify procedure / full rate....991
26.6.7.2 Test of the channel mode modify procedure / half rate....993
26.6.8 Test of ciphering mode setting....996
26.6.8.1 Ciphering mode / start ciphering....996
26.6.8.2 Ciphering mode / no ciphering....997
26.6.8.3 Ciphering mode / old cipher key....998
26.6.8.4 Ciphering mode / change of mode, algorithm and key....1000
26.6.8.5 Ciphering mode / IMEISV request....1012
26.6.9 Test of additional assignment....1014
26.6.10 Test of partial release....1014
26.6.11 Test of classmark....1014
26.6.11.1 Classmark change....1014
26.6.11.2 Classmark interrogation....1016
26.6.12 Test of channel release....1018
26.6.12.1 Channel release / SDCCH....1018
26.6.12.2 Channel release / SDCCH - no L2 ACK....1019
26.6.12.3 Channel release / TCH-F....1020
26.6.12.4 Channel release / TCH-F - no L2 ACK....1022
26.6.13 Test of starting time....1023
26.6.13.1 Dedicated assignment with starting time / successful case / time not elapsed....1026
26.6.13.2 Dedicated assignment with starting time / successful case / time elapsed....1028
26.6.13.3 Dedicated assignment with starting time and frequency redefinition / failure case / time not elapsed....1030
26.6.13.4 Dedicated assignment with starting time and frequency redefinition / failure case / time elapsed....1033
26.6.13.5 Handover with starting time / successful case / time not elapsed....1035
26.6.13.6 Handover with starting time / successful case / time elapsed....1037
26.6.13.7 Handover with starting time and frequency redefinition / failure case / time not elapsed....1039
26.6.13.8 Handover with starting time and frequency redefinition / failure case / time elapsed....1042
26.6.13.9 Immediate assignment with starting time / successful case / time not elapsed....1045
26.6.13.10 Immediate assignment with starting time / successful case / time elapsed....1047
26.6.14 Default contents of GSM 900 layer 3 messages for RR tests....1049
26.6.15 Default contents of DCS 1 800 layer 3 messages for RR tests....1060
26.6.16 Default contents of GSM 450 layer 3 messages for RR tests....1070
26.6.17 Default contents of GSM 480 layer 3 messages for RR tests....1081
26.6.18 Default contents of PCS 1900 layer 3 messages for RR tests....1092

26.6.19 Default contents of GSM 700 layer 3 messages for RR tests ....1102
26.6.20 Default contents of GSM 850 layer 3 messages for RR tests ....1113
26.7 Elementary procedures of mobility management ....1124
26.7.1 TMSI reallocation ....1125
26.7.2 Authentication ....1127
26.7.2.1 Authentication accepted ....1127
26.7.2.2 Authentication rejected ....1128
26.7.3 Identification ....1131
26.7.3.1 General Identification ....1131
26.7.3.2 Handling of IMSI shorter than the maximum length ....1133
26.7.4 Location updating ....1136
26.7.4.1 Location updating / accepted ....1136
26.7.4.2 Location updating / rejected ....1141
26.7.4.2.1 Location updating / rejected / IMSI invalid ....1141
26.7.4.2.2 Location updating / rejected / PLMN not allowed ....1144
26.7.4.2.3 Location updating / rejected / location area not allowed ....1148
26.7.4.2.4 Location updating / rejected / roaming not allowed in this location area ....1151
26.7.4.3 Location updating / abnormal cases ....1158
26.7.4.3.1 Location updating / abnormal cases / random access fails ....1158
26.7.4.3.2 Location updating / abnormal cases / attempt counter less or equal to 4, LAI different ....1160
26.7.4.3.3 Location updating / abnormal cases / attempt counter equal to 4 ....1166
26.7.4.3.4 Location updating / abnormal cases / attempt counter less or equal to 4, stored LAI equal to broadcast LAI ....1173
26.7.4.4 Location updating / release / expiry of T3240 ....1179
26.7.4.5 Location updating / periodic ....1180
26.7.4.5.1 Location updating / periodic spread ....1180
26.7.4.5.2 Location updating / periodic normal / test 1 ....1182
26.7.4.5.3 Location updating / periodic normal / test 2 ....1184
26.7.4.5.4 Location updating / periodic HPLMN search ....1187
26.7.4.6 Location updating / interworking of attach and periodic ....1191
26.7.5 MM connection ....1192
26.7.5.1 Introduction ....1192
26.7.5.2 MM connection / establishment with cipher ....1193
26.7.5.3 MM connection / establishment without cipher ....1194
26.7.5.4 MM connection / establishment rejected ....1195
26.7.5.5 MM connection / establishment rejected cause 4 ....1196
26.7.5.6 MM connection / expiry T3230 ....1198
26.7.5.7 MM connection / abortion by the network ....1199
26.7.5.7.1 MM connection / abortion by the network / cause #6 ....1199
26.7.5.7.2 MM connection / abortion by the network / cause not equal to #6 ....1202
26.7.5.8 MM connection / follow-on request pending ....1203
26.7.5.8.1 MM connection / follow-on request pending / test 1 ....1203
26.7.5.8.2 MM connection / follow-on request pending / test 2 ....1204
26.7.5.8.3 MM connection / follow-on request pending / test 3 ....1206
26.7.6 Default contents of messages ....1207
26.8 Tests related to circuit switched call control ....1210
26.8.1 Circuit switched Call Control (CC) state machine verification ....1210
26.8.1.1 General on CC state machine verification ....1210
26.8.1.2 Establishment of an outgoing call ....1211
26.8.1.2.1 Outgoing call / U0 null state ....1214
26.8.1.2.2 Outgoing call / U0.1 MM connection pending ....1215
26.8.1.2.3 Outgoing call / U1 call initiated ....1219
26.8.1.2.4 Outgoing call / U3 MS originating call proceeding ....1228
26.8.1.2.5 Outgoing call / U4 call delivered ....1244
26.8.1.2.6 U10 call active ....1254
26.8.1.2.7 U11 disconnect request ....1262
26.8.1.2.8 U12 disconnect indication ....1268
26.8.1.2.9 Outgoing call / U19 release request ....1273
26.8.1.3 Establishment of an incoming call / Initial conditions ....1279
26.8.1.3.1 Incoming call / U0 null state ....1282
26.8.1.3.2 Incoming call / U6 call present ....1283
26.8.1.3.3 Incoming call / U9 mobile terminating call confirmed ....1285

26.8.1.3.4 Incoming call / U7 call received ..... 1294
26.8.1.3.5 Incoming call / U8 connect request ..... 1304
26.8.1.4 In call functions ..... 1315
26.8.1.4.1 In-call functions / DTMF information transfer ..... 1315
26.8.1.4.2 In-call functions / user notification ..... 1317
26.8.1.4.3 In-call functions / channel changes ..... 1318
26.8.1.4.4 In-call functions / MS terminated in-call modification ..... 1322
26.8.1.4.5 In-call functions / MS originated in-call modification ..... 1323
26.8.2 Call Re-establishment ..... 1339
26.8.2.1 Call Re-establishment/call present, re-establishment allowed ..... 1339
26.8.2.2 Call Re-establishment/call present, re-establishment not allowed ..... 1341
26.8.2.3 Call Re-establishment/call under establishment, transmission stopped ..... 1342
26.8.3 User to user signalling ..... 1344
26.8.4 Default contents of message ..... 1346
26.9 Structured procedures ..... 1352
26.9.1 Structured procedures / general ..... 1352
26.9.2 Structured procedures / MS originated call / early assignment ..... 1353
26.9.3 Structured procedures / MS originated call / late assignment ..... 1356
26.9.4 Structured procedures / MS terminated call / early assignment ..... 1358
26.9.5 Structured procedures / MS terminated call / late assignment ..... 1361
26.9.6 Structured procedures / emergency call ..... 1363
26.9.6.1 Structured procedures / emergency call / idle updated ..... 1363
26.9.6.1.1 Structured procedures / emergency call / idle updated / preferred channel rate ..... 1363
26.9.6.1.2 Structured procedures / emergency call / idle updated, non-preferred channel rate ..... 1366
26.9.6.2 Structured procedures / emergency call / idle, no IMSI ..... 1366
26.9.6.2.1 Structured procedures / emergency call / idle, no IMSI / accept case ..... 1366
26.9.6.2.2 Structured procedures / emergency call / idle, no IMSI / reject case ..... 1368
26.9.7 Directed Retry / Mobile Originated Call ..... 1370
26.9.8 Directed Retry / Mobile Terminated Call ..... 1385
26.9.9 Default contents of messages ..... 1401
26.10 E-GSM or R-GSM signalling ..... 1408
26.10.1 E-GSM or R-GSM signalling / general considerations ..... 1408
26.10.2 E-GSM or R-GSM signalling / RR ..... 1410
26.10.2.1 E-GSM or R-GSM signalling / RR / Measurement ..... 1410
26.10.2.2 E-GSM or R-GSM signalling / RR / Immediate assignment ..... 1417
26.10.2.3 E-GSM or R-GSM signalling / RR / channel assignment procedure ..... 1419
26.10.2.4 E-GSM or R-GSM signalling / RR / Handover ..... 1423
26.10.2.4.1 E-GSM or R-GSM signalling / RR / Handover / Successful handover ..... 1423
26.10.2.4.2 E-GSM or R-GSM signalling / RR / Handover / layer 1 failure ..... 1429
26.10.2.5 E-GSM or R-GSM signalling / RR / Frequency Redefinition ..... 1431
26.10.3 E-GSM or R-GSM signalling / Structured procedure ..... 1434
26.10.3.1 E-GSM or R-GSM signalling / Structured procedure / Mobile originated call ..... 1435
26.10.3.2 E-GSM or R-GSM signalling / Structured procedures / emergency call ..... 1437
26.10.3.3 Default contents of messages ..... 1440
26.10.4 E-GSM or R-GSM signalling / Default message contents ..... 1441
26.11 Multiband signalling ..... 1445
26.11.1 General considerations ..... 1445
26.11.2 Multiband signalling / RR ..... 1445
26.11.2.1 Multiband signalling / RR / Immediate assignment procedure ..... 1445
26.11.2.2 Multiband signalling / RR / Handover ..... 1454
26.11.2.2.1 Multiband signalling / RR / Handover / successful / active call / non-synchronized ..... 1454
26.11.2.2.2 Multiband signalling / RR / Handover / layer 1 failure ..... 1474
26.11.2.2.3 Multiband signalling / RR / Handover / Multiband BCCH / successful / active call / non synchronized ..... 1481
26.11.2.2.4 Multiband signalling / RR / Handover/ Multiband BCCH / Intracell Handover - Interband Assignment ..... 1497
26.11.2.3 Multiband signalling / RR / Measurement reporting ..... 1523
26.11.3 Multiband signalling / MM ..... 1538
26.11.3.1 Multiband signalling / MM / Location updating ..... 1538
26.11.3.1.1 Location updating / accepted ..... 1538
26.11.3.1.2 Location updating / periodic ..... 1541
26.11.4 Multiband signalling / CC ..... 1544

26.11.5 Multiband signalling / Structured procedures ..... 1544
26.11.5.1 Multiband signalling / Structured procedures / MS originated call / early assignment ..... 1544
26.11.5.2 Structured procedures / MS terminated call / late assignment ..... 1555
26.11.6 Multiband signalling / Default messages contents ..... 1566
26.12 Enhanced Full Rate signalling ..... 1594
26.12.1 EFR signalling/ test of the channel mode modify procedure ..... 1594
26.12.2 EFR signalling/ tests of handover ..... 1597
26.12.2.1 EFR signalling / Handover / active call / successful case ..... 1598
26.12.3 EFR Signalling / Structured procedures / MS originated call / late assignment ..... 1650
26.12.4 Structured procedures / MS terminated call / l early assignment ..... 1653
26.12.5 Structured procedures / emergency call ..... 1656
26.12.6 EFR Signalling / Directed Retry / Mobile Originated Call ..... 1659
26.12.7 EFR Signalling / Directed Retry / Mobile Terminated Call ..... 1670
26.12.8 Default contents of layer 3 messages for Enhanced Full rate speech tests ..... 1683
26.13 Multislot signalling ..... 1693
26.13.1 Multislot signalling / RR ..... 1693
26.13.1.1 Multislot signalling / RR / Measurement ..... 1693
26.13.1.1.1 Multislot signalling / RR / Measurement / symmetric ..... 1693
26.13.1.1.2 Multislot signalling / RR / Measurement / asymmetric ..... 1702
26.13.1.1.3 Multislot signaling / RR / Measurement / asymmetric / change of the reported subchannel ..... 1713
26.13.1.2 Multislot signalling / RR / Dedicated assignment ..... 1719
26.13.1.2.1 Multislot signalling / RR / Dedicated assignment / successful case ..... 1719
26.13.1.2.2 Multislot signalling / RR / Dedicated assignment / failure / general case ..... 1756
26.13.1.3 Test of handover ..... 1793
26.13.1.3.1 Multislot signalling / RR / Handover / successful / active call / non-synchronized ..... 1793
26.13.1.3.2 Multislot signalling / RR / Handover / successful / call under establishment / non synchronized / resource upgrading ..... 1802
26.13.1.3.3 Multislot signalling / RR / Handover / successful / active call / finely synchronized / resource downgrading ..... 1812
26.13.1.3.4 Multislot signalling / RR / Handover / successful / call under establishment / finely synchronized / relocation of channels ..... 1819
26.13.1.3.5 Multislot signalling / RR /Handover / successful / call under establishment / pre-synchronized / resource upgrading ..... 1834
26.13.1.4 Multislot signalling / RR / Test of the channel mode modify procedure ..... 1842
26.13.1.5 Multislot signalling / RR / Early classmark sending ..... 1845
26.13.1.6 Default contents of layer 3 messages for RR tests ..... 1846
26.13.1.6.1 Default contents of GSM 900 layer 3 messages for RR tests ..... 1846
26.13.1.6.2 Default contents of DCS 1 800 layer 3 messages for RR tests ..... 1856
26.13.1.6.3 Default contents of GSM 450 layer 3 messages for RR tests ..... 1867
26.13.1.6.4 Default contents of GSM 480 layer 3 messages for RR tests ..... 1878
26.13.1.6.5 Default contents of GSM 700 layer 3 messages for RR tests ..... 1889
26.13.1.6.6 Default contents of GSM 850 layer 3 messages for RR tests ..... 1900
26.13.2 Multislot signalling / CC ..... 1912
26.13.2.1 Multislot signalling / CC / In-call functions ..... 1912
26.13.2.1.1 Multislot signalling / CC / In-call functions / User initiated service level upgrade / successful ..... 1912
26.13.2.1.2 Multislot signalling / CC / In-call functions / User initiated service level downgrade / successful ..... 1913
26.13.2.1.3 Multislot signalling / CC / In-call functions / User initiated service level upgrade / Time-out of timer T323 ..... 1915
26.13.2.1.4 Multislot signalling / CC / In-call functions / User initiated service level upgrade / modify reject ..... 1917
26.13.2.1.5 Multislot signalling / CC / In call functions / contents of some of the messages ..... 1918
26.13.3 Multislot signalling / Structured procedures ..... 1919
26.13.3.1 Multislot signalling / Structured procedures / MS originated call / early assignment / HSCSD / non-transparent ..... 1919
26.13.3.2 Multislot signalling / Structured procedures / MS originated call / late assignment / HSCSD / non-transparent ..... 1922
26.13.3.3 Multislot signalling / Structured procedures / MS originated call / early assignment / HSCSD / Transparent ..... 1925
26.13.3.4 Multislot signalling / Structured procedures / MS Terminated call / early assignment / HSCSD / non-transparent ..... 1928

26.13.3.5 Multislot signalling / Structured procedures / MS Terminated call / early assignment / HSCSD / Transparent....1932
26.13.3.6 Default test conditions during layer 3 tests....1936
26.13.3.7 Default contents of messages....1939
26.14 VGCS and VBS Tests....1945
26.14.1 VGCS-VBS / Notification....1946
26.14.1.1 VGCS-VBS / Notification / notification indication....1946
26.14.1.2 VGCS-VBS / Notification / NCH position....1950
26.14.1.3 VGCS-VBS / Notification / Reduced NCH monitoring....1952
26.14.1.4 VGCS-VBS / Notification / Limited Service state....1958
26.14.2 VGCS-VBS / Paging....1960
26.14.2.1 VGCS-VBS / Paging / Paging indication....1960
26.14.2.2 VGCS-VBS / Paging / Notification....1963
26.14.3 VGCS-VBS / RR Procedures....1967
26.14.3.1 VGCS-VBS / RR Procedures / frequency redefinition....1967
26.14.3.2 VGCS-VBS / RR Procedures / assignment....1977
26.14.3.3 VGCS-VBS / RR Procedures / handover / successful in group transmit mode....1982
26.14.3.4 VGCS-VBS / RR Procedures / handover / successful at group call establishment....2001
26.14.3.5 VGCS-VBS / RR Procedures / handover / failure....2016
26.14.3.6 VGCS-VBS / RR / Measurement Report....2017
26.14.3.6.1 Measurement / all neighbours present....2017
26.14.4 VGCS-VBS / Uplink Access and Uplink Reply Procedures....2025
26.14.4.1 VGCS-VBS / Uplink Access / uplink investigation....2025
26.14.4.2 Uplink Access / uplink access procedure....2027
26.14.4.3 VGCS-VBS / Uplink Reply in VGCS receive mode....2031
26.14.5 VGCS-VBS / Leaving Group Receive or Group Transmit Mode....2032
26.14.5.1 VGCS-VBS / Leaving group receive mode....2032
26.14.5.2 VGCS-VBS / Leaving group transmit mode....2034
26.14.6 VGCS-VBS / GCC-BCC Procedures....2036
26.14.6.1 VGCS-VBS / GCC-BCC Procedures / MO call establishment....2036
26.14.6.2 VGCS-VBS / GCC-BCC Procedures / Transaction Identifier....2039
26.14.6.3 VGCS-VBS / GCC-BCC Procedures / Call Termination / originator / group transmit mode....2041
26.14.6.4 VGCS-VBS / GCC-BCC Procedures / Call Termination / originator in group receive mode....2043
26.14.6.5 VGCS-VBS / GCC-BCC Procedures / Call Termination / not originator....2044
26.14.6.6 VGCS-VBS / GCC-BCC Procedures / GCC states....2046
26.14.6.7 VGCS-VBS / GCC-BCC Procedures / BCC states....2049
26.14.7 VGCS-VBS / Error Handling....2050
26.14.7.1 VGCS-VBS / Error Handling / short message length, unknown message type and TI....2050
26.14.7.2 VGCS-VBS / Error Handling / incorrect information elements....2054
26.14.7.3 VGCS-VBS / Messages not addressing VGCS receive mode....2058
26.14.8 VGCS-VBS / Structured Procedures....2060
26.14.8.1 VGCS-VBS / Structured Procedures / Very early and early assignment....2060
26.14.9 VGCS-VBS / Cell change....2063
26.14.9.1 VGCS-VBS / Cell Change / Same LA....2063
26.14.9.2 VGCS-VBS / Cell Change / Different LA....2066
26.14.9.3 VGCS-VBS / Cell Change / Different PLMN....2069
26.14.10 VGCS-VBS / Default Message Contents....2072
26.14.11 VGCS-VBS / User-to-Dispatcher Information....2076
26.14.11.1 VGCS-VBS / User-to-Dispatcher Information / BCC MO call....2076
26.14.11.2 VGCS-VBS / User-to-Dispatcher information / GCC MO call....2079
26.14.11.3 VGCS-VBS / User-to-Dispatcher information / Compressed user information in VBS fast call set-up....2081
26.14.11.4 VGCS-VBS / User-to-Dispatcher information / Compressed User-to-Dispatcher information in VGCS fast call set-up....2082
26.15 SoLSA signalling....2084
26.15.1 General considerations....2084
26.15.1.1 Default message content....2084
26.15.1.2 General initial conditions for SIM card....2085
26.15.2 SoLSA signalling / RR....2085
26.15.2.1 SoLSA signalling / RR / classmark interrogation....2085
26.15.3 SoLSA signalling / MM....2088
26.15.3.1 SoLSA signalling / MM / location updating....2088

26.15.3.1.1 Location updating / accepted ..... 2088
26.15.3.2 SoLSA signalling / MM / MM information ..... 2093
26.15.4 SoLSA signalling / CC ..... 2095
26.15.4.1 SoLSA signalling / CC / call re-establishment / call present ..... 2095
26.15.5 SoLSA signalling / structured procedures ..... 2098
26.15.5.1 SoLSA signalling / structured procedures / MS originated call / early assignment ..... 2098
26.15.5.2 SoLSA signalling / structured procedures / MS originated call / late assignment ..... 2101
26.15.5.3 SoLSA signalling / structured procedures / MS terminated call / early assignment ..... 2104
26.15.5.4 SoLSA signalling / structured procedures / MS terminated call / late assignment ..... 2107
26.15.5.5 SoLSA signalling / structured procedures / emergency call / idle updated ..... 2110
26.15.5.6 SoLSA signalling / structured procedures / emergency call / idle, no IMSI ..... 2113
26.16 Adaptive Multi Rate Signalling ..... 2115
26.16.1 Inband Signalling, Downlink Codec Adaptation ..... 2116
26.16.2 Inband Signalling, Uplink Codec Adaptation ..... 2119
26.16.3 Structured procedures / MS terminated call / early assignment / no initial codec mode ..... 2122
26.16.4 Structured procedures / MS originated call / late assignment / specified initial codec mode ..... 2125
26.16.5 AMR signalling / Handover / active call / successful case ..... 2127
26.16.6 Structured procedures / emergency call ..... 2133
26.16.7 AMR Signalling / Directed Retry / Mobile Originated Call ..... 2135
26.16.8 AMR Signalling / Directed Retry / Mobile Terminated Call ..... 2143
26.16.9 Default contents of layer 3 messages for AMR signalling tests ..... 2153
27 Testing of the SIM/ME interface ..... 2154
27.1 MS identification by short IMSI ..... 2159
27.1.1 MS identification by short IMSI - Normal case ..... 2159
27.1.2 MS identification by short IMSI, Phase 1 DCS SIM ..... 2159
27.2 MS identification by short TMSI ..... 2160
27.3 MS identification by long TMSI ..... 2162
27.4 MS identification by long IMSI, TMSI updating and cipher key sequence number assignment ..... 2163
27.5 Forbidden PLMNs, location updating and undefined cipher key ..... 2166
27.6 MS updating forbidden PLMNs ..... 2170
27.7 MS deleting forbidden PLMNs ..... 2172
27.8 MS updating the PLMN selector list ..... 2175
27.9 MS recognizing the priority order of the PLMN selector list ..... 2176
27.10 MS access control management ..... 2178
27.11 Exchange protocol tests ..... 2194
27.11.1 Character transmission ..... 2194
27.11.1.1 Bit/character duration during the transmission from the ME to the SIM ..... 2194
27.11.1.2 Bit/character duration during the transmission from the SIM simulator to the ME ..... 2194
27.11.1.3 Inter-character delay ..... 2195
27.11.1.4 Error handling during the transmission from the ME to the SIM ..... 2196
27.11.1.5 Error handling during transmission from the SIM to the ME ..... 2197
27.11.2 Answer to reset (RST) ..... 2198
27.11.2.1 Void ..... 2198
27.11.2.2 Acceptance of SIMs with active low RST ..... 2198
27.11.2.3 Characters of the answer to reset ..... 2198
27.11.2.4 PTS procedure ..... 2200
27.11.2.5 Reset repetition ..... 2201
27.11.2.6 Speed Enhancement ..... 2201
27.11.3 Command processing, procedure bytes ..... 2202
27.12 Evaluation of directory characteristics ..... 2203
27.12.1 Operating speed in authentication procedure ..... 2203
27.12.2 Clock stop ..... 2204
27.13 Mechanical tests ..... 2205
27.13.1 Contact pressure ..... 2205
27.13.2 Shape of contacts for IC card SIM card reader ..... 2206
27.14 Secret code usage ..... 2207
27.14.1 Entry of PIN ..... 2207
27.14.2 Change of PIN ..... 2207
27.14.3 Disabling the PIN ..... 2208
27.14.4 PUK entry ..... 2209
27.14.5 Entry of PIN2 ..... 2210

27.14.6 Change of PIN2 ....2211
27.14.7 PUK2 entry ....2212
27.15 Abbreviated Dialling Numbers (ADN) ....2213
27.16 MMI reaction to SIM status encoding ....2214
27.17 Electrical tests ....2215
27.17.1 Test of the power transition phases ....2217
27.17.1.1 Phase preceding ME power on ....2217
27.17.1.2 Phase during SIM power on ....2218
27.17.1.3 Phase during ME power off with clock stop forbidden ....2220
27.17.1.4 Phase during ME power off with clock stop allowed ....2221
27.17.1.5 SIM Type Recognition and Voltage Switching ....2223
27.17.1.5.1 Reaction of 3V only MEs on SIM type recognition failure ....2223
27.17.1.5.2 Reaction of 3V only MEs on type recognition of 5V only SIMs ....2224
27.17.1.5.3 Reaction of 3V technology MEs on type recognition of 5V only SIMs ....2225
27.17.1.5.4 Reaction of 3V technology MEs on type recognition of 3V technology SIMs ....2226
27.17.1.5.5 Reaction of 1,8V only MEs on SIM type recognition failure ....2227
27.17.1.5.6 Reaction of 1,8V only MEs on type recognition of 3V SIMs ....2228
27.17.1.5.7 Reaction of 1,8V technology MEs on type recognition of 3V technology SIMs ....2229
27.17.1.5.8 Reaction of 1,8V technology MEs on type recognition of 1,8V technology SIMs ....2230
27.17.2 Electrical tests on each ME contact ....2231
27.17.2.1 Electrical tests on contact C1 ....2232
27.17.2.1.1 Test 1 ....2232
27.17.2.1.2 Test 2 ....2234
27.17.2.2 Electrical tests on contact C2 ....2237
27.17.2.3 Electrical tests on contact C3 ....2238
27.17.2.4 [Not used] ....2240
27.17.2.5 Electrical tests on contact C7 ....2240
27.18 Fixed Number Dialling (FND) ....2243
27.18.1 ME and SIM with FND activated ....2243
27.18.1.1 $EF_{ADN}$ invalidated and not readable or updatable ....2243
27.18.2 ME and SIM with FND deactivated ....2245
27.18.3 Enabling, disabling and updating of FND ....2246
27.19 Phase identification ....2248
27.20 SIM presence detection ....2248
27.21 Advice of Charge (AoC) ....2249
27.21.1 AoC not supported by SIM ....2249
27.21.2 Maximum frequency of ACM updating ....2251
27.21.3 Call terminated when ACM greater than ACMmax ....2253
27.21.4 Response codes of increase command ....2255
28 Test of autocalling restrictions ....2258
28.1 General ....2258
28.2 Constraining the access to a single number (GSM 02.07 category 3) ....2258
28.3 Constraining the access to a single number (GSM 02.07 categories 1 and 2) ....2260
28.4 Behaviour of the MS when its list of blacklisted numbers is full ....2262
29 Testing of bearer services ....2265
29.1 General ....2265
29.2 Testing of transparent data services ....2265
29.2.1 Verification of synchronization ....2265
29.2.2 Filtering of channel control information for transparent BCs ....2268
29.2.3 Correct Terminal Compatibility Decision ....2269
29.2.3.1 Negotiation of Radio Channel Requirement (RCR) ....2269
29.2.3.2 Negotiation of Connection Element (CE) ....2270
29.2.3.3 Negotiation of Number of Stop Bits, Number of Data bits, and Parity ....2271
29.2.3.4 Negotiation of Modem Type ....2271
29.2.3.5 Negotiation of Intermediate Rate ....2272
29.2.3.6 Negotiation of User Information Layer 2 Protocol ....2273
29.2.3.7 Negotiation between TS 61 and TS 62: Mobile Originated call ....2273
29.2.3.8 Negotiation between TS 61 and TS 62: Mobile Terminated call ....2274
29.2.4 Data Rate Adaptation for Synchronous Transparent Bearer Capabilities ....2274
29.2.5 Network Independent Clocking ....2275
29.2.6 Asynchronous Transparent Bearer Capabilities ....2276

29.2.6.1 Data Rate Adaptation ..... 2276
29.2.6.2 Passage of the Break Signal ..... 2277
29.2.6.3 Overspeed/Underspeed Handling (Local Terminal) ..... 2278
29.2.6.4 Overspeed/Underspeed Handling (Remote Terminal) ..... 2279
29.2.7 Interchange circuit mapping for transparent bearer capabilities ..... 2280
29.3 Testing of non transparent data services (RLP tests) ..... 2281
29.3.1 Initialization ..... 2281
29.3.1.1 Normal initialization done by the MS ..... 2281
29.3.1.2 Initialization failure ..... 2283
29.3.1.2.1 Loss of UA frame ..... 2283
29.3.1.2.2 Total loss of UA frame ..... 2284
29.3.2 Data transfer ..... 2285
29.3.2.1 Default conditions ..... 2285
29.3.2.2 MS sends I+S frames ..... 2286
29.3.2.2.1 N(S) sequence number ..... 2286
29.3.2.2.2 Transmission window ..... 2287
29.3.2.2.3 Busy condition ..... 2289
29.3.2.3 SS sends I+S frames ..... 2291
29.3.2.3.1 N(R) sequence number ..... 2291
29.3.2.3.2 Busy condition ..... 2292
29.3.2.4 SS rejects I+S frames ..... 2294
29.3.2.4.1 REJ frame ..... 2294
29.3.2.4.2 SREJ frame ..... 2296
29.3.2.4.3 I+S reject frame ..... 2299
29.3.2.5 MS rejects I+S frames ..... 2302
29.3.2.5.1 Rejection with REJ or SREJ supervisory frames ..... 2302
29.3.2.5.2 Retransmission of REJ or SREJ frames ..... 2308
29.3.2.5.3 I+S reject frame ..... 2312
29.3.2.6 Checkpoint recovery ..... 2315
29.3.2.6.1 SS in checkpoint recovery mode ..... 2315
29.3.2.6.2 End of the window ..... 2319
29.3.2.6.3 End of a sequence ..... 2322
29.3.2.6.4 Time-out of one frame ..... 2324
29.3.2.6.5 No response to checkpointing ..... 2326
29.3.2.6.6 Incorrect response to checkpointing ..... 2328
29.3.2.6.7 Total loss of response to checkpointing ..... 2331
29.3.2.6.8 Retransmission of a sequence ..... 2334
29.3.2.6.9 N2 retransmission of a sequence ..... 2338
29.3.3 Negotiation of the RLP parameters ..... 2342
29.3.3.1 Negotiation initiated by the SS ..... 2342
29.3.3.2 Negotiation initiated by the MS ..... 2347
29.3.3.3 Collision of XID frames ..... 2352
29.3.3.4 Loss of XID frames ..... 2357
29.3.3.5 Total loss of XID frames ..... 2359
29.4 Facsimile tests for the transparent network support ..... 2361
29.4.1 General ..... 2361
29.4.2 Mobile originated call ..... 2362
29.4.2.1 Call establishment procedure ..... 2362
29.4.2.1.1 Alternate speech / facsimile ..... 2362
29.4.2.1.2 Automatic facsimile ..... 2363
29.4.2.2 Pre-message procedure ..... 2364
29.4.2.3 Message procedure ..... 2366
29.4.2.4 Post-message procedure ..... 2367
29.4.2.5 Call release procedure ..... 2368
29.4.2.6 CTC processing - 4th PPR for the same block ..... 2369
29.4.2.7 Transition from Facsimile to Speech - Procedure interrupt generated by receiving station ..... 2371
29.4.2.8 Transition from Facsimile to Speech - Procedure interrupt generated by transmitting station ..... 2373
29.4.2.9 Quality check ..... 2374
29.4.3 Mobile terminated call ..... 2375
29.4.3.1 Call Establishment Procedure ..... 2375
29.4.3.1.1 Alternate Speech/Facsimile ..... 2375
29.4.3.1.2 Automatic facsimile ..... 2378

29.4.3.2 Pre-message procedure....2379
29.4.3.3 Message procedure....2380
29.4.3.4 Post-message procedure....2381
29.4.3.5 Call release procedure....2382
29.4.3.6 Speed conversion factor....2383
29.4.3.7 Quality Check....2386
29.4.4 Notes....2386
30 Speech teleservices....2388
30.1 Sending sensitivity/frequency response....2388
30.2 Sending loudness rating....2390
30.3 Receiving sensitivity/frequency response....2391
30.4 Receiving loudness rating....2392
30.5 Side tones....2393
30.5.1 Side Tone Masking Rating (STMR)....2393
30.5.2 Listener Side Tone Rating (LSTR)....2394
30.6 Telephone Acoustic coupling Loss (TAL)....2395
30.6.1 Echo Loss (EL)....2395
30.6.2 Stability margin....2396
30.7 Distortion....2397
30.7.1 Sending....2397
30.7.2 Receiving....2398
30.8 Sidetone distortion....2399
30.9 Out-of-band signals....2400
30.9.1 Sending....2400
30.9.2 Receiving....2401
30.10 Idle channel noise....2402
30.10.1 Sending....2402
30.10.2 Receiving....2403
30.11 Ambient Noise Rejection....2404
30.12 Sending sensitivity/frequency response....2405
30.13 Sending loudness rating....2406
30.14 Receiving sensitivity/frequency response....2407
30.15 Receiving loudness rating....2409
30.16 Side Tone Masking Rating (STMR)....2410
30.17 Telephone Acoustic coupling Loss (TAL)....2410
30.17.1 Echo Loss (EL)....2410
30.17.2 Stability margin....2411
30.18 Sending Distortion....2411
30.19 Ambient Noise Rejection....2413
31 Test of supplementary services....2414
31.1 Number identification supplementary services....2414
31.1.1 CLIP....2414
31.1.1.1 Normal operation....2414
31.1.1.2 Interrogation....2415
31.1.1.2.1 Interrogation accepted....2415
31.1.1.2.2 Interrogation rejected....2416
31.1.2 CLIR....2418
31.1.2.1 Normal operation - requesting presentation of CLI....2418
31.1.2.2 Normal operation - requesting restriction of CLI presentation....2419
31.1.2.3 Interrogation....2420
31.1.2.3.1 Interrogation accepted....2420
31.1.2.3.2 Interrogation rejected....2422
31.1.3 COLP....2424
31.1.3.1 Normal operation....2424
31.1.3.2 Interrogation....2425
31.1.3.2.1 Interrogation accepted....2425
31.1.3.2.2 Interrogation rejected....2426
31.1.4 COLR....2428
31.1.4.1 Interrogation....2428
31.1.4.1.1 Interrogation accepted....2428
31.1.4.1.2 Interrogation rejected....2429

31.1.4.2 Normal operation ..... 2432
31.2 Call offering supplementary services ..... 2433
31.2.1 Call forwarding supplementary services ..... 2433
31.2.1.1 Registration ..... 2433
31.2.1.1.1 Registration accepted ..... 2433
31.2.1.1.2 Registration rejected ..... 2436
31.2.1.2 Erasure by the subscriber ..... 2439
31.2.1.2.1 Erasure accepted ..... 2439
31.2.1.2.2 Erasure rejected ..... 2442
31.2.1.3 Activation ..... 2444
31.2.1.4 Deactivation ..... 2446
31.2.1.5 Invocation ..... 2449
31.2.1.6 Interrogation ..... 2449
31.2.1.6.1 Interrogation accepted ..... 2449
31.2.1.6.2 Interrogation rejected ..... 2452
31.2.1.7 Normal operation ..... 2454
31.2.1.7.1 Served mobile subscriber side ..... 2454
31.2.1.7.2 Forwarded-to mobile subscriber side ..... 2458
31.2.2 Call transfer and mobile access hunting supplementary services ..... 2460
31.3 Call completion supplementary services ..... 2460
31.3.1 Call Waiting ..... 2460
31.3.1.1 Waiting call indication and confirmation ..... 2460
31.3.1.2 Normal operation with successful outcome ..... 2461
31.3.1.2.1 Waiting call accepted; existing call released ..... 2461
31.3.1.2.2 Waiting call accepted; existing call on hold ..... 2462
31.3.1.2.3 Existing call released by user A; waiting call accepted ..... 2464
31.3.1.3 Normal operation with unsuccessful outcome ..... 2465
31.3.1.3.1 Waiting call released by subscriber B ..... 2465
31.3.1.3.2 Waiting call released by calling user C ..... 2466
31.3.1.4 Activation ..... 2467
31.3.1.5 Deactivation ..... 2470
31.3.1.6 Interrogation ..... 2473
31.3.1.6.1 Interrogation accepted ..... 2473
31.3.1.6.2 Interrogation rejected ..... 2475
31.3.2 Call Hold ..... 2477
31.3.2.1 Hold invocation ..... 2477
31.3.2.2 Retrieve procedure ..... 2478
31.3.2.3 Alternate from one call to the other ..... 2479
31.4 Multi-party supplementary services ..... 2481
31.4.1 Beginning the MultiParty service ..... 2481
31.4.1.1 Beginning the MultiParty service, successful case ..... 2481
31.4.1.2 Beginning the MultiParty service, unsuccessful case ..... 2483
31.4.1.3 Beginning the MultiParty service, expiry of timer T(BuildMPTY) ..... 2485
31.4.2 Managing an active MultiParty call ..... 2486
31.4.2.1 Served mobile subscriber ..... 2486
31.4.2.1.1 Put the MultiParty call on hold ..... 2486
31.4.2.1.2 Create a private communication with one of the remote parties ..... 2491
31.4.2.1.3 Terminate the entire MultiParty call ..... 2495
31.4.2.1.4 Explicitly disconnect a remote party ..... 2496
31.4.2.2 Remote parties ..... 2497
31.4.2.2.1 Release from the MultiParty call ..... 2497
31.4.3 Managing a held MultiParty call ..... 2499
31.4.3.1 Retrieve the held MultiParty call ..... 2499
31.4.3.1.1 Retrieve the held MultiParty call, successful case ..... 2499
31.4.3.1.2 Retrieve the held MultiParty call, unsuccessful case ..... 2500
31.4.3.1.3 Retrieve the held MultiParty call, expiry of timer T(RetrieveMPTY) ..... 2502
31.4.3.2 Initiate a new call ..... 2503
31.4.3.3 Process a call waiting request ..... 2504
31.4.3.4 Terminate the held MultiParty call ..... 2506
31.4.4 Managing a single call and a MultiParty call ..... 2507
31.4.4.1 Served mobile subscriber ..... 2507
31.4.4.1.1 Disconnect the single call ..... 2507

31.4.4.1.2 Disconnect the MultiParty call ..... 2510
31.4.4.2 Disconnect all calls ..... 2513
31.4.4.3 Add the single call to the MPTY ..... 2514
31.4.4.3.1 Add the single call to the MPTY, successful case ..... 2514
31.4.4.3.2 Add the single call to the MPTY, maximum number of participants exceeded ..... 2516
31.4.4.4 Alternate between the MPTY call and the single call ..... 2517
31.4.5 Adding extra remote parties ..... 2519
31.5 Community of interest supplementary services ..... 2521
31.6 Charging supplementary services ..... 2521
31.6.1 Advice of Charge Charging ..... 2522
31.6.1.1 AoCC time related charging / MS originated call ..... 2522
31.6.1.2 AoCC time related charging / MS terminated call ..... 2525
31.6.1.3 AoCC volume related charging / MS originated call ..... 2527
31.6.1.4 AoCC volume related charging / MS terminated call ..... 2527
31.6.1.5 Change in charging information during a call ..... 2527
31.6.1.6 Different formats of charging information ..... 2530
31.6.1.7 AoCC on a Call Hold call ..... 2533
31.6.1.8 AoCC on a Multi-party call ..... 2536
31.6.2 Charge Storage ..... 2540
31.6.2.1 Removal of SIM during an active call ..... 2540
31.6.2.2 Interruption of power supply during an active call ..... 2542
31.6.2.3 MS going out of coverage during an active AoCC call ..... 2544
31.6.2.4 ACMmax operation / Mobile Originating ..... 2546
31.6.2.5 ACMmax operation / Mobile Terminating ..... 2549
31.6.3 Advice of Charge Information ..... 2552
31.6.3.1 AoCI time related charging / MS originated call ..... 2552
31.6.3.2 AoCI time related charging / MS terminated call ..... 2555
31.6.3.3 AoCI volume related charging / MS originated call ..... 2557
31.6.3.4 AoCI volume related charging / MS terminated call ..... 2557
31.6.3.5 Change in charging information during a call ..... 2557
31.6.3.6 Different formats of charging information ..... 2560
31.6.3.7 AoCI on a Call Hold call ..... 2563
31.6.3.8 AoCI on a Multi-party call ..... 2566
31.6.4 Default contents of messages ..... 2570
31.7 Additional information transfer supplementary services ..... 2571
31.8 Call restriction supplementary services ..... 2571
31.8.1 Registration of a password ..... 2571
31.8.1.1 Registration accepted ..... 2571
31.8.1.2 Registration rejected ..... 2574
31.8.1.2.1 Rejection after invoke of the RegisterPassword operation ..... 2574
31.8.1.2.2 Rejection after password check with negative result ..... 2576
31.8.1.2.3 Rejection after new password mismatch ..... 2578
31.8.2 Erasure ..... 2581
31.8.3 Activation ..... 2581
31.8.3.1 Activation accepted ..... 2581
31.8.3.2 Activation rejected ..... 2584
31.8.3.2.1 Rejection after invoke of ActivateSS operation ..... 2584
31.8.3.2.2 Rejection after use of password procedure ..... 2586
31.8.4 Deactivation ..... 2588
31.8.4.1 Deactivation accepted ..... 2588
31.8.4.2 Deactivation rejected ..... 2591
31.8.4.2.1 Rejection after invoke of DeactivateSS operation ..... 2591
31.8.4.2.2 Rejection after use of password procedure ..... 2593
31.8.5 Invocation ..... 2595
31.8.6 Interrogation ..... 2595
31.8.6.1 Interrogation accepted ..... 2595
31.8.6.2 Interrogation rejected ..... 2598
31.8.7 Normal operation ..... 2601
31.9 Handling of undefined (future) GSM supplementary services ..... 2602
31.9.1 Mobile station initiated Unstructured supplementary service data operation ..... 2602
31.9.1.1 ProcessUnstructuredSS-request/accepted ..... 2602
31.9.1.2 ProcessUnstructuredSS-request/cross phase compatibility and error handling ..... 2607

31.9.2 Network initiated unstructured supplementary service operations ....2612
31.9.2.1 UnstructuredSS-Notify/accepted....2612
31.9.2.3 UnstructuredSS-Request/accepted ....2617
31.10 MMI input for USSD ....2622
31.11 Specific message contents and ASN.1 codings ....2624
31.12 eMLPP Service....2671
31.12.1 eMLPP Service / priority level of MO call....2671
31.12.2 eMLPP Service / automatic answering point-to-point MT call ....2675
31.12.3 eMLPP Service / automatic answering MT VGCS or VBS call....2679
31.12.4 eMLPP Service / registration....2681
31.12.5 eMLPP Service / interrogation....2683
31.13 Explicit Call Transfer (ECT)....2685
31.13.1 Explicit Call Transfer invocation....2685
31.13.1.1 Explicit Call Transfer invocation, successful case, both calls active, clearing using DISCONNECT ....2685
31.13.1.2 Explicit Call Transfer invocation, successful case, both calls active, clearing using RELEASE ....2687
31.13.1.3 Explicit Call Transfer invocation, successful case, both calls active, clearing using RELEASE COMPLETE....2688
31.13.1.4 Explicit Call Transfer invocation, successful case, second call alerting ....2689
31.13.1.5 Explicit Call Transfer invocation, unsuccessful case ....2690
31.13.1.6 Explicit Call Transfer invocation, expiry of T(ECT) ....2692
31.14 User-to-User Signalling (UUS) ....2694
31.14.1 UUS / Implicit UUS1....2694
31.14.1.1 UUS / Implicit UUS1 / CC MO call ....2694
31.14.1.2 UUS / Implicit UUS1 / CC MT call....2698
31.14.1.3 UUS / Implicit UUS1 / Interactions with Call Waiting and call HOLD supplementary services ....2702
31.15 Follow Me (FM)....2707
31.15.1 Follow Me (FM) / Registration....2707
31.15.2 Follow Me (FM) / Interrogation ....2713
31.15.3 Follow Me (FM) / Erasure ....2716
32 Testing of speech transcoding functions ....2722
32.1 Full Rate Downlink speech transcoding....2722
32.2 Full Rate Downlink receiver DTX functions....2723
32.3 Full Rate Uplink speech transcoding....2726
32.4 Full Rate Uplink transmitter DTX functions....2727
32.5 Full Rate Speech channel transmission delay....2728
32.5.1 Definition and applicability ....2728
32.5.2 Conformance requirement ....2728
32.5.3 Test purpose....2728
32.5.4 Downlink processing delay....2729
32.5.5 Downlink coding delay....2729
32.5.6 Uplink processing delay....2730
32.5.7 Uplink coding delay....2730
32.6 Half Rate Downlink speech transcoding ....2731
32.7 Half Rate Downlink receiver DTX functions....2732
32.8 Half Rate Uplink speech transcoding....2733
32.9 Half Rate Uplink transmitter DTX functions ....2735
32.10 Half Rate Speech channel transmission delay....2736
32.10.1 Definition and applicability ....2736
32.10.2 Conformance requirement ....2736
32.10.3 Test purpose....2737
32.10.4 Downlink processing delay....2737
32.10.5 Downlink coding delay....2737
32.10.6 Uplink processing delay....2738
32.10.7 Uplink coding delay....2738
32.11 Intra cell channel change from a TCH/HS to a TCH/FS ....2739
32.12 Intra cell channel change from a TCH/FS to a TCH/HS ....2741
33 Mobile station features....2744
33.1 Entry and display of called number....2744
33.2 Indication of call progress signals ....2745
33.2.1 Definition and applicability ....2745

33.2.2 Conformance requirement ....2745
33.2.3 Test purpose....2745
33.2.4 Ringing tone....2745
33.2.5 Busy tone ....2746
33.2.6 Congestion tone ....2746
33.2.7 Authentication failure tone ....2747
33.2.8 Number unobtainable tone....2747
33.2.9 Call dropped tone....2747
33.3 Network selection / indication....2748
33.4 Invalid and blocked PIN indicators ....2752
33.5 Service indicator....2753
33.6 Subscription identity management ....2753
33.7 Barring of outgoing calls....2754
33.8 Prevention of unauthorized calls ....2755
34 Short message service (SMS)....2756
34.1 General ....2756
34.2 Short message service point to point ....2756
34.2.1 SMS mobile terminated ....2756
34.2.2 SMS mobile originated ....2761
34.2.3 Test of memory full condition and memory available notification:....2765
34.2.4 Test of the status report capabilities and of SMS-COMMAND: ....2769
34.2.5 Test of message class 0 to 3....2773
34.2.5.1 Short message class 0....2773
34.2.5.2 Test of class 1 short messages....2775
34.2.5.3 Test of class 2 short messages....2777
34.2.5.4 Test of class 3 short messages....2780
34.2.6 Test of short message type 0....2780
34.2.7 Test of the replace mechanism for SM type 1-7 ....2780
34.2.8 Test of the reply path scheme ....2784

41.1.6 RR / Paging / Before T3172 expiry....2922
41.2 RR procedures on CCCH related to temporary block flow establishment....2924
41.2.1 Permission to access the network....2924
41.2.1.1 Permission to access the network / priority classes....2924
41.2.2 Initiation of the packet access procedure....2925
41.2.2.1 Initiation of the packet access procedure / establishment causes....2925
41.2.2.2 Random references for single block packet access....2927
41.2.2.3 Random references for one phase packet access....2928
41.2.2.4 Initiation of the packet access procedure / timer T3146....2929
41.2.2.5 Initiation of the packet access procedure / Request Reference....2931
41.2.3 Packet immediate assignment / One phase packet access....2932
41.2.3.1 Two-message assignment / Successful case....2932
41.2.3.2 Two-message assignment / Failure cases....2934
41.2.3.3 Packet uplink assignment / Polling bit set....2936
41.2.3.4 One phase packet access / Contention resolution / Successful case....2937
41.2.3.5 One phase packet access / Contention resolution / TLLI mismatch....2938
41.2.3.6 One phase packet access / Contention resolution / Counter N3104....2939
41.2.3.7 One phase packet access / Contention resolution / Timer T3166....2940
41.2.3.8 One phase packet access / Contention resolution / 4 access repetition attempts....2942
41.2.3.9 One phase packet access / TBF starting time....2944
41.2.3.10 One phase packet access / Timing Advance Index present....2946
41.2.3.11 One phase packet access / Timing Advance Index not present....2947
41.2.4 Packet immediate assignment / Single block packet access....2948
41.2.4.1 Single block packet access / Packet Resource Request....2948
41.2.4.2 Single block packet access / Packet Measurement Report....2949
41.2.5 Packet immediate assignment / Packet access rejection....2950
41.2.5.1 Packet access rejection / wait indication....2950
41.2.5.2 Packet access rejection / assignment before T3142 expires....2951
41.2.6 Packet downlink assignment procedure using CCCH....2953
41.2.6.1 Initiation of packet downlink assignment procedure / MS listens to correct CCCH block....2953

41.2.6.2 Initiation of packet downlink assignment procedure / timer T3190 ..... 2954
41.2.6.3 Initiation of packet downlink assignment procedure / TBF starting time ..... 2955
41.2.6.4 Initiation of packet downlink assignment procedure / incorrect TFI ..... 2956
41.2.7 Single block packet downlink assignment ..... 2957
41.2.7.1 Single block packet downlink assignment / TBF Starting Time ..... 2957
41.2.7.2 Single block packet downlink assignment / MS returns to packet idle mode ..... 2958
41.2.8 Macros and default message contents ..... 2960
41.2.8.1 Macros ..... 2960
41.2.8.1.1 GPRS attach procedure ..... 2960
41.2.8.1.2 Uplink data transfer ..... 2961
41.2.8.1.3 Downlink data transfer ..... 2962
41.2.8.2 Default message contents ..... 2963
41.3 MAC/RLC Release ..... 2970
41.3.1 TBF Release / Uplink / Normal / MS initiated ..... 2970
41.3.1.1 TBF Release / Uplink / Normal / MS initiated / Acknowledged mode ..... 2970
41.3.1.2 TBF Release / Uplink / Normal / MS initiated / Unacknowledged mode ..... 2975
41.3.1.2.3 Method of test ..... 2975
41.3.1.3 TBF Release / Uplink / Normal / MS initiated / Channel coding change during countdown ..... 2978
41.3.2 TBF Release / Uplink / Normal / Network initiated ..... 2980
41.3.2.1 TBF Release / Uplink / Normal / Network initiated / Acknowledged mode ..... 2980
41.3.2.2 TBF Release / Uplink / Normal / Network initiated / Unacknowledged mode ..... 2981
41.3.3 TBF Release / Uplink / Network initiated / Abnormal release ..... 2982
41.3.4 TBF Release / Downlink / Normal / Network initiated ..... 2984
41.3.4.1 TBF Release / Downlink / Normal / Network initiated / Acknowledged mode ..... 2984
41.3.4.2 TBF Release / Downlink / Normal / Network initiated / Unacknowledged mode ..... 2987
41.3.5 PDCH Release ..... 2990
41.3.5.1 Void ..... 2990
41.3.5.2 PDCH Release / With TIMESLOTS_AVAILABLE ..... 2990
41.3.6 Default message contents ..... 2994
41.4 DCCH related RR procedures for TBF establishment ..... 2994
41.4.1 Default conditions and message contents ..... 2994
41.4.1.1 Default conditions ..... 2994
41.4.1.2 Default message contents ..... 2995
41.4.1.2.1 Default contents of system information messages ..... 2995
41.4.1.2.2 Default contents of L3 messages ..... 2995
41.4.2 Immediate Assignment of a DCCH ..... 2995
41.4.2.1 Immediate Assignment / Contention resolution failure ..... 2995
41.4.2.2 Immediate Assignment / Use of DCCH for Uplink TBF Establishment ..... 2998
41.4.2.3 Immediate Assignment / Use of DCCH for Downlink TBF Establishment ..... 3001
41.4.3 RR commands while on DCCH ..... 3004
41.4.3.1 Assignment Command ..... 3004
41.4.3.2 Handover ..... 3007
41.4.3.3 PDCH Assignment Command ..... 3010
41.4.3.3.1 Successful case ..... 3010
41.4.3.3.2 Failure / T3132 expires ..... 3013
41.4.3.4 Cell change order ..... 3015
41.4.3.4.1 Successful case / Normal procedure ..... 3015
41.4.3.4.2 Successful case / DCCH on the target cell ..... 3021
41.4.3.4.3 Failure / Immediate Assignment Reject on CCCH of the target cell ..... 3024
41.4.3.4.4 Failure / Packet Access Reject on PCCCH of the target cell ..... 3026
41.4.3.4.5 Failure / T3134 expiry ..... 3027
41.4.3.4.6 Contention resolution failure / GPRS supported using BCCH ..... 3029
41.4.3.4.7 Contention resolution failure / GPRS supported using PBCCH / Timer or counter expiry ..... 3031
41.4.3.4.8 Contention resolution failure / GPRS supported using PBCCH / TLLI mismatch ..... 3034
41.4.3.5 Release ..... 3037
41.4.3.6 Radio link failure ..... 3039

42 Test of Medium Access Control (MAC) protocol ..... 3042
42.1 Test of Medium Access Control (MAC) Procedures on PCCCH in idle mode ..... 3042
42.1.1 Packet Channel Request ..... 3042
42.1.1.1 Packet Channel Request / Message format ..... 3042
42.1.1.2 Packet Channel Request / Response to Packet Paging ..... 3043

42.1.1.3 Packet Channel Request / Access type ..... 3046
42.1.1.4 Packet Channel Request / Access persistence control on PRACH ..... 3047
42.1.1.4.1 Packet Channel Request / Access persistence control on PRACH / M+1 attempts ..... 3047
42.1.1.4.2 Packet Channel Request / Access persistence control on PRACH / Persistence level ..... 3048
42.1.1.4.3 Packet Channel Request / Access persistence control on PRACH / Successive Attempts ..... 3050
42.1.2 Packet Uplink/Downlink Assignment ..... 3052
42.1.2.1 Packet uplink assignment procedure ..... 3052
42.1.2.1.1 Packet Uplink Assignment / Packet access queuing notification procedure ..... 3052
42.1.2.1.1.1 Packet Uplink Assignment / Packet queuing notification / Stop sending Packet Channel Requests ..... 3052
42.1.2.1.1.2 Packet Uplink Assignment / Packet queuing notification / Ignoring Packet Queuing Notification ..... 3053
42.1.2.1.1.3 Packet Uplink Assignment / Packet queuing notification / Assigned PDCHs ..... 3055
42.1.2.1.1.4 Packet Uplink Assignment / Packet queuing notification / Expiry of timer T3162 ..... 3056
42.1.2.1.2 Packet Uplink Assignment / Response to packet polling request ..... 3057
42.1.2.1.3 Packet Uplink Assignment / Packet access reject procedure ..... 3058
42.1.2.1.3.1 Packet Uplink Assignment / Packet access reject / Action during Wait_Indication ..... 3058
42.1.2.1.3.2 Packet Uplink Assignment / Packet access reject / No respond ..... 3060
42.1.2.1.3.3 Packet Uplink Assignment / Packet access reject / Trigger RR connection ..... 3061
42.1.2.1.4 Packet Uplink Assignment / Packet Uplink Assignment handling ..... 3063
42.1.2.1.5 Packet Uplink Assignment / One or two phase access ..... 3064
42.1.2.1.6 Packet Uplink Assignment / Decoding of frequency parameters ..... 3067
42.1.2.1.7 Packet Uplink Assignment / Most recently received Packet Uplink Assignment ..... 3069
42.1.2.1.8 Packet Uplink Assignment / One phase access ..... 3070
42.1.2.1.8.1 Packet Uplink Assignment / One phase access / Contention Resolution ..... 3070
42.1.2.1.8.1.1 Packet Uplink Assignment / One phase access / Contention resolution / Inclusion of TLLI in RLC data blocks ..... 3071
42.1.2.1.8.1.2 Packet Uplink Assignment / One phase access / Contention resolution / Counter N3104 ..... 3073
42.1.2.1.8.1.3 Packet Uplink Assignment / One phase access / Contention resolution / Timer T3166 ..... 3074
42.1.2.1.8.1.4 Packet Uplink Assignment / One phase access / Contention resolution / TLLI mismatch ..... 3076
42.1.2.1.8.1.5 Packet Uplink Assignment / One phase access / Contention resolution / 4 access repetition attempts ..... 3078
42.1.2.1.8.2 Packet Uplink Assignment / One phase access / Timing Advance ..... 3079
42.1.2.1.8.2.1 Packet Uplink Assignment / One phase access / Timing Advance / TA Index present ..... 3079
42.1.2.1.8.2.2 Packet Uplink Assignment / One phase access / Timing Advance / TA Index not present ..... 3081
42.1.2.1.8.2.3 Packet Uplink Assignment / One phase access / Timing Advance / TA value field not provided ..... 3082
42.1.2.1.9 Packet Uplink Assignment / Two phase access ..... 3083
42.1.2.1.9.1 Packet Uplink Assignment / Two phase access / Packet Resource Request / RLC Octet Count 3083
42.1.2.1.9.2 Packet Uplink Assignment / Two phase access / Contention resolution ..... 3084
42.1.2.1.9.2.1 Packet Uplink Assignment / Two phase access / Contention resolution / Expiry of timer T3168 ..... 3084
42.1.2.1.9.2.2 Packet Uplink Assignment / Two phase access / Contention resolution / TLLI mismatch ..... 3085
42.1.2.1.9.3 Packet Uplink Assignment / Two phase access / Packet Resource Request / No respond to Packet Downlink Assignment ..... 3086
42.1.2.1.10 Packet Uplink Assignment / Abnormal cases ..... 3088
42.1.2.1.10.1 Packet Uplink Assignment / Abnormal cases / Incorrect PDCH assignment ..... 3088
42.1.2.1.10.2 Packet Uplink Assignment / Abnormal cases / Expiry of timer T3164 ..... 3089
42.1.2.1.11 Non DRX Mode on PCCCH ..... 3090
42.1.2.1.12 Variable PBCCH and PSI Scheduling ..... 3092
42.1.2.2 Packet Downlink Assignment ..... 3094
42.1.2.2.1 Packet Downlink Assignment / Response to poll bit ..... 3094
42.1.2.2.2 Packet Downlink Assignment / PCCCH monitoring ..... 3095
42.1.2.2.3 Packet Downlink Assignment / Frequency hopping ..... 3096
42.1.2.2.4 Packet Downlink Assignment / Response to Packet Polling ..... 3098
42.1.2.2.5 Packet Downlink Assignment / Abnormal cases ..... 3100
42.1.2.2.5.1 Packet Downlink Assignment / Abnormal cases / Incorrect PDCH assignment ..... 3100
42.1.2.2.5.2 Packet Downlink Assignment / Abnormal cases / Expiry of timer T3190 ..... 3101
42.1.3 Macro and default message contents ..... 3102
42.1.3.1 Macro ..... 3102
42.1.3.1.1 GPRS attach procedure ..... 3102
42.1.3.1.2 Uplink data transfer, dynamic allocation ..... 3103

42.1.3.1.3 GPRS detach procedure ..... 3103
42.1.3.2 Default Messages ..... 3104
42.2 Fixed Allocation in Packet Transfer Mode ..... 3109
42.2.1 Generic procedures to bring the MS into uplink transfer mode ..... 3109
42.2.1.1 One phase access ..... 3109
42.2.1.2 Two phase access ..... 3110
42.2.2 Fixed Allocation / Uplink Transfer ..... 3112
42.2.2.1 Fixed Allocation / Uplink Transfer /Normal operation ..... 3112
42.2.2.1.1 Fixed Allocation / Uplink Transfer / Normal operation / Blocks ..... 3112
42.2.2.1.2 Fixed Allocation / Uplink Transfer / Normal operation / Block Periods ..... 3114
42.2.2.2 Fixed Allocation / Uplink Transfer / Operation with TS_OVERRIDE for single-slot TX ..... 3116
42.2.2.3 Fixed Allocation / Uplink Transfer / Operation with TS_OVERRIDE for multi-slot TX ..... 3118
42.2.2.4 Fixed Allocation / Uplink Transfer / T3184 Expiry ..... 3120
42.2.2.5 Fixed Allocation / Uplink Transfer / T3188 ..... 3122
42.2.2.5.1 Fixed Allocation / Uplink Transfer / T3188/Expiry ..... 3122
42.2.2.5.2 Fixed Allocation / Uplink Transfer / T3188/Stop with Packet Uplink Assignment ..... 3124
42.2.2.5.3 Fixed Allocation / Uplink Transfer / T3188/Stop with Packet Uplink Ack/Nack with REPEAT_ALLOCATION ..... 3125
42.2.2.6 Fixed Allocation / Uplink Transfer / MS requests new resources/ T3168 ..... 3127
42.2.2.6.1 Fixed Allocation / Uplink Transfer / MS requests new resources/ T3168/Expiry ..... 3127
42.2.2.6.2 Fixed Allocation / Uplink Transfer / MS requests new resources/ T3168/Stop with Packet Uplink Assignment ..... 3129
42.2.2.6.3 Fixed Allocation / Uplink Transfer / MS requests new resources/ T3168/Stop with Packet Uplink Ack/Nack with REPEAT_ALLOCATION ..... 3130
42.2.2.6.4 Fixed Allocation / Uplink Transfer / MS requests new resources/ T3168/Stop with Packet Access Reject ..... 3132
42.2.2.6.5 Fixed Allocation / Uplink Transfer / MS requests new resources/ T3168/Continue with Packet Uplink Ack/Nack without REPEAT_ALLOCATION and without ALLOCATION_BITMAP ..... 3134
42.2.2.7 Fixed Allocation / Uplink Transfer / MS requests new resources/ Successful ..... 3135
42.2.2.7.1 Fixed Allocation / Uplink Transfer / MS requests new resources/ Successful/Packet Uplink Assignment with ALLOCATION_BITMAP ..... 3135
42.2.2.7.2 Fixed Allocation / Uplink Transfer / MS requests new resources/ Successful/Multiple Packet Uplink Assignments ..... 3137
42.2.2.7.3 Fixed Allocation / Uplink Transfer / MS requests new resources/ Successful/Packet Uplink Ack/Nack with ALLOCATION_BITMAP ..... 3139
42.2.2.7.4 Fixed Allocation / Uplink Transfer / MS requests new resources/ Successful/Multiple Packet Uplink Ack/Nack with ALLOCATION_BITMAP ..... 3140
42.2.2.7.5 Fixed Allocation / Uplink Transfer / MS requests new resources/ Successful/Multiple Packet Uplink Ack/Nack with REPEAT_ALLOCATION ..... 3143
42.2.2.8 Fixed Allocation / Uplink Transfer / MS requests new resources/ Failure ..... 3145
42.2.2.8.1 Fixed Allocation / Uplink Transfer / MS requests new resources/ Failure/Packet Access Reject ..... 3145
42.2.2.8.2 Fixed Allocation / Uplink Transfer / MS requests new resources/ Failure/Packet Access Reject with WAIT_INDICATION during allocation in progress ..... 3146
42.2.2.9 Fixed Allocation / Uplink Transfer / Network initiates new resources ..... 3148
42.2.2.10 Fixed Allocation / Uplink Transfer / PACCH operation ..... 3149
42.2.2.10.1 Fixed Allocation / Uplink Transfer / PACCH operation/ Normal Operation ..... 3149
42.2.2.10.2 Fixed Allocation / Uplink Transfer / PACCH operation/ PACCH message addressed to another MS ..... 3151
42.2.2.10.3 Fixed Allocation/ Uplink Transfer / Abnormal cases / PACCH timeslot removed ..... 3153
42.2.2.11 Fixed Allocation/ Uplink Transfer / Abnormal cases ..... 3155
42.2.2.11.1 Fixed Allocation/ Uplink Transfer / Abnormal cases / Assignment without fixed allocation ..... 3155
42.2.2.11.2 Fixed Allocation/ Uplink Transfer / Abnormal cases / Frequency not supported ..... 3156
42.2.2.11.3 Fixed Allocation/ Uplink Transfer / Abnormal cases / Invalid MA_NUMBER ..... 3158
42.2.3 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment ..... 3160
42.2.3.1 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/T3190 ..... 3160
42.2.3.1.1 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/ T3190/Half-Duplex ..... 3160
42.2.3.1.2 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/ T3190/Non Half-Duplex ..... 3162
42.2.3.2 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/ Ending uplink TBF ..... 3164

42.2.3.2.1 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/ Ending uplink TBF/ Half-Duplex ..... 3164
42.2.3.2.2 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/ Ending uplink TBF/ Non Half-Duplex ..... 3167
42.2.3.3 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment/ Abnormal cases ..... 3169
42.2.3.3.1 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment/ Abnormal cases / Violation of multi-slot capabilities ..... 3169
42.2.3.3.2 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment/ Abnormal cases / No defined PDCH ..... 3171
42.2.4 Fixed Allocation / Downlink Transfer with Uplink TBF Establishment ..... 3172
42.2.4.1 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168 ..... 3172
42.2.4.1.1 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Expiry ..... 3172
42.2.4.1.2 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Stop with Packet Uplink Assignment ..... 3174
42.2.4.2 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Uplink Assignment ..... 3176
42.2.4.2.1 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/Packet Uplink Assignment/ Non half-duplex ..... 3176
42.2.4.2.2 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/Packet Uplink Assignment/ Half-duplex ..... 3179
42.2.4.3 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/Packet Timeslot Reconfigure ..... 3182
42.2.4.3.1 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/Packet Timeslot Reconfigure/Starting time with AFN encoding ..... 3182
42.2.4.3.2 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/Packet Timeslot Reconfigure/Starting time with relative encoding ..... 3185
42.2.4.4 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/Packet Access Reject ..... 3188
42.2.4.4.1 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/Packet Access Reject/ With WAIT_INDICATION ..... 3188
42.2.4.4.2 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/Packet Access Reject/No WAIT_INDICATION ..... 3190
42.2.4.4.3 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/Packet Access Reject/With Polling ..... 3192
42.2.5 Default message contents ..... 3193
42.2.5.1 Default message contents ..... 3193
42.3 Dynamic Allocation in Packet Transfer Mode ..... 3198
42.3.1 Dynamic Allocation / Uplink Transfer ..... 3198
42.3.1.1 Dynamic Allocation / Uplink Transfer / Normal ..... 3198
42.3.1.1.1 Dynamic Allocation / Uplink Transfer / Normal / Successful ..... 3198
42.3.1.1.2 Dynamic Allocation / Uplink Transfer / Normal / Request new resources ..... 3201
42.3.1.1.3 Dynamic Allocation / Uplink Transfer / Normal / Starting frame number encoding ..... 3202
42.3.1.1.4 Dynamic Allocation / Uplink Transfer / Normal / Starting time ..... 3204
42.3.1.1.5 Dynamic Allocation / Uplink Transfer / Normal / Close-ended TBF ..... 3207
42.3.1.1.6 Dynamic Allocation / Uplink Transfer / Normal / T3180 expiry ..... 3210
42.3.1.1.7 Dynamic Allocation / Uplink Transfer / Normal / PACCH operation ..... 3213
42.3.1.1.8 Dynamic Allocation / Uplink Transfer / Normal / Two uplink timeslots ..... 3215
42.3.1.1.9 Dynamic Allocation / Uplink Transfer / Normal / Frequency parameters ..... 3217
42.3.1.2 Dynamic Allocation / Uplink Transfer / Abnormal ..... 3231
42.3.1.2.1 Void ..... 3231
42.3.1.2.2 Dynamic Allocation / Uplink Transfer / Abnormal / with cell reselection in acknowledged mode ..... 3231
42.3.1.2.3 Dynamic Allocation / Uplink Transfer / Abnormal / with cell reselection in unacknowledged mode ..... 3232
42.3.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment (concurrent) ..... 3234
42.3.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal ..... 3234
42.3.2.1.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Successful ..... 3234
42.3.2.1.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Multislot capabilities ..... 3239
42.3.2.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal ..... 3247
42.3.2.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal / with random access ..... 3247

42.3.2.2.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal / Continuation of normal operation....3251
42.3.3 Dynamic Allocation / Resource reallocation....3253
42.3.3.1 Dynamic Allocation / Resource reallocation / Successful....3253
42.3.3.1.1 Dynamic Allocation / Resource reallocation / Successful / Higher throughput class or higher radio priority....3254
42.3.3.1.2 Dynamic Allocation / Resource reallocation / Successful / Lower throughput class....3259
42.3.3.1.3 Dynamic Allocation / Resource reallocation / Successful / Different RLC mode and higher radio priority....3262
42.3.3.2 Dynamic Allocation / Resource reallocation / Abnormal....3265
42.3.3.2.1 Dynamic Allocation / Resource reallocation / Abnormal / T3168 expiry....3265
42.3.3.2.2 Dynamic Allocation / Resource reallocation / Abnormal / Invalid assignment....3268
42.3.3.3 Dynamic Allocation / Resource reallocation / Reject....3273
42.3.4 Default message contents....3276
42.4 Measurement reports and Cell change order procedures....3285
42.4.1 Measurement reports....3285
42.4.1.1 Network Control measurement reporting / Uplink / Normal case....3285
42.4.1.2 Network Control measurement reporting / Idle mode / New cell reselection....3288
42.4.1.3 Network Control measurement reporting / Downlink transfer / Normal case....3291
42.4.2 Cell change order procedures....3294
42.4.2.1 Cell change order procedure / Uplink transfer....3294
42.4.2.1.1 Cell change order procedure / Uplink transfer / Normal case....3294
42.4.2.1.2 Cell change order procedure / Uplink transfer / Failure cases / T3174 expiry....3295
42.4.2.1.3 Cell change order procedure / Uplink transfer / Failure cases / REJECT from the new cell....3297
42.4.2.1.4 Cell change order procedure / Uplink transfer / Failure cases / Contention resolution failure....3298
42.4.2.1.5 Cell change order procedure / Uplink transfer / Failure cases / REJECT from the new cell and T3176 expiry....3299
42.4.2.1.6 Cell change order procedure / Uplink transfer / Failure cases / Frequency not implemented....3301
42.4.2.2 Cell change order procedure / Downlink transfer....3302
42.4.2.2.1 Cell change order procedure / Downlink transfer / Normal case....3302
42.4.2.2.2 Cell change order procedure / Downlink transfer / Failure cases / REJECT from the new cell....3303
42.4.2.2.3 Cell change order procedure / Downlink transfer / Failure cases / Frequency not implemented 3305
42.4.2.3 Cell change order procedure / Simultaneous uplink and downlink transfer....3306
42.4.2.3.1 Cell change order procedure / Simultaneous uplink and downlink transfer / Normal case....3306
42.4.2.3.2 Cell change order procedure / Simultaneous uplink and downlink transfer / Failure case / T3174 expiry....3309

42.4.4 Cell Change Order Procedures without PBCCH....3313
42.4.4.1 Network Controlled Cell Reselection – Packet Measurement Order Procedure....3313
42.4.4.2 Network Controlled Cell Reselection/validity of reselection parameters/MS enters standby state....3314
42.5 Downlink Transfer....3315
42.5.1 Downlink Transfer / Normal Operation....3315
42.5.1.1 Downlink Transfer/ Normal Operation / Relative Encoding TBF starting time....3315
42.5.1.2 Downlink Transfer/ Normal Operation / Without TBF starting time....3317
42.5.2 Downlink Transfer / Polling....3318
42.5.2.1 Downlink Transfer/ Polling/ Normal operation/RLC data block....3318
42.5.2.2 Downlink Transfer/ Polling/ Packet Polling Request/ Access Burst format....3320
42.5.2.3 Downlink Transfer/ Polling/ Packet Polling Request/ Control block format....3321
42.5.3 Downlink Transfer / T3190 Expiry / Initial allocation....3323
42.5.3.1 Downlink Transfer/ T3190 Expiry / Initial allocation / Restart with valid RLC data block....3323
42.5.4 Downlink Transfer / T3190 Expiry / Resource reallocation....3325
42.5.4.1 Downlink Transfer/ T3190 Expiry / Resource reallocation / Without TBF starting time....3325
42.5.4.2 Downlink Transfer/ T3190 Expiry / Resource reallocation / With TBF starting time....3327
42.5.4.3 Downlink Transfer/ T3190 Expiry / Resource reallocation / Restart with valid RLC data block....3328
42.5.5 Downlink Transfer / Reestablishment....3330

42.5.5.1 Downlink Transfer/ Reestablishment/ T3192 Expiry....3330
42.5.5.2 Downlink Transfer/ Reestablishment/ Packet Downlink Assignment....3333
42.5.5.3 Downlink Transfer/ Reestablishment/ Invalid Frequency Parameters IE....3335
43 RLC Test Cases....3338
43.1 Acknowledged Mode....3338
43.1.1 Acknowledged mode / Uplink TBF....3338
43.1.1.1 Acknowledged mode / Uplink TBF / Send state variable V(S)....3338
43.1.1.2 Acknowledged mode / Uplink TBF / Transmit window size....3340
43.1.1.3 Acknowledged mode / Uplink TBF / Acknowledge state variable V(A)....3341
43.1.1.4 Acknowledged mode / Uplink TBF / Negatively acknowledged RLC data blocks....3343
43.1.1.5 Acknowledged mode / Uplink TBF / Invalid Negative Acknowledgment....3346
43.1.1.6 Acknowledged mode / Uplink TBF / Decoding of Received Block Bitmap....3347
43.1.2 Acknowledged mode / Downlink TBF....3350
43.1.2.1 Acknowledged mode / Downlink TBF / Receive state variable V(R)....3350
43.1.2.2 Acknowledged mode / Downlink TBF / Receive window state variable V(Q)....3351
43.1.2.3 Acknowledged mode / Downlink TBF / Re-assembly of RLC data blocks....3352
43.1.2.4 Acknowledged mode / Downlink TBF / Re-assembly / Length Indicator....3353
43.2 Control Blocks....3354
43.2.1 Control Blocks Re-assembly....3354
43.3 Default Message Contents and Macros....3356
43.3.1 Message Contents....3356
43.3.1.1 Packet Uplink Assignment....3356
43.3.2 Macros....3357
43.3.2.1 Macro for uplink dynamic allocation two phase access (PBCCH not present)....3357
43.3.2.2 Macro for downlink TBF establishment (PBCCH not present)....3357
44 Test case requirements for GPRS mobility management....3358
44.1 Applicability, default conditions and default messages....3358
44.2 Elementary procedures of GPRS mobility management....3358
44.2.1 GPRS attach procedure....3358
44.2.1.1 Normal GPRS attach....3358
44.2.1.1.1 GPRS attach / accepted....3359
44.2.1.1.2 GPRS attach / rejected / IMSI invalid / illegal MS....3362
44.2.1.1.3 GPRS attach / rejected / IMSI invalid / GPRS services not allowed....3365
44.2.1.1.4 GPRS attach / rejected / PLMN not allowed....3366
44.2.1.1.5 GPRS attach / rejected / roaming not allowed in this location area....3370
44.2.1.1.6 GPRS attach / abnormal cases / access barred due to access class control....3378
44.2.1.1.7 GPRS attach / abnormal cases / change of cell into new routing area....3381
44.2.1.1.8 GPRS attach / abnormal cases / power off....3383
44.2.1.1.9 GPRS attach / abnormal cases / GPRS detach procedure collision....3384
44.2.1.2 Combined GPRS attach....3386
44.2.1.2.1 Combined GPRS attach / GPRS and non-GPRS attach accepted....3386
44.2.1.2.2 Combined GPRS attach / GPRS only attach accepted....3390
44.2.1.2.3 Combined GPRS attach / GPRS attach while IMSI attach....3396
44.2.1.2.4 Combined GPRS attach / rejected / IMSI invalid / illegal ME....3398
44.2.1.2.5 Combined GPRS attach / rejected / GPRS services and non-GPRS services not allowed....3401
44.2.1.2.6 Combined GPRS attach / rejected / GPRS services not allowed....3404
44.2.1.2.7 Combined GPRS attach / rejected / location area not allowed....3407
44.2.1.2.8 Combined GPRS attach / abnormal cases / attempt counter check / miscellaneous reject causes....3411
44.2.1.2.9 Combined GPRS attach / abnormal cases / GPRS detach procedure collision....3414
44.2.2 GPRS detach procedure....3417
44.2.2.1 MS initiated GPRS detach procedure....3417
44.2.2.1.1 GPRS detach / power off / accepted....3417
44.2.2.1.2 GPRS detach / accepted....3418
44.2.2.1.3 GPRS detach / abnormal cases / attempt counter check / procedure timeout....3419
44.2.2.1.4 GPRS detach / abnormal cases / GMM common procedure collision....3422
44.2.2.1.5 GPRS detach / power off / accepted....3423
44.2.2.1.6 GPRS detach / accepted / GPRS/IMSI detach....3424
44.2.2.1.7 GPRS detach / accepted / IMSI detach....3426
44.2.2.1.8 GPRS detach / abnormal cases / change of cell into new routing area....3429
44.2.2.1.9 GPRS detach / abnormal cases / GPRS detach procedure collision....3430

44.2.2.2 Network initiated GPRS detach procedure ....3432
44.2.2.2.1 GPRS detach / re-attach not required / accepted ....3432
44.2.2.2.2 GPRS detach / rejected / IMSI invalid / GPRS services not allowed ....3434
44.2.2.2.3 GPRS detach / IMSI detach / accepted ....3436
44.2.2.2.4 GPRS detach / re-attach requested / accepted ....3437
44.2.2.2.5 GPRS detach / rejected / location area not allowed ....3439
44.2.3 Routing area updating procedure ....3443
44.2.3.1 Normal routing area updating ....3443
44.2.3.1.1 Routing area updating / accepted ....3443
44.2.3.1.2 Routing area updating / rejected / IMSI invalid / illegal ME ....3446
44.2.3.1.3 Routing area updating / rejected / MS identity cannot be derived by the network ....3448
44.2.3.1.4 Routing area updating / rejected / location area not allowed ....3450
44.2.3.1.5 Routing area updating / abnormal cases / attempt counter check / miscellaneous reject causes ....3453
44.2.3.1.6 Routing area updating / abnormal cases / change of cell into new routing area ....3456
44.2.3.1.7 Routing area updating / abnormal cases / change of cell during routing area updating procedure ....3458
44.2.3.1.8 Routing area updating / abnormal cases / P-TMSI reallocation procedure collision ....3460
44.2.3.2 Combined routing area updating ....3462
44.2.3.2.1 Combined routing area updating / combined RA/LA accepted ....3462
44.2.3.2.2 Combined routing area updating / MS in CS operation at change of RA ....3465
44.2.3.2.3 Combined routing area updating / RA only accepted ....3467
44.2.3.2.4 Combined routing area updating / rejected / PLMN not allowed ....3473
44.2.3.2.5 Combined routing area updating / rejected / roaming not allowed in this location area ....3476
44.2.3.2.6 Combined routing area updating / abnormal cases / access barred due to access class control ....3482
44.2.3.2.7 Combined routing area updating / abnormal cases / attempt counter check / procedure timeout ....3486
44.2.3.2.8 Combined routing area updating / abnormal cases / change of cell into new routing area ....3489
44.2.3.2.9 Combined routing area updating / abnormal cases / change of cell during routing area updating procedure ....3491
44.2.3.2.10 Combined routing area updating / abnormal cases / GPRS detach procedure collision ....3493
44.2.3.3 Periodic routing area updating ....3496
44.2.3.3.1 Periodic routing area updating / accepted ....3496
44.2.3.3.2 Periodic routing area updating / accepted / T3312 default value ....3498
44.2.3.3.3 Periodic routing area updating / no cell available / network mode I ....3500
44.2.3.3.4 Periodic routing area updating / no cell available ....3502
44.2.4 P-TMSI reallocation ....3504
44.2.5 GPRS authentication and ciphering ....3506
44.2.5.1 Test of authentication ....3506
44.2.5.1.1 Authentication accepted ....3507
44.2.5.1.2 Authentication rejected ....3508
44.2.5.2 Test of ciphering mode setting ....3510
44.2.5.2.1 Ciphering mode / start ciphering ....3511
44.2.5.2.2 Ciphering mode / stop ciphering ....3513
44.2.5.2.3 Ciphering mode / IMEISV request ....3516
44.2.6 Identification procedure ....3519
44.2.6.1 General Identification ....3519
44.2.7 GMM READY timer handling ....3520
45 Session Management Procedures ....3526
45.1 Definition and applicability ....3526
45.2 PDP context activation ....3526
45.2.1 Initiated by the mobile station ....3526
45.2.1.1 Attach initiated by context activation/QoS Offered by Network is the QoS Requested ....3526
45.2.1.2 QoS Offered by Network is a lower QoS ....3528
45.2.1.2.1 QoS Accepted by MS ....3528
45.2.1.2.2 QoS Rejected by MS ....3530
45.2.2 PDP context activation requested by the network, successful and unsuccessful ....3532
45.2.4 Abnormal cases ....3535
45.2.4.1 T3380 Expiry ....3535
45.2.4.2 Collision of MS initiated and network requested PDP context activation ....3537
45.3 PDP context modification procedure ....3539
45.3.1 PDP context modification ....3539

45.4 PDP context deactivation procedure....3542
45.4.1 PDP context deactivation initiated by the MS....3542
45.4.2 PDP context deactivation initiated by the network....3544
45.4.3 Abnormal cases....3547
45.4.3.1 T3390 Expiry....3547
45.4.3.2 Collision of MS and network initiated PDP context deactivation requests....3549
45.5 Unknown or Unforeseen Transaction Identifier/Non-semantical Mandatory Information Element Errors....3551
45.5.1 Error cases....3551
46 ....3556
46.1 LLC Tests....3556
46.1.1 Default Conditions....3556
46.1.2 Test cases....3557
46.1.2.1 Unacknowledged data transfer....3557
46.1.2.1.1 Data transmission in protected mode....3557
46.1.2.1.2 Data transmission in unprotected mode....3558
46.1.2.1.3 Reception of I frame in ADM....3559
46.1.2.2 Acknowledged data transfer....3560
46.1.2.2.1 Link establishment....3560
46.1.2.2.1.1 Link establishment from MS to SS....3560
46.1.2.2.1.2 Link establishment from SS to MS....3561
46.1.2.2.1.3 Loss of UA frame....3562
46.1.2.2.1.4 Total loss of UA frame....3563
46.1.2.2.1.5 DM response....3564
46.1.2.2.2 MS sends I+S frames....3565
46.1.2.2.2.1 Checking N(S)....3565
46.1.2.2.2.2 Busy condition at the peer, with RR sent for resumption of transmission....3566
46.1.2.2.2.3 Busy condition at the peer, with ACK sent for resumption of transmission....3568
46.1.2.2.2.4 SACK frame....3570
46.1.2.2.3 Reception of I + S frames at the MS....3571
46.1.2.2.3.1 Checking N(R)....3571
46.1.2.2.3.2 MS handling busy condition during bi-directional data transfer....3572
46.1.2.2.3.3 SACK frame....3574
46.1.2.2.3.4 ACK frame....3575
46.1.2.2.4 Link Reestablishment....3576
46.1.2.2.4.1 Reestablishment due to reception of SABM....3576
46.1.2.2.4.2 Reestablishment due to N200 failures....3578
46.1.2.2.4.3 Reestablishment due to reception of DM....3579
46.1.2.3 Collision of commands and responses....3580
46.1.2.3.1 Collision of SABM....3580
46.1.2.3.2 Collision of SABM and DISC....3581
46.1.2.3.3 Collision of SABM and XID commands....3582
46.1.2.4 Unsolicited response frames....3583
46.1.2.4.1 Unsolicited DM....3583
46.1.2.5 FRMR frames....3584
46.1.2.5.1 Sending FRMR due to undefined command control field....3584
46.1.2.5.2 Sending FRMR due to reception of an S frame with incorrect length....3585
46.1.2.5.3 Sending FRMR due to reception of an I frame information field exceeding the maximum length....3586
46.1.2.5.4 Frame reject condition during establishment of ABM....3588
46.1.2.6 Multiple Connections....3589
46.1.2.6.1 Simultaneous acknowledged and unacknowledged data transfer on the same SAPI....3589
46.1.2.6.2 Simultaneous acknowledged and unacknowledged data transfer on different SAPIs....3590
46.1.2.7 XID Negotiation....3592
46.1.2.7.1 Negotiation initiated by the SS during ABM, for T200 and N200....3592
46.1.2.7.2 Negotiation initiated by the SS during ADM, for N201-I....3593
46.1.2.7.3 Negotiation initiated by the SS (using SABM, for IOV-I)....3594
46.1.2.7.4 Negotiation initiated by the SS (during ADM, for N201-U)....3595
46.1.2.7.5 Negotiation initiated by the SS (during ADM, for IOV-UI)....3596
46.1.2.7.6 Negotiation initiated by the SS (during ABM, for Reset)....3598
46.1.2.7.7 XID command with unrecognised type field....3600
46.1.2.7.8 XID Response with out of range values....3601

46.2 SNDCP Tests....3602
46.2.1 Default Conditions....3602
46.2.2 Test cases....3603
46.2.2.1 Data transfer....3603
46.2.2.1.1 Mobile originated normal data transfer with LLC in acknowledged mode....3603
46.2.2.1.2 Mobile originated normal data transfer with LLC in unacknowledged mode....3604
46.2.2.1.3 Usage of acknowledged mode for data transmission before and after PDP Context modification, on different SAPIs....3606
46.2.2.1.4 Reset indication during unacknowledged mode....3607
46.2.2.1.5 Reset indication during acknowledged mode....3608
46.2.2.2 Segmentation....3610
46.2.2.2.1 LLC link re-establishment on receiption of SN-DATA PDU with F=0 in ack mode in the Receive First Segment state....3610
46.2.2.2.2 LLC link re-establishment on receiving second segment with F=1 and with different PCOMP and DCOMP values in the acknowledged mode data transfer....3611
46.2.2.2.3 Single segment N-PDU from MS....3612
46.2.2.3 Link Release....3613
46.2.2.3.1 LLC link release on receiving DM from the SS during link establishment....3613
46.2.2.4 XID negotiation....3613
46.2.2.4.1 Response from MS on receiving XID request from the SS....3613
46.2.2.4.2 Response from MS on receiving an XID request from the SS with an unassigned entity number....3615
46.2.2.4.3 Response from MS on receiving an XID response from the SS with unrecognised type field....3616
46.2.2.5 LLC link release on receiving “Invalid XID response” from the network during link establishment procedure....3617
47 Void....3619
48 Void....3619
49 Void....3619

50.2.4 EGPRS Default contents of Layer 3 messages....3624
50.2.4.1 IMMEDIATE ASSIGNMENT message:....3626
50.2.4.2 IMMEDIATE ASSIGNMENT REJECT message:....3626
50.2.4.3 PDCH ASSIGNMENT COMMAND message (downlink):....3627
50.3 Default EGPRS Conditions, Message Contents and Macros for the Higher Layer Test Cases....3628
50.4 EGPRS Macros....3628
50.4.1 Overview....3628
50.4.2 EGPRS Default Message Contents....3628
50.4.3 EGPRS Macro Message Sequences....3628
50.4.3.1 Acknowledged downlink data....3629
50.4.3.2 Downlink data transfer....3629
50.4.3.3 Uplink data transfer....3629
50.4.3.4 Uplink dynamic allocation one phase access....3630
50.4.3.5 Uplink dynamic allocation one phase access with contention resolution....3631
50.4.3.6 Uplink dynamic allocation two phase access....3631
50.4.3.7 Uplink fixed allocation one phase access....3632
50.4.3.8 Uplink fixed allocation one phase access with contention resolution....3633
50.4.3.9 Uplink fixed allocation two phase access....3634

50.4.3.10 Downlink TBF establishment....3634
50.5 Test PDP contexts....3634
51 EGPRS Paging, TBF establishment/release and DCCH related procedures....3636
51.1 RR / Paging....3636
51.1.1 RR / Paging / on PCCCH for EGPRS service successful....3636
51.1.1.1 RR / Paging / on PCCCH for EGPRS service / normal paging with P-TMSI successful....3636
51.1.1.2 RR / Paging / on PCCCH for EGPRS service / normal paging with IMSI successful....3638
51.1.1.3 RR / Paging / on PCCCH for EGPRS service / extended paging with P-TMSI successful....3640
51.1.1.4 RR / Paging / on PCCCH for EGPRS service / paging reorganisation successful....3643
51.1.2 RR / Paging / on PCCCH for circuit-switched services / paging successful....3645
51.1.3 RR / Paging / on PCCCH / paging ignored....3648
51.1.4 RR / Paging / on PACCH for circuit-switched services....3651
51.1.4.1 RR / Paging / on PACCH for circuit-switched services/ paging successful....3651
51.1.4.2 RR / Paging / on PACCH for circuit-switched services/ paging ignored....3653
51.1.5 RR / Paging / on CCCH for EGPRS service....3655
51.1.5.1 RR / Paging / on CCCH for EGPRS service / normal paging....3655
51.1.5.1.1 RR / Paging / on CCCH for EGPRS service / normal paging with P-TMSI successful....3655
51.1.5.1.2 RR / Paging / on CCCH for EGPRS service / normal paging with IMSI successful....3657
51.1.5.1.3 RR / Paging / on CCCH for EGPRS service / normal paging with P-TMSI ignored....3661
51.1.5.2 RR / Paging / on CCCH for EGPRS service / extended paging....3663
51.1.5.2.1 RR / Paging / on CCCH for EGPRS service / extended paging with P-TMSI successful....3663
51.1.5.3 RR / Paging / on CCCH for EGPRS service / paging reorganisation....3665
51.1.5.4 RR / Paging / on CCCH for EGPRS service / default message contents....3668
51.1.6 RR / Paging / Before T3172 expiry....3668
51.2 RR procedures on CCCH related to temporary block flow establishment....3670
51.2.1 Permission to access the network....3670
51.2.1.1 Permission to access the network / priority classes....3670
51.2.2 Initiation of the packet access procedure....3673
51.2.2.1 Initiation of the packet access procedure / establishment causes....3673
51.2.2.2 Random references for two phase packet access....3675
51.2.2.3 Random references for one phase packet access....3676
51.2.2.4 Initiation of the packet access procedure / timer T3146....3677
51.2.2.5 Initiation of the packet access procedure / Request Reference....3679
51.2.3 Packet immediate assignment / One phase packet access....3680
51.2.3.1 Two-message assignment / Successful case....3680
51.2.3.2 Two-message assignment / Failure cases....3682
51.2.3.3 Packet uplink assignment / Polling bit set....3684
51.2.3.4 One phase packet access / Contention resolution / Successful case....3685
51.2.3.5 One phase packet access / Contention resolution / TLLI mismatch....3686
51.2.3.6 One phase packet access / Contention resolution / Counter N3104....3688
51.2.3.7 One phase packet access / Contention resolution / Timer T3166....3689
51.2.3.8 One phase packet access / Contention resolution / 4 access repetition attempts....3692
51.2.3.9 One phase packet access / TBF starting time....3693
51.2.3.10 One phase packet access / Timing Advance Index present....3695
51.2.3.11 One phase packet access / Timing Advance Index not present....3696
51.2.4 Packet immediate assignment / Multiblock packet access....3698
51.2.4.1 Multiblock packet access / Packet Resource Request....3698
51.2.4.2 Single block packet access / Packet Measurement Report....3699
51.2.5 Packet immediate assignment / Packet access rejection....3700
51.2.5.1 Packet access rejection / wait indication....3700
51.2.5.2 Packet access rejection / assignment before T3142 expires....3702
51.2.6 Packet downlink assignment procedure using CCCH....3703
51.2.6.1 Initiation of packet downlink assignment procedure / MS listens to correct CCCH block....3703
51.2.6.2 Initiation of packet downlink assignment procedure / timer T3190....3705
51.2.6.3 Initiation of packet downlink assignment procedure / TBF starting time....3706
51.2.6.4 Initiation of packet downlink assignment procedure / incorrect TFI....3708
51.3 MAC/RLC Release....3709
51.3.1 TBF Release / Uplink / Normal / MS initiated....3709
51.3.1.1 TBF Release / Uplink / Normal / MS initiated / Acknowledged mode....3709
51.3.1.2 TBF Release / Uplink / Normal / MS initiated / Unacknowledged mode....3714
51.3.1.3 TBF Release / Uplink / Normal / MS initiated / Channel coding change during countdown....3717

51.3.2 TBF Release / Uplink / Normal / Network initiated ....3719
51.3.2.1 TBF Release / Uplink / Normal / Network initiated / Acknowledged mode....3719
51.3.2.2 TBF Release / Uplink / Normal / Network initiated / Unacknowledged mode....3720
51.3.3 TBF Release / Uplink / Network initiated / Abnormal release ....3722
51.3.4 TBF Release / Downlink / Normal / Network initiated ....3723
51.3.4.1 TBF Release / Downlink / Normal / Network initiated / Acknowledged mode....3723
51.3.4.2 TBF Release / Downlink / Normal / Network initiated / Unacknowledged mode....3727
51.3.5 PDCH Release ....3730
51.3.5.1 PDCH Release / Without TIMESLOTS_AVAILABLE....3730
51.3.5.2 PDCH Release / With TIMESLOTS_AVAILABLE....3733
51.3.6 Default message contents....3738
52 EGPRS Test of Medium Access Control (MAC) protocol ....3739
52.1 Void....3739
52.2 Fixed Allocation in Packet Transfer Mode....3739
52.2.1 Fixed Allocation/ Uplink Transfer....3739
52.2.1.1 Fixed Allocation/ Uplink Transfer/ Normal operation/ Blocks....3739
52.2.1.2 Fixed Allocation/ Uplink Transfer/ Normal operation/ Blocks Periods....3740
52.2.1.3 Fixed Allocation/ Uplink Transfer/ Normal operation/ ALLOCATION_BITMAP _LENGTH not Present....3743
52.2.1.4 Fixed Allocation/ Uplink Transfer/ Operation with TS_OVERRIDE/ Single-slot TX....3744
52.2.1.5 Fixed Allocation/ Uplink Transfer/ Operation with TS_OVERRIDE/ Multi-slot TX ....3746
52.2.1.6 Fixed Allocation/ Uplink Transfer/ T3184....3748
52.2.1.7 Fixed Allocation/ Uplink Transfer/ T3188/ Expiry....3750
52.2.1.8 Fixed Allocation/ Uplink Transfer/ T3188/ Stop with Packet Uplink Assignment....3752
52.2.1.9 Fixed Allocation/ Uplink Transfer/ T3188/ Stop with PACKET UPLINK ACK/NACK with REPEAT_ALLOCATION....3754
52.2.1.10 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ T3168/ Expiry ....3755
52.2.1.11 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ T3168/ Stop with Packet Uplink Assignment....3757
52.2.1.12 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ T3168/ Stop with Packet Uplink Ack/Nack with REPEAT_ALLOCATION....3759
52.2.1.13 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ T3168/ Stop with Packet Access Reject ....3760
52.2.1.14 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ T3168/ Continue with Packet Uplink Ack/Nack without REPEAT_ALLOCATION and without ALLOCATION_BITMAP ....3762
52.2.1.15 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ Successful/ Packet Uplink Assignment with ALLOCATION_BITMAP....3764
52.2.1.16 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ Successful/ Multiple Packet Uplink Assignments....3765
52.2.1.17 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ Successful/ Packet Uplink Ack/Nack with ALLOCATION_BITMAP....3767
52.2.1.18 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ Successful/ Multiple Packet Uplink Ack/Nack with ALLOCATION_BITMAP....3769
52.2.1.19 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ Successful/ Multiple Packet Uplink Ack/Nack with REPEAT_ALLOCATION....3771
52.2.1.20 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ Failure/ Packet Access Reject ....3773
52.2.1.21 Fixed Allocation/ Uplink Transfer/ MS requests new resources/ Failure/ Packet Access Reject with WAIT_INDICATION during allocation in progress ....3774
52.2.1.22 Fixed Allocation/ Uplink Transfer/ Network initiates new resources....3776
52.2.1.23 Fixed Allocation/ Uplink Transfer/ PACCH operation/ Normal Operation....3777
52.2.1.24 Fixed Allocation/ Uplink Transfer/ PACCH operation/ PACCH message addressed to another MS....3779
52.2.1.25 Fixed Allocation/ Uplink Transfer/ Abnormal cases/ PACCH timeslot removed....3781
52.2.1.26 Fixed Allocation/ Uplink Transfer/ Abnormal cases/ Assignment without fixed allocation....3783
52.2.1.27 Fixed Allocation/ Uplink Transfer/ Abnormal cases/ Frequency not supported....3784
52.2.1.28 Fixed Allocation/ Uplink Transfer/ Abnormal cases/ Invalid MA_NUMBER....3786
52.2.2 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment....3787
52.2.2.1 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/ T3190/ Half-Duplex....3787
52.2.2.2 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment/ T3190/ Non Half-Duplex.3790
52.2.2.3 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment/ Ending uplink TBF/ Half-Duplex....3792

52.2.2.4 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment/ Ending uplink TBF/ Non Half-Duplex ....3795
52.2.2.5 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment/ Abnormal cases/ Violation of multi-slot capabilities ....3797
52.2.2.6 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment/ Abnormal cases/ No defined PDCH ....3799
52.2.3 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment ....3800
52.2.3.1 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Expiry ....3800
52.2.3.2 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Stop with Packet Uplink Assignment ....3802
52.2.3.3 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Uplink Assignment/ Non half-duplex ....3804
52.2.3.4 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Uplink Assignment/ Half-duplex ....3807
52.2.3.5 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Timeslot Reconfigure/ Starting time with AFN encoding ....3809
52.2.3.6 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Timeslot Reconfigure/ Starting time with relative encoding ....3812
52.2.3.7 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Access Reject/ With WAIT_INDICATION ....3814
52.2.3.8 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Access Reject/ No WAIT_INDICATION ....3816
52.2.3.9 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Access Reject/ With Polling ....3818
52.2.4 Default message contents and Macros ....3819
52.2.4.1 Default message contents ....3819
52.2.4.2 Macros ....3825
52.2.4.2.1 Macro for uplink fixed allocation one phase access ....3825
52.2.4.2.2 Macro for uplink fixed allocation two phase access ....3826
52.2.4.2.3 Macro for downlink TBF establishment ....3829
52.3 EGPRS Testcases for Dynamic Allocation in Packet Transfer Mode ....3829
52.3.1 Dynamic Allocation / Uplink Transfer ....3829
52.3.1.1 Dynamic Allocation / Uplink Transfer / Normal ....3829
52.3.1.1.1 Dynamic Allocation / Uplink Transfer / Normal / Successful ....3829
52.3.1.1.2 Dynamic Allocation / Uplink Transfer / Normal / Request new resources ....3832
52.3.1.1.3 Dynamic Allocation / Uplink Transfer / Normal / Starting frame number encoding ....3834
52.3.1.1.4 Dynamic Allocation / Uplink Transfer / Normal / Starting time ....3836
52.3.1.1.5 Dynamic Allocation / Uplink Transfer / Normal / Close-ended TBF ....3840
52.3.1.1.6 Dynamic Allocation / Uplink Transfer / Normal / T3180 expiry ....3843
52.3.1.1.7 Dynamic Allocation / Uplink Transfer / Normal / PACCH operation ....3845
52.3.1.1.8 Dynamic Allocation / Uplink Transfer / Normal / Two uplink timeslots ....3847
52.3.1.1.9 Dynamic Allocation / Uplink Transfer / Normal / Frequency parameters ....3849
52.3.1.2 Dynamic Allocation / Uplink Transfer / Abnormal ....3865
52.3.1.2.1 Dynamic Allocation / Uplink Transfer / Abnormal / with random access ....3865
52.3.1.2.2 Dynamic Allocation / Uplink Transfer / Abnormal / with cell reselection in acknowledged mode ....3866
52.3.1.2.3 Dynamic Allocation / Uplink Transfer / Abnormal / with cell reselection in unacknowledged mode ....3868
52.3.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment (concurrent) ....3870
52.3.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal ....3870
52.3.2.1.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Successful ....3870
52.3.2.1.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Multislot capabilities ....3876
52.3.2.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal ....3885
52.3.2.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal / with random access ....3885
52.3.2.2.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal / Continuation of normal operation ....3890
52.3.3 Dynamic Allocation / Resource reallocation ....3892
52.3.3.1 Dynamic Allocation / Resource reallocation / Successful ....3892

52.3.3.1.1 Dynamic Allocation / Resource reallocation / Successful / Higher throughput class or higher radio priority ..... 3892
52.3.3.1.2 Dynamic Allocation / Resource reallocation / Successful / Lower throughput class ..... 3897
52.3.3.1.3 Dynamic Allocation / Resource reallocation / Successful / Different RLC mode and higher radio priority ..... 3900
52.3.3.2 Dynamic Allocation / Resource reallocation / Abnormal ..... 3903
52.3.3.2.1 Dynamic Allocation / Resource reallocation / Abnormal / T3168 expiry ..... 3903
52.3.3.2.2 Dynamic Allocation / Resource reallocation / Abnormal / Invalid assignment ..... 3906
52.3.3.3 Dynamic Allocation / Resource reallocation / Reject ..... 3912
52.3.4 Default message contents ..... 3916
52.4 Measurement reports and Cell change order procedures ..... 3926
52.4.1 Measurement reports ..... 3926
52.4.1.1 Network Control measurement reporting / Uplink / Normal case ..... 3926
52.4.1.2 Network Control measurement reporting / Idle mode / New cell reselection ..... 3929
52.4.1.3 Network Control measurement reporting / Downlink transfer / Normal case ..... 3932
52.4.2 Cell change order procedures ..... 3935
52.4.2.1 Cell change order procedure / Uplink transfer ..... 3935
52.4.2.1.1 Cell change order procedure / Uplink transfer / Normal case ..... 3935
52.4.2.1.2 Cell change order procedure / Uplink transfer / Failure cases / T3174 expiry ..... 3936
52.4.2.1.3 Cell change order procedure / Uplink transfer / Failure cases / REJECT from the new cell ..... 3938
52.4.2.1.4 Cell change order procedure / Uplink transfer / Failure cases / Contention resolution failure ..... 3939
52.4.2.1.5 Cell change order procedure / Uplink transfer / Failure cases / REJECT from the new cell and T3176 expiry ..... 3941
52.4.2.1.6 Cell change order procedure / Uplink transfer / Failure cases / Frequency not implemented ..... 3942
52.4.2.2 Cell change order procedure / Downlink transfer ..... 3943
52.4.2.2.1 Cell change order procedure / Downlink transfer / Normal case ..... 3943
52.4.2.2.2 Cell change order procedure / Downlink transfer / Failure cases / REJECT from the new cell ..... 3945
52.4.2.2.3 Cell change order procedure / Downlink transfer / Failure cases / Frequency not implemented 3946
52.4.2.3 Cell change order procedure / Simultaneous uplink and downlink transfer ..... 3947
52.4.2.3.1 Cell change order procedure / Simultaneous uplink and downlink transfer / Normal case ..... 3947
52.4.2.3.2 Cell change order procedure / Simultaneous uplink and downlink transfer / Failure case / T3174 expiry ..... 3950
52.4.3 Macros and Default Message contents ..... 3951
52.4.3.1 Macros ..... 3951
52.4.3.1.1 Uplink packet transfer mode / Dynamic allocation ..... 3951
52.4.3.1.2 Uplink packet transfer mode / Fixed allocation ..... 3952
52.4.3.2 Default Messages ..... 3952
52.4.3.2.1 PACKET CELL CHANGE ORDER message ..... 3952
52.4.3.2.2 PACKET CELL CHANGE FAILURE message ..... 3952
52.4.3.2.3 PACKET MEASUREMENT ORDER message ..... 3953
52.4.4 Cell Change Order Procedures without PBCCH ..... 3954
52.4.4.1 Network Controlled Cell Reselection – Packet Measurement Order Procedure ..... 3954
52.4.4.2 Network Controlled Cell Reselection/validity of reselection parameters/MS enters standby state ..... 3955
52.5 Void ..... 3956
52.5.1 Void ..... 3956
52.5.2 Void ..... 3956
52.5.3 Void ..... 3956
52.5.4 Void ..... 3956
52.5.5 Downlink Transfer / Reestablishment ..... 3956
52.5.5.1 Downlink Transfer/ Reestablishment/ T3192 Expiry ..... 3956
52.5.5.2 Downlink Transfer/ Reestablishment/ Packet Downlink Assignment ..... 3959
52.5.5.3 Downlink Transfer/ Reestablishment/ Invalid Frequency Parameters IE ..... 3961
53 Test of EGPRS Radio Link Control (RLC) Protocol ..... 3964
53.1 Acknowledged Mode ..... 3964
53.1.1 Acknowledged Mode/ Uplink TBF ..... 3964
53.1.1.1 Acknowledged Mode/ Uplink TBF/ Send State Variable V(S) ..... 3964
53.1.1.2 Acknowledged Mode/ Uplink TBF/ Acknowledge State Variable V(A) ..... 3966
53.1.1.3 Acknowledged Mode/ Uplink TBF/ Window Size/ Default Value ..... 3967
53.1.1.4 Acknowledged Mode/ Uplink TBF/ Window Size/ Assigned Value ..... 3969
53.1.1.5 Acknowledged mode/ Uplink TBF/ Invalid Negative Acknowledgement ..... 3971
53.1.1.6 Acknowledged Mode/ Uplink TBF/ Countdown Value ..... 3973

53.1.1.7 Acknowledged Mode/ Uplink TBF/ Interpretation of Receive Block Bitmap ..... 3974
53.1.1.8 Acknowledged Mode/ Uplink TBF/ Pre-emptive Transmission/ Default Mode ..... 3976
53.1.1.9 Acknowledged Mode/ Uplink TBF/ Pre-emptive Transmission Bit Set to '1' ..... 3978
53.1.1.9.1 Conformance requirements ..... 3978
53.1.1.10 Acknowledged Mode/ Uplink TBF/ Pre-emptive Transmission Bit Set to '0'/ PENDING_ACK Blocks ..... 3979
53.1.1.11 Acknowledged Mode/ Uplink TBF/ Pre-emptive Transmission Bit Set to '0'/ Negative Acknowledgement ..... 3981
53.1.1.12 Acknowledged Mode/ Uplink TBF/ Retransmission/ Split RLC Data Block ..... 3983
53.1.1.13 Acknowledged Mode/ Uplink TBF/ Calculation of BSN2 ..... 3985
53.1.1.14 Acknowledged Mode/ Uplink TBF/ Verification of Coding Schemes ..... 3987
53.1.1.15 Acknowledged Mode/ Uplink TBF/ Recalculation of CV on MCS change ..... 3989
53.1.1.16 Acknowledged Mode/ Uplink TBF/ Retransmission/ Padding in the Data Field ..... 3991
53.1.1.17 Acknowledged Mode/ Uplink TBF/ Retransmission/ Puncturing Scheme Cycle ..... 3994
53.1.1.18 EGPRS Acknowledged mode / Uplink TBF / Link Adaptation Procedure for retransmission ..... 3995
53.1.1.19 EGPRS Acknowledged mode / Uplink TBF / Link Adaptation Procedure for initial transmission ..... 4000
53.1.1.20 Acknowledged Mode/ Uplink TBF/ Retransmission/ MCS Selection without Re-segmentation ..... 4002
53.1.1.21 Acknowledged Mode/ Uplink TBF/ Initial Puncturing Scheme After MCS Switching ..... 4006
53.1.2 Acknowledged Mode/ Downlink TBF ..... 4007
53.1.2.1 Acknowledged Mode/ Downlink TBF/ Receive State Variable V(R) ..... 4007
53.1.2.2 Acknowledged Mode/ Downlink TBF/ Receive Window State Variable V(Q) ..... 4008
53.1.2.3 Acknowledged Mode/ Downlink TBF/ Window Size/ Default Value ..... 4010
53.1.2.4 Acknowledged Mode/ Downlink TBF/ Window Size/ Assigned Value ..... 4011
53.1.2.5 Acknowledged Mode/ Downlink TBF/ BOW ..... 4013
53.1.2.6 Acknowledged Mode/ Downlink TBF/ EOW ..... 4014
53.1.2.7 Acknowledged Mode/ Downlink TBF/ Measurement Report ..... 4016
53.1.2.8 Acknowledged Mode/ Downlink TBF/ Generation of Bitmap ..... 4017
53.1.2.9 Acknowledged Mode/ Downlink TBF/ Interpretation of BSN2 ..... 4018
53.1.2.10 Acknowledged Mode/ Downlink TBF/ Split RLC Data Block ..... 4019
53.1.2.11 Acknowledged Mode/ Downlink TBF/ First Partial Bitmap and Next Partial Bitmap ..... 4021
53.1.2.12 Acknowledged Mode/ Downlink TBF/ Decoding of Coding Schemes ..... 4022
53.1.2.13 Acknowledged Mode/ Downlink TBF/ IR Operation ..... 4023
53.1.2.14 Acknowledged Mode/ Downlink TBF/ Received Bitmap/ Compressed ..... 4025
53.1.2.15 Acknowledged Mode/ Downlink TBF/ Received Bitmap/ Uncompressed ..... 4027
53.1.2.16 Acknowledged Mode/ Downlink TBF/ Received Block Bitmap/ Compressed Bitmap Starting Colour Code ..... 4028
53.1.2.17 Acknowledged Mode/ Downlink TBF/ Received Block Bitmap/ Terminating Code and Make-up Code ..... 4029
53.2 Default Message Contents and Macros ..... 4031
53.2.1 Message Contents ..... 4031
53.2.1.1 PACKET UPLINK ASSIGNMENT ..... 4031
53.2.2 Macros ..... 4032
53.2.2.1 Macro for uplink dynamic allocation two phase access (PBCCH not present) ..... 4032
53.2.2.2 Macro for downlink TBF establishment (PBCCH not present) ..... 4033
54 Void ..... 4034
55 Void ..... 4034
56 Void ..... 4034
57 Void ..... 4034
58 Void ..... 4034
59 Void ..... 4034
60 Inter-system hard handover from GSM to UTRAN ..... 4034
60.1 Inter system handover to UTRAN/From GSM/Speech/Success ..... 4036
60.2 Inter system handover to UTRAN/From GSM/Data/Same data rate/Success ..... 4044
60.3 Inter system handover to UTRAN/From GSM/Data/Data rate upgrading/Success ..... 4058
60.4 Inter system handover to UTRAN/From GSM/Speech/Establishment/Success ..... 4060
60.5 Inter system handover to UTRAN/From GSM/Speech/Blind HO/Success ..... 4062
60.6 Inter system handover to UTRAN/From GSM/Speech/Failure ..... 4070
60.7 Inter system handover to UTRAN/From GSM/Failure/Cause: Frequency not implemented ..... 4071

60.8 Inter system handover to UTRAN/From GSM/Failure/Cause: UTRAN preconfiguration unknown ....4073
60.9 Inter system handover to UTRAN/From GSM/Failure/Cause: Protocol Error ....4076

61-69 Void ....4077

70 Location Services ....4077
70.1 Default conditions ....4077
70.1.1 Default conditions during LCS tests ....4077
70.2 Network Induced Location Request ....4078
70.2.1 LCS Network Induced Emergency Call on an SDCCH / idle, no IMSI ....4078
70.2.2 Positioning / RR / Classmark Interrogation tests ....4081
70.2.3 Network Induced Location Request Emergency Call on an SDCCH ....4084

**Annex 1 (normative): Reference test methods ....4088**

A1.1 General Conditions (GC) ....4088
A1.1.1 Outdoor test site and general arrangements for measurements involving the use of radiated fields (GC4) ....4088
A1.1.2 Anechoic shielded chamber (GC5) ....4088
A1.1.3 Temporary antenna connector (GC7) ....4089
A1.1.4 Temporary antenna connector characteristics ....4089
A1.1.5 Calibration of the temporary antenna connector ....4090
A1.1.5.1 Antenna radiation pattern ....4090
A1.1.5.2 Test range calibration ....4092
A1.1.5.3 Temporary antenna connector coupling factor ....4092

A1.2 Normal and extreme Test Conditions (TC) ....4093
A1.2.1 Power sources and ambient temperatures (TC2) ....4093
A1.2.2 Normal test conditions (TC2.1) ....4093
A1.2.3 Extreme test conditions (TC2.2) ....4094
A1.2.4 Vibration requirements (TC4) ....4095

**Annex 2: Not used ....4096**

**Annex 3: Protocol implementation information ....4097**

A3.1 Protocol Implementation Conformance Statement (PICS) ....4097
A3.1.1 LAPDm protocol (GSM 04.05 and 04.06) ....4097
A3.1.1.1 Simplified protocol - GSM 04.06 section 6 ....4097
A3.1.1.2 Management of SAPI = 3 - GSM 04.11 section 2.3 ....4097
A3.1.2 Mobility management ....4097
A3.1.2.1 IMSI detach initiation by the MS - GSM 04.08 section 4.3.4.1 ....4097
A3.1.2.2 IMSI detach completion by the MS - GSM 04.08 section 4.3.4.3 ....4097
A3.1.2.3 MM specific procedures - GSM 04.08 section 4.4 and 4.5.1.1 ....4097
A3.1.2.4 Receiving an MM STATUS message - GSM 04.08 section 4.6 ....4097
A3.1.3 Call control ....4098
A3.1.3.1 Status enquiry procedures - GSM 04.08 section 5.5.3.1 ....4098
A3.1.3.2 Receiving a STATUS message by a CC entity - GSM 04.08 section 5.5.3.2 ....4098
A3.1.3.3 Called side compatibility checking - GSM 04.08 annex B.3 ....4098
A3.1.3.4 Disconnect on incoming call ....4098
A3.1.4 Layer 1 ....4098
A3.1.4.1 Optional storage of BCCH carrier information - GSM 05.08 section 6.3 ....4098
A3.1.5 Autocalling - (ref.: GSM 02.07, annex 1) ....4098
A3.1.6 Transient states ....4098

A3.2 Protocol Implementation Extra Information for Testing (PIXIT) ....4099
A3.2.0 Introduction ....4099
A3.2.1 Basic characteristics ....4100
A3.2.1.1 Type of antenna ....4100
A3.2.1.2 Power supply ....4100
A3.2.1.3 Power class of the MS ....4100
A3.2.1.4 Channel modes supported ....4100
A3.2.1.5 Teleservices supported ....4100
A3.2.1.6 Supplementary services supported ....4101
A3.2.1.7 Bearer services supported ....4101
A3.2.1.8 SIM removal ....4101
A3.2.1.9 Classmark ....4101

A3.2.1.10 Type of SIM/ME interface (ref. GSM 11.11 and GSM 11.12) ..... 4102
A3.2.1.11 Multislot class ..... 4102
A3.2.2 Man machine interface ..... 4102
A3.2.2.1 Mobile station features ..... 4102
A3.2.2.2 Short message service ..... 4103
A3.2.2.3 Supplementary services ..... 4103
A3.2.2.3.1 Call forwarding ..... 4103
A3.2.2.3.2 Call restriction ..... 4104
A3.2.2.3.3 Handling of (undefined) GSM supplementary services ..... 4104
A3.2.3 Electrical Man Machine Interface (EMMI) ..... 4104
A3.2.3.1 Methods supported for activation/deactivation of EMMI ..... 4104
A3.2.3.2 Transmission rate supported by the ME on the EMMI ..... 4104
A3.2.3.3 Layer 3 messages supported on the EMMI ..... 4104
A3.2.3.4 Keystroke sequence messages ..... 4104
A3.2.3.5 Internal malfunction detected messages ..... 4105
A3.2.4 Digital Audio Interface (DAI) ..... 4105
A3.2.5 Characteristics related to bearer services or teleservices ..... 4105
A3.2.5.1 Access interface ..... 4105
A3.2.5.2 Configuration of the MT ..... 4105
A3.2.5.3 Capability information ..... 4105
A3.2.5.4 Subaddress or DDI number ..... 4106
A3.2.5.5 User to user signalling ..... 4106
A3.2.5.6 Data call set-up and data call clearing ..... 4106
A3.2.5.7 Characteristics of non-transparent data services ..... 4106
A3.2.5.8 Possible ways of setting-up a call from either an external interface or internally ..... 4106
A3.2.5.9 Application layer causing automatic call termination ..... 4107
A3.2.5.10 Call re-establishment for MS not supporting speech ..... 4107
A3.2.6 International mobile station equipment identity ..... 4107
A3.2.7 Receiver intermediate frequencies ..... 4107
A3.2.8 Artificial ear ..... 4107

**Annex 4: Test SIM Parameters ..... 4110**

A4.1 Introduction ..... 4110
A4.1.1 Definitions ..... 4110
A4.1.2 Definition of the test algorithm for authentication ..... 4110

A4.2 Default Parameters for the test SIM ..... 4110

A4.3 Default settings for the Elementary Files (EFs) ..... 4111
A4.3.1 $EF_{ICCID}$ (ICC Identification) ..... 4111
A4.3.2 $EF_{LP}$ (Language preference) ..... 4111
A4.3.3 $EF_{IMSI}$ (IMSI) ..... 4111
A4.3.4 $EF_{Kc}$ (Ciphering key Kc) ..... 4111
A4.3.5 $EF_{PLMNsel}$ (PLMN selector) ..... 4111
A4.3.6 $EF_{HPLMN}$ (HPLMN search period) ..... 4112
A4.3.7 $EF_{ACMmax}$ (ACM maximum value) ..... 4112
A4.3.8 $EF_{SST}$ (SIM service table) ..... 4112
A4.3.9 $EF_{ACM}$ (Accumulated call meter) ..... 4113
A4.3.10 $EF_{PUCT}$ (Price per unit and currency table) ..... 4113
A4.3.11 $EF_{CBMI}$ (Cell broadcast Message Identifier Selection) ..... 4113
A4.3.12 $EF_{BCCH}$ (Broadcast control channels) ..... 4113
A4.3.13 $EF_{ACC}$ (Access control class) ..... 4114
A4.3.14 $EF_{FPLMN}$ (Forbidden PLMNs) ..... 4114

# Foreword

This Technical Specification has been produced by the 3GPP.

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of this TS, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

x the first digit:

≥ 3 Indicates TSG approved document under change control (Release 2000).

y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.

z the third digit is incremented when editorial only changes have been incorporated in the specification.

The present document describes the technical characteristics and methods of test for Mobile Stations (MSs), operating in the 400 MHz, 700 MHz, 850 MHz, 900 MHz, 1 800 MHz and/or 1900 MHz frequency band (GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and/or PCS 1900) within the digital cellular telecommunications system. Definition 'all types of mobiles' inludes all systems listed above (GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900).

The present document is part 1 of a multi-part EN covering the Digital cellular telecommunications system (GSM Phase2 and Phase 2+ Releases 96, 97, 98, 99 and 3GPP Release 2000); Mobile Station (MS) conformance specification, as identified below:

**Part 1: Conformance specification**
**Reference: 3GPP TS 51.010-1.**

Part 2: Protocol Implementation Conformance Statement (PICS) proforma specification.
Reference: 3GPP TS 51.010-2.

Part 3: Layer 3 (L3) Abstract Test Suite (ATS).
Reference: 3GPP TS 51.010-3.

Part 4: SIM Application Toolkit conformance specification.
Reference: 3GPP TS 11.10-4.

# 1 Scope

The present document describes the technical characteristics and methods of test for Mobile Stations (MS), for the Pan European digital cellular communications system and Personal Communication Systems (PCS) operating in the 400 MHz, 700 MHz, 850 MHz, 900 MHz, 1 800 MHz and 1900 MHz band (GSM 400, GSM 900, DCS 1 800 and PCS 1900), standardized by ETSI Special Mobile Group (SMG).

The present document is valid for MS implemented according to GSM Phase2 or Phase2+ R96, or R97, or R98, or R99 or 3GPP Release 2000.

A subset of the tests is referenced in the GSM Common Technical Regulations (CTRs) and is used for regulatory conformance testing according to the EEC procedures for Telecommunications Terminal Equipment (TTE) type approval (EC Directive 91/263/EEC; also known as the "Terminal Directive" or "Second Phase Directive"). The remaining tests can be used to verify conformance with the GSM core technical specifications for those requirements that are not considered "essential" in the sense of the EC Directive 91/263/EEC (Article 4).

The present document covers the minimum characteristics considered necessary in order to provide sufficient performance for mobile equipment and to prevent interference to other services or to other users, and to the PLMNs.

It does not necessarily include all the characteristics which may be required by a user or subscriber, nor does it necessarily represent the optimum performance achievable.

It applies to the public land mobile radio service in the GSM 400, 700 MHz, 850 MHz, GSM 900, DCS 1 800 and PCS 1900 systems, using constant envelope modulation and operating on radio frequencies in the 400, 700, 850, 900, 1 800 and 1900 MHz bands respectively with a channel separation of 200 kHz and carrying 8 full rate channels or 16 half rate channels per carrier according to the TDMA principle.

The present document is part of the GSM-series of technical specifications. This EN neither replaces any of the other GSM technical specifications or GSM related ETSs or ENs, nor is it created to provide full understanding of (or parts of) the GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 systems. This EN lists the requirements, and provides the methods of test for testing a MS for conformance to the GSM standard.

For a full description of the system, reference should be made to all the GSM technical specifications or GSM related ETSs or ENs. Clause 2 provides a complete list of the GSM technical specifications, GSM related ETSs, ENs, and ETRs, on which this conformance test specifications is based.

The present document applies to the unit which includes the hardware to establish a connection across the radio interface.

If there is a difference between this conformance document, and any other GSM technical specification or GSM related ETS or EN, or 3GPP TS, then the other GSM technical specification or GSM related ETS or EN or 3GPP TS shall prevail.

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.
  - For a Phase2+ Release 4 MS, references to GSM documents are to version 4.x.y, when available.
  - For a Phase2+ Release 1999 MS, references to GSM documents are to version 8.x.y, when available.

- For a Phase2+ Release 1998 MS, references to GSM documents are to version 7.x.y, when available.
- For a Phase2+ Release 1997 MS, references to GSM documents are to version 6.x.y, when available.
- For a Phase2+ Release 1996 MS, references to GSM documents are to version 5.x.y,. when available.
- For a Phase2 MS, references to GSM documents are to version 4.x.y.

# 3 Definitions, conventions, and applicability

For abbreviations and acronyms, see GSM 01.04.

## 3.1 Mobile station definition and configurations

In this EN, a MS can be:

- a vehicle mounted station;
- a portable station;
- a handheld station;
- a vehicle mounted/portable station;
- a vehicle mounted/handheld station.

A MS is the complete equipment configuration which may take part in a communication. However, this may not be the MS as it is offered to a test house for conformance testing.

In general, the MS, as it will be presented to a test house for conformance testing, is the station without all the additional Terminal Equipment (TE). Such a piece of hardware is also called a Mobile Termination (MT), but in this EN, the expression MS is used for any form of MS hardware as it is offered to the test house.

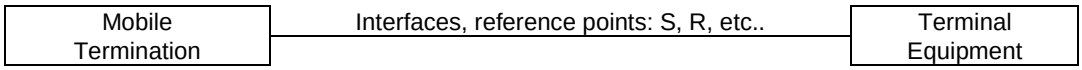

**Figure 3-1**

During the tests, the interfaces of the MT shall be connected to a System Simulator (SS), which will also emulate the TE. For some tests, it may be necessary to establish a pre-configured setup of the MS.

EXAMPLE: For reception of automatic fax group 3 to a fax machine on the R-interface, the MS needs configuration information about the presence of such a machine on that interface.

As an alternative, the TE may be physically integrated.

For a more detailed description of MS-configurations, see GSM 02.06.

# 3.2 Applicability

## 3.2.1 Applicability of this specification

### 3.2.1.1 MS equipped with a connector

If a MS is equipped with a connector, to connect terminal equipment on an S or R reference point as defined in GSM 04.02, then testing of the MS may include testing of appropriate functioning to and from this connector.

This EN does not apply to TE which is to be connected to that connector, even if it is delivered with the MS.

### 3.2.1.2 GPRS

Several important tests are missing in this EN for the following types of GPRS MS:

- Type 2 MS. [GSM 05.02]
- MS with 3 or more TX-slots. (Included in the test cases are multislot classes 1, 2, 3, 4, 5, 6, 8, 9, 10, 19 and 24) [GSM 05.02]
- GPRS only MS
- Mobiles that can operate in class A. [GSM 03.60]
- Mobiles that can operate in class B in Network mode III. [GSM 03.60]
- Optional GPRS features

## 3.2.2 Applicability of the individual tests

This information has been moved to 3GPP TS 51.010-2 Annex B.

## 3.2.3 Applicability to terminal equipment

If a MS is delivered for conformance testing, and it contains physically integrated TE, then this EN applies to the complete MS including that TE.

This EN also applies to separate TE that is delivered for conformance testing with the MS. The MS is then tested as an MT0. In that case, the specific TE with which the MS is tested is documented in the test report.

# 3.3 Definitions

The following definitions are used in this EN:

**idle updated:**

The MS is defined to be "idle updated" if the following three conditions are fulfilled:

- its update status is U1 UPDATED (cf. GSM 04.08);
- it is in the MM state MM-IDLE (cf. GSM 04.08);
- it is in the RR idle mode (cf. GSM 04.08).

**idle not updated:**

The MS is defined to be "idle not updated" if the following three conditions are fulfilled:

- its update status is U2 NOT UPDATED (cf. GSM 04.08);
- it is in the MM state MM-IDLE (cf. GSM 04.08);
- it is in the RR idle mode (cf. GSM 04.08).

**arbitrary:**

If for a test, a test purpose, a test group, or a test suite, which uses a certain parameter the value of that parameter has to be chosen arbitrarily in a certain set of values, this means that:

- for each value in the set the MS is required to fulfil the requirements of the test, test purpose, test group, or test suite, but that
- the test, test purpose, test group, or test suite is only performed for one value in the set, the selection of which is made by the test operator.

## 3.4 Conventions for mathematical notations

For the purpose of this EN mathematical terms used throughout this EN are given in this subclause.

### 3.4.1 Mathematical signs

The "plus or minus" sign is expressed by "±".

The sign "multiplied by" is expressed by "*".

The sign "divided by" is expressed by "/", or the common division bar.

The sign "greater than or equal to" is expressed by "≥".

The sign "less than or equal to" is expressed by "≤".

### 3.4.2 Powers to the base 10

Powers to the base 10 are expressed by "10Ex", where x is the exponent, e.g. 10E-5, 10E6.

## 3.5 Conventions on electrical terms

### 3.5.1 Radio Frequency (RF) input signal level

In general, the RF input signal level to the MS is expressed in terms of the received field strength E in dBµV/m (assuming a 0 dBi gain antenna). This is related to the power level P in dBm by the following formula (see GSM 05.05)

GSM 400: E (dBµV/m) = P (dBm) + 130.5 (calculated for a frequency of 460 MHz).

GSM 700: E (dBµV/m) = P (dBm) + 134.9 (calculated for a frequency of 770 MHz).

GSM 850: E (dBµV/m) = P (dBm) + 135.9 (calculated for a frequency of 859 MHz).

GSM 900: E (dBµV/m) = P (dBm) + 136,5 (calculated for a frequency of 925 MHz).

DCS 1 800: E (dBµV/m) = P (dBm) + 142,3 (calculated for a frequency of 1 795 MHz).

PCS 1900: E (dBµV/m) = P (dBm) + 142,9 (calculated for a frequency of 1 920 MHz).

According to annex 1 subclause A1.1.5.3, in all tests in which a handheld MS normally only equipped with integral antenna is the unit under test, the equivalent input signal level into a temporary test connector is determined from:

Ein= Ereq + F

where: Ein= input signal level to a temporary antenna connector (dBµVemf);

Ereq = signal level required by the test (dBµVemf);

F = coupling factor (dB) at the respective ARFCN.

Since F has to be determined by each test house individually, Ein cannot be given as a figure in test procedures.

If the case of integral antenna is applicable, the input signal level is then expressed in the test procedures as:

Ereq dBµVemf( ),

where the empty parenthesis is to be read as Ein.

Alternatively, the input signal level to the MS at the antenna connector can be expressed in dBµVemf( ). This is related to the power level P in dBm by the following formula, assuming a 50 ohm antenna connector:

Input signal level (dBµVemf( )) = P(dBm) + 113

### 3.5.2 Reference sensitivity level

In this EN the term:

Reference Sensitivity level ( )

is used to indicate that the SS establishes reference sensitivity level taking account of any loses associated with the RF connection to the MS.

### 3.5.3 Power level of fading signal

The power level of a fading signal is defined as the total signal level averaged over time.

## 3.6 Terms on test conditions

### 3.6.1 Radio test conditions

The radio propagation conditions refer to multipath propagation models of GSM 05.05.

They are expressed by typical profiles:

- static;
- rural area (RA);
- hilly terrain (HT);
- urban area (TU); or for
- equalization test (EQ).

The non-static profiles are also related to typical speeds of movement of the MS expressed in km/h, e.g. TU1,5, TU3, TU50, HT100, EQ50.

In this EN the following conventions are used:

**Table 3.2**

| Term | for GSM 400 represents | for GSM 700 represents | For GSM 850 and GSM 900 represents | for DCS 1800 and PCS 1900 represents |
|---|---|---|---|---|
| RA | RA500 | RA300 | RA250 | RA130 |
| HT | HT200 | HT120 | HT100 | HT100 |
| TUhigh | TU100 | TU60 | TU50 | TU50 |
| TUlow | TU6 | TU3.6 | TU3 | TU1,5 |
| EQ | EQ100 | EQ60 | EQ50 | EQ50 |

For tests using ARFCN ranges the following tables (3.3, 3.4) shall be used.

**Table 3.3**

| Term | P-GSM 900 | DCS 1 800 | E-GSM 900 | R-GSM 900 |
|---|---|---|---|---|
| Low ARFCN range | 1 to 5 | 513 to 523 | 975 to 980 | 955 to 960 (R-GSM) and 975 to 980 (E-GSM) |
| Mid ARFCN range | 60 to 65 | 690 to 710 | 60 to 65 | 60 to 65 |
| High ARFCN range | 120 to 124 | 874 to 884 | 120 to 124 | 120 to 124 |

**Table 3.4**

| Term | GSM 450 | GSM 480 | PCS 1900 | GSM 750 | GSM 850 |
|---|---|---|---|---|---|
| Low ARFCN range | 259 to 261 | 306 to 308 | 513 to 523 | 438 to 452 | 128 to 132 |
| Mid ARFCN range | 275 to 277 | 322 to 324 | 650 to 670 | 472 to 474 | 188 to 192 |
| High ARFCN range | 291 to 293 | 338 to 340 | 799 to 809 | 507 to 511 | 247 to 251 |

NOTE 1: For definitions of GSM 450, GSM 480, GSM 750, GSM 850, P-GSM 900, DCS 1 800, PCS 1900, E-GSM 900 and R-GSM 900 refer to GSM 05.05.

NOTE 2: In this EN the term "GSM 900" is used to cover the primary GSM band, the extended GSM band and the railway-GSM band.

NOTE3: For R-GSM two low ARFCN ranges are defined. Unless specified otherwise for a specific test the ARFCN range defined for E-GSM900 MS is used for the testing of MS supporting the R-GSM 900 frequency range.

# 4 Test Equipment

## 4.1 Terms used to describe test equipment in this EN

In order to perform MS conformity testing, the use of test equipment is necessary to provide the MS with stimulus signals and to analyse and record the resulting responses.

Throughout this EN the term "System Simulator" is used to describe the suite of test equipment required to interact with the following MS interfaces:

- antenna
- acoustic
- data port
- power supply
- DAI

The term "SIM simulator" is used to describe the test equipment required to interact with the SIM/ME interface.

A "test SIM" has the physical characteristics of a standard SIM card, (see 11.11) with specific parameters defined in annex 4.

## 4.2 Functional requirements of test equipment

This EN does not include a functional description of the test equipment required to perform the tests. These requirements should be deduced from the test descriptions and the information in annex 5.

Annex 5 describes the requirements for the test equipment which cannot be derived from, and which are assumed in, the conformance test descriptions described in this EN. Specifically, stimulus setting and measurement uncertainty requirements are defined in annex 5.

# 5 Testing methodology in general (layers 1, 2, and 3)

## 5.1 Testing of optional functions and procedures

Any function or procedure which is optional, as indicated in this EN , may be subject to a conformance test if it is implemented in the MS.

A declaration by the apparatus supplier (PICS/PIXIT) is used to determine whether an optional function/procedure has been implemented.

## 5.2 Test interfaces and facilities

The air interface (Um reference point) provides the main test interface for the purpose of performing conformance tests.

The SS layer 2 and layer 3 shall react with the MS on the air interface in accordance with the BSS requirements in the GSM 04.xx and 05.xx series recommendations, except where the description defines otherwise.

The provision of the following special conformance test facilities is mandatory where applicable:

- support of special conformance test functions, which are enabled by the insertion of a dedicated SIM for testing (test-SIM);
- provision of a Digital Audio Interface (only for MS which support speech services, or alternate speech/data services);
- for equipment which does not have a permanent external 50 ohm connector, a temporary 50 ohm antenna connector shall be provided in accordance with the requirements of annex 1 GC7;
- for MS supporting diversity, or for any other reason having more than one RF connector (or temporary connector in the case of integral antenna MS) the manufacturer shall supply coupling and / or terminating devices so that the tests can be performed via a single transmit / receive RF connection.

Furthermore, an optional Electrical Man Machine Interface (EMMI), is specified.

These special conformance test facilities, with the exception of the temporary antenna connector, are described in subclause 36.1.

Actions at the user side of the equipment under test (i.e. at the man-machine Interface, at the S- or R- interface, at the SIM-interface, execution of higher layer processes in the case of data services) are used to invoke actions at layers 1, 2 and 3 of the Dm-channel protocol within the equipment under test.

## 5.3 Different protocol layers

The conformance tests for each layer of the Dm-channel protocol are specified separately and the test configuration(s) to be used in testing each layer is specified in the subclause of this EN relating to the conformance tests for that layer.

## 5.4 Information to be provided by the apparatus supplier

The apparatus supplier shall provide two kinds of information:

- information with respect to the protocol: Protocol Implementation Conformance Statement (PICS);
- information with respect to the man machine interface: Protocol Implementation Extra Information required for Testing (PIXIT).

The complete list of the information to be provided by the apparatus supplier is a matter between the apparatus supplier and the test house but an example of the information to be supplied is given in informative annex 3 of this EN.

## 5.5 Definitions of transmit and receive times

The time a burst is received or transmitted is defined to be in the middle of the burst, i.e. transition from Bit Number BN74 to BN75 for all bursts except random access bursts, the middle of which is the transition from BN48 to BN49.

The reception/transmission time of speech or data blocks or a signalling frame (layer 2 and layer 3) is defined to be the reception/transmission time of the last burst containing part of the block or frame.

The start of a layer 2 or 3 frame is defined to be the time of the first burst containing part of the layer 2 or 3 frame. (The time of a burst is defined to be in the middle of the burst.)

The end of a layer 2 or 3 frame is defined to be the time of the last burst containing part of the layer 2 or 3 frame.

# 6 Reference test methods

## 6.1 General

Annex 1 gives reference test conditions to be used throughout this EN, unless otherwise specified. It consists of a part on general conditions, and a part on normal and extreme test conditions.

Unless otherwise specified, tests are run using the normal test conditions.

If a test is to be run using the extreme test conditions then this is identified in the test description.

For all tests, the MS is connected to the SS. This connection, unless otherwise specified, is to the permanent antenna connector for a MS which is equipped with one, or via the temporary antenna connector defined in annex 1, GC7, for a MS with an integral antenna, and not normally having a means of connecting an external antenna.

## 6.2 Choice of frequencies in the frequency hopping mode

For the tests using frequency hopping, 38 frequencies are used over

GSM 850: a 21 MHz band

P-GSM 900: a 21 MHz band

E-GSM 900: a [21] MHz band

R-GSM 900: a 23 MHz band

DCS 1 800: a 75 MHz band

PCS 1900: a 60 MHz band

For the tests using frequency hopping, 14 frequencies are used over

GSM 450: a 6.4 MHz band

GSM 480: a 6.4 MHz band

For the tests using frequency hopping, 24 frequencies are used over

GSM 750: a 12.4 MHz band

**Table 6.1: Hopping frequencies**

| | ARFCN |
|---|---|
| GSM 450 | 260, 262, 265, 267, 269, 272, 274, 278, 280, 282, 285, 287, 290, 292 |
| GSM 480 | 307, 309, 312, 314, 316, 319, 321, 325, 327, 329, 332, 334, 337, 339 |
| GSM 750 | 444, 447, 450, 451, 455, 457, 459, 463, 464, 467, 471, 475, 479, 482, 483, 486, 489, 490, 494, 496, 498, 502, 503, 505 |
| GSM 850 | 137, 141, 144, 145, 149, 151, 153, 157, 158, 161, 165, 169, 172, 173, 177, 179, 181, 185, 186, 189, 193, 197, 200, 201, 205, 207, 209, 213, 214, 217, 221, 225, 228, 229, 233, 235, 237, 241 |
| P-GSM900 | 10, 14, 17, 18, 22, 24, 26, 30, 31, 34, 38, 42, 45, 46, 50, 52, 54, 58, 59, 62, 66, 70, 73, 74, 78, 80, 82, 86, 87, 90, 94, 98, 101, 102, 106, 108, 110, 114 |
| E-GSM900 | 984, 988, 991, 992, 996, 998, 1000, 1004, 1005, 1008, 1012, 1016, 1019, 1020, 1022, 2, 6, 10, 14, 17, 18, 22, 24, 26, 30, 31, 34, 38, 42, 45, 46, 50, 52, 54, 58, 59, 62, 64 |
| R-GSM 900 | 955, 963, 966, 967, 971, 974, 984, 988, 991, 992, 996, 998, 1000, 1004, 1005, 1008, 1012, 1016, 1019, 1020, 1022, 2, 6, 10, 14, 17, 18, 22, 24, 26, 30, 31, 34, 36, 38, 42, 43, 45 |
| DCS 1 800 | 522, 539, 543, 556, 564, 573, 585, 590, 606, 607, 624, 627, 641, 648, 658, 669, 675, 690, 692, 709, 711, 726, 732, 743, 753, 760, 774, 777, 794, 795, 811, 816, 828, 837, 845, 858, 862, 879 |
| PCS 1900 | 522, 539, 543, 547, 556, 564, 573, 585, 590, 596, 606, 607, 615, 624, 627, 633, 641, 648, 658, 669, 675, 684, 690, 692, 703, 709, 711, 726, 732, 743, 753, 760, 774, 777, 789, 794, 795, 803 |

NOTE: The range of frequencies available during tests under simulated fading conditions is restricted by the fading simulator bandwidth.

For the tests using frequency hopping on packet data channels a reduced number of frequencies shall be used for certain bands.

**Table 6.2: Packet Data Channel Hopping frequencies**

| | ARFCN |
|---|---|
| E-GSM900 | 2, 14, 22, 30, 38, 46, 54, 62, 988, 996, 998, 1004, 1012, 1016, 1020, 1022 |
| DCS 1 800 | 522, 564, 585, 606, 625, 648, 669, 690, 709, 726, 743, 760, 777, 795, 816, 837, 858, 879 |
| PCS 1900 | 522, 547, 573, 596, 606, 624, 641, 669, 675, 692, 711, 743, 753, 777, 789, 794, 795, 803 |

# 6.3 "Ideal" radio conditions

In this EN the following conditions are referenced by the term "ideal" radio conditions:

No multipath conditions

MS power control level:

| | | |
|---|---|---|
| GSM 400: | | 7 |
| GSM 700: | | 7 |
| GSM 850: | | 7 |
| GSM 900: | | 7 |
| DCS 1 800: | | 3 |
| PCS 1900 | | 3 |
| RF level to MS: | 63 dBµVemf( ) | (not tests in subclause 14.4, 14.5 or 18.1.4) |
| RF level to MS: | 20 dB above reference sensitivity level ( ) | (subclause 14.4 and 14.5) |
| RF level to MS: | 28 dBµVemf( ) | (tests in subclause 18.1.4) |

## 6.4 Standard test signals

The standard test signals C0, C1, I0, I1 and I2 as used in this EN, are defined in annex 5.

## 6.5 Power (control) levels

In this EN, except where explicitly stated otherwise, if the MS is commanded to its minimum power (control) level, the SS is allowed to signal power control level 19 for GSM 400, GSM 700, GSM 850, GSM 900, and 15 for DCS 1 800 and PCS 1900. Furthermore, except where explicitly stated otherwise, if the MS is commanded to its maximum power (control) level, and if MS_TXPWR_MAX_CCH is set to the maximum output power of the MS, the SS is allowed to signal the power control level corresponding to the maximum output power for the power class of the MS. For a GSM 400 or GSM 900 power class 2 MS, the SS is allowed to signal power control level 2.

# 7 Implicit testing

For some GSM features conformance is not verified explicitly in this EN. This does not imply that correct functioning of these features is not essential, but that these are implicitly tested to a sufficient degree in other tests. Examples for implicitly tested features are frequency hopping and encryption.

It should be noted that for these features some aspects have to be and are explicitly tested, e.g. the ability to switch to frequency hopping or non-hopping, and the ability to change the encryption mode setting.

# 8 Measurement uncertainty

The measured value relating to the corresponding limit shall be used to determine whether or not a terminal equipment meets the requirement. (ETR 028 annex B).

This process is often referred to as "shared risk".

# 9 Format of tests

In general the following basic format for tests is used:

*.*..* Title

*.*..*.1 Definition and applicability

This sections provides, if necessary, a definition of the feature/function being tested and the applicability of the test to different MS (e.g. speech only, data only etc.).

*.*..*.2 Conformance requirement

This section details the core specification requirements being tested and includes any necessary core specification references.

*.*..*.3 Test purpose

This section details the purpose of the test.

*.*..*.4 Method of test

*.*..*.4.1 Initial conditions

If present this section defines the initial conditions to be established before running the test.

*.*..*.4.2 Procedure

This section details the test procedure.

*.*..*.5 Test requirements

This section details the conditions to be met for successful completion of the test.

[However for the Layer 3 tests, in general, a slightly modified format, as described below, is used:

*.*..* Title

*.*..*.1 Conformance requirement

References

*.*..*.2 Test purpose

*.*..*.3 Method of test

Initial conditions

# 10 Generic call set up procedures

## 10.1 Generic call set-up procedure for mobile terminating speech calls

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Terminating Speech call set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

### 10.1.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see annex 1 TC.2.1)
- The special Test-SIM (see annex 4) shall be inserted.

- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

### 10.1.2 Definition of system information messages

The following parameters shall be coded into the system information messages. Parameters shall be coded according to GSM 04.08.

The RACH Control Parameters IE shall be the same in SYSTEM INFORMATION TYPE 1, TYPE 2, TYPE 3 and TYPE 4 messages.

The Location Area Identification IE, Cell Selection Parameters IE, and P1 bit shall be the same in SYSTEM INFORMATION TYPE 3 and TYPE 4 messages.

SYSTEM INFORMATION TYPE 1

| Information Element | Value/remark |
|---|---|
| Cell channel description | Includes the hopping sequence ARFCNs, if hopping is used |
| RACH control parameters | |
| MAX RETRANS | Any Value |
| TX-INTEGER | Any Value |
| CELL BAR ACCESS | Not barred |
| CALL RE-ESTABLISHMENT | Not Allowed |
| EMERGENCY CALL | Allowed |
| ACCESS CONTROL CLASS (0...9, 11...15) | None Barred |
| SI1 rest octets | Spare Octets |

SYSTEM INFORMATION TYPE 2

| Information Element | Value/remark |
|---|---|
| BCCH Frequency list | Indicates seven surrounding cells on any ARFCN of the supported band, excluding ARFCNs in or immediately adjacent to those specified in subclause 6.2 |
| NCC permitted | |
| NCC PERMITTED | e.g. all NCCs permitted |
| RACH control parameters | |
| MAX RETRANS | Any Value |
| TX-INTEGER | Any Value |
| CELL BAR ACCESS | Not barred |
| CALL RE-ESTABLISHMENT | Not Allowed |
| EMERGENCY CALL | Allowed |
| ACCESS CONTROL CLASS (0...9, 11...15) | None Barred |

SYSTEM INFORMATION TYPE 3

| Information Element | Value/remark |
|---|---|
| Cell identity | |
| CI VALUE | 0001 hex (not relevant) |
| Location Area Identification | |
| MCC | 001 decimal (not relevant) |
| MNC | 01 decimal (not relevant)<br>011 decimal (not relevant) for PCS 1900 |
| LAC | 0001 hex (not relevant) |
| Control Channel Description | |
| ATT (IMSI att/det) | MS shall not apply (not relevant) |
| BS-AG-BLKS-RES | 0 blocks reserved (not relevant) |
| CCCH-CONF | Combined CCCH/SDCCH (not relevant) |
| BS-PA-MFRMS | 5 multiframes (not relevant) |
| T3212 | Infinite |
| Cell options | |
| PWRC | power control not set |
| DTX | MS must not use DTX |
| RADIO LINK TIME-OUT | 8 |
| Cell selection parameters | |
| CELL RESELECT HYSTERESIS | 0 dB |
| MS-TXPWR-MAX-CCH | Max. output power of MS |
| RXLEV-ACCESS-MIN | -90 dBm |
| ACS | There are no additional cell parameters included in SI7 and SI8 |
| NECI | New establishment cause not supported |
| RACH control parameters | |
| MAX RETRANS | Any Value |
| TX-INTEGER | Any Value |
| CELL BAR ACCESS | Not barred |
| CALL RE-ESTABLISHMENT | Not Allowed |
| EMERGENCY CALL | Allowed |
| ACCESS CONTROL CLASS (0...9, 11...15) | None Barred |
| SI3 rest octets | |
| P1 | C2 parameters not present |

SYSTEM INFORMATION TYPE 4

| Information Element | Value/remark |
|---|---|
| Location Area Identification | |
| MCC | 001 decimal (not relevant) |
| MNC | 01 decimal (not relevant)<br>011 decimal (not relevant) for PCS 1900 |
| LAC | 0001 hex (not relevant) |
| Cell selection parameters | |
| CELL RESELECT HYSTERESIS | 0 dB |
| MS-TXPWR-MAX-CCH | Max. output power of MS |
| RXLEV-ACCESS-MIN | -90 dBm |
| RACH control parameters | |
| MAX RETRANS | Any Value |
| TX-INTEGER | Any Value |
| CELL BAR ACCESS | Not barred |
| CALL RE-ESTABLISHMENT | Not Allowed |
| EMERGENCY CALL | Allowed |
| ACCESS CONTROL CLASS (0...9, 11...15) | None Barred |
| CBCH Channel Description | Omitted |
| CBCH Mobile Allocation | Omitted |
| SI4 rest octets | |
| P1 | C2 parameters not present |

SYSTEM INFORMATION TYPE 5

| Information Element | Value/remark |
|---|---|
| Neighbour cell description | As BCCH Frequency list in SI 2 |

SYSTEM INFORMATION TYPE 6

| Information Element | Value/remark |
|---|---|
| Cell identity | |
| CI VALUE | 0001 hex (not relevant) |
| Location Area Identification | |
| MCC | 001 decimal (not relevant) |
| MNC | 01 decimal (not relevant<br>011 decimal (not relevant) for PCS 1900) |
| LAC | 0001 hex (not relevant) |
| Cell options | |
| PWRC | power control not set |
| DTX | MS must not use DTX |
| RADIO LINK TIME-OUT | 8 |
| NCC permitted | |
| NCC PERMITTED | e.g. all NCCs permitted |

### 10.1.3 Procedure

An MS terminating call on a TCH/FS shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Sent on the correct paging subchannel |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause indicates "answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered |
| 9 | SS | | SS starts ciphering |
| 10 | SS -> MS | SETUP | Message contains the signal IE |
| 11 | MS -> SS | CALL CONFIRMED | |
| A12 | MS -> SS | CONNECT | |
| B12 | MS -> SS | ALERTING | |
| B13 | MS | | An alerting indication as defined in a PICS/PIXIT statement given by the MS |
| B14 | MS | | The MS is made to accept the call in a way described in a PICS/PIXIT statement |
| B15 | MS -> SS | CONNECT | |
| 16 | SS -> MS | ASSIGNMENT COMMAND | |
| 17 | MS -> SS | ASSIGNMENT COMPLETE | |
| 18 | MS | | The TCH is through connected in both directions |
| 19 | SS -> MS | CONNECT ACKNOWLEDGE | |

10.1.4 Specific message contents

PAGING REQUEST TYPE 1 (GSM 04.08, 9.1.22) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal Paging |
| Channel Needed | spare, any channel |
| Mobile Identity 1 | |
| Odd/even no of digits | As applicable for TMSI |
| Type of Identity | TMSI |
| Identity digits | As applicable |
| Mobile Identity 2 | Omitted |
| P1 rest octets | Spare octets |

IMMEDIATE ASSIGNMENT (GSM 04.08, 9.1.18) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal |
| Channel Description | |
| Channel Type | SDCCH/SACCH 1(4) |
| Time slot number | zero |
| Training seq. code | same as BCCH |
| Hopping | No |
| ARFCN | ARFCN of the BCCH |
| Random Reference | |
| Random access info | As in CHAN REQ |
| N51, N32, N26 | As applicable |
| Timing Advance | 0 |
| Mobile allocation | length 0 due to hopping |
| IA rest octets | Spare octets |

AUTHENTICATION REQUEST (GSM 04.08, 9.2.2) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | MM |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering key seq. number | Arbitrary |
| Authent. parameter RAND | Arbitrary |

CIPHERING MODE COMMAND (GSM 04.08, 9.1.9) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering mode setting | Start ciphering |
| Algorithm Identifier | Supported by the MS |
| Cipher Response | IMEISV shall not be included |

SETUP (GSM 04.08, 9.3.23) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | CC |
| Transaction Identifier | SS orig. |
| Message Type | |
| Signal | any non-reserved value |
| Bearer capability 1 | Appropriate for the basic service selected for the test or omitted |

ASSIGNMENT COMMAND (GSM 04.08, 9.1.2) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Channel Description | |
| Channel type | Bm + ACCHs |
| Time slot number | Arbitrary |
| Training seq. code | Default |
| Hopping | No |
| ARFCN | Default |
| Power level | Power control level 7 |
| Channel mode | Speech full rate |

CONNECT ACKNOWLEDGE (GSM 04.08, 9.3.6) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | CC |
| Transaction Identifier | SS orig. |
| Message Type | |

## 10.2 Generic call set-up procedure for mobile originating speech calls

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Originating Speech (MOC) call set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

### 10.2.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see [annex 1 TC.2.1])
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

### 10.2.2 Definition of system information messages

See subclause 10.1.2.

### 10.2.3 Procedure

An MS originating call on a TCH/FS shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | MS | | "called number" entered |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause indicates "originating call, NECI <> 1" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered |
| 9 | SS | | SS starts ciphering |
| 10 | MS -> SS | SETUP | |
| 11 | SS -> MS | CALL PROCEEDING | |
| 12 | SS -> MS | ALERTING | |
| 13 | MS | | An alerting indication as defined in an PICS/PIXIT statement is given by the MS |
| 14 | SS -> MS | ASSIGNMENT COMMAND | |
| 15 | MS -> SS | ASSIGNMENT COMPLETE | |
| 16 | SS -> MS | CONNECT | |
| 17 | MS -> SS | CONNECT ACKNOWLEDGE | |
| 18 | MS | | The TCH is through connected in both directions |

### 10.2.4 Specific message contents

IMMEDIATE ASSIGNMENT (GSM 04.08, 9.1.18) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal |
| Channel Description | |
| Channel Type | SDCCH/SACCH 1(4) |
| Time slot number | zero |
| Training seq. code | same as BCCH |
| Hopping | No |
| ARFCN | ARFCN of the BCCH |
| Random Reference | |
| Random access info | As in CHAN REQ |
| N51, N32, N26 | As applicable |
| Timing Advance | 0 |
| Mobile allocation | length 0 due to hopping |
| IA rest octets | Spare octets |

AUTHENTICATION REQUEST (GSM 04.08, 9.2.2) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | MM |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering key seq. number | Arbitrary |
| Authent. parameter RAND | Arbitrary |

CIPHERING MODE COMMAND (GSM 04.08, 9.1.9) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering mode setting | Start ciphering |
| Algorithm Identifier | Supported by the MS |
| Cipher Response | IMEISV shall not be included |

CALL PROCEEDING (GSM 04.08, 9.3.3) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Repeat Indicator | Omitted |
| Bearer Capability 1 | Omitted |
| Bearer Capability 2 | Omitted |
| Facility | Omitted |
| Progress Indicator | Omitted |

ALERTING (GSM 04.08, 9.3.1) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Facility | Omitted |
| Progress Indicator | Omitted |
| User-user | Omitted |

ASSIGNMENT COMMAND (GSM 04.08, 9.1.2) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Channel Description | |
| Channel type | Bm + ACCHs |
| Time slot number | Arbitrary |
| Training seq. code | Default |
| Hopping | No |
| ARFCN | Default |
| Power level | Power control level 7 |
| Channel mode | Speech full rate |

CONNECT (GSM 04.08, 9.3.5) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Facility | Omitted |
| Progress Indicator | Omitted |
| Connected number | Omitted |
| Connected Subaddress | Omitted |
| User-user | Omitted |

# 10.3 Generic call set-up procedure for mobile terminating data calls

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Terminating Data call set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

## 10.3.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see annex 1 TC.2.1)
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

## 10.3.2 Definition of system information messages

See subclause 10.1.2.

## 10.3.3 Procedure

An MS terminating call on a TCH shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Sent on the correct paging subchannel |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause indicates "answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered |
| 9 | SS | | SS starts ciphering |
| 10 | SS -> MS | SETUP | A call is set up according to the required characteristics of the test procedure. Bearer Capability and Signal IEs included |
| 11 | MS -> SS | CALL CONFIRMED | Bearer Capability shall or shall not be included according to the rules given in GSM 04.08 and GSM 07.01 |
| A12 | MS -> SS | CONNECT | |
| B12 | MS -> SS | ALERTING | |
| B13 | MS | | An alerting indication as defined in a PICS/PIXIT statement given by the MS |
| B14 | MS | | The MS is made to accept the call in a way described in a PICS/PIXIT statement |
| B15 | MS -> SS | CONNECT | |
| 16 | SS -> MS | ASSIGNMENT COMMAND | |
| 17 | MS -> SS | ASSIGNMENT COMPLETE | |
| 18 | MS | | The TCH is through connected in both directions |
| 19 | SS -> MS | CONNECT ACKNOWLEDGE | |

### 10.3.4 Specific message contents

PAGING REQUEST TYPE 1 (GSM 04.08, 9.1.22) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal Paging |
| Channel Needed | spare, any channel |
| Mobile Identity 1 | |
| Odd/even no of digits | As applicable for TMSI |
| Type of Identity | TMSI |
| Identity digits | As applicable |
| Mobile Identity 2 | Omitted |
| P1 rest octets | Spare octets |

IMMEDIATE ASSIGNMENT (GSM 04.08, 9.1.18) to the MS

## 10.4 Generic call set-up procedure for mobile originating data calls

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Originating Data call set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

### 10.4.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see [annex 1 TC.2.1])
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

### 10.4.2 Definition of system information messages

See subclause 10.1.2.

### 10.4.3 Procedure

An MS originating call on a TCH shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | MS | | "called number" entered |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause indicates "originating call, NECI <> 1" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered |
| 9 | SS | | SS starts ciphering |
| 10 | MS -> SS | SETUP | |
| 11 | SS -> MS | CALL PROCEEDING | |
| 12 | SS -> MS | ALERTING | |
| 13 | MS | | An alerting indication as defined in an PICS/PIXIT statement is given by the MS |
| 14 | SS -> MS | ASSIGNMENT COMMAND | |
| 15 | MS -> SS | ASSIGNMENT COMPLETE | |
| 16 | SS -> MS | CONNECT | |
| 17 | MS -> SS | CONNECT ACKNOWLEDGE | |
| 18 | MS | | The TCH is through connected in both directions |

### 10.4.4 Specific message contents

IMMEDIATE ASSIGNMENT (GSM 04.08, 9.1.18) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal |
| Channel Description | |
| Channel Type | SDCCH/SACCH 1(4) |
| Time slot number | zero |
| Training seq. code | same as BCCH |
| Hopping | No |
| ARFCN | ARFCN of the BCCH |
| Random Reference | |
| Random access info | As in CHAN REQ |
| N51, N32, N26 | As applicable |
| Timing Advance | 0 |
| Mobile allocation | length 0 due to hopping |
| IA rest octets | Spare octets |

AUTHENTICATION REQUEST (GSM 04.08, 9.2.2) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | MM |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering key seq. number | Arbitrary |
| Authent. parameter RAND | Arbitrarily selected |

CIPHERING MODE COMMAND (GSM 04.08, 9.1.9) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering mode setting | Start ciphering |
| Algorithm Identifier | Supported by the MS |
| Cipher Response | IMEISV shall not be included |

CALL PROCEEDING (GSM 04.08, 9.3.3) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Repeat Indicator | Present if and only if Bearer Capability 1 and Bearer Capability 2 are present in this message |
| Bearer Capability 1 | Present if negotiation of BC 1 or BC 2 necessary (e.g. reception of "Both" for CE parameter in SETUP), else omitted |
| Radio Channel Requirement | spare |
| Connection element | T (in case of "Both T (NT) preferred" received) |
| NIRR | No meaning |
| Other parameters | Same as sent by the MS in the SETUP, where applicable |
| Bearer Capability 2 | Present if dual BC-IE received and negotiation of either BC 1 or BC 2 necessary, else omitted |
| Radio Channel Requirement | spare |
| Connection element | T in case of "Both, T (NT) preferred" in the SETUP message else same as in the SETUP message |
| NIRR | No meaning |
| Other parameters | Same as sent by the MS in the SETUP, where applicable |
| NOTE: If both BC 1 and BC 2 are present, then one and only one of them shall indicate speech. | |
| Facility | Omitted |
| Progress Indicator | Omitted |

ALERTING (GSM 04.08, 9.3.1) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Facility | Omitted |
| Progress Indicator | Omitted |
| User-user | Omitted |

ASSIGNMENT COMMAND (GSM 04.08, 9.1.2) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | RR |
| Transaction Identifier | Not used |
| Message Type | |
| Channel Description | |
| Channel type | Bm + ACCHs |
| Time slot number | Arbitrary |
| Training seq. code | Default |
| Hopping | No |
| FB no | Band no 0 |
| ARFCN | Default |
| Power level | Power control level 7 |
| Channel mode | If no negotiation took place:<br>- Speech FR (resp. HR) if first BC IE in the SETUP indicated speech FR (resp. HR);<br>- Set according to the table below if first BC - IE in the SETUP indicates data or fax If negotiation took place;<br>- Speech FR (resp. HR) if first BC-IE in the CALL PROCEEDING indicated speech FR (resp. HR);<br>- Set according to the table below if first BC - IE in the CALL PROCEEDING indicates data or fax |

**Table 10-2: Correspondence between User rate (UR) and Channel Mode (CM) for transparent (T) and non transparent (NT) connections**

| UR | 9,6kbit/s | 4,8kbit/s | 2,4kbit/s | 1,2kbit/s | 1,2/0,075kbit/s | 0,3kbit/s |
|---|---|---|---|---|---|---|
| CM T FR | 12FR | 6 FR | 3,6 FR | 3,6 FR | 3,6 FR | 3,6 FR |
| CM T HR | n.a | 6 HR | 3,6 HR | 3,6 HR | 3,6 HR | 3,6 HR |
| CM NT FR | 12 FR | 12 FR | 12 FR | 12 FR | 12 FR | 12 FR |
| CM NT HR | n.a | 6 HR | 6 HR | 6 HR | 6 HR | 6 HR |

CONNECT (GSM 04.08, 9.3.5) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Facility | Omitted |
| Progress Indicator | Omitted |
| Connected number | Omitted |
| Connected Subaddress | Omitted |
| User-user | Omitted |

## 10.5 Generic call set-up procedure for mobile terminating multislot configuration, minimum number of timeslots allocated

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Terminating multislot connection set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

### 10.5.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see annex 1 TC.2.1)
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

### 10.5.2 Definition of system information messages

See subclause 10.1.2.

### 10.5.3 Procedure

An MS terminating multislot connection shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Sent on the correct paging subchannel |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause indicates "answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM |
| 5 | MS -> SS | CLASSMARK CHANGE | Multislot class |
| 6 | SS -> MS | AUTHENTICATION REQUEST | |
| 7 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value |
| 8 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 9 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered |
| 10 | SS | | SS starts ciphering |
| 11 | SS -> MS | SETUP | A multislot connection is set up according to the required characteristics of the test procedure. Bearer Capability and Signal IEs included |
| 12 | MS -> SS | CALL CONFIRMED | Bearer Capability shall or shall not be included according to the rules given in GSM 04.08 and GSM 07.01 |
| A12 | MS -> SS | CONNECT | |
| B13 | MS -> SS | ALERTING | |
| B14 | MS | | An alerting indication as defined in a PICS/PIXIT statement given by the MS |
| B15 | MS | | The MS is made to accept the call in a way described in a PICS/PIXIT statement |
| B16 | MS -> SS | CONNECT | |
| 17 | SS -> MS | ASSIGNMENT COMMAND | In multislot allocation only one timeslot is allocated. |
| 18 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the TCH/Sm channel |
| 19 | MS | | The TCH(s) is through connected in both directions |
| 20 | SS -> MS | CONNECT ACKNOWLEDGE | |

### 10.5.4 Specific message contents

PAGING REQUEST TYPE 1 (GSM 04.08, 9.1.22) to the MS

| Information Element | Value/remark |
|---|---|

# 10.6 Generic call set-up procedure for mobile originating multislot configuration, minimum number of timeslots allocated

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Originating multislot connection set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

## 10.6.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see [annex 1 TC.2.1])
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

## 10.6.2 Definition of system information messages

See subclause 10.1.2.

### 10.6.3 Procedure

An MS originating multislot connection shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | MS | | "called number" entered |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause indicates "originating call, NECI <> 1" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM |
| 5 | MS -> SS | CLASSMARK CHANGE | Multislot class |
| 6 | SS -> MS | AUTHENTICATION REQUEST | |
| 7 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value |
| 8 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 9 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered |
| 10 | SS | | SS starts ciphering |
| 11 | MS -> SS | SETUP | A multislot connection is set up according to the required characteristics of the test procedure. |
| 12 | SS -> MS | CALL PROCEEDING | |
| 13 | SS -> MS | ALERTING | |
| 14 | MS | | An alerting indication as defined in an PICS/PIXIT statement is given by the MS |
| 15 | SS -> MS | ASSIGNMENT COMMAND | In multislot allocation only one timeslot is allocated. |
| 16 | MS -> SS | ASSIGNMENT COMPLETE | Sent on TCH/Sm channel. |
| 17 | SS -> MS | CONNECT | |
| 18 | MS -> SS | CONNECT ACKNOWLEDGE | |
| 19 | MS | | The TCH(s) is through connected in both directions |

# 10.7 Generic procedure for GPRS downlink data transfer

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Terminating Data transfer procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

## 10.7.1 Initial conditions

System Simulator:

- 1 cell, default parameters as specified in section 40.
- Ideal radio conditions and Timing advance set to 0.

Mobile Station:

- The MS shall be operated under normal test conditions (see annex 1 TC.2.1)
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is GPRS attached with a P-TMSI allocated and the test PDP context2 activated.

## 10.7.2 Definition of system information messages

See section 40.

## 10.7.3 Procedure

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | | | Start an application in the MS that continually reads all received data |
| 2 | SS -> MS | PACKET PAGING REQUEST | Contains P-TMSI of the MS. Sent on PPCH. |
| 3 | MS -> SS | PACKET CHANNEL REQUEST | ACCESS TYPE = " Page Response ". Received on PRACH. |
| 4 | SS -> MS | PACKET UPLINK ASSIGNMENT | Random Reference = pertaining to the message received in step 3. Sent on PAGCH. Single block assignment. |
| 5 | MS -> SS | UPLINK RLC DATA BLOCK | LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. . |
| 6 | SS -> MS | PACKET UPLINK ACK/NACK | Acknowledge the received RLC data block. Sent on PACCH. Poll bit in the MAC header is set to indicate a valid RRBP. |
| 7 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | As RLC/MAC control block. Received on PACCH. |
| 8 | SS -> MS | PACKET DOWNLINK ASSIGNMENT | Poll bit in the MAC header is set to indicate a valid RRBP. Sent on PCCCH. TIMESLOT_ALLOCATION arbitrarily chosen but shall not exceed the multislot capabilities of the MS. Other parameters as specified in each test case. |
| 9 | MS -> SS | PACKET CONTROL ACKNOWLEDGEMENT | Received on PACCH. |

Note. The MS is always granted a USF whenever the MS is expected to send.

### 10.7.4 Specific message contents

See section 40.

## 10.8 Generic procedure for GPRS uplink data transfer

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Originated Data transfer procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

### 10.8.1 Initial conditions

System Simulator:

- 1 cell, default parameters as specified in section 40.
- Ideal radio conditions and Timing advance set to 0.

Mobile Station:

- The MS shall be operated under normal test conditions (see annex 1 TC.2.1)
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

### 10.8.2 Definition of system information messages

See section 40.

### 10.8.3 Procedure

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | | | Start an application in the MS that continually sends data |
| 2 | MS -> SS | PACKET CHANNEL REQUEST | Received on PRACH. |
| 3 | SS -> MS | PACKET UPLINK ASSIGNMENT | Single block assignment, to order the MS to follow the two phase access procedure. Sent on PAGCH. |
| 4 | MS -> SS | PACKET RESOURCE REQUEST | Two phase access procedure. Received on the single block assigned in step 3. |
| 5 | SS -> MS | PACKET UPLINK ASSIGNMENT | Sent on PACCH of the same PDCH assigned in step 2. TIMESLOT_ALLOCATION arbitrarily chosen but shall not exceed the multislot capabilities of the MS. Open ended assignment. |
| 6 | SS -> MS | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PACCH containing USF assigned to the MS. |

Note. The MS is always granted a USF whenever the MS is expected to send.

### 10.8.4 Specific message contents

PACKET UPLINK ACK/NACK message:

| | |
|---|---|
| MESSAGE_TYPE | 001001 |
| PAGE_MODE | Normal Paging |
| UPLINK_TFI | 00,<br>same as the TFI value of the TBF which the message applies |
| | 0, message escape |
| CHANNEL_CODING_COMMAND | Same coding scheme as in the assigned TBF which the message applies to |
| Ack/Nack Description | |
| - FINAL_ACK_INDICATION | 0 (not a final ACK) |
| - STARTING_SEQUENCE_NUMBER | V( R ) |
| - RECEIVED_BLOCK_BITMAP | Acknowledge the all data blocks transmitted by the MS |
| {0\|1<CONTENTION_RESOLUTION_TLLI>} | 0 (no contention resolution TLLI) |
| {0\|1<Packet Timing Advance>} | 0 (no packet timing advance) |
| {0\|1<Power Control Parameters>} | 0 (no power control parameters) |
| {0\|1<Extension bits>} | 0 (no extension bits present) |
| {0\|1<Fixed Allocation parameters>} | 0 (no fixed allocation parameters present) |
| spare padding | Spare Padding |

PACKET UPLINK ASSIGNMENT message (two-phase dynamic allocation assigning a TBF):

| | |
|---|---|
| MESSAGE_TYPE | 001010 |
| PAGE_MODE | Normal Paging |
| {0\|1<PERSISTENCE_LEVEL>} | 0 (no persistence level present) |
| - Address information | 10 (TLLI) |
| - TLLI | The value received from the MS |
| | 0, message escape |
| CHANNEL_CODING_COMMAND | Arbitrarily chosen from the valid values (default CS-1) |
| TLLI_BLOCK_CHANNEL_CODING | '0'B, cs-1 |
| Packet Timing Advance | |
| - {0\|1<TIMING_ADVANCE_VALUE>} | 1 (timing advance value) |
| - TIMING_ADVANCE_VALUE | 0 bit periods |
| - {0\|1<TIMING_ADVANCE_INDEX> | 0 (no timing advance index) |
| <TIMING_ADVANCE_TIMESLOT_NUMBER >} | |
| {0\|1<Frequency Parameters>} | 1 (Frequency Parameters present) |
| - Frequency Parameters | |
| - TSC | Arbitrarily chosen (default 5) |
| - | 01 (indirect encoding) |
| - MAIO | Value arbitrarily chosen |
| - MA_NUMBER | Value arbitrarily chosen from PSI2s defined (default 0001) |
| - {0\|1<CHANGE_MARK_1> | 00 |
| {0\|1<CHANGE_MARK_2>}} | |
| Dynamic allocation | 01 |
| - Extended Dynamic Allocation | 0 ( Dynamic allocation) |
| - {0\|1<P0><PR_MODE>} | 0 |
| - USF_GRANULARITY | 0, one block |
| - {0\|1<UPLINK_TFI_ASSIGNMENT>} | 1 ( uplink TFI assignment) |
| - UPLINK_TFI_ASSIGNMENT | Arbitrarily chosen (default 00101) |
| - {0\|1<RLC_DATA_BLOCKS_GRANTED>} | 0 (no RLC_DATA_BLOCKS_GRANTED, open-ended TBF) |
| - {0\|1<TBF_STARTING_TIME>} | 0 (no starting time) |
| - | 1 (Timeslot Allocation with Power Control Parameters) one slot arbitrarily chosen and the following USF_TNx and GAMMA_TNx shall be corresponding to the chosen value, default timeslot 2 assigned) |
| - ALPHA | 0.5 |
| - {0\|1<USF_TN0><GAMMA_TN0>} | 0 (timeslot 0 not assigned) |

See also section 40.

# 11 General tests

## 11.1 Verification of support and non-support of services (multiple numbering scheme or ISDN)

### 11.1.1 Mobile Terminated (MT) calls

#### 11.1.1.1 Definition and applicability

This test applies to all MS. It is repeated for all Mobile Terminated Bearer Services / Teleservices according to GSM 02.02 and GSM 02.03 except Teleservices 21, 22 and 23.

#### 11.1.1.2 Conformance requirement

1. The MS shall check the Information Elements for Bearer Capability in a received SETUP message, and if it agrees to the proposed set, it shall respond with a CALL CONFIRMED message.

   GSM 04.08, 5.2.2.2; GSM 04.08, 5.2.2.3.

2. The MS in the "Null" state, U0, ready to receive a SETUP shall reject a SETUP with Information Elements for Bearer Capability which are incompatible with the Bearer Services / Teleservices supported by the MS, and shall send a RELEASE COMPLETE message.

   GSM 04.08, 5.2.2.2; GSM 04.08, 5.2.2.3.1; GSM 07.01, 8.3.1; GSM 04.08, B.3.2.

#### 11.1.1.3 Test purpose

1. To verify that the MS, for the case of the Multinumbering scheme or ISDN, accepts a SETUP message, where the Information Elements for Bearer Capability are compatible with the Bearer Services / Teleservices declared as supported by the MS, by sending a CALL CONFIRMED message.

   This is verified for all Mobile Terminated Bearer Services / Teleservices declared as supported by the MS.

2. To verify that the MS in the "Null" state, U0, when receiving a SETUP message containing incompatible Information Elements for Bearer Capability will respond with a RELEASE COMPLETE message.

   This is verified for all Mobile Terminated Bearer Services / Teleservices not declared as supported by the MS.

#### 11.1.1.4 Method of test

##### 11.1.1.4.1 Initial conditions

For an MS with an external interface the interface shall be setup in such a way that the MS is able to successfully receive the call for the service in question. The manufacturer shall state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

The PIXIT statement for the service in question shall be consistent with the PICS statement made by the manufacturer and will result for this tests in one or several valid BC codings as presented in section 11.8.

The generic call set-up procedure shall be followed up to and including the reception of the CIPHERING MODE COMPLETE message from the MS.

#### 11.1.1.4.2 Procedure

a) For a Mobile Terminated Bearer Service / Teleservice declared as supported by the MS. The SS transmits a SETUP message.

The SETUP shall contain a single or dual BC-IE where the parameter values are arbitrarily selected among those declared as supported by the MS in PIXIT statements and corresponding to the Bearer Service / Teleservice being tested.

b) If more than one BC-IE (or pair of) correspond to the Bearer Service / Teleservice being tested, step a) is repeated once (and only once) with another single or dual BC-IE. The BC-IE shall be chosen in such a way that as many parameters as possible are different from the previous BC-IE. In particular, if more than one value for the "Connection Element" parameter is possible, the new BC-IE shall contain a different value from the previous one for this parameter.

c) Step a) and b) are repeated for all Bearer Services / Teleservices declared as supported by the MS.

d) For an Mobile Terminated Bearer Service / Teleservice not declared as supported by the MS. The SS transmits SETUP. If the MS supports TS62 but not TS61, then TS61 is not tested.

The SETUP shall contain a single or dual BC-IE where the parameter values are arbitrarily selected among those defined in GSM 07.01 Annex II and corresponding to the Bearer Service / Teleservice being tested. The complete coding of the corresponding BC-IE(s) can be found in section 11.8.

e) Step d) is repeated for all Bearer Services / Teleservices not declared as supported by the MS.

#### 11.1.1.5 Test requirement

1) After steps a), b) and c), the MS shall send a CALL CONFIRMED message. The MS may contain a single or dual BC-IE. If present these IEs are not checked.

2) After steps d) and e), the MS shall send a RELEASE COMPLETE message with cause value 88 - incompatible destination.

## 11.1.2 Mobile Originated (MO) calls

#### 11.1.2.1 Definition and applicability

This test applies to all MS able to initiate an MO call. It is repeated for all Mobile Originated Bearer Services / Teleservices according to GSM 02.02 and GSM 02.03 except Teleservices 21, 22 and 23, which are supported by the MS.

#### 11.1.2.2 Conformance requirement

1. The MS shall set up a call with a SETUP message containing a single or multiple BC-IE and if required by the service, a single or multiple LLC according to the actual configuration of the MS. Two bearer capabilities can be present only in the cases described in GSM 07.01.

   GSM 04.08, 5.2.2.2; GSM 04.08, 5.2.2.3.1; GSM 04.08, 9.3.2; GSM 07.01, 8.3.3.

2. The Repeat Indicator Information Element shall be included in the SETUP message, when the in-call modification procedure is used.

   GSM 04.08, 9.3.2.

#### 11.1.2.3 Test purpose

1. To verify that the MS generates a SETUP message which includes a single or multiple Bearer Capability and if required by the service, a single or multiple LLC, according to the actual configuration on the MS.

   This is verified for all Mobile Originated Bearer Services / Teleservices described in GSM 07.01 and declared as supported by the MS.

2. To verify that the MS includes a correctly encoded Repeat Indicator if it includes multiple Bearer Capabilities in the SETUP message.

#### 11.1.2.4 Method of test

##### 11.1.2.4.1 Initial conditions

If possible, the MS shall be configured to initiate an outgoing call with a specified BC and with the corresponding LLC when the ITC value is "unrestricted digital" in the SETUP message. The manufacturer must state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an outgoing call can be initiated.

The PIXIT statement for the service in question shall be consistent with the PICS statement made by the manufacturer and will result for this test in one valid BC coding as presented in section 11.8.

##### 11.1.2.4.2 Procedure

a) The MS shall be made to initiate a call.

b) If the MS can be configured to send a specific BC, the test is repeated with the MS configured for all possible preferred Bearer Services and Teleservices declared as supported by the MS. The complete coding of the corresponding BC-IE(s) can be found in section 11.8.

#### 11.1.2.5 Test requirement

The MS shall send a SETUP message, which shall contain the BC among those declared as supported by the MS. If the MS is configured to send a specific BC, the SETUP message shall contain this particular BC. The BC-IE(s) shall be set according to GSM 07.01. When an ITC value is set to "unrestricted digital" the MS shall include the corresponding LLC information element.

Where two BCs are contained in the SETUP message, it shall be checked that the combination is allowed, according to GSM 07.01 and that a Repeat Indicator is also included.

## 11.2 Verification of support of the single numbering scheme

### 11.2.1 Definition and applicability

This test applies to all MS.

### 11.2.2 Conformance requirement

1. The MS shall respond to a SETUP message containing no BC-IE with a CALL CONFIRMED message including the single or multiple Bearer Capability, according to the actual configuration of the MS. Two bearer capabilities can be present only in the cases described in GSM 07.01.

   GSM 04.08, 5.2.2.2; GSM 04.08, 5.2.2.3.1; GSM 04.08, 9.3.2; GSM 07.01, 8.3.3

2. The Repeat Indicator Information Element shall be included in the CALL CONFIRMED message, when the in-call modification procedure is used, and no Bearer Capability Information Element is included in the received SETUP message.

   GSM 04.08, 9.3.2

### 11.2.3 Test purpose

1. To verify that the MS, for the case of the Single Numbering Scheme, accepts a SETUP message, where the Information Elements for Bearer Capability and Lower and Higher Layer Compatibility are not present by sending a CALL CONFIRMED message, which includes the single or multiple Bearer Capabilities, according to the actual configuration on the MS.

   This is verified for one Mobile Terminated Bearer Service / Teleservice described in GSM 07.01 and declared as supported by the MS.

2. To verify that the MS includes a correctly encoded Repeat Indicator if it includes multiple Bearer Capabilities in the CALL CONFIRMED message.

### 11.2.4 Method of test

#### 11.2.4.1 Initial conditions

The MS is setup to receive a call. If possible, the MS shall be configured to respond to an incoming call with a specified BC selected arbitrarily from those declared as supported by the MS, in the CALL CONFIRMED message, in reply to a SETUP message with no BC, LLC or HLC elements. The manufacturer must state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

The generic call set-up procedure shall be followed up to and including the reception of the CIPHERING MODE COMPLETE message from the MS.

The PIXIT statement for the service in question shall be consistent with the PICS statement made by the manufacturer and will result for this tests in one or several valid BC codings as presented in section 11.8.

#### 11.2.4.2 Procedure

The SS transmits a SETUP message with no BC, LLC or HLC elements.

### 11.2.5 Test requirement

The MS shall send a CALL CONFIRMED message, which shall contain the BC among those declared as supported by the MS. If the MS is configured to respond with a specific BC, the CALL CONFIRMED message shall contain this particular BC. The BC-IE shall be coded according to GSM 07.01.

Where two BCs are contained in the CALL CONFIRMED message, it shall be checked that the combination is allowed, according to GSM 07.01 and that a Repeat Indicator is also included.

## 11.3 Verification of non-support of services (Advice of Charge Charging (AoCC))

### 11.3.1 Definition and applicability

This test applies to MS which do **not** support AoCC.

Test procedures (a) and (b) apply to MS which support MT calls.

Test procedure (c) applies to MS which support MO calls.

Test procedure (d) applies to MS which support at least one circuit switched basic service.

### 11.3.2 Conformance requirement

1. An MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a CONNECT message containing AoCC information shall acknowledge the CONNECT message but ignore and not acknowledge the AoCC information sent within the CONNECT.

2. An MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information contained within the FACILITY.

3. An MS claiming to **not** support AoCC and in the incoming call / U9 call confirmed state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information contained within the FACILITY.

4. An MS claiming to **not** support AoCC and in the U10 call active state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information contained within the FACILITY.

   GSM 03.86 sections 1.2, 1.3, 2.2, 2.3; GSM 04.86 section 2.

### 11.3.3 Test purpose

1. To verify that an MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a CONNECT message containing AoCC information acknowledges the CONNECT message but ignores and does not acknowledge the AoCC information sent within the CONNECT.

2. To verify that an MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a FACILITY message containing AoCC information ignores and does not acknowledge the AoCC information contained within the FACILITY.

3. To verify that an MS claiming to not support AoCC and in the incoming call / U9 call confirmed state, on receipt of a FACILITY message containing AoCC information ignores and does not acknowledge the AoCC information contained within the FACILITY.

4. To verify that an MS claiming to **not** support AoCC and in the U10 call active state, on receipt of a FACILITY message containing AoCC information ignores and does not acknowledge the AoCC information contained within the FACILITY.

### 11.3.4 Method of test

#### 11.3.4.1 Initial conditions

The generic call set up procedures are followed up to and including the reception, or transmission, of the ALERTING message by the MS.

#### 11.3.4.2 Procedure

a) For an Mobile Originated call in the U4 state the SS transmits CONNECT containing AoCC information.

b) For an Mobile Originated call in the U4 state the SS transmits FACILITY containing AoCC information.

c) For an Mobile Terminated call in the U9 state the SS transmits a FACILITY containing AoCC information.

d) For a call in the U10 state the SS transmits a FACILITY containing AoCC information

### 11.3.5 Test requirement

The MS shall ignore the AoCC information sent to it in the Facility information elements as part of the CONNECT/FACILITY messages and not send any AoCC information acknowledgement. It shall be checked for 15 seconds that the MS does not transmit any AoCC information acknowledgement after the receipt of AoCC information.

# 11.4 Verification of non-support of services (call hold)

## 11.4.1 Definition and applicability

Applicable to MS which do **not** support the Call-Hold supplementary service. This test applies only to MSs that claim to support AoCC. This test applies only to MS which support MO calls.

## 11.4.2 Conformance requirement

An MS claiming to **not** support the Call Hold supplementary service and in the U10 call active state shall, when the appropriate Call Hold MMI command is entered:

- Fail to put the first call on hold.
- Fail to place the second call.
- Optionally provide some indication to the user of an error.

GSM 02.83; GSM 04.83

## 11.4.3 Test purpose

To verify that an MS claiming to **not** support the Call Hold supplementary service and in the U10 call active state, reacts in the following manner when the appropriate call hold MMI command is entered:

- MS fails to put the first call on hold
- MS fails to place the second call.
- Optionally provides some indication to the user of an error.

## 11.4.4 Method of test

### 11.4.4.1 Initial conditions

The mobile originating generic call set up procedures shall be followed up to and including the transmission by the MS of the CONNECT ACKNOWLEDGE to place the call in the U10 call active state.

### 11.4.4.2 Procedure

A second directory number is entered followed by "SEND" via the MMI.

## 11.4.5 Test requirement

The MS shall not send any HOLD messages on the dedicated channel. This is checked for 3 seconds.

The MS may however send other messages.

The MS may also give the user an indication of the error that has occurred.

# 11.5 Verification of non-support of services (multiparty)

## 11.5.1 Definition and applicability

Applicable for MSs that support the Call-Hold supplementary service but **not** the MultiParty supplementary service. This test applies only to MSs that support AoCC. This test applies only to MS which support MO calls.

## 11.5.2 Conformance requirement

An MS claiming to not support the MultiParty supplementary service and in the U10 call active state with one call and in the held state with another call shall, when the appropriate MultiParty MMI command is entered:

- Fail to combine the three parties in a MultiParty call.
- Optionally provide some indication to the user of an error.

GSM 02.83, 02.84; GSM 04.83, GSM 04.84.

### 11.5.3 Test purpose

To verify that an MS claiming to not support the MultiParty supplementary service and in the U10 call active state with one call and another call on hold, reacts in the following manner when the appropriate MultiParty MMI command is entered:

- Fails to combine the three parties in a MultiParty call.
- Optionally provides some indication to the user of an error.

### 11.5.4 Method of test

#### 11.5.4.1 Initial conditions

The mobile originating generic call set up procedures shall be followed up to and including the transmission by the MS of the CONNECT ACKNOWLEDGE to place the call in the U10 call active state. A second directory number is then entered followed by send to put the first call on hold and place a second call.

#### 11.5.4.2 Procedure

"3" followed by "SEND" is entered via the MMI.

### 11.5.5 Test requirement

The MS shall not send a FACILITY message, containing the build multiparty request, on the dedicated channel. This is checked for 3 seconds.

The MS may however send other messages.

The MS may also give the user an indication of the error that has occurred.

## 11.6 Verification of non-support of feature (Fixed Dialling Number (FDN))

### 11.6.1 Definition and applicability

This test applies to MS which do **not** support FDN. This test applies only to MS which support MO calls.

### 11.6.2 Conformance requirement

1. An MS claiming to **not** support FDN that has a SIM with FDN allocated and activated in its SIM Service Table (Service Number 3) and has FDN "enabled" shall refuse a request from the user to attempt an outgoing call.
2. An MS claiming to **not** support FDN that has a SIM with FDN allocated and activated in its SIM Service Table (Service Number 3) and has FDN "enabled" shall not respond to paging.
3. An MS claiming **not** to support FDN that has a SIM with FDN allocated and activated shall not attempt to rehabilitate the IMSI and Location Information Elementary Files of the SIM.

   GSM 02.07 section B3.2, GSM 11.11 section 11.2.1.

### 11.6.3 Test purpose

1. To verify that an MS claiming to **not** support FDN and that has a SIM with FDN allocated and activated in its SIM Service Table and has FDN “enabled”. i.e. AND, IMSI and Location Information Elementary Files are Invalidated inserted, it refuses an attempt to make an outgoing call made by the user.

2. To verify that an MS claiming to **not** support FDN and that has a SIM with FDN allocated and activated in its SIM Service Table and has FDN “enabled”. i.e. AND, IMSI and Location Information Elementary Files are Invalidated inserted, it does not answer to paging.

3. To verify that an MS claiming **not** to support FDN and that has a SIM with FDN allocated and activated in its SIM Service Table and has FDN “enabled”. i.e. AND, IMSI and Location Information Elementary Files are Invalidated inserted, does not attempt to rehabilitate IMSI and Location Information.

### 11.6.4 Method of test

#### 11.6.4.1 Initial conditions

The ME is powered off. No SIM is inserted in the ME.

#### 11.6.4.2 Procedure

a) A SIM with FDN allocated and activated in its SIM Service Table and has FDN "enabled" is inserted in the ME and the MS is powered on.

b) An outgoing CM connection is attempted by the user.

c) The MS paged with its IMSI.

d) The MS is powered off and the SIM is examined using a suitable tool to determine if the IMSI and Location Information Elementary Files have been Rehabilitated.

### 11.6.5 Test requirement

1) in step b), the MS shall not send a CHANNEL REQUEST message.

2) in step c), the MS shall not send a CHANNEL REQUEST message.

3) in step d), the IMSI an Location Information Elementary Files shall be Invalidated.

## 11.7 IMEI Security

### 11.7.1 Conformance requirements

The IMEI shall not be changed after the ME’s final production process. It shall resist tampering, i.e. manipulation and change, by any means (e.g. physical, electrical and software).

NOTE: This requirement is valid for new GSM Phase 2 and Release 96, 97, 98 and 99 MEs type approved after 1st June 2002.

02.09, 02.16, 03.03

### 11.7.2 Test purpose

To verify the conformance requirement.

### 11.7.3 Method of test

Not available.

### 11.7.4 Declaration

The manufacturer shall declare that :

He has taken necessary and sufficient steps to ensure that any individual or organisation cannot economically change the IMEI after the ME's final production process.

And that the IMEI resists tampering, i.e. manipulation and change, by any means (e.g. physical, electrical and software).

## 11.8 Coding of the Bearer Capability information element

This section describes the coding of the bearer capability IE in a SETUP and in a CALL CONFIRMED message according to GSM 07.01 and GSM 04.08.

More precisely, the matter of section 11.8.1 is the coding of the bearer capability IE in a mobile terminating SETUP and section 11.8.2 deals with the coding of the bearer capability IE in a mobile originating SETUP and in a CALL CONFIRMED message.

In the whole section "x", "y" and "X" have the following meanings:

- when a field is coded with values of "x", it means that several bit combinations are authorized and the allowable ones are described in the relevant paragraph or section;
- "y" means that the value of the spare bit can be set to either 0 or 1 at the sending side and that the receiving side shall accept either of these values;
- "X" in the hexadecimal coding of the Bearer Capability IE reflects all the possible values taken by an octet taking account of the number of bits coded as "'x" or "y" and their place in the octet.

## 11.8.1 Network to MS Direction

### 11.8.1.1 BS 21 to 26 - Asynchronous Service

#### 11.8.1.1.1 BS 21

|---|---|---|---|---|---|---|---|---|---|---|
| | User Rate in Octet 6a: | - | - | - | - | 0 | 1 | 0 | 1 | 9,6 kbit/s |

Depending on the support or not of both modes, Non Transparent and Transparent, the connection element field may have the following values:

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | Connection element in Octet 6c: | - | 0 | 1 | - | - | - | - | - | Non transparent |

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | Connection element in Octet 6c: | - | 1 | x | - | - | - | - | - | Both T or NT preferred |

If present, Octet 7 shall have the following value:

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Octet 7 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 0 | Extension<br>Layer 2 id<br>X.25 |

### 11.8.1.6 TS 62 - Automatic Facsimile group 3

The repeat Indicator in the Setup message is not available.

The BC GSM is coded as described in chapter 11.8.1.5.

## 11.8.2 MS to SS direction

In the whole section 11.8.2, "1)" and "2)" stand for:

1) Not applicable in a CALL CONFIRMED message.

2) Not applicable in a CALL CONFIRMED message responding to a SETUP message with no BC-IE (PSTN-originated call with single numbering scheme).

If the MS supports only Full Rate

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Radio Channel Requirement in Octet 3: | - | 0 | 1 | - | - | - | - | - | Full rate support only mobile station |

Else

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Radio Channel Requirement in Octet 3: | - | 1 | x | - | - | - | - | - | Dual rate mobile station |

### 11.8.2.1 BS 21 to 26 - Asynchronous Service

If the MS supports only SAP I.440/I.450

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| SAP in Octet 5: | - | - | - | - | - | 0 | 0 | 1 | I.440/I.450 |

If the MS supports only SAP X.28 non dedicated PAD

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| SAP in Octet 5: | - | - | - | - | - | 1 | 0 | 1 | X.28 nond |

Else

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| SAP in Octet 5: | - | - | - | - | - | x | 0 | 1 | I.440/I.450 or X.28 nond |

The use of the alternative configuration "Autobauding modem type 1" in BS 22 to BS 26 is the same as indicated for BS 21 in clause 11.8.2.1.1.1 and 11.8.2.1.1.2.

#### 11.8.2.1.1 BS 21

Depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control". If octet 7 is present, the value ISO 6429 (0 1000) means "Inband flow control" and the value COPnoFLCT (0 1100) means "No flow control".

11.8.2.1.2 BS 22

Same as BS 21 except

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | User Rate in Octet 6a: | - | - | - | - | 0 | 0 | 1 | 0 | 1,2 kbit/s |
| If different from "none", | Modem Type Octet 6c: | - | - | - | 0 | 0 | 0 | 1 | 0 | Modem V.22 |

In case of 3,1kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

#### 11.8.2.1.3 BS 24

Same as BS 21 except

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | User Rate in Octet 6a: | - | - | - | - | 0 | 0 | 1 | 1 | 2,4 kbit/s |
| If different from "none", | Modem Type Octet 6c: | - | - | - | 0 | 0 | 0 | 1 | 1 | Modem V.22bis |
| | | | | | | | 1 | 0 | 1 | Modem V.26ter |

In case of 3,1kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

#### 11.8.2.1.4 BS 25

Same as BS 21 except

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | User Rate in Octet 6a: | - | - | - | - | 0 | 1 | 0 | 0 | 4,8 kbit/s |
| If different from "none", | Modem Type Octet 6c: | - | - | - | 0 | 0 | 1 | 1 | 0 | Modem V.32 |

In case of 3,1kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

#### 11.8.2.1.5 BS 26

Same as BS 21 except

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | NIRR in Octet 4: | - | - | - | - | - | - | 0 | - | no meaning |
| | User Rate in Octet 6a: | - | - | - | - | 0 | 1 | 0 | 1 | 9,6 kbit/s |
| | Interm. Rate in Octet 6b: | - | 1 | 1 | - | - | - | - | - | 16 kbit/s |
| If different from "none", | Modem Type Octet 6c: | - | - | - | 0 | 0 | 1 | 1 | 0 | Modem V.32 |

In case of 3,1kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

#### 11.8.2.1.6 BS 23

Same as BS 21 except

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | User Rate in Octet 6a: | - | - | - | - | 0 | 1 | 1 | 1 | 1,2 kbit/s/75 bit/s |
| If different from "none", | Modem Type Octet 6c: | - | - | - | 0 | 0 | 1 | 0 | 0 | Modem V.23 |

In case of 3,1kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

# 12 Transceiver

## 12.1 Conducted spurious emissions

### 12.1.1 MS allocated a channel

#### 12.1.1.1 Definition and applicability

Conducted spurious emissions, when the MS has been allocated a channel, are emissions from the antenna connector at frequencies other than those of the carrier and sidebands associated with normal modulation.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS with a permanent antenna connector.

#### 12.1.1.2 Conformance requirement

1. The conducted spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.1.

   1.1 Under normal voltage conditions; GSM 05.05, 4.3/4.3.3.

   1.2 Under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

**Table 12.1**

| Frequency range | Power level in dBm | | |
|---|---|---|---|
| | GSM400, GSM 700, GSM 850, GSM900 | DCS1800 | PCS1900 |
| 9 kHz to 1 GHz | -36 | -36 | -36 |
| 1 GHz to 12,75 GHz | -30 | | -30 |
| 1 GHz to 1710 MHz | | -30 | |
| 1710 MHz to 1785 MHz | | -36 | |
| 1785 MHz to 12,75 GHz | | -30 | |

#### 12.1.1.3 Test purpose

1. To verify that conducted spurious emissions from the MS when allocated a channel do not exceed the conformance requirements. These conducted spurious emissions will be measured in the frequency band 100 kHz to 12,75 GHz excluding the following received bands :

   For GSM 400, GSM 900 and DCS 1 800:

   - the band 925 – 960 MHz
   - the band 1805 – 1880 MHz

   In addition for GSM 400 MS:

   - the band 460,4 – 467,6 MHz
   - the band 488,8 – 496 MHz

   For GSM 700, GSM 850 and PCS 1 900:

   - the band 747 – 762 MHz
   - the band 869 – 894 MHz

- the band 1930 – 1990 MHz

1.1 Under normal voltage conditions.

1.2 Under extreme voltage conditions.

NOTE: The band 9 - 100 kHz is not tested, because of test implementation problems.

#### 12.1.1.4 Method of test

##### 12.1.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

The SS commands the MS to loop back its channel decoder output to channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

##### 12.1.1.4.2 Procedure

a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured at the connector of the transceiver, as the power level of any discrete signal, higher than the requirement in table 12.1 minus 6 dB, delivered into a 50 Ohm load.

   The measurement bandwidth based on a 5 pole synchronously tuned filter is according to table 12.2. The power indication is the peak power detected by the measuring system.

   The measurement on any frequency shall be performed for at least one TDMA frame period with the exception of the idle frame.

NOTE: This ensures that both the active times (MS transmitting) and the quiet times are measured.

b) The test is repeated under extreme voltage test conditions ([Annex 1, TC2.2 and TC3]).

**Table 12.2**

| Frequency range | Frequency offset | Filter bandwidth | Approx video bandwidth |
|---|---|---|---|
| 100 kHz to 50 MHz | - | 10 kHz | 30 kHz |
| 50 to 500 MHz<br>excl. relevant TX band:<br>GSM 450: 450.4 to 457.6 MHz;<br>GSM 480: 478.8 to 486 MHz,<br>and the RX bands:<br>For GSM 400 MS:<br>460.4 to 467.6 MHz;<br>488.8 to 496 MHz. | - | 100 kHz | 300 kHz |
| 500 MHz to 12,75 GHz,<br><br>excl. relevant TX band:<br>GSM 750: 777 to 792 MHz<br>GSM 850: 824 to 849 MHz;<br>P-GSM: 890 to 915 MHz;<br>E-GSM: 880 to 915 MHz;<br>DCS: 1710 to 1785 MHz,<br>PCS 1 900: 1850 to 1910 MHz;<br>and the RX bands:<br>For GSM 400 MS, GSM 900 MS<br>and DCS 1800 MS:<br><br>925 to 960 MHz;<br>1805 to 1880 MHz.<br>For GSM 700 MS, GSM 850 MS<br>and PCS 1900 MS:<br><br>747 to 762 MHz;<br>869 to 894 MHz;<br>1930 to 1990 MHz | 0 to 10 MHz<br>>= 10 MHz<br>>= 20 MHz<br>>= 30 MHz<br><br>(offset from edge<br>of relevant TX band) | 100 kHz<br>300 kHz<br>1 MHz<br>3 MHz | 300 kHz<br>1 MHz<br>3 MHz<br>3 MHz |
| relevant TX band:<br>GSM 450: 450.4 to 457.6 MHz<br>GSM 480: 478.8 to 486 MHz<br>GSM 750: 777 to 792 MHz<br>GSM 850: 824 to 849 MHz<br>P-GSM: 890 to 915 MHz<br>E-GSM: 880 to 915 MHz<br>DCS: 1710 to 1785 MHz<br>PCS 1 900: 1850 to 1910 MHz; | 1,8 to 6,0 MHz<br>> 6,0 MHz<br><br><br><br><br><br><br>(offset from carrier) | 30 kHz<br>100 kHz | 100 kHz<br>300 kHz |

NOTE 1: The excluded RX bands are tested in section [13.4].

NOTE 2: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range.

NOTE 3: Due to practical implementation, the video bandwidth is restricted to a maximum of 3 MHz.

#### 12.1.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.3.

**Table 12.3**

| Frequency range | | Power level in dBm | | |
|---|---|---|---|---|
| | | GSM400, GSM 700, GSM 850, GSM900 | DCS1800 | PCS 1900 |
| 100 kHz to | 1 GHz | -36 | -36 | -36 |
| 1 GHz to | 12,75 GHz | -30 | | -30 |
| 1 GHz to | 1710 MHz | | -30 | |
| 1710 MHz to | 1785 MHz | | -36 | |
| 1785 MHz to | 12,75 GHz | | -30 | |

## 12.1.2 MS in idle mode

### 12.1.2.1 Definition and applicability

Conducted spurious emissions are any emissions from the antenna connector, when the MS is in idle mode.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850,GSM 900, DCS 1 800 MS and PCS 1 900 with a permanent antenna connector.

### 12.1.2.2 Conformance requirement

1. The conducted spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.4.

   1.1 Under normal voltage conditions; GSM 05.05, 4.3/4.3.3.

   1.2 Under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

**Table 12.4**

| Frequency range | | Power level in dBm | |
|---|---|---|---|
| | | GSM400, GSM900, DCS1800 | GSM 700, GSM 850, PCS1900 |
| 9 kHz to | 880 MHz | -57 | -57 |
| 880 MHz to | 915 MHz | -59 | -57 |
| 915 MHz to | 1000 MHz | -57 | -57 |
| 1 GHz to | 1710 MHz | -47 | |
| 1710 MHz to | 1785 MHz | -53 | |
| 1785 MHz to | 12,75 GHz | -47 | |
| 1 GHz to | 1850 MHz | | -47 |
| 1850 MHz to | 1910 MHz | | -53 |
| 1910 MHz to | 12,75 GHz | | -47 |

### 12.1.2.3 Test purpose

1. To verify that conducted spurious emissions, in the frequency band 100 kHz to 12,75 GHz from the MS when in idle mode do not exceed the conformance requirements.

   1.1 Under normal voltage conditions.

   1.2 Under extreme voltage conditions.

NOTE: The band 9 - 100 kHz is not tested, because of test implementation problems.

#### 12.1.2.4 Method of test

##### 12.1.2.4.1 Initial conditions

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS_AG_BLKS_RES is set to 0 so that the MS receiver will operate continually.

The CCCH_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

##### 12.1.2.4.2 Procedure

a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured as the power level of any discrete signal, higher than the requirement in table 12.4 minus 6 dB, delivered into a 50 Ohm load.

The measurement bandwidth based on a 5 pole synchronously tuned filter is set according to table 12.5. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

**Table 12.5**

| Frequency range | Filter bandwidth | Video bandwidth |
|---|---|---|
| 100 kHz to 50 MHz | 10 kHz | 30 kHz |
| 50 MHz to 12,75 GHz | 100 kHz | 300 kHz |

b) The test is repeated under extreme voltage test conditions ([Annex 1, TC2.2 and TC3]).

#### 12.1.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.6.

**Table 12.6**

| Frequency range | | Power level in dBm | |
|---|---|---|---|
| | | GSM400, GSM900, DCS1800 | GSM 700, GSM 850, PCS1900 |
| 100 kHz to | 880 MHz | -57 | -57 |
| 880 MHz to | 915 MHz | -59 | -57 |
| 915 MHz to | 1000 MHz | -57 | -57 |
| 1 GHz to | 1710 MHz | -47 | |
| 1710 MHz to | 1785 MHz | -53 | |
| 1785 MHz to | 12,75 GHz | -47 | |
| 1 GHz to | 1850 MHz | | -47 |
| 1850 MHz to | 1910 MHz | | -53 |
| 1910 MHz to | 12,75 GHz | | -47 |

# 12.2 Radiated spurious emissions

This test is performed either on an outdoor test site, fulfilling the requirements of [GC4 of Annex 1], or in an anechoic shielded chamber, fulfilling the requirements of ([GC5 of Annex 1)]. Performing the measurement in the anechoic shielded chamber is preferred. The sample shall be placed at the specified height on the support.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then additional precautions are necessary to ensure correct measurement. These measures are familiar to test houses which perform spurious emissions tests and are:

a) Raise/lower the test antenna through the specified height range during both the emission detection and substitution parts of the test.

b) Perform a qualitative pre-search in a shielded environment for test sites where the ambient RF environment can prevent the detection of spurious emissions which exceed the limit.

c) Detect emissions at a more sensitive threshold to that specified in section 12.2.1.4 to allow for destructive interference due to ground plane reflections at the test antenna search height.

## 12.2.1 MS allocated a channel

### 12.2.1.1 Definition and applicability

Radiated spurious emissions, when the MS has been allocated a channel, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of GSM 400, GSM 700, GSM 850,GSM 900, DCS 1 800 and PCS 1 900 MS. The test applies to all types of GSM 400, GSM 700, GSM 850,GSM 900, DCS 1 800 and PCS 1 900 MS with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

NOTE: A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

### 12.2.1.2 Conformance requirement

1. The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.7 under normal voltage conditions; GSM 05.05, 4.3/4.3.3.

2. The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.7 under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/annex D.2.

**Table 12.7**

| Frequency range | | Power level in dBm | | |
|---|---|---|---|---|
| | | GSM400, GSM 700, GSM 850, GSM900 | DCS1800 | PCS 1900 |
| 30 MHz to | 1 GHz | -36 | -36 | -36 |
| 1 GHz to | 4 GHz | -30 | | -30 |
| 1 GHz to | 1710 MHz | | -30 | |
| 1710 MHz to | 1785 MHz | | -36 | |
| 1785 MHz to | 4 GHz | | -30 | |

### 12.2.1.3 Test purpose

1. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under normal voltage conditions.

2. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under extreme voltage conditions.

### 12.2.1.4 Method of test

#### 12.2.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

NOTE: The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The SS commands the MS to loop back its channel decoder output to its channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

#### 12.2.1.4.2 Procedure

a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS is detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

NOTE: This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which an emission has been detected, the MS shall be rotated to obtain maximum response and the effective radiated power of the emission determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.

c) The measurement bandwidth, based on a 5 pole synchronously tuned filter, is set according to table 12.8. The power indication is the peak power detected by the measuring system.

The measurement on any frequency shall be performed for at least one TDMA frame period, with the exception of the idle frame.

NOTE 1: This ensures that both the active times (MS transmitting) and the quiet times are measured.

NOTE 2: For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

d) The measurements are repeated with the test antenna in the orthogonal polarization plane.

e) The test is repeated under extreme voltage test conditions (see [Annex 1, TC2.2]).

**Table 12.8**

| Frequency range | Frequency offset | Filter bandwidth | Approx video bandwidth |
|---|---|---|---|
| 30 to 50 MHz | - | 10 kHz | 30 kHz |
| 50 to 500 MHz | - | 100 kHz | 300 kHz |

| 500 MHz to 4 GHz, | 0 to 10 MHz | 100 kHz | 300 kHz |
| , | >= 10 MHz | 300 kHz | 1 MHz |
| Excl. relevant TX band: | >= 20 MHz | 1 MHz | 3 MHz |
| GSM 750: 777 to 792 MHz | >= 30 MHz | 3 MHz | 3 MHz |
| GSM 850: 824 to 849 MHz<br>P-GSM: 890 to 915 MHz;<br>E-GSM: 880 to 915 MHz;<br>DCS: 1710 to 1785 MHz.<br>PCS 1 900: 1850 to 1910 MHz | (offset from edge of relevant TX band) | | |
| Relevant TX band: | | | |
| GSM 450: 450.4 to 457.6 MHz | 1,8 to 6,0 MHz | 30 kHz | 100 kHz |
| GSM 480: 478.8 to 486 MHz | > 6,0 MHz | 100 kHz | 300 kHz |
| GSM 750: 777 to 792 MHz<br>GSM 850: 824 to 849 MHz<br>P-GSM: 890 to 915 MHz<br>E-GSM: 880 to 915 MHz<br>DCS: 1710 to 1785 MHz<br>PCS 1 900: 1850 to 1910 MHz | (offset from carrier) | | |

NOTE 1: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range.

NOTE 2: Due to practical implementation of a SS, the video bandwidth is restricted to a maximum of 3 MHz.

#### 12.2.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.7.

### 12.2.2 MS in idle mode

#### 12.2.2.1 Definition and applicability

Radiated spurious emissions, when the MS is in idle mode, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS. The test applies to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

NOTE: A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

#### 12.2.2.2 Conformance requirement

1. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.9. under normal voltage conditions; GSM 05.05, 4.3/4.3.3.

2. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.9. under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

**Table 12.9**

| Frequency range | | Power level in dBm | |
|---|---|---|---|
| | | GSM400, GSM900, DCS1800 | GSM 700, GSM 850, PCS 1900 |
| 30 MHz to | 880 MHz | -57 | -57 |
| 880 MHz to | 915 MHz | -59 | -57 |
| 915 MHz to | 1000 MHz | -57 | -57 |
| 1 GHz to | 1710 MHz | -47 | |
| 1710 MHz to | 1785 MHz | -53 | |
| 1785 MHz to | 4 GHz | -47 | |
| 1 GHz to | 1850 MHz | | -47 |
| 1850 MHz to | 1910 MHz | | -53 |
| 1910 MHz to | 4GHz | | -47 |

12.2.2.3 Test purpose

1. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under normal voltage conditions.

2. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under extreme voltage conditions.

12.2.2.4 Method of test

12.2.2.4.1 Initial conditions

NOTE: The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS_AG_BLKS_RES is set to 0 so that the MS receiver will operate continually.

The CCCH_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

12.2.2.4.2 Procedure

a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS are detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

NOTE: This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which a spurious emission has been detected the MS is rotated to obtain a maximum response. The effective radiated power of the emission is determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.

c) The measurement bandwidth based on a 5 pole synchronously tuned filter shall be according to table 12.10. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

NOTE: For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

**Table 12.10**

| Frequency range | Filter bandwidth | Video bandwidth |
|---|---|---|
| 30 MHz to 50 MHz | 10 kHz | 30 kHz |
| 50 MHz to 4 GHz | 100 kHz | 300 kHz |

d) The measurements are repeated with the test antenna in the orthogonal polarization plane.

e) The test is repeated under extreme voltage test conditions (see [Annex 1, TC2.2]).

#### 12.2.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.9.

## 12.3 Conducted spurious emissions for MS supporting the R-GSM frequency band

This section applies only to MS supporting the R-GSM frequency band

### 12.3.1 MS allocated a channel

#### 12.3.1.1 Definition and applicability

Conducted spurious emissions, when the MS has been allocated a channel, are emissions from the antenna connector at frequencies other than those of the carrier and sidebands associated with normal modulation.

The requirements and this test apply to all types of R-GSM 900 MS with a permanent antenna connector.

#### 12.3.1.2 Conformance requirement

1. The conducted spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.11.

   1.1 Under normal voltage conditions; GSM 05.05, 4.3/4.3.3.

   1.2 Under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

**Table 12.11**

| Frequency range | Power level in dBm | |
|---|---|---|
| | R-GSM900 small MS | R-GSM900 other MS |
| 9 kHz to 1 GHz | -36 | |
| 9 kHz to 876 MHz | | -36 |
| 876 MHz to 915 MHz | | -42 |
| 915 MHz to 1 GHz | | -36 |
| 1 GHz to 12,75 GHz | -30 | -30 |

#### 12.3.1.3 Test purpose

1. To verify that conducted spurious emissions, in the frequency band 100 kHz to 12,75 GHz excluding the R-GSM900 and DCS 1 800 receive bands, from the MS when allocated a channel do not exceed the conformance requirements.

1.1 Under normal voltage conditions.

1.2 Under extreme voltage conditions.

NOTE: The band 9 - 100 kHz is not tested, because of test implementation problems.

#### 12.3.1.4 Method of test

##### 12.3.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

The SS commands the MS to loop back its channel decoder output to channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

##### 12.3.1.4.2 Procedure

a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured at the connector of the transceiver, as the power level of any discrete signal, higher than the requirement in table 12.11 minus 6 dB, delivered into a 50 Ohm load.

The measurement bandwidth based on a 5 pole synchronously tuned filter is according to table 12.12. The power indication is the peak power detected by the measuring system.

The measurement on any frequency shall be performed for at least one TDMA frame period with the exception of the idle frame.

NOTE: This ensures that both the active times (MS transmitting) and the quiet times are measured.

b) The test is repeated under extreme voltage test conditions ([Annex 1, TC2.2 and TC3]).

**Table 12.12**

| Frequency range | Frequency offset | Filter bandwidth | Approx video bandwidth |
|---|---|---|---|
| 100 kHz to 50 MHz | - | 10 kHz | 30 kHz |
| 50 to 500 MHz | - | 100 kHz | 300 kHz |
| 500 MHz to 12,75 GHz,<br><br>excl. relevant TX band:<br>R-GSM: 876 to 915 MHz;<br>;<br>,<br>and the RX bands:<br>921 to 960 MHz;<br>1805 to 1880 MHz. | 0 to 10 MHz<br>>= 10 MHz<br>>= 20 MHz<br>>= 30 MHz<br><br>(offset from edge of relevant TX band) | 100 kHz<br>300 kHz<br>1 MHz<br>3 MHz | 300 kHz<br>1 MHz<br>3 MHz<br>3 MHz |
| relevant TX band:<br>R-GSM: 876 to 915 MHz | 1,8 to 6,0 MHz<br>> 6,0 MHz<br>(offset from carrier) | 30 kHz<br>100 kHz | 100 kHz<br>300 kHz |

NOTE 1: The frequency ranges 921 MHz to 960 MHz and 1 805 MHz to 1 880 MHz are excluded as these ranges are tested in section [13.9].

NOTE 2: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range.

NOTE 3: Due to practical implementation, the video bandwidth is restricted to a maximum of 3 MHz.

#### 12.3.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.13.

**Table 12.13**

| Frequency range | | Power level in dBm | |
|---|---|---|---|
| | | R-GSM900 small MS | R-GSM900 other MS |
| 100 kHz to | 1 GHz | -36 | |
| 100 kHz to | 876 MHz | | -36 |
| 876 MHz to | 915 MHz | | -42 |
| 915 MHz to | 1 GHz | | -36 |
| 1 GHz to | 12,75 GHz | -30 | -30 |

## 12.3.2 MS in idle mode

#### 12.3.2.1 Definition and applicability

Conducted spurious emissions are any emissions from the antenna connector, when the MS is in idle mode.

The requirements and this test apply to all types of R-GSM 900 MS with a permanent antenna connector.

#### 12.3.2.2 Conformance requirement

1. The conducted spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.14.

   1.1 Under normal voltage conditions; GSM 05.05, 4.3/4.3.3.

   1.2 Under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

**Table 12.14**

| Frequency range | | Power level in dBm |
|---|---|---|
| 9 kHz to | 880 MHz | -57 |
| 880 MHz to | 915 MHz | -59 |
| 915 MHz to | 1000 MHz | -57 |
| 1 GHz to | 1710 MHz | -47 |
| 1710 MHz to | 1785 MHz | -53 |
| 1785 MHz to | 12,75 GHz | -47 |

#### 12.3.2.3 Test purpose

1. To verify that conducted spurious emissions, in the frequency band 100 kHz to 12,75 GHz from the MS when in idle mode do not exceed the conformance requirements.

   1.1 Under normal voltage conditions.

   1.2 Under extreme voltage conditions.

NOTE: The band 9 - 100 kHz is not tested, because of test implementation problems.

#### 12.3.2.4 Method of test

##### 12.3.2.4.1 Initial conditions

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS_AG_BLKS_RES is set to 0 so that the MS receiver will operate continually.

The CCCH_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

#### 12.3.2.4.2 Procedure

a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured as the power level of any discrete signal, higher than the requirement in table 12.14 minus 6 dB, delivered into a 50 Ohm load.

The measurement bandwidth based on a 5 pole synchronously tuned filter is set according to table 12.15. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

**Table 12.15**

| Frequency range | Filter bandwidth | Video bandwidth |
|---|---|---|
| 100 kHz to 50 MHz | 10 kHz | 30 kHz |
| 50 MHz to 12,75 GHz | 100 kHz | 300 kHz |

b) The test is repeated under extreme voltage test conditions ([Annex 1, TC2.2 and TC3]).

#### 12.3.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.16.

**Table 12.16**

| Frequency range | | Power level in dBm |
|---|---|---|
| 100 kHz to | 880 MHz | -57 |
| 880 MHz to | 915 MHz | -59 |
| 915 MHz to | 1000 MHz | -57 |
| 1 GHz to | 1710 MHz | -47 |
| 1710 MHz to | 1785 MHz | -53 |
| 1785 MHz to | 12,75 GHz | -47 |

## 12.4 Radiated spurious emissions for MS supporting the R-GSM frequency band

This section applies only to MS supporting the R-GSM frequency band.

This test is performed either on an outdoor test site, fulfilling the requirements of [GC4 of Annex 1], or in an anechoic shielded chamber, fulfilling the requirements of ([GC5 of Annex 1)]. Performing the measurement in the anechoic shielded chamber is preferred. The sample shall be placed at the specified height on the support.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then additional precautions are necessary to ensure correct measurement. These measures are familiar to test houses which perform spurious emissions tests and are:

a) Raise/lower the test antenna through the specified height range during both the emission detection and substitution parts of the test.

b) Perform a qualitative pre-search in a shielded environment for test sites where the ambient RF environment can prevent the detection of spurious emissions which exceed the limit.

c) Detect emissions at a more sensitive threshold to that specified in section 12.4.1.4 to allow for destructive interference due to ground plane reflections at the test antenna search height.

## 12.4.1 MS allocated a channel

### 12.4.1.1 Definition and applicability

Radiated spurious emissions, when the MS has been allocated a channel, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of R-GSM 900 MS. The test applies to all types of R-GSM with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

NOTE: A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

### 12.4.1.2 Conformance requirement

1. The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 1217 under normal voltage conditions; GSM 05.05, 4.3/4.3.3.

2. The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.17 under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/annex D.2.

**Table 12.17**

| Frequency range | | Power level in dBm | |
|---|---|---|---|
| | | R-GSM900 small MS | R-GSM900 other MS |
| 30 MHz to | 1 GHz | -36 | |
| 30 MHz to | 876 MHz | | -36 |
| 876 MHz to | 915 MHz | | -42 |
| 915 MHz to | 1 GHz | | -36 |
| 1 GHz to | 4 GHz | -30 | -30 |

### 12.4.1.3 Test purpose

1. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under normal voltage conditions.

2. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under extreme voltage conditions.

### 12.4.1.4 Method of test

#### 12.4.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

NOTE: The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The SS commands the MS to loop back its channel decoder output to its channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

#### 12.4.1.4.2 Procedure

a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS is detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

NOTE: This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which an emission has been detected, the MS shall be rotated to obtain maximum response and the effective radiated power of the emission determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.

c) The measurement bandwidth, based on a 5 pole synchronously tuned filter, is set according to table 12.18. The power indication is the peak power detected by the measuring system.

The measurement on any frequency shall be performed for at least one TDMA frame period, with the exception of the idle frame.

NOTE 1: This ensures that both the active times (MS transmitting) and the quiet times are measured.

NOTE 2: For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

d) The measurements are repeated with the test antenna in the orthogonal polarization plane.

e) The test is repeated under extreme voltage test conditions (see [Annex 1, TC2.2]).

**Table 12.18**

| Frequency range | Frequency offset | Filter bandwidth | Approx video bandwidth |
|---|---|---|---|
| 30 to 50 MHz | - | 10 kHz | 30 kHz |
| 50 to 500 MHz | - | 100 kHz | 300 kHz |
| 500 MHz to 4 GHz, | 0 to 10 MHz | 100 kHz | 300 kHz |
| , | >= 10 MHz | 300 kHz | 1 MHz |
| excl. relevant TX band: | >= 20 MHz | 1 MHz | 3 MHz |
| R-GSM: 876 to 915 MHz; | >= 30 MHz | 3 MHz | 3 MHz |
| | (offset from edge of relevant TX band) | | |
| relevant TX band: | | | |
| R-GSM: 876 to 915 MHz | 1,8 to 6,0 MHz | 30 kHz | 100 kHz |
| | > 6,0 MHz (offset from carrier) | 100 kHz | 300 kHz |

NOTE 1: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range.

NOTE 2: Due to practical implementation of a SS, the video bandwidth is restricted to a maximum of 3 MHz.

#### 12.4.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.17.

## 12.4.2 MS in idle mode

### 12.4.2.1 Definition and applicability

Radiated spurious emissions, when the MS is in idle mode, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of R-GSM 900 MS. The test applies to all types of R-GSM 900 with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

NOTE: A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

### 12.4.2.2 Conformance requirement

1. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.19. under normal voltage conditions; GSM 05.05, 4.3/4.3.3.

2. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.19. under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

**Table 12.19**

| Frequency range | | Power level in dBm |
|---|---|---|
| 30 MHz to | 880 MHz | -57 |
| 880 MHz to | 915 MHz | -59 |
| 915 MHz to | 1000 MHz | -57 |
| 1 GHz to | 1710 MHz | -47 |
| 1710 MHz to | 1785 MHz | -53 |
| 1785 MHz to | 4 GHz | -47 |

### 12.4.2.3 Test purpose

1. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under normal voltage conditions.

2. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under extreme voltage conditions.

### 12.4.2.4 Method of test

#### 12.4.2.4.1 Initial conditions

NOTE: The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS_AG_BLKS_RES is set to 0 so that the MS receiver will operate continually.

The CCCH_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

#### 12.4.2.4.2 Procedure

a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS are detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

NOTE: This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which a spurious emission has been detected the MS is rotated to obtain a maximum response. The effective radiated power of the emission is determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.

c) The measurement bandwidth based on a 5 pole synchronously tuned filter shall be according to table 12.20. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

NOTE: For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

**Table 12.20**

| Frequency range | Filter bandwidth | Video bandwidth |
|---|---|---|
| 30 MHz to 50 MHz | 10 kHz | 30 kHz |
| 50 MHz to 4 GHz | 100 kHz | 300 kHz |

d) The measurements are repeated with the test antenna in the orthogonal polarization plane.

e) The test is repeated under extreme voltage test conditions (see [Annex 1, TC2.2]).

#### 12.4.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.19.

# 13 Transmitter

## 13.1 Frequency error and phase error

### 13.1.1 Definition and applicability

The frequency error is the difference in frequency, after adjustment for the effect of the modulation and phase error, between the RF transmission from the MS and either:

- the RF transmission from the BS, or
- the nominal frequency for the ARFCN used.

The phase error is the difference in phase, after adjustment for the effect of the frequency error, between the RF transmission from the MS and the theoretical transmission according to the intended modulation.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

### 13.1.2 Conformance requirement

1. The MS carrier frequency shall be accurate to within 0,1 ppm, or accurate to within 0,1 ppm compared to signals received from the BS. For GSM 400 MS a value of 0.2 ppm shall be used in both cases.

   1.1 Under normal conditions; GSM 05.10, 6.1.

   1.2 Under vibration conditions; GSM 05.10, 6.1; GSM 05.05, annex D D.2.3.

   1.3 Under extreme conditions; GSM 05.10, 6.1; GSM 05.05, 4.4; GSM 05.05, annex D D.2.1, D.2.2.

2. The RMS phase error (difference between the phase error trajectory and its linear regression on the active part of the time slot) for each burst shall not be greater than 5 degrees.

   2.1 Under normal conditions; GSM 05.05, 4.6.

   2.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.

   2.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.

3. The maximum peak deviation during the useful part of each burst shall not be greater than 20 degrees.

   3.1 Under normal conditions; GSM 05.05, 4.6.

   3.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.

   3.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.

### 13.1.3 Test purpose

1. To verify that the MS carrier frequency error does not exceed 0,1 ppm (0.2 ppm for GSM 400):

   1.1 Under normal conditions.

   1.2 When the MS is being vibrated.

   1.3 Under extreme conditions.

NOTE: The transmit frequency accuracy of the SS is expected to be sufficient to ensure that the difference between 0,1 ppm (0.2 ppm for GSM 400) absolute and 0,1 ppm (0.2 ppm for GSM 400) compared to signals received from the BS would be small enough to be considered insignificant.

2 To verify that the RMS phase error on the useful part of the bursts transmitted by the MS does not exceed conformance requirement 2:

   2.1 Under normal conditions.

   2.2 When the MS is being vibrated.

   2.3 Under extreme conditions.

3 To verify that the maximum phase error on the useful part of the bursts transmitted by the MS does not exceed conformance requirement 3.

   3.1 Under normal conditions.

   3.2 When the MS is being vibrated.

   3.3 Under extreme conditions.

### 13.1.4. Method of test

NOTE: In order to measure the accuracy of the frequency and phase error a sampled measurement of the transmitted phase trajectory is obtained. This is compared with the theoretically expected phase trajectory. The regression line of the difference between the expected trajectory and the measured trajectory is an indication of the frequency error (assumed constant through the burst), whilst the departure of the phase differences from this trajectory is a measure of the phase error. The peak phase error is the value furthest from the regression line and the RMS phase error is the root mean square average of the phase error of all samples.

#### 13.1.4.1 Initial conditions

A call is set up according to the Generic call setup procedure.

The SS commands the MS to hopping mode (table 6.1).

NOTE: It is not necessary to test in hopping mode but is done here as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to make sure bursts are taken from a few different channels.

The SS activates ciphering mode.

NOTE: Ciphering mode is active during this test to give a pseudo-random bit stream to the modulator.

The SS commands the MS to complete the traffic channel loop back without signalling of erased frames (see 36.2.1.1).

The SS generates Standard Test Signal C1 of annex 5.

#### 13.1.4.2 Procedure

a) For one transmitted burst, the SS captures the signal as a series of phase samples over the period of the burst. These samples are evenly distributed over the duration of the burst with a minimum sampling rate of 2/T, where T is the modulation symbol period. The received phase trajectory is then represented by this array of at least 294 samples.

b) The SS then calculates, from the known bit pattern and the formal definition of the modulator contained in GSM 05.04, the expected phase trajectory.

c) From a) and b) the phase trajectory error is calculated, and a linear regression line computed through this phase trajectory error. The slope of this regression line is the frequency error of the mobile transmitter relative to the simulator reference. The difference between the regression line and the individual sample points is the phase error of that point.

c.1) The sampled array of at least 294 phase measurements is represented by the vector:

$\varnothing_m = \varnothing_m(0)...\varnothing_m(n)$

where the number of samples in the array n+1 >= 294.

c.2) The calculated array, at the corresponding sampling instants, is represented by the vector:

$\varnothing_c = \varnothing_c(0)...\varnothing_c(n)$.

c.3) The error array is represented by the vector:

$\varnothing_e = \{\varnothing_m(0) - \varnothing_c(0)\}.....\{\varnothing_m(n) - \varnothing_c(n)\} = \varnothing_e(0)...\varnothing_e(n)$.

c.4) The corresponding sample numbers form a vector t = t(0)...t(n).

c.5) By regression theory the slope of the samples with respect to t is k where:

$$k = \frac{\sum_{j=0}^{j=n} t(j) * \varnothing_e(j)}{\sum_{j=0}^{j=n} t(j)^2}$$

c.6) The frequency error is given by k/(360 * γ), where γ is the sampling interval in s and all phase samples are measured in degrees.

c.7) The individual phase errors from the regression line are given by:

$\varnothing_e(j)$ - k*t(j).

c.8) The RMS value $\varnothing_e$ of the phase errors is given by:

$$\varnothing_e(RMS) = \left[ \frac{\sum_{j=0}^{j=n} \{\varnothing_e(j) - k * t(j)\}^2}{n+1} \right]^{1/2}$$

d) Steps a) to c) are repeated for 20 bursts, not necessarily contiguous.

e) The SS instructs the MS to its maximum power control level, all other conditions remaining constant. Steps a) to d) are repeated.

f) The SS instructs the MS to the minimum power control level, all other conditions remaining constant. Steps a) to d) are repeated.

g) The MS is hard mounted on a vibration table and vibrated at the frequency/amplitudes specified in annex 1, TC4.

During the vibration steps a) to f) are repeated.

NOTE: If the call is terminated when mounting the MS to the vibration table, it will be necessary to establish the initial conditions again before repeating steps a) to f).

h) The MS is re-positioned on the vibration table in the two orthogonal planes to the plane used in step g). For each of the orthogonal planes step g) is repeated.

i) Steps a) to f) are repeated under extreme test conditions (see annex 1, TC2.2).

NOTE: The series of samples taken to determine the phase trajectory could also be used, with different post-processing, to determine the transmitter burst characteristics of 13.3. Although described independently, it is valid to combine the tests of 13.1 and 13.3, giving both answers from single sets of captured data.

### 13.1.5 Test requirements

#### 13.1.5.1 Frequency error

For all measured bursts, the frequency error, derived in step c.6), shall be less than 0.1 ppm, except for GSM 400 MS where a value of 0.2 ppm shall be used.

#### 13.1.5.2 Phase error

For all measured bursts, the RMS phase error, derived in step c.8), shall not exceed 5 degrees.

For all measured bursts, each individual phase error, derived in step c.7), shall not exceed 20 degrees.

# 13.2 Frequency error under multipath and interference conditions

## 13.2.1 Definition and applicability

The frequency error under multipath and interference conditions is a measure of the ability of the MS to maintain frequency synchronization with the received signal under conditions of Doppler shift, multipath reception and interference.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

## 13.2.2 Conformance requirement

1. The MS carrier frequency error for each burst shall be accurate to within 0,1 ppm (0,2 ppm for GSM 400), or 0,1 ppm (0,2 ppm for GSM 400) compared to signals received from the BS for signal levels down to 3 dB below the reference sensitivity level.

   1.1 Under normal conditions; GSM 05.10, 6/6.1.

   1.2 Under extreme conditions; GSM 05.10, 6/6.1; GSM 05.05 annex D D.2.1, D.2.2.

2. The MS carrier frequency error for each burst shall be accurate to within 0,1 ppm (0,2 ppm for GSM 400), or 0,1 ppm (0,2 ppm for GSM 400) compared to signals received from the BS for 3 dB less carrier to interference ratio than the reference interference ratios (GSM 05.10, 6/6.1).

## 13.2.3 Test purpose

1. To verify that the MS carrier frequency error at reference sensitivity, under conditions of multipath and Doppler shift does not exceed 0,1 ppm (0.2 ppm for GSM 400) + the frequency error due to the Doppler shift of the received signal and the assessment error in the MS.

   1.1 Under normal conditions.

   1.2 Under extreme conditions.

NOTE: Although the conformance requirement states that frequency synchronization should be maintained for input signals 3 dB below reference sensitivity. Due to the Radio Link Failure counter this test condition cannot be established. Hence all tests in this section are conducted at reference sensitivity level.

2. To verify that the MS carrier frequency error, under interference conditions and TUlow fading profile, does not exceed 0,1 ppm (0.2 ppm for GSM 400) + the frequency error due to the Doppler shift of the received signal and the assessment error in the MS.

NOTE: The test adds the effect of Doppler shift to the requirements as the conformance requirement refers to signals input to the MS receiver whereas the frequency reference for measurement will not take account of the Doppler shift.

## 13.2.4 Method of test

This test uses the same measurement process as test 13.1 for the MS operating under various RF conditions.

NOTE: The BA list sent on the BCCH and the SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCH but if they are provided none will be within 5 channels of the ARFCN used for the serving BCCH or TCH.

### 13.2.4.1 Initial conditions

The MS is brought into the idle updated state on a serving cell with BCCH in the mid ARFCN range.

### 13.2.4.2 Procedure

a) The level of the serving cell BCCH is set to 10 dB above the reference sensitivity level( ) and the fading function set to RA. The SS waits 30 s for the MS to stabilize to these conditions. The SS is set up to capture the

first burst transmitted by the MS during call establishment. A call is initiated by the SS on a channel in the mid ARFCN range as described for the generic call set up procedure but to a TCH at level 10 dB above the reference sensitivity level( ) and fading function set to RA.

b) The SS calculates the frequency accuracy of the captured burst as described in test 13.1.

c) The SS sets the serving cell BCCH and TCH to the reference sensitivity level( ) applicable to the type of MS, still with the fading function set to RA and then waits 30 s for the MS to stabilize to these conditions.

d) The SS shall capture subsequent bursts from the traffic channel in the manner described in test 13.1.

NOTE: Due to the very low signal level at the MS receiver input the MS receiver is liable to error. The "looped back" bits are therefore also liable to error, and hence the SS does not know the expected bit sequence. The SS will have to demodulate the received signal to derive (error free) the transmitter burst bit pattern. Using this bit pattern the SS can calculate the expected phase trajectory according to the definition within GSM 05.04.

e) The SS calculates the frequency accuracy of the captured burst as described in test 13.1.

f) Steps d) and e) are repeated for 5 traffic channel bursts spaced over a period of not less than 20 s.

g) The initial conditions are established again and steps a) to f) are repeated but with the fading function set to HT100 (HT200 for GSM 400, HT120 for GSM 700).

h) The initial conditions are established again and steps a) to f) are repeated but with the fading function set to TU50 (TU100 for GSM 400, TU 60 for GSM 700).

i) The initial conditions are established again and steps a) and b) are repeated but with the following differences:

- the levels of the BCCH and TCH are set to 18 dB above reference sensitivity level( ).
- two further independent interfering signals are sent on the same nominal carrier frequency as the BCCH and TCH and at a level 10 dB below the level of the TCH and modulated with random data, including the midamble.
- the fading function for all channels is set to TUlow.

j) The SS waits 100 s for the MS to stabilize to these conditions.

k) Repeat steps d) to f), except that at step f) the measurement period must be extended to 200 s and the number of measurements increased to 20.

l) The initial conditions are established again and steps a) to k) are repeated for ARFCN in the Low ARFCN range.

m) The initial conditions are established again and steps a) to k) are repeated for ARFCN in the High ARFCN range.

n) Repeat step h) under extreme test conditions (see annex 1, TC2.2).

### 13.2.5 Test requirements

The frequency error, with reference to the SS carrier frequency as measured in repeats of step e), for each measured burst shall be less than the values shown in tables 13-1a and 13-1b.

**Table 13-1a: Requirements for frequency error under multipath, Doppler shift and interference conditions**

| GSM 850 and GSM 900 | | DCS 1 800 | | PCS 1 900 | |
|---|---|---|---|---|---|
| **Propagation condition** | **Permitted frequency error** | **Propagation condition** | **Permitted frequency error** | **Propagation condition** | **Permitted frequency error** |
| RA250 | +/- 300 Hz | RA130 | +/- 400 Hz | RA130 | +/- 420 Hz |
| HT100 | +/- 180 Hz | HT100 | +/- 350 Hz | HT100 | +/- 370 Hz |
| TU50 | +/- 160 Hz | TU50 | +/- 260 Hz | TU50 | +/- 280 Hz |
| TU3 | +/- 230 Hz | TU1,5 | +/- 320 Hz | TU1,5 | +/- 330 Hz |

**Table 13-1b: Requirements for frequency error under multipath, Doppler shift and interference conditions**

| GSM 450 | | GSM 480 | | GSM 700 | |
|---|---|---|---|---|---|
| **Propagation condition** | **Permitted frequency error** | **Propagation condition** | **Permitted frequency error** | **Propagation condition** | **Permitted frequency error** |
| RA500 | +/- 300 Hz | RA500 | +/- 300 Hz | RA 300 | +/- 300 Hz |
| HT200 | +/- 180 Hz | HT200 | +/- 180 Hz | HT 120 | +/- 180 Hz |
| TU100 | +/- 160 Hz | TU100 | +/- 160 Hz | TU 60 | +/- 160 Hz |
| TU6 | +/- 230 Hz | TU6 | +/- 230 Hz | TU 3.6 | +/- 230 Hz |

## 13.3 Transmitter output power and burst timing

### 13.3.1 Definition and applicability

The transmitter output power is the average value of the power delivered to an artificial antenna or radiated by the MS and its integral antenna, over the time that the useful information bits of one burst are transmitted.

The transmit burst timing is the envelope of the RF power transmitted with respect to time. The timings are referenced to the transition from bit 13 to bit 14 of the Training Sequence ("midamble") before differential decoding. The timing of the modulation is referenced to the timing of the received signal from the SS.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

### 13.3.2 Conformance requirement

1. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, table for GMSK modulation, according to its power class, with a tolerance of +/- 2 dB under normal conditions; GSM 05.05, 4.1.1, table for GMSK modulation.

2. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, table for GMSK modulation, according to its power class, with a tolerance of +/- 2,5 dB under extreme conditions; GSM 05.05, 4.1.1, table for GMSK modulation; GSM 05.05 annex D D.2.1, D.2.2.

3. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 1), with a tolerance of +/- 3, 4 or 5 dB under normal conditions; GSM 05.05, 4.1.1.

4. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 2), with a tolerance of +/- 4, 5 or 6 dB under extreme conditions; GSM 05.05, 4.1.1; GSM 05.05 annex D D.2.1, D.2.2.

5. The output power actually transmitted by the MS at consecutive power control levels shall form a monotonic sequence and the interval between power control levels shall be 2 +/- 1,5 dB (1 +/- 1dB between power control level 30 and 31 for PCS 1 900); GSM 05.05, 4.1.1.

6. The transmitted power level relative to time for a normal burst shall be within the power/time template given in GSM 05.05, annex B figure B.1:

   6.1 Under normal conditions; GSM 05.05, 4.5.2..

   6.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.

7. When accessing a cell on the RACH and before receiving the first power command during a communication on a DCCH or TCH (after an IMMEDIATE ASSIGNMENT), all GSM, class 1 and class 2 DCS 1 800 and PCS 1 900 MS shall use the power control level defined by the MS_TXPWR_MAX_CCH parameter broadcast on the BCCH of the cell, or if MS_TXPWR_MAX_CCH corresponds to a power control level not supported by the MS as defined by its power class, the MS shall act as though the closest supported power control level had been broadcast. A Class 3 DCS 1 800 MS shall use the POWER_OFFSET parameter.

8. The transmissions from the MS to the BS, measured at the MS antenna, shall be 468,75 - TA bit periods behind the transmissions received from the BS, where TA is the last timing advance received from the current serving BS. The tolerance on these timings shall be +/- 1 bit period:

   8.1 Under normal conditions; GSM 05.10, 6.4.

   8.2 Under extreme conditions; GSM 05.10, 6.4, GSM 05.05 annex D D.2.1, D.2.2.

9. The transmitted power level relative to time for a random access burst shall be within the power/time template given in GSM 05.05, annex B figure B.3:

   9.1 Under normal conditions; GSM 05.05, 4.5.2.

   9.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.

10 The MS shall use a TA value of 0 for the Random Access burst sent:

   10.1 Under normal conditions; GSM 05.10, 6.6.

   10.2 Under extreme conditions; GSM 05.10, 6.6, GSM 05.05 annex D D.2.1, D.2.2.

### 13.3.3 Test purpose

1. To verify that the maximum output power of the MS, under normal conditions, is within conformance requirement 1.

2. To verify that the maximum output power of the MS, under extreme conditions, is within conformance requirement 2.

3. To verify that all power control levels, relevant to the class of MS, are implemented in the MS and have output power levels, under normal conditions, within conformance requirement 3.

4. To verify that all power control levels have output power levels, under extreme conditions, within conformance requirement 4.

5. To verify that the step in the output power transmitted by the MS at consecutive power control levels is within conformance requirement 5 under normal conditions.

6. To verify that the output power relative to time, when sending a normal burst is within conformance requirement 6:

   6.1 Under normal conditions.

   6.2 Under extreme conditions.

7. To verify that the MS uses the maximum power control level according to its power class if commanded to a power control level exceeding its power class.

8. To verify that, for normal bursts, the MS transmissions to the BS are timed within conformance requirement 8:

   8.1 Under normal conditions.

   8.2 Under extreme conditions.

9. To verify that the output power relative to time, when sending an access burst is within conformance requirement 9:

   9.1 Under normal conditions.

   9.2 Under extreme conditions.

10. To verify that, for an access burst, the MS transmission to the BS is timed within conformance requirement 10:

    10.1 Under normal conditions.

    10.2 Under extreme conditions.

### 13.3.4 Methods of test

Two methods of test are described, separately for:

1) equipment fitted with a permanent antenna connector and for

2) equipment fitted with an integral antenna, and which cannot be connected to an external antenna except by the fitting of a temporary test connector as a test fixture.

NOTE: The behaviour of the MS in the system is determined to a high degree by the antenna, and this is the only transmitter test in this EN using the integral antenna. Further studies are ongoing on improved testing on the integral antenna, taking practical conditions of MS use into account.

#### 13.3.4.1 Method of test for equipment with a permanent antenna connector

##### 13.3.4.1.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power. MS TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

##### 13.3.4.1.2 Procedure

a) Measurement of normal burst transmitter output power

   The SS takes power measurement samples evenly distributed over the duration of one burst with a sampling rate of at least 2/T, where T is the bit duration. The samples are identified in time with respect to the modulation on the burst. The SS identifies the centre of the useful 147 transmitted bits, i.e. the transition from bit 13 to bit 14 of the midamble, as the timing reference.

   The transmitter output power is calculated as the average of the samples over the 147 useful bits. This is also used as the 0 dB reference for the power/time template.

b) Measurement of normal burst timing delay

   The burst timing delay is the difference in time between the timing reference identified in a) and the corresponding transition in the burst received by the MS immediately prior to the MS transmit burst sampled.

c) Measurement of normal burst power/time relationship

   The array of power samples measured in a) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in a).

d) Steps a) to c) are repeated with the MS commanded to operate on each of the power control levels defined, even those not supported by the MS.

e) The SS commands the MS to the maximum power control level supported by the MS and steps a) to c) are repeated for ARFCN in the Low and High ranges.

f) Measurement of access burst transmitter output power

The SS causes the MS to generate an Access Burst on an ARFCN in the Mid ARFCN range, this could be either by a handover procedure or a new request for radio resource. In the case of a handover procedure the Power Level indicated in the HANDOVER COMMAND message is the maximum power control level supported by the MS. In the case of an Access Burst the MS shall use the Power Level indicated in the MS_TXPWR_MAX_CCH parameter. If the power class of the MS is DCS 1 800 Class 3, the MS shall also use the POWER_OFFSET parameter.

The SS takes power measurement samples evenly distributed over the duration of the access burst as described in a). However, in this case the SS identifies the centre of the useful bits of the burst by identifying the transition from the last bit of the synch sequence. The centre of the burst is then five data bits prior to this point and is used as the timing reference.

The transmitter output power is calculated as the average of the samples over the 87 useful bits of the burst. This is also used as the 0 dB reference for the power/time template.

g) Measurement of access burst timing delay

The burst timing delay is the difference in time between the timing reference identified in f) and the MS received data on the common control channel.

h) Measurement of access burst power/time relationship

The array of power samples measured in f) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in f).

i) Depending on the method used in step f) to cause the MS to send an Access Burst, the SS sends either a HANDOVER COMMAND with power control level set to 10 or it changes the System Information elements MS_TXPWR_MAX_CCH and for DCS 1 800 the POWER_OFFSET on the serving cell BCCH in order to limit the MS transmit power on the Access Burst to power control level 10 (+23 dBm for GSM 400, GSM 700, GSM 850, and GSM 900 or +10 dBm for DCS 1 800 and PCS 1 900) and then steps f) to h) are repeated.

j) Steps a) to i) are repeated under extreme test conditions (annex 1, TC2.2) except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

#### 13.3.4.2 Method of test for equipment with an integral antenna

NOTE: If the MS is equipped with a permanent connector, such that the antenna can be disconnected and the SS be connected directly, then the method of section 13.3.4.1 will be applied.

The tests in this section are performed on an unmodified test sample.

##### 13.3.4.2.1 Initial conditions

The MS is placed in the anechoic shielded chamber (annex 1, GC5) or on the outdoor test site, on an isolated support, in the position for normal use, at a distance of at least 3 metres from a test antenna, connected to the SS.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then, in addition, it is necessary to raise/lower the test antenna through the specified height range to maximize the received power levels from both the test sample and the substitution antenna.

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power. MS_TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

##### 13.3.4.2.2 Procedure

a) With the initial conditions set according to subclause 13.3.4.2.1 the test procedure in 13.3.4.1.2 is followed up to and including step i), except that in step a), when measurements are done at maximum power for ARFCN in the

Low, Mid and High range, the measurement is made eight times with the MS rotated by n*45 degrees for all values of n in the range 0 to 7.

The measurements taken are received transmitter output power measurements rather than transmitter output power measurements, the output power measurement values can be derived as follows.

b) Assessment of test site loss for scaling of received output power measurements.

The MS is replaced by a half-wave dipole, resonating at the centre frequency of the transmit band, connected to an RF generator.

The frequency of the RF signal generator is set to the frequency of the ARFCN used for the 24 measurements in step a), the output power is adjusted to reproduce the received transmitter output power averages recorded in step a).

For each indication the power, delivered by the generator (in Watts) to the half-wave dipole, is recorded. These values are recorded in the form Pnc, where n = MS rotation and c = channel number.

For each channel number used compute:

$$\text{Pac(Watts into dipole)} = \frac{1}{8} * \sum_{n=0}^{n=7} \text{Pnc}$$

from which: Pac (Tx dBm) = $10\log_{10}$(Pac) + 30 + 2,15

The difference, for each of the three channels, between the actual transmitter output power averaged over the 8 measurement orientations and the received transmitter output power at orientation n = 0 is used to scale the received measurement results to actual transmitter output powers for all measured power control levels and ARFCN, which can then be checked against the requirements.

c) Temporary antenna connector calibration factors (transmit)

A modified test sample equipped with a temporary antenna connector is placed in a climatic test chamber and is linked to the SS by means of the temporary antenna connector.

Under normal test conditions, the power measurement and calculation parts of steps a) to i) of 13.3.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

NOTE: The values noted here are related to the output transmitter carrier power levels under normal test conditions, which are known after step b). Therefore frequency dependent calibration factors that account for the effects of the temporary antenna connector can be determined.

d) Measurements at extreme test conditions.

NOTE: Basically the procedure for extreme conditions is:

- the power/time template is tested in the "normal" way,
- the radiated power is measured by measuring the difference with respect to the radiated power under normal test conditions.

Under extreme test conditions steps a) to i) of 13.3.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

The transmitter output power under extreme test conditions is calculated for each burst type, power control level and for every frequency used by adding the frequency dependent calibration factor, determined in c), to the values obtained at extreme conditions in this step.

### 13.3.5 Test requirements

a) The transmitter output power, under every combination of normal and extreme test conditions, for normal bursts and access bursts, at each frequency and for each power control level applicable to the MS power class, shall be at the relevant level shown in table 13-2, table 13-3 or table 13-4 within the tolerances also shown in table 13-2, table 13-3 or table 13-4.

GSM 400, GSM 700, GSM 850 and GSM 900 only - begin

**Table 13-2: GSM 400, GSM 700, GSM 850 and GSM 900 transmitter output power for different power classes**

| Power class | | | | Power control level | Transmitter output power | Tolerances | |
|---|---|---|---|---|---|---|---|
| 2 | 3 | 4 | 5 | | dBm | normal | extreme |
| · | | | | 2 | 39 | +/-2 dB | +/-2,5 dB |
| · | · | | | 3 | 37 | +/-3 dB*) | +/-4 dB*) |
| · | · | | | 4 | 35 | +/-3 dB | +/-4 dB |
| · | · | · | | 5 | 33 | +/-3 dB*) | +/-4 dB*) |
| · | · | · | | 6 | 31 | +/-3 dB | +/-4 dB |
| · | · | · | · | 7 | 29 | +/-3 dB*) | +/-4 dB*) |

*) When the power control level corresponds to the power class of the MS, then the tolerances shall be 2,0 dB under normal test conditions and 2,5 dB under extreme test conditions.

PCS 1 900 only - end

b) The difference between the transmitter output power at two adjacent power control levels, measured at the same frequency, shall not be less than 0,5 dB and not be more than 3,5 dB. For PCS 1 900 Class 3 the difference between the transmitter output power at power controls level 30 and 31, measured at the same frequency, shall not be less than 0 dB and not be more than 2 dB.

c) The power/time relationship of the measured samples for normal bursts shall be within the limits of the power time template of figure 13-1 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

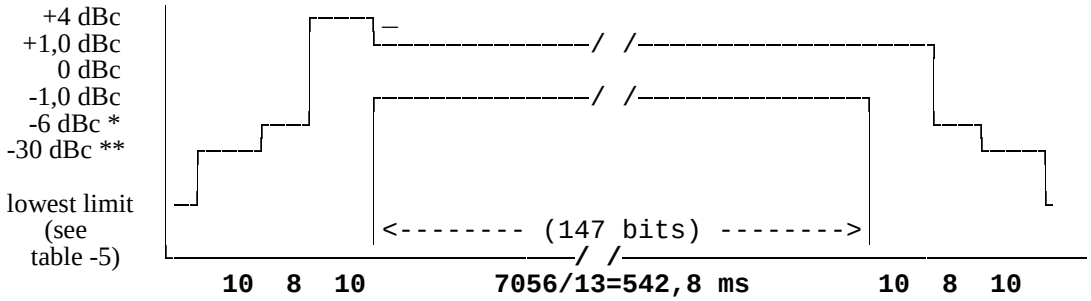

**Figure 13-1: Power / time template for normal bursts**

* For GSM400, GSM 700, GSM 850 and GSM900 MS:

-4 dBc for power control level 16

-2 dBc for power control level 17

-1 dBc for power control levels 18 and 19

For DCS1800 and PCS1900 MS: -4 dBc for power control level 11

-2 dBc for power control level 12

-1 dBc for power control levels 13, 14 and 15

** For GSM400, GSM 700, GSM 850 and GSM900 MS:

-30 dBc or -17 dBm, whichever is the higher

For DCS1800 and PCS1900 MS: -30 dBc or -20 dBm, whichever is the higher

**Table 13-5: Lowest measurement limit for power / time template**

| | lowest limit |
|---|---|
| GSM400, GSM 700, GSM 850, GSM900 | -59 dBc or -54 dBm whichever is the highest, except for the timeslot preceding the active slot, for which the allowed level is equal to -59 dBc or -36 dBm, whichever is the highest |
| DCS1800, PCS1900 | -48 dBc or -48 dBm whichever is the highest |

d) All the power control levels, for the type and power class of the MS as stated by the manufacturer, shall be implemented in the MS.

e) When the transmitter is commanded to a power control level outside of the capability corresponding to the type and power class of the MS as stated by the manufacturer, then the transmitter output power shall be within the tolerances for the closest power control level corresponding to the type and power class as stated by the manufacturer.

f) The centre of the transmitted normal burst as defined by the transition of bits 13/14 of the midamble shall be 3 timeslot periods (1731 μs) +/- 1 bit period (+/- 3,69 μs) after the centre of the corresponding received burst.

g) The power/time relationship of the measured samples for access bursts shall be within the limits of the power time template of figure 13-2 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

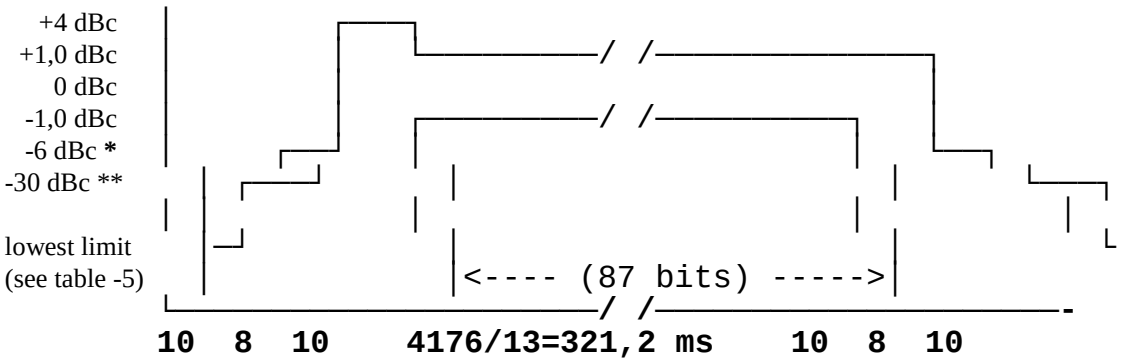

**Figure 13-2: Power / time template for access burst**

* For GSM400, GSM 700, GSM 850 and GSM900 MS:

-4 dBc for power control level 16

-2 dBc for power control level 17

-1 dBc for power control levels 18 and 19

For DCS1800 and PCS1900 MS: -4 dBc for power control level 11

-2 dBc for power control level 12

-1 dBc for power control levels 13, 14 and 15

** For GSM400, GSM 700, GSM 850 and GSM900 MS:

-30 dBc or -17 dBm, whichever is the higher

For DCS1800 and PCS1900 MS: -30 dBc or -20 dBm, whichever is the higher

h) The centre of the transmitted access burst shall be an integer number of timeslot periods less 30 bit periods relative to any CCCH midamble centre with a tolerance of +/- 1 bit period (+/- 3,69 μs).

# 13.4 Output RF spectrum

## 13.4.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

## 13.4.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in GSM 05.05, 4.2.1, table a1) for GSM 400, GSM 700, GSM 850 and GSM 900, table b1) for DCS 1 800 or table c1) for PCS 1 900, with the following lowest measurement limits:

   - -36 dBm below 600 kHz offset from the carrier,
   - -51 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or -56 dBm for DCS 1 800 and PCS 1 900 from 600 kHz out to less than 1 800 kHz offset from the carrier,

- -46 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or -51 dBm for DCS 1 800 and PCS 1 900 at and beyond 1 800 kHz offset from the carrier,

but with the following exceptions at up to -36 dBm:

- up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier,

- up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.

1.1 Under normal conditions; GSM 05.05, 4.2.1.

1.2 Under extreme conditions; GSM 05.05, 4.2.1; GSM 05.05, annex D D.2.1, D.2.2.

2. The level of the output RF spectrum due to switching transients shall be no more than given in GSM 05.05, 4.2.2, table "a) Mobile Station:".

2.1 Under normal conditions; GSM 05.05, 4.2.2.

2.2 Under extreme conditions; GSM 05.05, 4.2.2; GSM 05.05 annex D D.2.1, D.2.2.

3. When allocated a channel, the power emitted by a GSM 400, GSM 900 and DCS 1 800 MS, in the band 935 to 960 MHz shall be no more than -79 dBm, in the band 925 to 935 MHz shall be no more than -67 dBm and in the band 1 805 to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 to 960 MHz and 1 805 to 1 880 MHz where exceptions at up to -36 dBm are permitted. For GSM 400 MS, in addition, the power emitted by MS, in the bands of 460.4 to 467.6 MHz and 488.8 to 496 MHz shall be no more than –67 dBm except in three measurements in each of the bands 460.4 to 467.6 MHz and 488.8 to 496 MHz where exceptions at up to –36 dBm are permitted. For GSM 700, GSM 850 and PCS 1 900 MS, the power emitted by MS, in the band of 747 to 757 MHz shall be no more than –79 dBm, in the band of 757 to 762 MHz shall be no more than –73 dBm, in the band 869 to 894 MHz shall be no more than –79 dBm, in the band 1 930 to 1 990 MHz shall be no more than –71 dBm except in five measurements in each of the bands 747 to 762 MHz, 869 to 894 MHz and 1 930 to 1 990 MHz where exceptions at up to –36 dBm are permitted. Under normal conditions; GSM 05.05, 4.3.3.

### 13.4.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1.

1.1 Under normal conditions.

1.2 Under extreme conditions.

2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 when a reasonable margin is allowed for the effect of spectrum due to modulation.

2.1 Under normal conditions.

2.2 Under extreme conditions.

3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3.

### 13.4.4 Method of test

#### 13.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure.

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to handover the MS between the three channels tested at the appropriate time.

The SS commands the MS to complete the traffic channel loop back without signalling of erased frames (see 36.2.1.1). This is to set a defined random pattern for the transmitter.

The SS sends Standard Test Signal C1 (annex 5) to the MS at a level of 23 dBμVemf( ).

#### 13.4.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.

b) The other settings of the spectrum analyser are set as follows:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 30 kHz
- Video averaging: may be used, depending on the implementation of the test

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

The MS is commanded to its maximum power control level.

c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.

d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

For GSM 400, GSM 900 and DCS 1 800:

at 200 kHz intervals over the band 925 - 960 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1805 - 1880 MHz for each measurement over 50 bursts.

In addition for GSM 400 MS:

at 200 kHz intervals over the band 460.4 to 467.6 MHz for each measurement over 50 bursts,

at 200 kHz intervals over the band 488.8 to 496 MHz for each measurement over 50 bursts.

For GSM 700, GSM 850 and PCS 1 900:

at 200 kHz intervals over the band 747 to 762 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 869 - 894 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1930 – 1990 MHz for each measurement over 50 bursts.

e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).

f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

FT

FT + 100 kHz FT - 100 kHz

FT + 200 kHz FT - 200 kHz

FT + 250 kHz FT - 250 kHz

FT + 200 kHz * N FT - 200 kHz * N

where N = 2, 3, 4, 5, 6, 7, and 8

and FT = RF channel nominal centre frequency.

g) The spectrum analyser settings are adjusted to:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 100 kHz
- Peak hold

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level.

h) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

FT + 400 kHz FT - 400 kHz

FT + 600 kHz FT - 600 kHz

FT + 1,2 MHz FT - 1,2 MHz

FT + 1,8 MHz FT - 1,8 MHz

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

i) Step h) is repeated for power control levels 7 and 11.

j) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the Low ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.

k) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.

l) Steps a) b) f) g) and h) are repeated under extreme test conditions (annex 1, TC2.2). except that at step g) the MS is commanded to power control level 11.

### 13.4.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 450.4 to 457.6 MHz, 478.8 to 486 MHz, 777 to 792 MHz, 824 to 849 MHz, 880 to 915 MHz, 1710 to 1785 MHz, or 1 850 to 1 910 MHz, the temporary antenna connector coupling factor, determined according to 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 925 to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS. For a GSM 400, GSM 700, GSM 850, DCS 1 800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1805 to 1880 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for DCS 1 800 MS. For GSM 400, GSM 700, GSM 850, GSM 900 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 460.4 to 467.6 MHz or 488.8 to 496 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 400 MS. For a GSM 700, GSM 850, GSM 900, DCS 1800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1930 to 1990 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for PCS 1 900 MS. For GSM 400, GSM 700, GSM 850, GSM 900 or DCS 1 800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 747 to 762 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 700 MS. For a GSM 400, GSM 850, GSM 900, DCS 1800 or PCS 1900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 869 to 894 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 850 MS. For a GSM 400, GSM 700, GSM 900, DCS 1800 or PCS 1900 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference GSM 05.05 section 4.2.1).

a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), h), j), k) and l) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 13-6 for GSM 400, GSM 700, GSM 850 and GSM 900, table 13-7 for DCS 1 800 or table 13-8 for PCS 1 900 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

**Table 13-6a: GSM 400, GSM 700, GSM 850 and GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| | **power levels in dB relative to the measurement at FT** | | | | |
|---|---|---|---|---|---|
| **Power level** | **Frequency offset (kHz)** | | | | |
| **(dBm)** | **0-100** | **200** | **250** | **400** | **600 to <1800** |
| 39 | +0,5 | -30 | -33 | -60 | -66 |
| 37 | +0,5 | -30 | -33 | -60 | -64 |
| 35 | +0,5 | -30 | -33 | -60 | -62 |
| <= 33 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -51 |

**Table 13-7: DCS 1 800 Spectrum due to modulation out to less than 1 800 kHz offset**

| | power levels in dB relative to the measurement at FT | | | | |
|---|---|---|---|---|---|
| **Power level** | **Frequency offset (kHz)** | | | | |
| **(dBm)** | **0-100** | **200** | **250** | **400** | **600 to <1800** |
| <= 36 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -56 |

**Table 13-8: PCS 1 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| | power levels in dB relative to the measurement at FT | | | | | |
|---|---|---|---|---|---|---|
| **Power level** | **Frequency offset (kHz)** | | | | | |
| **(dBm)** | **0-100** | **200** | **250** | **400** | **600 to <1200** | **1200 to <1800** |
| <= 33 | +0,5 | -30 | -33 | -60 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | | |
| | -36 | -36 | -36 | -36 | -56 | -56 |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 13-7 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

**Table 13-9: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)**

| power levels in dB relative to the measurement at FT | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| **GSM400, GSM 700, GSM 850 and GSM900** | | | | **DCS1800** | | | **PCS1900** | | |
| **Power** | **Frequency offset** | | | **Power** | **Frequency offset** | | **Power** | **Frequency offset** | |

| **(dBm)** | **1800 to** | **3000 to** | **>= 6000** | **(dBm)** | **1800 to** | **>= 6000** | **(dBm)** | **1800 to** | **>= 6000** |
| | **< 3000** | **< 6000** | | | **< 6000** | | | **< 6000** | |
| 39 | -69 | -71 | -77 | 36 | -71 | -79 | 33 | -68 | -76 |
| 37 | -67 | -69 | -75 | 34 | -69 | -77 | 32 | -67 | -75 |
| 35 | -65 | -67 | -73 | 32 | -67 | -75 | 30 | -65 | -73 |
| <= 33 | -63 | -65 | -71 | 30 | -65 | -73 | 28 | -63 | -71 |
| | | | | 28 | -63 | -71 | 26 | -61 | -69 |
| | | | | 26 | -61 | -69 | <= 24 | -59 | -67 |
| | | | | <= 24 | -59 | -67 | | | |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | | | | | |
| | -46 | -46 | -46 | | -51 | -51 | | -51 | -51 |

c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.

d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.

e) For GSM 400, GSM 900 and DCS 1 800 MS the spurious emissions in the bands 925 - 935 MHz, 935 - 960 MHz and 1 805 - 1 880 MHz, measured in step d), shall not exceed the values shown in table 13-10 except in up to five measurements in the band 925 to 960 MHz and five measurements in the band 1 805 to 1 880 MHz where a level up to -36 dBm is permitted. For GSM 400 MS, in addition, the MS spurious emissions in the bands 460.4 to 467.6 MHz and 488.8 to 496 MHz shall not exceed the value of –67 dBm, except in up to three measurements in each of the bands 460.4 to 467.6 MHz and 488.8 to 496 MHz where a level up to –36 dBm is permitted. For GSM 700, GSM 850 and PCS 1 900 MS the spurious emissions in the bands 747 – 757 MHz, 757 – 762 MHz, 869 - 894 MHz and 1930 – 1990 MHz shall not exceed the values shown in table 13-10 except in up to five measurements in each of the bands 747 to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to –36 dBm is permitted.

**Table 13-10: Spurious emissions in the MS receive bands**

| Band (MHz) | Spurious emissions level (dBm) | |
|---|---|---|
| | GSM400, GSM900 and DCS1800 | GSM 700, GSM 850 and PCS1900 |
| 925 to 935 | -67 | |
| 935 to 960 | -79 | |
| 1805 to 1880 | -71 | |
| 747 to 757 | | -79 |
| 757 to 762 | | -73 |
| 869 to 894 | | -79 |
| 1930 to 1990 | | -71 |

f) For the power ramp sidebands of steps h) and i) the power levels must not exceed the values shown in table 13-11 for GSM 400, GSM 700, GSM 850 and GSM 900, table 13-12 for DCS 1 800 or table 13-13 for PCS 1 900.

**Table 13-11: GSM Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency | | | |
|---|---|---|---|---|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 39 dBm | -13 dBm | -21 dBm | -21 dBm | -24 dBm |
| 37 dBm | -15 dBm | -21 dBm | -21 dBm | -24 dBm |
| 35 dBm | -17 dBm | -21 dBm | -21 dBm | -24 dBm |
| 33 dBm | -19 dBm | -21 dBm | -21 dBm | -24 dBm |
| 31 dBm | -21 dBm | -23 dBm | -23 dBm | -26 dBm |
| 29 dBm | -23 dBm | -25 dBm | -25 dBm | -28 dBm |
| 27 dBm | -23 dBm | -26 dBm | -27 dBm | -30 dBm |
| 25 dBm | -23 dBm | -26 dBm | -29 dBm | -32 dBm |
| 23 dBm | -23 dBm | -26 dBm | -31 dBm | -34 dBm |
| <= +21 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

**Table 13-12: DCS 1 800 Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency | | | |
|---|---|---|---|---|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 36 dBm | -16 dBm | -21 dBm | -21 dBm | -24 dBm |
| 34 dBm | -18 dBm | -21 dBm | -21 dBm | -24 dBm |
| 32 dBm | -20 dBm | -22 dBm | -22 dBm | -25 dBm |
| 30 dBm | -22 dBm | -24 dBm | -24 dBm | -27 dBm |
| 28 dBm | -23 dBm | -25 dBm | -26 dBm | -29 dBm |
| 26 dBm | -23 dBm | -26 dBm | -28 dBm | -31 dBm |
| 24 dBm | -23 dBm | -26 dBm | -30 dBm | -33 dBm |
| 22 dBm | -23 dBm | -26 dBm | -31 dBm | -35 dBm |
| <= +20 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

**Table 13-13: PCS 1 900 Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency | | | |
|---|---|---|---|---|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 33 dBm | -19 dBm | -22 dBm | -22 dBm | -25 dBm |
| 32 dBm | -20 dBm | -22 dBm | -22 dBm | -25 dBm |
| 30 dBm | -22 dBm | -24 dBm | -24 dBm | -27 dBm |
| 28 dBm | -23 dBm | -25 dBm | -26 dBm | -29 dBm |
| 26 dBm | -23 dBm | -26 dBm | -28 dBm | -31 dBm |
| 24 dBm | -23 dBm | -26 dBm | -30 dBm | -33 dBm |
| 22 dBm | -23 dBm | -26 dBm | -31 dBm | -35 dBm |
| <= +20 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

NOTE 2: These figures are different from the requirements in GSM 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 13-11, table 13-12 and table 13-13 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at <1 800 kHz.

# 13.5 Void

# 13.6 Frequency error and phase error in HSCSD multislot configurations

## 13.6.1 Definition and applicability

The frequency error is the difference in frequency, after adjustment for the effect of the modulation and phase error, between the RF transmission from the MS and either:

- the RF transmission from the BS, or
- the nominal frequency for the ARFCN used.

The phase error is the difference in phase, after adjustment for the effect of the frequency error, between the RF transmission from the MS and the theoretical transmission according to the intended modulation.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850,GSM 900, DCS 1 800 and PCS 1 900 MS and any multiband MS which are capable of HSCSD multislot operation.

### 13.6.2 Conformance requirement

1. The MS carrier frequency shall be accurate to within 0,1 ppm, or accurate to within 0,1 ppm compared to signals received from the BS.

   1.1 Under normal conditions; GSM 05.10, 6.1.

   1.2 Under vibration conditions; GSM 05.10, 6.1; GSM 05.05, annex D D.2.3.

   1.3 Under extreme conditions; GSM 05.10, 6.1; GSM 05.05, 4.4; GSM 05.05, annex D D.2.1, D.2.2.

2. The RMS phase error (difference between the phase error trajectory and its linear regression on the active part of the time slot) for each burst shall not be greater than 5 degrees.

   2.1 Under normal conditions; GSM 05.05, 4.6.

   2.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.

   2.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.

3. The maximum peak deviation during the useful part of each burst shall not be greater than 20 degrees.

   3.1 Under normal conditions; GSM 05.05, 4.6.

   3.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.

   3.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.

### 13.6.3 Test purpose

1. To verify that in a multislot configuration the MS carrier frequency error does not exceed 0,1 ppm:

   1.1 Under normal conditions.

   1.2 When the MS is being vibrated.

   1.3 Under extreme conditions.

NOTE: The transmit frequency accuracy of the SS is expected to be sufficient to ensure that the difference between 0,1 ppm absolute and 0,1 ppm compared to signals received from the BS would be small enough to be considered insignificant.

2 To verify that the RMS phase error on the useful part of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 2:

   2.1 Under normal conditions.

   2.2 When the MS is being vibrated.

   2.3 Under extreme conditions.

3 To verify that the maximum phase error on the useful part of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 3.

   3.1 Under normal conditions.

   3.2 When the MS is being vibrated.

   3.3 Under extreme conditions.

### 13.6.4 Method of test

NOTE: In order to measure the accuracy of the frequency and phase error a sampled measurement of the transmitted phase trajectory is obtained. This is compared with the theoretically expected phase trajectory. The regression line of the difference between the expected trajectory and the measured trajectory is an indication of the frequency error (assumed constant through the burst), whilst the departure of the phase differences from this trajectory is a measure of the phase error. The peak phase error is the value furthest from the regression line and the RMS phase error is the root mean square average of the phase error of all samples.

#### 13.6.4.1 Initial conditions

A call is set up according to the generic call setup procedure for multislot HSCSD.

The SS commands the MS to hopping mode (table 13.6.1).

NOTE: It is not necessary to test in hopping mode but is done here as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to make sure bursts are taken from a few different channels.

The SS activates ciphering mode.

NOTE: Ciphering mode is active during this test to give a pseudo-random bit stream to the modulator.

The SS sets the MS to operate in a multislot configuration with maximum number of transmitted time slots.

The SS commands the MS to complete the traffic channel multislot loop back including signalling of erased frames.

The SS generates Standard Test Signal C1 of annex 5.

#### 13.6.4.2 Procedure

a) For one transmitted burst on the last multislot subchannel, the SS captures the signal as a series of phase samples over the period of the burst. These samples are evenly distributed over the duration of the burst with a minimum sampling rate of 2/T, where T is the modulation symbol period. The received phase trajectory is then represented by this array of at least 294 samples.

b) The SS then calculates, from the known bit pattern and the formal definition of the modulator contained in GSM 05.04, the expected phase trajectory.

c) From a) and b) the phase trajectory error is calculated, and a linear regression line computed through this phase trajectory error. The slope of this regression line is the frequency error of the mobile transmitter relative to the simulator reference. The difference between the regression line and the individual sample points is the phase error of that point.

c.1) The sampled array of at least 294 phase measurements is represented by the vector:

$\varnothing_m = \varnothing_m(0)...\varnothing_m(n)$

where the number of samples in the array n+1 >= 294.

c.2) The calculated array, at the corresponding sampling instants, is represented by the vector:

$\varnothing_c = \varnothing_c(0)...\varnothing_c(n)$.

c.3) The error array is represented by the vector:

$\varnothing_e = \{\varnothing_m(0) - \varnothing_c(0)\}.....\{\varnothing_m(n) - \varnothing_c(n)\} = \varnothing_e(0)...\varnothing_e(n)$.

c.4) The corresponding sample numbers form a vector t = t(0)...t(n).

c.5) By regression theory the slope of the samples with respect to t is k where:

$$k = \frac{\sum_{j=0}^{j=n} t(j) * \varnothing_e(j)}{\sum_{j=0}^{j=n} t(j)^2}$$

c.6) The frequency error is given by k/(360 * γ), where γ is the sampling interval in s and all phase samples are measured in degrees.

c.7) The individual phase errors from the regression line are given by:

$\varnothing_e(j) - k*t(j)$.

c.8) The RMS value $\varnothing_e$ of the phase errors is given by:

$$\varnothing_e(RMS) = \left[ \frac{\sum_{j=0}^{j=n} \{\varnothing_e(j) - k * t(j)\}^2}{n+1} \right]^{1/2}$$

d) Steps a) to c) are repeated for 20 bursts, not necessarily contiguous.

e) The SS instructs the MS to its maximum power control level on each multislot subchannel, all other conditions remaining constant. Steps a) to d) are repeated.

f) The SS instructs the MS to the minimum power control level on each multislot subchannel, all other conditions remaining constant. Steps a) to d) are repeated.

g) The MS is hard mounted on a vibration table and vibrated at the frequency/amplitudes specified in annex 1, TC4.

During the vibration steps a) to f) are repeated.

NOTE: If the call is terminated when mounting the MS to the vibration table, it will be necessary to establish the initial conditions again before repeating steps a) to f).

h) The MS is re-positioned on the vibration table in the two orthogonal planes to the plane used in step g). For each of the orthogonal planes step g) is repeated.

i) Steps a) to f) are repeated under extreme test conditions (see annex 1, TC2.2).

NOTE: The series of samples taken to determine the phase trajectory could also be used, with different post-processing, to determine the transmitter burst characteristics of 'Transmitter output power and burst timing in multislot configuration'. Although described independently, it is valid to combine these two tests, giving both answers from single sets of captured data.

### 13.6.5 Test requirements

#### 13.6.5.1 Frequency error

For all measured bursts, the frequency error, derived in step c.6), shall be less than 10E-7.

#### 13.6.5.2 Phase error

For all measured bursts, the RMS phase error, derived in step c.8), shall not exceed 5 degrees.

For all measured bursts, each individual phase error, derived in step c.7), shall not exceed 20 degrees.

# 13.7 Transmitter output power and burst timing in HSCSD configurations

## 13.7.1 Definition and applicability

The transmitter output power is the average value of the power delivered to an artificial antenna or radiated by the MS and its integral antenna, over the time that the useful information bits of one burst are transmitted.

The transmit burst timing is the envelope of the RF power transmitted with respect to time. The timings are referenced to the transition from bit 13 to bit 14 of the Training Sequence ("midamble") before differential decoding. The timing of the modulation is referenced to the timing of the received signal from the SS.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS and multiband any MS which are capable of HSCSD multislot operation.

## 13.7.2 Conformance requirement

1. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, first table, according to its power class, with a tolerance of +/- 2 dB under normal conditions; GSM 05.05, 4.1.1, first table.

2. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, first table, according to its power class, with a tolerance of +/- 2,5 dB under extreme conditions; GSM 05.05, 4.1.1, first table; GSM 05.05 annex D D.2.1, D.2.2.

3. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, third table (for GSM 400, GSM 700, GSM 850 and GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1900), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 1), with a tolerance of +/- 3, 4 or 5 dB under normal conditions; GSM 05.05, 4.1.1, third, fourth or fifth table.

4. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, third table (for GSM 400, GSM 700, GSM 850 and GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1900), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 2), with a tolerance of +/- 4, 5 or 6 dB under extreme conditions; GSM 05.05, 4.1.1, third, fourth or fifth table; GSM 05.05 annex D D.2.1, D.2.2.

5. The output power actually transmitted by the MS at consecutive power control levels shall form a monotonic sequence and the interval between power control levels shall be 2 +/- 1,5 dB (1 +/- 1dB between power control level 30 and 31 for PCS 1 900); GSM 05.05, 4.1.1.

6. The transmitted power level relative to time for a normal burst shall be within the power/time template given in GSM 05.05, annex B figure B1. In multislot configurations where the bursts in two or more consecutive time slots are actually transmitted at the same frequency, the template of annex B shall be respected at the beginning and the end of the series of consecutive bursts. The output power during the guard period between every two consecutive active timeslots shall not exceed the level allowed for the useful part of the first timeslot or the level allowed for the useful part of the second timeslot plus 3dB, whichever is the highest:

   6.1 Under normal conditions; GSM 05.05, 4.5.2..

   6.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.

7. In multislot configurations, bidirectional subchannels shall be individually power controlled; GSM 05.08, 4.2.

8. When accessing a cell on the RACH and before receiving the first power command during a communication on a DCCH or TCH (after an IMMEDIATE ASSIGNMENT), all GSM and class 1and class 2 DCS 1 800 and PCS 1 900 MS shall use the power control level defined by the MS_TXPWR_MAX_CCH parameter broadcast on the BCCH of the cell, or if MS_TXPWR_MAX_CCH corresponds to a power control level not supported by the MS as defined by its power class, the MS shall act as though the closest supported power control level had been broadcast. A Class 3 DCS 1 800 MS shall use the POWER_OFFSET parameter.

9. The transmissions from the MS to the BS, measured at the MS antenna, shall be 468,75 - TA bit periods behind the transmissions received from the BS, where TA is the last timing advance received from the current serving BS. The tolerance on these timings shall be +/- 1 bit period:

9.1 Under normal conditions; GSM 05.10, 6.4.

9.2 Under extreme conditions; GSM 05.10, 6.4, GSM 05.05 annex D D.2.1, D.2.2.

10. The transmitted power level relative to time for a random access burst shall be within the power/time template given in GSM 05.05, annex B figure B3:

10.1 Under normal conditions; GSM 05.05, 4.5.2.

10.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.

11 The MS shall use a TA value of 0 for the Random Access burst sent:

11.1 Under normal conditions; GSM 05.10, 6.6.

11.2 Under extreme conditions; GSM 05.10, 6.6, GSM 05.05 annex D D.2.1, D.2.2.

### 13.7.3 Test purpose

1. To verify that the maximum output power of the MS in HSCSD multislot configuration, under normal conditions, is within conformance requirement 1.

2. To verify that the maximum output power of the MS in HSCSD multislot configuration, under extreme conditions, is within conformance requirement 2.

3. To verify that all power control levels, relevant to the class of MS, are implemented in the MS in HSCSD multislot configuration and have output power levels, under normal conditions, within conformance requirement 3.

4. To verify that all power control levels have output power levels, under extreme conditions, within conformance requirement 4.

5. To verify that the step in the output power transmitted by the MS in HSCSD multislot configuration at consecutive power control levels is within conformance requirement 5 under normal conditions.

6. To verify that the output power relative to time, when sending a normal burst is within conformance requirement 6 in HSCSD multislot configuration:

6.1 Under normal conditions.

6.2 Under extreme conditions.

7. To verify that the MS in HSCSD multislot configuration uses the maximum power control level according to its power class if commanded to a power control level exceeding its power class.

8. To verify that, for normal bursts, the MS transmissions to the BS are timed within conformance requirement 8 in HSCSD multislot configuration:

8.1 Under normal conditions.

8.2 Under extreme conditions.

9. To verify that the output power relative to time, when sending an access burst is within conformance requirement 9 in HSCSD multislot configuration:

9.1 Under normal conditions.

9.2 Under extreme conditions.

10. To verify that, for an access burst, the MS transmission to the BS is timed within conformance requirement 10 in HSCSD multislot configuration:

10.1 Under normal conditions.

10.2 Under extreme conditions.

11. To verify that, power is individually controlled on bidirectional HSCSD subchannels

### 13.7.4 Methods of test

Two methods of test are described, separately for:

1) equipment fitted with a permanent antenna connector and for

2) equipment fitted with an integral antenna, and which cannot be connected to an external antenna except by the fitting of a temporary test connector as a test fixture.

NOTE: The behaviour of the MS in the system is determined to a high degree by the antenna, and this is the only transmitter test in this EN using the integral antenna. Further studies are ongoing on improved testing on the integral antenna, taking practical conditions of MS use into account.

#### 13.7.4.1 Method of test for equipment with a permanent antenna connector

##### 13.7.4.1.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for HSCSD multislot configuration on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power and MS to operate in its highest number of uplink slots. MS TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

##### 13.7.4.1.2 Procedure

a) Measurement of normal burst transmitter output power

The SS takes power measurement samples evenly distributed over the duration of one burst with a sampling rate of at least 2/T, where T is the bit duration. The samples are identified in time with respect to the modulation on the burst. The SS identifies the centre of the useful 147 transmitted bits, i.e. the transition from bit 13 to bit 14 of the midamble, as the timing reference.

The transmitter output power is calculated as the average of the samples over the 147 useful bits. This is also used as the 0 dB reference for the power/time template.

b) Measurement of normal burst timing delay

The burst timing delay is the difference in time between the timing reference identified in a) and the corresponding transition in the burst received by the MS immediately prior to the MS transmit burst sampled.

c) Measurement of normal burst power/time relationship

The array of power samples measured in a) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in a).

d) Steps a) to c) are repeated on each multislot subchannel with the MS commanded to operate on each of the power control levels defined, even those not supported by the MS.

e) The SS commands the MS to the maximum power control level supported by the MS and steps a) to c) are repeated on each multislot subchannel for ARFCN in the Low and High ranges.

f) The SS commands the MS to the maximum power control level in the first multislot subchannel allocated and to the minimum power control level in the second multislot subchannel allocated. Any further timeslots allocated are to be set to the maximum power control level. Steps a) to c) and corresponding measurements on each subchannel are repeated.

g) Measurement of access burst transmitter output power

The SS causes the MS to generate an Access Burst on an ARFCN in the Mid ARFCN range, this could be either by a handover procedure or a new request for radio resource. In the case of a handover procedure the Power Level indicated in the HANDOVER COMMAND message is the maximum power control level supported by the MS. In the case of an Access Burst the MS shall use the Power Level indicated in the MS_TXPWR_MAX_CCH parameter. If the power class of the MS is DCS 1 800 Class 3, the MS shall also use the POWER_OFFSET parameter.

The SS takes power measurement samples evenly distributed over the duration of the access burst as described in a). However, in this case the SS identifies the centre of the useful bits of the burst by identifying the transition from the last bit of the synch sequence. The centre of the burst is then five data bits prior to this point and is used as the timing reference.

The transmitter output power is calculated as the average of the samples over the 87 useful bits of the burst. This is also used as the 0 dB reference for the power/time template.

h) Measurement of access burst timing delay

The burst timing delay is the difference in time between the timing reference identified in g) and the MS received data on the common control channel.

i) Measurement of access burst power/time relationship

The array of power samples measured in g) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in g).

j) Depending on the method used in step g) to cause the MS to send an Access Burst, the SS sends either a HANDOVER COMMAND with power control level set to 10 or it changes the System Information elements MS_TXPWR_MAX_CCH and for DCS 1 800 the POWER_OFFSET on the serving cell BCCH in order to limit the MS transmit power on the Access Burst to power control level 10 (+23 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or +10 dBm for DCS 1 800 and PCS 1900) and then steps g) to i) are repeated.

k) Steps a) to j) are repeated under extreme test conditions (annex 1, TC2.2) except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

#### 13.7.4.2 Method of test for equipment with an integral antenna

NOTE: If the MS is equipped with a permanent connector, such that the antenna can be disconnected and the SS be connected directly, then the method of section 13.7.4.1 will be applied.

The tests in this section are performed on an unmodified test sample.

##### 13.7.4.2.1 Initial conditions

The MS is placed in the anechoic shielded chamber (annex 1, GC5) or on the outdoor test site, on an isolated support, in the position for normal use, at a distance of at least 3 metres from a test antenna, connected to the SS.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then, in addition, it is necessary to raise/lower the test antenna through the specified height range to maximize the received power levels from both the test sample and the substitution antenna.

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power. MS_TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

##### 13.7.4.2.2 Procedure

a) With the initial conditions set according to subclause 13.7.4.2.1 the test procedure in 13.7.4.1.2 is followed up to and including step j), except that in step a), when measurements are done at maximum power for ARFCN in the Low, Mid and High range, the measurement is made eight times with the MS rotated by n*45 degrees for all values of n in the range 0 to 7.

The measurements taken are received transmitter output power measurements rather than transmitter output power measurements, the output power measurement values can be derived as follows.

b) Assessment of test site loss for scaling of received output power measurements.

The MS is replaced by a half-wave dipole, resonating at the centre frequency of the transmit band, connected to an RF generator.

The frequency of the RF signal generator is set to the frequency of the ARFCN used for the 24 measurements in step a), the output power is adjusted to reproduce the received transmitter output power averages recorded in step a).

For each indication the power, delivered by the generator (in Watts) to the half-wave dipole, is recorded. These values are recorded in the form Pnc, where n = MS rotation and c = channel number.

For each channel number used compute:

$$\text{Pac(Watts into dipole)} = \frac{1}{8} * \sum_{n=0}^{n=7} \text{Pnc}$$

from which: Pac (Tx dBm) = $10\log_{10}$(Pac) + 30 + 2,15

The difference, for each of the three channels, between the actual transmitter output power averaged over the 8 measurement orientations and the received transmitter output power at orientation n = 0 is used to scale the received measurement results to actual transmitter output powers for all measured power control levels and ARFCN, which can then be checked against the requirements.

c) Temporary antenna connector calibration factors (transmit)

A modified test sample equipped with a temporary antenna connector is placed in a climatic test chamber and is linked to the SS by means of the temporary antenna connector.

Under normal test conditions, the power measurement and calculation parts of steps a) to j) of 13.7.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

NOTE: The values noted here are related to the output transmitter carrier power levels under normal test conditions, which are known after step b). Therefore frequency dependent calibration factors that account for the effects of the temporary antenna connector can be determined.

d) Measurements at extreme test conditions.

NOTE: Basically the procedure for extreme conditions is:

- the power/time template is tested in the "normal" way,
- the radiated power is measured by measuring the difference with respect to the radiated power under normal test conditions.

Under extreme test conditions steps a) to j) of 13.7.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

The transmitter output power under extreme test conditions is calculated for each burst type, power control level and for every frequency used by adding the frequency dependent calibration factor, determined in c), to the values obtained at extreme conditions in this step.

### 13.7.5 Test requirements

a) The transmitter output power on each subchannel, under every combination of normal and extreme test conditions, for normal bursts and access bursts, at each frequency and for each power control level applicable to the MS power class, shall be at the relevant level shown in table 13.7-1, table 13.7-2 or table 13.7-3 within the tolerances also shown in table 13.7-1, table 13.7-2 or table 13.7-3.

GSM 400, GSM 700, GSM 850 and GSM 900 only - begin

**Table 13.7-1: GSM 400, GSM 700, GSM 850 and GSM 900 transmitter output power for different power classes**

| Power class | | | | Power control level | Transmitter output power | Tolerances | |
|---|---|---|---|---|---|---|---|
| 2 | 3 | 4 | 5 | | dBm | normal | extreme |
| · | | | | 2 | 39 | +/-2 dB | +/-2,5 dB |
| · | · | | | 3 | 37 | +/-3 dB*) | +/-4 dB*) |
| · | · | | | 4 | 35 | +/-3 dB | +/-4 dB |
| · | · | · | | 5 | 33 | +/-3 dB*) | +/-4 dB*) |

| · | · | · | 10 | 10 | +/-4 dB | +/-5 dB |
| · | · | · | 11 | 8 | +/-4 dB | +/-5 dB |
| · | · | · | 12 | 6 | +/-4 dB | +/-5 dB |
| · | · | · | 13 | 4 | +/-4 dB | +/-5 dB |
| · | · | · | 14 | 2 | +/-5 dB | +/-6 dB |
| · | · | · | 15 | 0 | +/-5 dB | +/-6 dB |

*) When the power control level corresponds to the power class of the MS, then the tolerances shall be 2,0 dB under normal test conditions and 2,5 dB under extreme test conditions.

PCS 1 900 only - end

b) The difference between the transmitter output power at two adjacent power control levels, measured at the same frequency, shall not be less than 0,5 dB and not be more than 3,5 dB. For PCS 1 900 Class 3 the difference between the transmitter output power at power controls level 30 and 31, measured at the same frequency, shall not be less than 0 dB and not be more than 2 dB.

c) The power/time relationship of the measured samples for normal bursts shall be within the limits of the power time template of figure 13.7-2 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

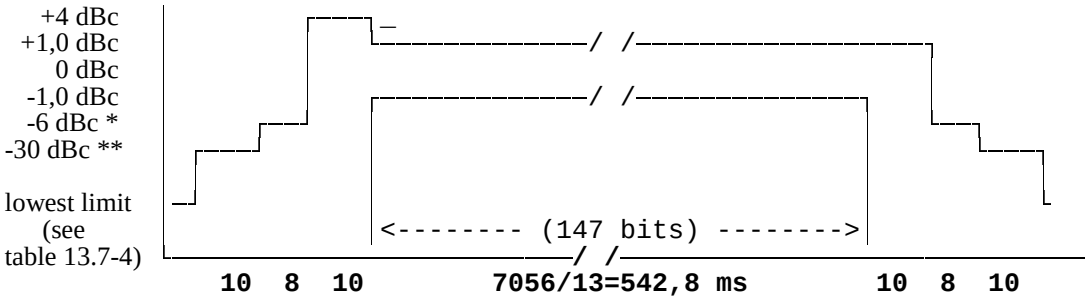

**Figure 13.7-2: Power / time template for normal bursts**

* For GSM400, GSM 700, GSM 850 and GSM900 MS:

-4 dBc for power control level 16

-2 dBc for power control level 17

-1 dBc for power control levels 18 and 19

For DCS1800 and PCS 1900 MS: -4 dBc for power control level 11

-2 dBc for power control level 12

-1 dBc for power control levels 13, 14 and 15

** For GSM400, GSM 700, GSM 850 and GSM900 MS:

-30 dBc or -17 dBm, whichever is the higher

For DCS1800 and PCS 1900 MS: -30 dBc or -20 dBm, whichever is the higher

**Table 13.7-4: Lowest measurement limit for power / time template**

| | lowest limit |
|---|---|
| GSM400, GSM 700, GSM 850, GSM900 | -59 dBc or -54 dBm whichever is the highest, except for the timeslot preceding the active slot, for which the allowed level is -59 dBc or -36 dBm, whichever is the highest |
| DCS1800, PCS 1900 | -48 dBc or -48 dBm whichever is the highest |

d) All the power control levels, for the type and power class of the MS as stated by the manufacturer, shall be implemented in the MS.

e) When the transmitter is commanded to a power control level outside of the capability corresponding to the type and power class of the MS as stated by the manufacturer, then the transmitter output power shall be within the tolerances for the closest power control level corresponding to the type and power class as stated by the manufacturer.

f) The centre of the transmitted normal burst as defined by the transition of bits 13/14 of the midamble shall be 3 timeslot periods (1731 μs) +/- 1 bit period (+/- 3,69 μs) after the centre of the corresponding received burst.

g) The power/time relationship of the measured samples for access bursts shall be within the limits of the power time template of figure 13.7-3 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

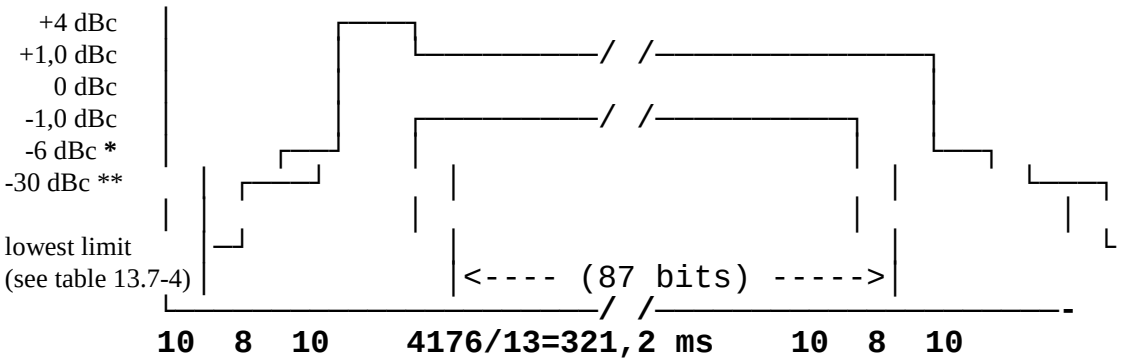

**Figure 13.7-3: Power / time template for access burst**

* For GSM400, GSM 700, GSM 850 and GSM900 MS:

-4 dBc for power control level 16

-2 dBc for power control level 17

-1 dBc for power control levels 18 and 19

For DCS1800 and PCS 1900 MS: -4 dBc for power control level 11

-2 dBc for power control level 12

-1 dBc for power control levels 13, 14 and 15

** For GSM400, GSM 700, GSM 850 and GSM900 MS:

-30 dBc or -17 dBm, whichever is the higher

For DCS1800 and PCS 1900 MS: -30 dBc or -20 dBm, whichever is the higher

h) The centre of the transmitted access burst shall be an integer number of timeslot periods less 30 bit periods relative to any CCCH midamble centre with a tolerance of +/- 1 bit period (+/- 3,69 μs).

# 13.8 Output RF spectrum in HSCSD multislot configuration

## 13.8.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MS and any multiband MS, which are capable of HSCSD multislot operation.

## 13.8.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in GSM 05.05, 4.2.1, table a) for GSM 400, GSM 700, GSM 850 and GSM 900, table b) for DCS 1 800 or table c) for PCS 1 900, with the following lowest measurement limits:

   - -36 dBm below 600 kHz offset from the carrier,
   - -51 dBm for GSM 400 and GSM 900 or -56 dBm for DCS 1 800 and PCS 1900 from 600 kHz out to less than 1 800 kHz offset from the carrier,

- -46 dBm for GSM 400 and GSM 900 or -51 dBm for DCS 1 800 and PCS 1900 at and beyond 1 800 kHz offset from the carrier,

but with the following exceptions at up to -36 dBm:

- up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier,

- up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.

1.1 Under normal conditions; GSM 05.05, 4.2.1.

1.2 Under extreme conditions; GSM 05.05, 4.2.1; GSM 05.05, annex D D.2.1, D.2.2.

2. The level of the output RF spectrum due to switching transients shall be no more than given in GSM 05.05, 4.2.2, table "a) Mobile Station:".

2.1 Under normal conditions; GSM 05.05, 4.2.2.

2.2 Under extreme conditions; GSM 05.05, 4.2.2; GSM 05.05 annex D D.2.1, D.2.2.

3. When allocated a channel, the power emitted by a GSM 400, GSM 900 and DCS 1 800 MS, in the band 935 to 960 MHz shall be no more than -79 dBm, in the band 925 to 935 MHz shall be no more than -67 dBm and in the band 1 805 to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 to 960 MHz and 1 805 to 1 880 MHz where exceptions at up to -36 dBm are permitted. For GSM 400 MS, in addition, the power emitted by MS, in the bands of 460.4 to 467.6 MHz and 488.8 to 496 MHz shall be no more than –67 dBm except in three measurements in each of the bands 460.4 to 467.6 MHz and 488.8 to 496 MHz where exceptions at up to –36 dBm are permitted. For PCS 1 900 MS, the power emitted by MS, in the band 869 to 894 MHz shall be no more than –79 dBm, in the band 1 930 to 1 990 MHz shall be no more than –71 dBm except in five measurements in each of the bands 869 to 894 MHz and 1 930 to 1 990 MHz where exceptions at up to –36 dBm are permitted. For GSM 700 and GSM 850, the power emitted by MS, in the band 747 to 757 MHz shall be no more than –79 dBm, in the band of 757 to 762 MHz shall be no more than –73 dBm, in the band 869 to 894 MHz shall be no more than –79 dBm, in the band 1 930 to 1 990 MHz shall be no more than –71 dBm except in five measurements in each of the bands 747 to 762 MHz, 869 to 894 MHz and 1 930 to 1 990 MHz where exceptions at up to –36 dBm are permitted. Under normal conditions; GSM 05.05, 4.3.3.

### 13.8.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1 in the multislot configurations.

1.1 Under normal conditions.

1.2 Under extreme conditions.

2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 in the multislot configurations when a reasonable margin is allowed for the effect of spectrum due to modulation.

2.1 Under normal conditions.

2.2 Under extreme conditions.

3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3 in the multislot configurations.

### 13.8.4 Method of test

#### 13.8.4.1 Initial conditions

A call is set up according to the generic call set up procedure for multislot HSCSD.

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to handover the MS between the three channels tested at the appropriate time.

The SS sends Standard Test Signal C1 (annex 5) to the MS at a level of 23 dBµVemf( ).

The SS sets the MS to operate in a multislot configuration where is maximum number of transmitting timeslots. Maximum power level is set in all channels.

#### 13.8.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.

b) The other settings of the spectrum analyser are set as follows:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 30 kHz
- Video averaging: may be used, depending on the implementation of the test

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst in one of the active time slots is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.

d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

For GSM 400, GSM 900 and DCS 1 800:

at 200 kHz intervals over the band 925 - 960 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1805 - 1880 MHz for each measurement over 50 bursts.

in addition for GSM 400 MS:

at 200 kHz intervals over the band 460.4 to 467.6 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 488.8 to 496 MHz for each measurement over 50 bursts.

For GSM 700 and GSM 850.

at 200 kHz intervals over the band 747 to 762 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 869 - 894 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1930 – 1990 MHz for each measurement over 50 bursts.

For PCS 1 900:

at 200 kHz intervals over the band 869 - 894 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1930 – 1990 MHz for each measurement over 50 bursts.

e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).

f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

FT

FT + 100 kHz FT - 100 kHz

FT + 200 kHz FT - 200 kHz

FT + 250 kHz FT - 250 kHz

FT + 200 kHz * N FT - 200 kHz * N

where N = 2, 3, 4, 5, 6, 7, and 8

and FT = RF channel nominal centre frequency.

g) Steps a) to f) is repeated except that in step a) the spectrum analyzer is gated so that the burst of the next active time slot is measured.

h) The spectrum analyser settings are adjusted to:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 100 kHz
- Peak hold

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level in every transmitted time slot.

i) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

FT + 400 kHz FT - 400 kHz

FT + 600 kHz FT - 600 kHz

FT + 1,2 MHz FT - 1,2 MHz

FT + 1,8 MHz FT - 1,8 MHz

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

j) Step i) is repeated for power control levels 7 and 11.

k) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the Low ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.

l) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.

m) Steps a) b) f) h), and i) are repeated under extreme test conditions (annex 1, TC2.2). except that at step h) the MS is commanded to power control level 11.

### 13.8.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 450.4 to 457.6 MHz, 478.8 to 486 MHz, 777 to 792 MHz, 824 to 849 MHz, 880 to 915 MHz, 1710 to 1785 MHz or 1 850 to 1 910 MHz, the temporary antenna connector coupling factor, determined according to 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 925 to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS. For a GSM 400, GSM 700, GSM 850 or DCS 1 800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1805 to 1880 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for DCS 1 800 MS. For GSM 400, GSM 700, GSM 850, GSM 900 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 460.4 to 467.6 MHz or 488.8 to 496 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 400 MS. For a GSM 700, GSM 850, GSM 900, DCS 1800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 747 to 762 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 700 MS. For a GSM 400, GSM 850, GSM 900 or DCS 1800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 869 to 894 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 850 MS. For a GSM 400, GSM 700, GSM 900 or DCS 1800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1930 to 1990 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for PCS 1 900 MS. For GSM 400, GSM 900 or DCS 1 800 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference GSM 05.05 section 4.2.1).

a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), i), k), l) and m) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 1 for GSM 400, GSM 700, GSM 850 and GSM 900, table 2 for DCS 1 800 or table 3 for PCS 1 900 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

**Table 1: GSM 400, GSM 700, GSM 850 and GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| | **power levels in dB relative to the measurement at FT** | | | | |
|---|---|---|---|---|---|
| **Power level** | **Frequency offset (kHz)** | | | | |
| **(dBm)** | **0-100** | **200** | **250** | **400** | **600 to <1800** |

| The values above are subject to the minimum absolute levels (dBm) below. | | | | | | |
| | -36 | -36 | -36 | -36 | -56 | -56 |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 4 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

| The values above are subject to the minimum absolute levels (dBm) below. | | | | | | | | | |
| | -46 | -46 | -46 | | -51 | -51 | | -51 | -51 |

c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.

d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.

e) For GSM 400, GSM 900 and DCS 1 800 MS spurious emissions in the bands 925 - 935 MHz, 935 - 960 MHz and 1 805 - 1 880 MHz, measured in step d), shall not exceed the values shown in table 5 except in up to five measurements in the band 925 to 960 MHz and five measurements in the band 1 805 to 1 880 MHz where a level up to -36 dBm is permitted. For GSM 400 MS, in addition, the MS spurious emissions in the bands 460.4 to 467.6 MHz and 488.8 to 496 MHz shall not exceed the value of –67 dBm, except in up to three measurements in each of the bands 460.4 to 467.6 MHz and 488.8 to 496 MHz where a level up to –36 dBm is permitted. For GSM 700 and GSM 850 the spurious emissions in the bands 747 – 757 MHz, 757 – 762 MHz and 869 - 894 MHz and 1930 – 1990 MHz shall not exceed the values shown in table 4 except in up to five measurements in each of the bands 747 to 762 MHz and 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to –36 dBm is permitted. For PCS 1 900 MS the spurious emissions in the bands 869 - 894 MHz and 1930 – 1990 MHz shall not exceed the values shown in table 5 except in up to five measurements in each of the bands 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to –36 dBm is permitted.

**Table 5: Spurious emissions in the MS receive bands**

| Band (MHz) | Spurious emissions level (dBm) | |
|---|---|---|
| | GSM400, GSM900 and DCS1800 | GSM 700, GSM 850 and PCS1900 |
| 925 to 935 | -67 | |
| 935 to 960 | -79 | |
| 1805 to 1880 | -71 | |
| 747 to 757 | | -79 |
| 757 to 762 | | -73 |
| 869 to 894 | | -79 |
| 1930 to 1990 | | -71 |

f) For the power ramp sidebands of steps h), i) and k) the power levels must not exceed the values shown in table 6 for GSM 400, GSM 700, GSM 850 and GSM 900, table 7 for DCS 1 800 or table 8 for PCS 1 900.

**Table 6: GSM Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency | | | |
|---|---|---|---|---|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 39 dBm | -13 dBm | -21 dBm | -21 dBm | -24 dBm |
| 37 dBm | -15 dBm | -21 dBm | -21 dBm | -24 dBm |
| 35 dBm | -17 dBm | -21 dBm | -21 dBm | -24 dBm |
| 33 dBm | -19 dBm | -21 dBm | -21 dBm | -24 dBm |
| 31 dBm | -21 dBm | -23 dBm | -23 dBm | -26 dBm |
| 29 dBm | -23 dBm | -25 dBm | -25 dBm | -28 dBm |
| 27 dBm | -23 dBm | -26 dBm | -27 dBm | -30 dBm |
| 25 dBm | -23 dBm | -26 dBm | -29 dBm | -32 dBm |
| 23 dBm | -23 dBm | -26 dBm | -31 dBm | -34 dBm |
| <= +21 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

**Table 7: DCS 1 800 Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency | | | |
|---|---|---|---|---|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 36 dBm | -16 dBm | -21 dBm | -21 dBm | -24 dBm |
| 34 dBm | -18 dBm | -21 dBm | -21 dBm | -24 dBm |
| 32 dBm | -20 dBm | -22 dBm | -22 dBm | -25 dBm |
| 30 dBm | -22 dBm | -24 dBm | -24 dBm | -27 dBm |
| 28 dBm | -23 dBm | -25 dBm | -26 dBm | -29 dBm |
| 26 dBm | -23 dBm | -26 dBm | -28 dBm | -31 dBm |
| 24 dBm | -23 dBm | -26 dBm | -30 dBm | -33 dBm |
| 22 dBm | -23 dBm | -26 dBm | -31 dBm | -35 dBm |
| <= +20 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

**Table 8: PCS 1 900 Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency | | | |
|---|---|---|---|---|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 33 dBm | -19 dBm | -22 dBm | -22 dBm | -25 dBm |
| 32 dBm | -20 dBm | -22 dBm | -22 dBm | -25 dBm |
| 30 dBm | -22 dBm | -24 dBm | -24 dBm | -27 dBm |
| 28 dBm | -23 dBm | -25 dBm | -26 dBm | -29 dBm |
| 26 dBm | -23 dBm | -26 dBm | -28 dBm | -31 dBm |
| 24 dBm | -23 dBm | -26 dBm | -30 dBm | -33 dBm |
| 22 dBm | -23 dBm | -26 dBm | -31 dBm | -35 dBm |
| <= +20 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

NOTE 2: These figures are different from the requirements in GSM 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 6, table 7 and table 8 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at <1 800 kHz.

# 13.9 Output RF spectrum for MS supporting the R-GSM band

## 13.9.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of R-GSM 900.

## 13.9.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in GSM 05.05, 4.2.1, table a) for R-GSM 900 with the following lowest measurement limits:

   - -36 dBm below 600 kHz offset from the carrier,
   - -51 dBm for R-GSM 900 from 600 kHz out to less than 1 800 kHz offset from the carrier,
   - -46 dBm for R-GSM 900 at and beyond 1 800 kHz offset from the carrier,

   but with the following exceptions at up to -36 dBm:

- up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier,
- up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.

1.1 Under normal conditions; GSM 05.05, 4.2.1.

1.2 Under extreme conditions; GSM 05.05, 4.2.1; GSM 05.05, annex D D.2.1, D.2.2.

2. The level of the output RF spectrum due to switching transients shall be no more than given in GSM 05.05, 4.2.2, table "a) Mobile Station:".

   2.1 Under normal conditions; GSM 05.05, 4.2.2.

   2.2 Under extreme conditions; GSM 05.05, 4.2.2; GSM 05.05 annex D D.2.1, D.2.2.

3. When allocated a channel, the power emitted by the MS, in the band 935 to 960 MHz shall be no more than -79 dBm, in the band 925 to 935 MHz shall be no more than -67 dBm, in the band 921 to 925 MHz shall be no more than –60 dBm and in the band 1 805 to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 to 960 MHz and 1 805 to 1 880 MHz where exceptions at up to -36 dBm are permitted. Under normal conditions; GSM 05.05, 4.3.3.

### 13.9.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1.

   1.1 Under normal conditions.

   1.2 Under extreme conditions.

2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 when a reasonable margin is allowed for the effect of spectrum due to modulation.

   2.1 Under normal conditions.

   2.2 Under extreme conditions.

3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3.

### 13.9.4 Method of test

#### 13.9.4.1 Initial conditions

A call is set up according to the generic call set up procedure.

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low R-GSM ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to handover the MS between the three channels tested at the appropriate time.

The SS commands the MS to complete the traffic channel loop back without signalling of erased frames (see 36.2.1.1). This is to set a defined random pattern for the transmitter.

The SS sends Standard Test Signal C1 (annex 5) to the MS at a level of 23 dBμVemf( ).

13.9.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.

b) The other settings of the spectrum analyser are set as follows:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 30 kHz
- Video averaging: may be used, depending on the implementation of the test

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

The MS is commanded to its maximum power control level.

c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.

d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the band 921 - 960 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1805 - 1880 MHz for each measurement over 50 bursts.

e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).

f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

FT

FT + 100 kHz FT - 100 kHz

FT + 200 kHz FT - 200 kHz

FT + 250 kHz FT - 250 kHz

FT + 200 kHz * N FT - 200 kHz * N

where N = 2, 3, 4, 5, 6, 7, and 8

and FT = RF channel nominal centre frequency.

g) The spectrum analyser settings are adjusted to:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 100 kHz

- Peak hold

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level.

h) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

FT + 400 kHz FT - 400 kHz

FT + 600 kHz FT - 600 kHz

FT + 1,2 MHz FT - 1,2 MHz

FT + 1,8 MHz FT - 1,8 MHz

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

i) Step h) is repeated for power control levels 7 and 11.

j) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the Low R-GSM ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.

k) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.

l) Steps a), b), f), g) and h) are repeated under extreme test conditions (annex 1, TC2.2). except that at step g) the MS is commanded to power control level 11.

### 13.9.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 876 to 915 MHz or 1710 to 1785 MHz, the temporary antenna connector coupling factor, determined according to 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 921 to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1805 to 1880 MHz for R-GSM 900 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference GSM 05.05 section 4.2.1).

a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), h), j), k) and l) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 13.9-1 for R-GSM 900 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

**Table 13.9-1a: R-GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| | power levels in dB relative to the measurement at FT | | | | |
|---|---|---|---|---|---|
| **Power level** | **Frequency offset (kHz)** | | | | |
| **(dBm)** | **0-100** | **200** | **250** | **400** | **600 to <1800** |
| 39 | +0,5 | -30 | -33 | -60 | -66 |
| 37 | +0,5 | -30 | -33 | -60 | -64 |
| 35 | +0,5 | -30 | -33 | -60 | -62 |
| <= 33 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -51 |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 13.9-2 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

**Table 13.9-2: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)**

| **Power levels in dB relative to the measurement at FT** | | | |
|---|---|---|---|
| **R-GSM900** | | | |
| **Power** | **Frequency offset** | | |
| **level** | **kHz** | | |
| **(dBm)** | **1800 to** | **3000 to** | **>= 6000** |
| | **< 3000** | **< 6000** | |
| 39 | -69 | -71 | -77 |
| 37 | -67 | -69 | -75 |
| 35 | -65 | -67 | -73 |
| <= 33 | -63 | -65 | -71 |
| **The values above are subject to the minimum absolute levels (dBm) below** | | | |
| | -46 | -46 | -46 |

c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.

d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.

e) The MS spurious emissions in the bands 921 – 925, 925 - 935 MHz, 935 - 960 MHz and 1 805 - 1 880 MHz, measured in step d), for all types of MS, shall not exceed the values shown in table 13.9-3 except in up to five measurements in the band 925 to 960 MHz and five measurements in the band 1 805 to 1 880 MHz where a level up to -36 dBm is permitted.

**Table 13.9-3: Spurious emissions in the R-GSM MS receive bands**

| Band (MHz) | Spurious emissions level (dBm) |
|---|---|
| 921 to 925 | -60 |
| 925 to 935 | -67 |
| 935 to 960 | -79 |
| 1805 to 1880 | -71 |

f) For the power ramp sidebands of steps h) and i) the power levels must not exceed the values shown in table 13.9-4 for GSM 900.

**Table 13.9-4: R-GSM Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency | | | |
|---|---|---|---|---|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 39 dBm | -13 dBm | -21 dBm | -21 dBm | -24 dBm |
| 37 dBm | -15 dBm | -21 dBm | -21 dBm | -24 dBm |
| 35 dBm | -17 dBm | -21 dBm | -21 dBm | -24 dBm |
| 33 dBm | -19 dBm | -21 dBm | -21 dBm | -24 dBm |
| 31 dBm | -21 dBm | -23 dBm | -23 dBm | -26 dBm |
| 29 dBm | -23 dBm | -25 dBm | -25 dBm | -28 dBm |
| 27 dBm | -23 dBm | -26 dBm | -27 dBm | -30 dBm |
| 25 dBm | -23 dBm | -26 dBm | -29 dBm | -32 dBm |
| 23 dBm | -23 dBm | -26 dBm | -31 dBm | -34 dBm |
| <= +21 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

NOTE 2: These figures are different from the requirements in GSM 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 13.9-4 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at <1 800 kHz.

# 13.15 (void)

# 13.16 GPRS transmitter tests

## 13.16.1 Frequency error and phase error in GPRS multislot configuration

### 13.16.1.1 Definition and applicability

The frequency error is the difference in frequency, after adjustment for the effect of the modulation and phase error, between the RF transmission from the MS and either:

- the RF transmission from the BS, or
- the nominal frequency for the ARFCN used.

The phase error is the difference in phase, after adjustment for the effect of the frequency error, between the RF transmission from the MS and the theoretical transmission according to the intended modulation.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MS which are capable of GPRS multislot operation on the uplink.

### 13.16.1.2 Conformance requirement

1. The MS carrier frequency shall be accurate to within 0,1 ppm compared to signals received from the BS.

   1.1 Under normal conditions; GSM 05.10, 6.1.

   1.2 Under vibration conditions; GSM 05.10, 6.1; GSM 05.05, annex D D.2.3.

   1.3 Under extreme conditions; GSM 05.10, 6.1; GSM 05.05, 4.4; GSM 05.05, annex D D.2.1, D.2.2.

2. The RMS phase error (difference between the phase error trajectory and its linear regression on the active part of the time slot) for each burst shall not be greater than 5 degrees.

   2.1 Under normal conditions; GSM 05.05, 4.6.

   2.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.

   2.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.

3. The maximum peak deviation during the useful part of each burst shall not be greater than 20 degrees.

   3.1 Under normal conditions; GSM 05.05, 4.6.

   3.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.

3.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.

#### 13.16.1.3 Test purpose

1. To verify that in a multislot configuration the MS carrier frequency error does not exceed 0.1 ppm:

   Under normal conditions

   1.2 When the MS is being vibrated

   1.3 Under extreme conditions

2. To verify that the RMS phase error on the useful parts of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 2:

   2.1 Under normal conditions

   2.2 When the MS is being vibrated

   2.3 Under extreme conditions

3. To verify that the maximum phase error on the useful parts of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 3:

   3.1 Under normal conditions

   3.2 When the MS is being vibrated

   3.3 Under extreme conditions

#### 13.16.1.4 Method of the test

NOTE: In order to measure the accuracy of the frequency and phase error a sampled measurement of the transmitted phase trajectory is obtained. This is compared with the theoretically expected phase trajectory. The regression line of the difference between the expected trajectory and the measured trajectory is an indication of the frequency error (assumed constant through the burst), whilst the departure of the phase differences from this trajectory is a measure of the phase error. The peak phase error is the value furthest from the regression line and the RMS phase error is the root mean square average of the phase error of all samples.

##### 13.16.1.4.1 Initial conditions

The test shall be run under the default GPRS conditions defined in section 40.

The SS commands the MS to hopping mode (table 13.6.1, GSM 11.10).

NOTE: It is not necessary to test in hopping mode but is done here as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to make sure bursts are taken from a few different channels.

The MS shall be operated with it's highest number of uplink slots.

The Test Mode defined in GSM Rec. 4.14 (par 5.4) will be utilised. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks

Mode (b) transmitting looped-back RLC data blocks

then Mode (a) will be used.

If Mode (b) is used then the SS sends the psuedo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

13.16.1.4.2 Procedure

a) For one transmitted burst on the last slot of the multislot configuration, the SS captures the signal as a series of phase samples over the period of the burst. These samples are evenly distributed over the duration of the burst with a minimum sampling rate of 2/T, where T is the modulation symbol period. The received phase trajectory is then represented by this array of at least 294 samples.

b) The SS then calculates, from the known bit pattern and the formal definition of the modulator contained in GSM 05.04, the expected phase trajectory.

c) From a) and b) the phase trajectory error is calculated, and a linear regression line computed through this phase trajectory error. The slope of this regression line is the frequency error of the mobile transmitter relative to the simulator reference. The difference between the regression line and the individual sample points is the phase error of that point.

c.1) The sampled array of at least 294 phase measurements is represented by the vector:

$\varnothing_m = \varnothing_m(0)...\varnothing_m(n)$

where the number of samples in the array n+1 >= 294.

c.2) The calculated array, at the corresponding sampling instants, is represented by the vector:

$\varnothing_c = \varnothing_c(0)...\varnothing_c(n)$.

c.3) The error array is represented by the vector:

$\varnothing_e = \{\varnothing_m(0) - \varnothing_c(0)\}.....\{\varnothing_m(n) - \varnothing_c(n)\} = \varnothing_e(0)...\varnothing_e(n)$.

c.4) The corresponding sample numbers form a vector t = t(0)...t(n).

c.5) By regression theory the slope of the samples with respect to t is k where:

$$k = \frac{\sum_{j=0}^{j=n} t(j) * \varnothing_e(j)}{\sum_{j=0}^{j=n} t(j)^2}$$

c.6) The frequency error is given by k/(360 * g), where g is the sampling interval in s and all phase samples are measured in degrees.

c.7) The individual phase errors from the regression line are given by:

$\varnothing_e(j) - k*t(j)$.

c.8) The RMS value $\varnothing_e$ of the phase errors is given by:

$$\varnothing_e(RMS) = \left[ \frac{\sum_{j=0}^{j=n} \{\varnothing_e(j) - k * t(j)\}^2}{n+1} \right]^{1/2}$$

d) Steps a) to c) are repeated for 20 bursts, not necessarily contiguous.

e) The SS instructs the MS to its maximum power control level by setting the power control parameter ALPHA ($\alpha$) to 0 and GAMMA_TN ($\Gamma_{CH}$) for each timeslot to the desired power level in the Packet Uplink Assignment message (Closed Loop Control, see 05.08. Annex B.2), all other conditions remaining constant. Steps a) to d) are repeated.

f) The SS instructs the MS to the minimum power control level, all other conditions remaining constant. Steps a) to d) are repeated.

g) The MS is hard mounted on a vibration table and vibrated at the frequency/amplitudes specified in annex 1, TC4.

During the vibration steps a) to f) are repeated.

NOTE: If the call is terminated when mounting the MS to the vibration table, it will be necessary to establish the initial conditions again before repeating steps a) to f).

h) The MS is re-positioned on the vibration table in the two orthogonal planes to the plane used in step g). For each of the orthogonal planes step g) is repeated.

i) Steps a) to f) are repeated under extreme test conditions (see annex 1, TC2.2).

#### 13.16.1.5.1 Frequency error

For all measured bursts, the frequency error, derived in step c.6), shall be less than 10E-7.

#### 13.16.1.5.2 Phase error

For all measured bursts, the RMS phase error, derived in step c.8), shall not exceed 5 degrees.

For all measured bursts, each individual phase error, derived in step c.7), shall not exceed 20 degrees.

## 13.16.2 Transmitter output power in GPRS multislot configuration

### 13.16.2.1 Definition and applicability

The transmitter output power is the average value of the power delivered to an artificial antenna or radiated by the MS and its integral antenna, over the time that the useful information bits of one burst are transmitted.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MS and any multiband MS, which are capable of GPRS multislot operation on the uplink.

### 13.16.2.2 Conformance requirement

1. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, first table, according to its power class, with a tolerance of +/- 2 dB under normal conditions; GSM 05.05, 4.1.1, first table.

2. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, first table, according to its power class, with a tolerance of +/- 2,5 dB under extreme conditions; GSM 05.05, 4.1.1, first table; GSM 05.05 annex D D.2.1, D.2.2.

3. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, third table (for GSM 400, GSM 700, GSM 850 and GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1 900), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 1), with a tolerance of +/- 3, 4 or 5 dB under normal conditions; GSM 05.05, 4.1.1, third, fourth or fifth table.

4. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, third table (for GSM 400, GSM 700, GSM 850 and GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1 900), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 2), with a tolerance of +/- 4, 5 or 6 dB under extreme conditions; GSM 05.05, 4.1.1, third, fourth or fifth table; GSM 05.05 annex D D.2.1, D.2.2.

5. The output power actually transmitted by the MS at consecutive power control levels shall form a monotonic sequence and the interval between power control levels shall be 2 +/- 1,5 dB (1 +/- 1dB between power control level 30 and 31 for PCS 1 900); GSM 05.05, 4.1.1.

6. The transmitted power level relative to time for a normal burst shall be within the power/time template given in GSM 05.05, annex B figure B1. In multislot configurations where the bursts in two or more consecutive time slots are actually transmitted at the same frequency the template of annex B shall respected during the useful part of each burst and at the beginning and the end of the series of consecutive bursts. The output power during the guard period between every two consecutive active timeslots shall not exceed the level allowed for the useful

part of the first timeslot or the level allowed for the useful part of the second timeslot plus 3 dB, whichever is the highest.:

6.1 Under normal conditions; GSM 05.05, 4.5.2..

6.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.

When accessing a cell on the PRACH or RACH and before receiving the first power control parameters during packet transfer on PDCH, all GSM and class 1 and class 2 DCS 1 800 and PCS 1900 MS shall use the power control level defined by the GPRS_MS_TXPWR_MAX_CCH parameter broadcast on the PBCCH or MS_TXPWR_MAX_CCH parameter broadcast on the BCCH of the cell. When MS_TXPWR_MAX_CCH is received on the BCCH, a class 3 DCS 1800 MS shall add to it the value POWER_OFFSET broadcast on the BCCH. If MS_TXPWR_MAX_CCH or the sum defined by: MS_TXPWR_MAX_CCH plus POWER_OFFSET corresponds to a power control level not supported by the MS as defined by its power class, the MS shall act as though the closest supported power control level had been broadcast.

8. The transmitted power level relative to time for a Random Access burst shall be within the power/time template given in GSM 05.05, annex B figure B3:

   9.1 Under normal conditions; GSM 05.05, 4.5.2.

   9.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.

#### 13.16.2.3 Test purpose

1. To verify that the maximum output power of the MS in GPRS multislot configuration, under normal conditions, is within conformance requirement 1.

2. To verify that the maximum output power of the MS in GPRS multislot configuration, under extreme conditions, is within conformance requirement 2.

3. To verify that all power control levels, relevant to the class of MS, are implemented in the MS in GPRS multislot configuration and have output power levels, under normal conditions, within conformance requirement 3.

4. To verify that all power control levels have output power levels, under extreme conditions, within conformance requirement 4.

5. To verify that the step in the output power transmitted by the MS in GPRS multislot configuration at consecutive power control levels is within conformance requirement 5 under normal conditions.

6. To verify that the output power relative to time, when sending a normal burst is within conformance requirement 6 in GPRS multislot configuration:

   6.1 Under normal conditions.

   6.2 Under extreme conditions.

7. To verify that the MS in GPRS multislot configuration uses the maximum power control level according to its power class if commanded to a power control level exceeding its power class.

8. To verify that the output power relative to time, when sending an access burst is within conformance requirement 8 in GPRS multislot configuration:

   9.1 Under normal conditions.

   9.2 Under extreme conditions.

#### 13.16.2.4 Methods of test

Two methods of test are described, separately for:

1) equipment fitted with a permanent antenna connector and for

2) equipment fitted with an integral antenna, and which cannot be connected to an external antenna except by the fitting of a temporary test connector as a test fixture.

NOTE: The behaviour of the MS in the system is determined to a high degree by the antenna, and this is the only transmitter test in this ETS using the integral antenna. Further studies are ongoing on improved testing on the integral antenna, taking practical conditions of MS use into account.

#### 13.16.2.4.1 Method of test for equipment with a permanent antenna connector

##### 13.16.2.4.1.1 Initial conditions

The test shall be run under the default GPRS conditions defined in section 40.

The MS shall be operated with its highest number of uplink slots.

The Test Mode defined in GSM Rec. 4.14 (par 5.4) will be utilised. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks

Mode (b) transmitting looped-back RLC data blocks

then Mode (a) will be used.

If Mode (b) is used then the SS sends the psuedo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

The SS controls the power level by setting the concerned time slot's power control parameter ALPHA ($\alpha$) to 0 and GAMMA_TN ($\Gamma_{CH}$) to the desired power level in the Packet Uplink Assignment message (Closed Loop Control, see 05.08. Annex B.2) GPRS_ MS TXPWR_MAX_CCH / MS TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

##### 13.16.2.4.1.2 Procedure

a) Measurement of normal burst transmitter output power

The SS takes power measurement samples evenly distributed over the duration of one burst with a sampling rate of at least 2/T, where T is the bit duration. The samples are identified in time with respect to the modulation on the burst. The SS identifies the centre of the useful 147 transmitted bits, i.e. the transition from bit 13 to bit 14 of the midamble, as the timing reference.

The transmitter output power is calculated as the average of the samples over the 147 useful bits. This is also used as the 0 dB reference for the power/time template.

b) Measurement of normal burst power/time relationship

The array of power samples measured in a) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in a).

c) Steps a) to b) are repeated on each timeslot within the multislot configuration with the MS commanded to operate on each of the power control levels defined, even those not supported by the MS.

d) The SS commands the MS to the maximum power control level supported by the MS and steps a) to b) are repeated on each timeslot within the multislot configuration for ARFCN in the Low and High ranges.

e) The SS commands the MS to the maximum power control level in the first timeslot allocated within the multislot configuration and to the minimum power control level in the second timeslot allocated. Any further timeslots allocated are to be set to the maximum power control level. Steps a) to b) and corresponding measurements on each timeslot within the multislot configuration are repeated.

f) Measurement of access burst transmitter output power

The SS causes the MS to generate an Access Burst on an ARFCN in the Mid ARFCN range, this could be either by a cell re-selection or a new request for radio resource. In the case of a cell re-selection procedure the Power Level indicated in the PSI3 message is the maximum power control level supported by the MS. In the case of an Access Burst the MS shall use the Power Level indicated in the GPRS_MS_TXPWR_MAX_CCH parameter. If

the power class of the MS is DCS 1 800 Class 3 and the Power Level is indicated by the MS_TXPWR_MAX_CCH parameter, the MS shall also use the POWER_OFFSET parameter.

The SS takes power measurement samples evenly distributed over the duration of the access burst as described in a). However, in this case the SS identifies the centre of the useful bits of the burst by identifying the transition from the last bit of the synch sequence. The centre of the burst is then five data bits prior to this point and is used as the timing reference.

The transmitter output power is calculated as the average of the samples over the 87 useful bits of the burst. This is also used as the 0 dB reference for the power/time template.

g) Measurement of access burst power/time relationship

The array of power samples measured in f) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in f).

h) Depending on the method used in step f) to cause the MS to send an Access Burst, the SS sends either a PACKET CELL CHANGE ORDER along with power control level set to 10 in PSI3 parameter GPRS_MS_TXPWR_MAX_CCH or it changes the (Packet) System Information elements (GPRS_)MS_TXPWR_MAX_CCH and for DCS 1 800 the POWER_OFFSET on the serving cell PBCCH/BCCH in order to limit the MS transmit power on the Access Burst to power control level 10 (+23 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or +10 dBm for DCS 1 800 and PCS 1900) and then steps f) to g) are repeated.

i) Steps a) to h) are repeated under extreme test conditions (annex 1, TC2.2) except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

#### 13.16.2.4.2 Method of test for equipment with an integral antenna

NOTE: If the MS is equipped with a permanent connector, such that the antenna can be disconnected and the SS be connected directly, then the method of section 13.16.2.4.1 will be applied.

The tests in this section are performed on an unmodified test sample.

##### 13.16.2.4.2.1 Initial conditions

The MS is placed in the anechoic shielded chamber (annex 1, GC5) or on the outdoor test site, on an isolated support, in the position for normal use, at a distance of at least 3 metres from a test antenna, connected to the SS.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then, in addition, it is necessary to raise/lower the test antenna through the specified height range to maximize the received power levels from both the test sample and the substitution antenna.

The Initial Conditions for the test are defined in 13.16.2.4.1.1.

##### 13.16.2.4.2.2 Procedure

a) With the initial conditions set according to subclause 13.16.2.4.2.1 the test procedure in 13.16.2.4.1.2 is followed up to and including step h), except that in step a), when measurements are done at maximum power for ARFCN in the Low, Mid and High range, the measurement is made eight times with the MS rotated by n*45 degrees for all values of n in the range 0 to 7.

The measurements taken are received transmitter output power measurements rather than transmitter output power measurements, the output power measurement values can be derived as follows.

b) Assessment of test site loss for scaling of received output power measurements.

The MS is replaced by a half-wave dipole, resonating at the centre frequency of the transmit band, connected to an RF generator.

The frequency of the RF signal generator is set to the frequency of the ARFCN used for the 24 measurements in step a), the output power is adjusted to reproduce the received transmitter output power averages recorded in step a).

For each indication the power, delivered by the generator (in Watts) to the half-wave dipole, is recorded. These values are recorded in the form Pnc, where n = MS rotation and c = channel number.

For each channel number used compute:

$$\text{Pac(Watts into dipole)} = \frac{1}{8} * \sum_{n=0}^{n=7} \text{Pnc}$$

from which: Pac (Tx dBm) = $10\log_{10}$(Pac) + 30 + 2,15

The difference, for each of the three channels, between the actual transmitter output power averaged over the 8 measurement orientations and the received transmitter output power at orientation n = 0 is used to scale the received measurement results to actual transmitter output powers for all measured power control levels and ARFCN, which can then be checked against the requirements.

c) Temporary antenna connector calibration factors (transmit)

A modified test sample equipped with a temporary antenna connector is placed in a climatic test chamber and is linked to the SS by means of the temporary antenna connector.

Under normal test conditions, the power measurement and calculation parts of steps a) to j) of 13.16.2.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

NOTE: The values noted here are related to the output transmitter carrier power levels under normal test conditions, which are known after step b). Therefore frequency dependent calibration factors that account for the effects of the temporary antenna connector can be determined.

d) Measurements at extreme test conditions.

NOTE: Basically the procedure for extreme conditions is:

- the power/time template is tested in the "normal" way,
- the radiated power is measured by measuring the difference with respect to the radiated power under normal test conditions.

Under extreme test conditions steps a) to h) of 13.16.2.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

The transmitter output power under extreme test conditions is calculated for each burst type, power control level and for every frequency used by adding the frequency dependent calibration factor, determined in c), to the values obtained at extreme conditions in this step.

### 13.16.2.5 Test requirements

a) The transmitter output power, under every combination of normal and extreme test conditions, for normal bursts and access bursts, at each frequency and for each power control level applicable to the MS power class, shall be at the relevant level shown in table 13.16.2-1, table 13.16.2-2 or table 13.16.2-3 within the tolerances also shown in table 13.16.2-1, table 13.16.2-2 or table 13.16.2-3.

GSM 400, GSM 700, GSM 850 and GSM 900 only - begin

**Table 13.16.2-1: GSM 400, GSM 700, GSM 850 and GSM 900 transmitter output power for different power classes**

| Power class | | | | Power control level | Transmitter output power | Tolerances | |
|---|---|---|---|---|---|---|---|
| 2 | 3 | 4 | 5 | | dBm | normal | extreme |
| · | | | | 2 | 39 | +/-2 dB | +/-2,5 dB |
| · | · | | | 3 | 37 | +/-3 dB*) | +/-4 dB*) |
| · | · | | | 4 | 35 | +/-3 dB | +/-4 dB |
| · | · | · | | 5 | 33 | +/-3 dB*) | +/-4 dB*) |
| · | · | · | | 6 | 31 | +/-3 dB | +/-4 dB |
| · | · | · | · | 7 | 29 | +/-3 dB*) | +/-4 dB*) |
| · | · | · | · | 8 | 27 | +/-3 dB | +/-4 dB |
| · | · | · | · | 9 | 25 | +/-3 dB | +/-4 dB |
| · | · | · | · | 10 | 23 | +/-3 dB | +/-4 dB |
| · | · | · | · | 11 | 21 | +/-3 dB | +/-4 dB |
| · | · | · | · | 12 | 19 | +/-3 dB | +/-4 dB |
| · | · | · | · | 13 | 17 | +/-3 dB | +/-4 dB |
| · | · | · | · | 14 | 15 | +/-3 dB | +/-4 dB |
| · | · | · | · | 15 | 13 | +/-3 dB | +/-4 dB |
| · | · | · | · | 16 | 11 | +/-5 dB | +/-6 dB |
| · | · | · | · | 17 | 9 | +/-5 dB | +/-6 dB |
| · | · | · | · | 18 | 7 | +/-5 dB | +/-6 dB |
| · | · | · | · | 19 | 5 | +/-5 dB | +/-6 dB |

*) When the power control level corresponds to the power class of the MS, then the tolerances shall be 2,0 dB under normal test conditions and 2,5 dB under extreme test conditions.

GSM 400, GSM 700, GSM 850 and GSM 900 only - end

DCS 1 800 only - begin

**Table 13.16.2-2: DCS 1 800 transmitter output power for different power classes**

| Power class | | | Power control level | Transmitter output power | Tolerances | |
|---|---|---|---|---|---|---|
| 1 | 2 | 3 | | dBm | normal | extreme |

| · | · | · | 11 | 8 | +/-4 dB | +/-5 dB |
| · | · | · | 12 | 6 | +/-4 dB | +/-5 dB |
| · | · | · | 13 | 4 | +/-4 dB | +/-5 dB |
| · | · | · | 14 | 2 | +/-5 dB | +/-6 dB |
| · | · | · | 15 | 0 | +/-5 dB | +/-6 dB |

*) When the power control level corresponds to the power class of the MS, then the tolerances shall be 2,0 dB under normal test conditions and 2,5 dB under extreme test conditions.

PCS 1 900 only - end

b) The difference between the transmitter output power at two adjacent power control levels, measured at the same frequency, shall not be less than 0,5 dB and not be more than 3,5 dB. For PCS 1 900 Class 3 the difference between the transmitter output power at power controls level 30 and 31, measured at the same frequency, shall not be less than 0 dB and not be more than 2 dB.

c) The power/time relationship of the measured samples for normal bursts shall be within the limits of the power time template of figure 13-7-2 (GSM 11.10) at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

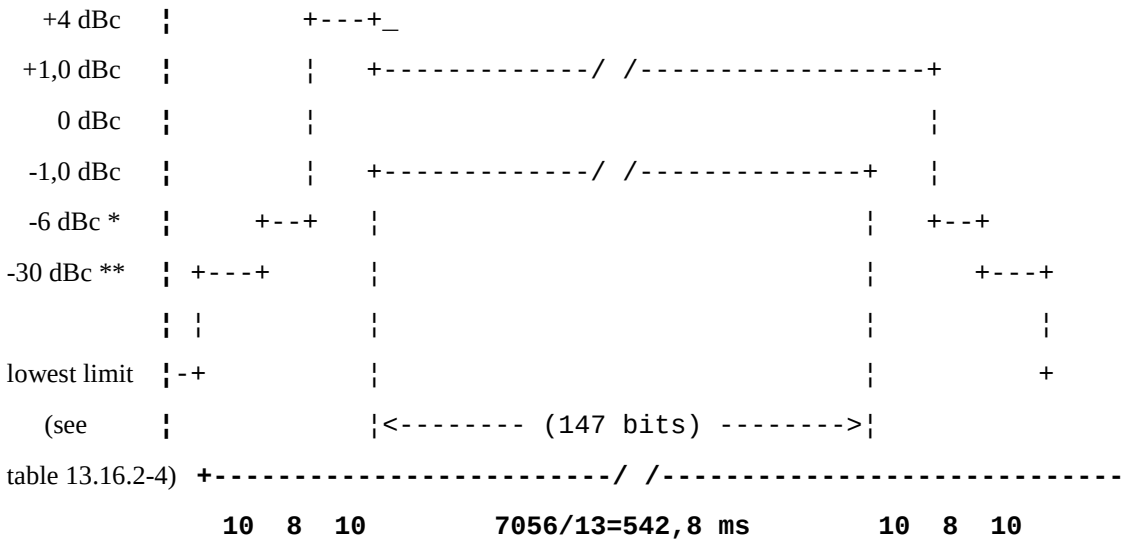

**Figure 13.16.2-1: Power / time template for normal bursts**

* For GSM400, GSM 700, GSM 850 and GSM900 MS:

-4 dBc for power control level 16

-2 dBc for power control level 17

-1 dBc for power control levels 18 and 19

For DCS1800 and PCS 1900 MS: -4 dBc for power control level 11

-2 dBc for power control level 12

-1 dBc for power control levels 13, 14 and 15

** For GSM400, GSM 700, GSM 850 and GSM900 MS:

-30 dBc or -17 dBm, whichever is the higher

For DCS1800 and PCS 1900MS: -30 dBc or -20 dBm, whichever is the higher

**Table 13.16.2-4: Lowest measurement limit for power / time template**

| | lowest limit |
|---|---|
| GSM400, GSM 700, GSM 850, GSM900 | -59 dBc or -54 dBm whichever is the highest, except for the timeslot preceding the active slot, for which the allowed level is -59 dBc or -36 dBm, whichever is the highest |
| DCS1800 PCS 1900 | -48 dBc or -48 dBm whichever is the highest |

d) All the power control levels, for the type and power class of the MS as stated by the manufacturer, shall be implemented in the MS.

e) When the transmitter is commanded to a power control level outside of the capability corresponding to the type and power class of the MS as stated by the manufacturer, then the transmitter output power shall be within the tolerances for the closest power control level corresponding to the type and power class as stated by the manufacturer.

f) The power/time relationship of the measured samples for access bursts shall be within the limits of the power time template of figure 13-7-3 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

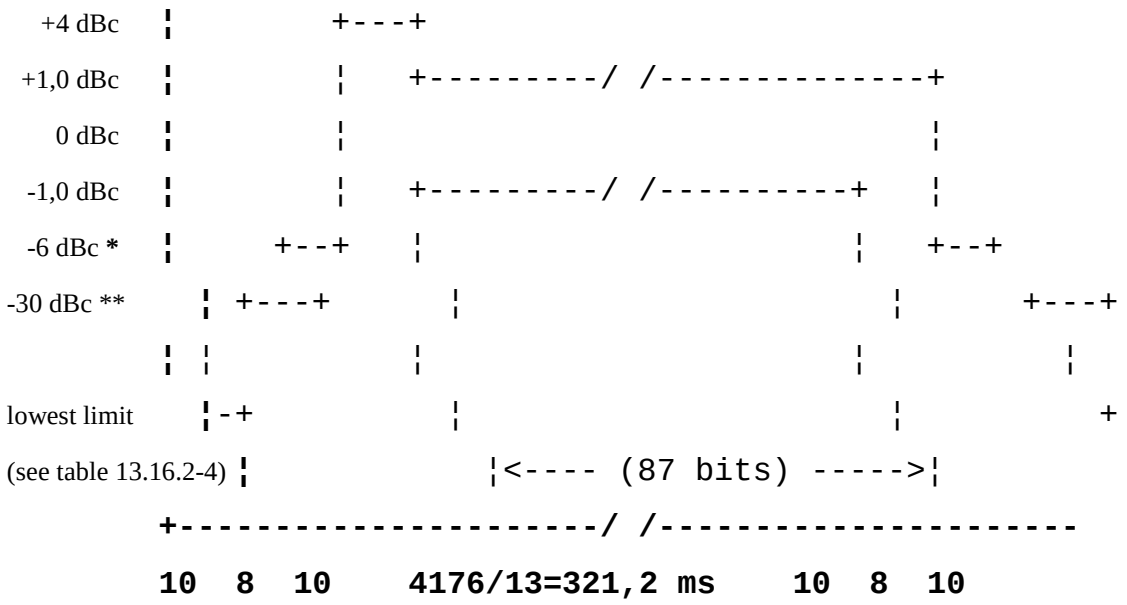

**Figure 13.16.2-2: Power / time template for access burst**

* For GSM400, GSM 700, GSM 850 and GSM900 MS:

-4 dBc for power control level 16

-2 dBc for power control level 17

-1 dBc for power control levels 18 and 19

For DCS1800 and PCS 1900 MS: -4 dBc for power control level 11

-2 dBc for power control level 12

-1 dBc for power control levels 13, 14 and 15

** For GSM400, GSM 700, GSM 850 and GSM900 MS:

-30 dBc or -17 dBm, whichever is the higher

For DCS1800 and PCS 1900 MS: -30 dBc or -20 dBm, whichever is the higher

## 13.16.3 Output RF spectrum in GPRS multislot configuration

### 13.16.3.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MS and any multiband MS, which are capable of GPRS multislot operation on the uplink.

### 13.16.3.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in GSM 05.05, 4.2.1, table a) for GSM 400, GSM 700, GSM 850 and GSM 900, table b) for DCS 1 800 or table c) for PCS 1 900, with the following lowest measurement limits:

   - -36 dBm below 600 kHz offset from the carrier,
   - -51 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or -56 dBm for DCS 1 800 and PCS 1 900 from 600 kHz out to less than 1 800 kHz offset from the carrier,
   - -46 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or -51 dBm for DCS 1 800 and PCS 1 900 at and beyond 1 800 kHz offset from the carrier,

   but with the following exceptions at up to -36 dBm:

   - up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier,
   - up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.

   1.1 Under normal conditions; GSM 05.05, 4.2.1.

   1.2 Under extreme conditions; GSM 05.05, 4.2.1; GSM 05.05, annex D D.2.1, D.2.2.

2. The level of the output RF spectrum due to switching transients shall be no more than given in GSM 05.05, 4.2.2, table "a) Mobile Station:".

   2.1 Under normal conditions; GSM 05.05, 4.2.2.

   2.2 Under extreme conditions; GSM 05.05, 4.2.2; GSM 05.05 annex D D.2.1, D.2.2.

3. When allocated a channel, the power emitted by a GSM 400, GSM 900 and DCS 1 800 MS, in the band 935 to 960 MHz shall be no more than -79 dBm, in the band 925 to 935 MHz shall be no more than -67 dBm and in the band 1 805 to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 to 960 MHz and 1 805 to 1 880 MHz where exceptions at up to -36 dBm are permitted. For GSM 400 MS, in addition, the power emitted by MS, in the bands of 460.4 to 467.6 MHz and 488.8 to 496 MHz shall be no more than –67 dBm except in three measurements in each of the bands 460.4 to 467.6 MHz and 488.8 to 496 MHz where exceptions at up to –36 dBm are permitted. For GSM 700 and GSM 850, the power emitted by MS, in the band of 747 to 757 MHz shall be no more than –79 dBm, in the band of 757 to 762 MHz shall be no more than –73 dBm, in the band 869 to 894 MHz shall be no more than –79 dBm, in the band 1 930 to 1 990 MHz shall be no more than –71 dBm except in five measurements in each of the bands 747 to 762 MHz, 869 to 894 MHz and 1 930 to 1 990 MHz where exceptions at up to –36 dBm are permitted. For PCS 1 900 MS, the power emitted by MS, in the band 869 to 894 MHz shall be no more than –79 dBm, in the band 1 930 to 1 990 MHz shall be no more than –71 dBm except in five measurements in each of the bands 869 to 894 MHz and 1 930 to 1 990 MHz where exceptions at up to –36 dBm are permitted. Under normal conditions; GSM 05.05, 4.3.3.

### 13.16.3.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1 in the GPRS multislot configurations.

   1.1 Under normal conditions.

   1.2 Under extreme conditions.

2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 in the GPRS multislot configurations when a reasonable margin is allowed for the effect of spectrum due to modulation.

   2.1 Under normal conditions.

   2.2 Under extreme conditions.

3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3 in the GPRS multislot configurations.

### 13.16.3.4 Method of test

#### 13.16.3.4.1 Initial conditions

The test shall be run under the default GPRS conditions defined in section 40.

The MS shall be operated with its highest number of uplink slots.

The Test Mode defined in GSM Rec. 4.14 (par 5.4) will be utilised. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks

Mode (b) transmitting looped-back RLC data blocks

then Mode (a) will be used.

If Mode (b) is used then the SS sends the psuedo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.The SS shall use a level of 23 dBμVemf( ).

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to cell re-select the MS between the three channels tested at the appropriate time.

#### 13.16.3.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.

b) The other settings of the spectrum analyser are set as follows:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 30 kHz
- Video averaging: may be used, depending on the implementation of the test

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst in one of the active time slots is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.

d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

For GSM 400, GSM 900 and DCS 1 800:

at 200 kHz intervals over the band 925 - 960 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1805 - 1880 MHz for each measurement over 50 bursts.

in addition for GSM 400 MS:

at 200 kHz intervals over the band 460.4 to 467.6 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 488.8 to 496 MHz for each measurement over 50 bursts.

For GSM 700 and GSM 850:

at 200 kHz intervals over the band 747 to 762 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 869 - 894 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1930 – 1990 MHz for each measurement over 50 bursts.

For PCS 1 900:

at 200 kHz intervals over the band 869 - 894 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1930 – 1990 MHz for each measurement over 50 bursts.

e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).

f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

FT

FT + 100 kHz FT - 100 kHz

FT + 200 kHz FT - 200 kHz

FT + 250 kHz FT - 250 kHz

FT + 200 kHz * N FT - 200 kHz * N

where N = 2, 3, 4, 5, 6, 7, and 8

and FT = RF channel nominal centre frequency.

g) Steps a) to f) is repeated except that in step a) the spectrum analyzer is gated so that the burst of the next active time slot is measured.

h) The spectrum analyser settings are adjusted to:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 100 kHz
- Peak hold

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level in every transmitted time slot.

i) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

FT + 400 kHz FT - 400 kHz

FT + 600 kHz FT - 600 kHz

FT + 1,2 MHz FT - 1,2 MHz

FT + 1,8 MHz FT - 1,8 MHz

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

j) Step i) is repeated for power control levels 7 and 11.

k) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the Low ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.

l) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.

m) Steps a) b) f) h), and i) are repeated under extreme test conditions (annex 1, TC2.2). except that at step h) the MS is commanded to power control level 11.

#### 13.16.3.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 450.4 to 457.6 MHz, 478.8 to 486 MHz, 777 to 792 MHz, 824 to 849 MHz, 880 to 915 MHz, 1710 to 1785 MHz, or 1 850 to 1 910 MHz, the temporary antenna connector coupling factor, determined according to 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 925 to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS. For a GSM 400, GSM 700, GSM 850, DCS 1 800 or PCS 1900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1805 to 1880 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for DCS 1 800 MS. For a GSM 400, GSM 700, GSM 850, GSM 900 or PCS 1900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 460.4 to 467.6 MHz or 488.8 to 496 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 400 MS. For a GSM 700, GSM 850, GSM 900, DCS 1800 or PCS 1900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 747 to 762 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 700 MS. For a GSM 400, GSM 850, GSM 900 or DCS 1800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 869 to 894 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 850 MS. For a GSM 400, GSM 700, GSM 900 or DCS 1800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1930 to 1990 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for PCS 1 900 MS. For GSM 400, GSM 900 or DCS 1 800 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference GSM 05.05 section 4.2.1).

a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), i), k), l) and m) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 13.16.3-1 for GSM 400, GSM 700, GSM 850 and GSM 900, table 13.16.3-2 for DCS 1 800 or table 13.16.3-3 for PCS 1 900 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

**Table 13.16.3-1: GSM 400, GSM 700, GSM 850 and GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| | power levels in dB relative to the measurement at FT | | | | |
|---|---|---|---|---|---|
| **Power level** | **Frequency offset (kHz)** | | | | |
| **(dBm)** | **0-100** | **200** | **250** | **400** | **600 to <1800** |
| 39 | +0,5 | -30 | -33 | -60 | -66 |
| 37 | +0,5 | -30 | -33 | -60 | -64 |
| 35 | +0,5 | -30 | -33 | -60 | -62 |
| <= 33 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -51 |

**Table 13.16.3-2: DCS 1 800 Spectrum due to modulation out to less than 1 800 kHz offset**

| | power levels in dB relative to the measurement at FT | | | | |
|---|---|---|---|---|---|
| **Power level** | **Frequency offset (kHz)** | | | | |
| **(dBm)** | **0-100** | **200** | **250** | **400** | **600 to <1800** |
| <= 36 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -56 |

**Table 13.16.3-3: PCS 1 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| | power levels in dB relative to the measurement at FT | | | | | |
|---|---|---|---|---|---|---|
| **Power level** | **Frequency offset (kHz)** | | | | | |
| **(dBm)** | **0-100** | **200** | **250** | **400** | **600 to <1200** | **1200 to <1800** |
| <= 33 | +0,5 | -30 | -33 | -60 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | | |
| | -36 | -36 | -36 | -36 | -56 | -56 |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 13.16.3-4 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

**Table 13.16.3-4: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)**

| power levels in dB relative to the measurement at FT | | | | | | | | | |

| | < 3000 | < 6000 | | | < 6000 | | | < 6000 | |
| 39 | -69 | -71 | -77 | 36 | -71 | -79 | 33 | -68 | -76 |
| 37 | -67 | -69 | -75 | 34 | -69 | -77 | 32 | -67 | -75 |
| 35 | -65 | -67 | -73 | 32 | -67 | -75 | 30 | -65 | -73 |
| <= 33 | -63 | -65 | -71 | 30 | -65 | -73 | 28 | -63 | -71 |
| | | | | 28 | -63 | -71 | 26 | -61 | -69 |
| | | | | 26 | -61 | -69 | <= 24 | -59 | -67 |
| | | | | <= 24 | -59 | -67 | | | |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | | | | | |
| | -46 | -46 | -46 | | -51 | -51 | | -51 | -51 |

c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.

d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.

e) For GSM 400, GSM 900 and DCS 1 800 MS the MS spurious emissions in the bands 925 - 935 MHz, 935 - 960 MHz and 1 805 - 1 880 MHz, measured in step d), shall not exceed the values shown in table 13.16.3-5 except in up to five measurements in the band 925 to 960 MHz and five measurements in the band 1 805 to 1 880 MHz where a level up to -36 dBm is permitted. For GSM 400 MS, in addition, the MS spurious emissions in the bands 460.4 to 467.6 MHz and 488.8 to 496 MHz shall not exceed the value of –67 dBm, except in up to three measurements in each of the bands 460.4 to 467.6 MHz and 488.8 to 496 MHz where a level up to –36 dBm is permitted. For GSM 700 and GSM 850 the spurious emissions in the bands 747 to 757 MHz, 757 to 762 MHz, 869 - 894 MHz and 1930 – 1990 MHz shall not exceed the values shown in table 13.16.3-4 except in up to five measurements in each of the bands 747 to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to –36 dBm is permitted. For PCS 1 900 MS the spurious emissions in the bands 869 - 894 MHz and 1930 – 1990 MHz shall not exceed the values shown in table 13.16.3-5 except in up to five measurements in each of the bands 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to –36 dBm is permitted.

**Table 13.16.3-5: Spurious emissions in the MS receive bands**

| Band (MHz) | Spurious emissions level (dBm) | |
|---|---|---|
| | GSM400, GSM900 and DCS1800 | PCS1900 |
| 925 to 935 | -67 | |
| 935 to 960 | -79 | |
| 1805 to 1880 | -71 | |
| 747 to 757 | | -79 |
| 757 to762 | | -73 |
| 869 to 894 | | -79 |
| 1930 to 1990 | | -71 |

f) For the power ramp sidebands of steps h), i) and k) the power levels must not exceed the values shown in table 13.16.3-6 for GSM 400, GSM 700, GSM 850 and GSM 900, table 13.16.3-7 for DCS 1 800 or table 13.16.3-8 for PCS 1 900.

**Table 13.16.3-6: GSM Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency | | | |
|---|---|---|---|---|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 39 dBm | -13 dBm | -21 dBm | -21 dBm | -24 dBm |
| 37 dBm | -15 dBm | -21 dBm | -21 dBm | -24 dBm |
| 35 dBm | -17 dBm | -21 dBm | -21 dBm | -24 dBm |
| 33 dBm | -19 dBm | -21 dBm | -21 dBm | -24 dBm |
| 31 dBm | -21 dBm | -23 dBm | -23 dBm | -26 dBm |
| 29 dBm | -23 dBm | -25 dBm | -25 dBm | -28 dBm |
| 27 dBm | -23 dBm | -26 dBm | -27 dBm | -30 dBm |
| 25 dBm | -23 dBm | -26 dBm | -29 dBm | -32 dBm |
| 23 dBm | -23 dBm | -26 dBm | -31 dBm | -34 dBm |
| <= +21 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

**Table 13.16.3-7: DCS 1 800 Spectrum due to switching transients**

| 30 dBm | -22 dBm | -24 dBm | -24 dBm | -27 dBm |
| 28 dBm | -23 dBm | -25 dBm | -26 dBm | -29 dBm |
| 26 dBm | -23 dBm | -26 dBm | -28 dBm | -31 dBm |
| 24 dBm | -23 dBm | -26 dBm | -30 dBm | -33 dBm |
| 22 dBm | -23 dBm | -26 dBm | -31 dBm | -35 dBm |
| <= +20 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

NOTE 2: These figures are different from the requirements in GSM 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 13.16.3-6, table 13.16.3-7 and table 13.16.3-8 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at <1 800 kHz.

# 13.17 EGPRS transmitter tests

## 13.17.1 Frequency error and Modulation accuracy in EGPRS Configuration

### 13.17.1.1 Definition and applicability

The frequency error is the difference in frequency, after adjustment for the effect of the modulation accuracy between the RF transmission from the MS and either:

- the RF transmission from the BS, or
- the nominal frequency for the ARFCN used.

Modulation Accuracy

For GMSK, the modulation accuracy of the transmitted signal is described as the phase accuracy (phase error) of the GMSK modulated signal. The phase error for GSMK modulation is the difference in phase, after adjustment for the effect of the frequency error, between the RF transmission from the MS and the theoretical transmission according to the intended modulation.

Since the conformance requirement, test procedure and test requirement for GMSK modulation accuracy (RMS Phase error and maximum peak deviation) are defined in section 13.16.1 for GPRS MS, being thereby defined also for all EGPRS MS in that section, only 8PSK modulation accuracy conformance requirement, test procedure and test requirement are defined in this section.

For 8-PSK, the error vector between the vector representing the transmitted signal and the vector representing the error-free modulated signal defines modulation accuracy. The magnitude of the error vector is called Error Vector Magnitude (EVM). Origin suppression is defined to be the ratio of the carrier leakage to the modulated signal.

The requirements and this test apply to EGPRS MS which are capable of 8PSK modulated transmission in the uplink. For multiband MS, requirements and this test apply to all applicable bands.

### 13.17.1.2 Conformance requirement

1. The carrier frequency under 8PSK modulation shall be accurate to within 0,2ppm for GSM 400 and 0,1 ppm for all other bands compared to signals received from the BS.

   1.1 Under normal conditions; GSM 05.10, 6.1.

   1.2 Under vibration conditions; GSM 05.10, 6.1; GSM 05.05, annex D D.2.3.

   1.3 Under extreme conditions; GSM 05.10, 6.1; GSM 05.05, 4.4; GSM 05.05, annex D D.2.1, D.2.2.

2. The RMS EVM over the useful part of any burst of the 8-PSK modulated signal shall not exceed:

   4.1 9.0% Under normal conditions; GSM 05.05, 4.6.2.1

   4.2 10.0% Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.

3. The peak EVM values of any burst of the 8PSK modulated signal shall be ≤ 30%

   5.1 Under normal conditions; GSM 05.05, 4.6.2.3.

   5.2 Under extreme conditions; GSM 05.05, 4.6.2.3; GSM 05.05, annex D D.2.1, D.2.2.

4. The 95:th-percentile value of any burst of the 8-PSK modulated signal shall be ≤15%.

   6.1 Under normal conditions; GSM 05.05, 4.6.2.4.

   6.2 Under extreme conditions; GSM 05.05, 4.6.2.4; GSM 05.05, annex D D.2.1, D.2.2.

5. The Origin Offset Suppression for any 8PSK modulated signal shall exceed 30dB.

   7.1 Under normal conditions; 05.05 4.6.2.2.

7.2 Under extreme conditions; 05.05 4.6.2.2; GSM 05.05, annex D D.2.1, D.2.2.

#### 13.17.1.3 Test purpose

To verify that the carrier frequency error does not exceed conformance requirement 1:

1.1 Under normal conditions

1.2 When the MS is being vibrated

1.3 Under extreme conditions

To verify that the RMS EVM over the useful part of the burst, excluding tail bits, transmitted by the MS does not exceed conformance requirement 2:

4.1 Under normal conditions

4.2 When the MS is being vibrated

4.3 Under extreme conditions

To verify that the peak EVM values over the useful part of the burst, excluding tail bits, transmitted by the MS does not exceed conformance requirement 3:

5.1 Under normal conditions

5.2 When the MS is being vibrated

5.3 Under extreme conditions

To verify that the 95:th percentile EVM over the useful part of any burst, excluding tail bits, does not exceed conformance requirement 4:

6.1 Under normal conditions

6.2 When the MS is being vibrated

6.3 Under extreme conditions

To verify that the origin offset suppression does exceed conformance requirement 5:

7.1 Under normal conditions

7.2 When the MS is being vibrated

7.3 Under extreme conditions

#### 13.17.1.4 Method of the test

##### Initial conditions

The test shall be run under the default EGPRS conditions defined in section 50.

The SS shall command the MS to hopping mode (for the choice of frequencies in the frequency hopping mode, see section 6.2 and tables 6-1 and 6-2)

NOTE: It is not necessary to test in hopping mode but is done here as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to make sure bursts are taken from a few different channels.

The MS shall be operated with its highest number of uplink slots.

The Test Mode defined in 3GPP TS 04.14 Sect. 5.4 shall be utilised. If the MS I s capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks

Mode (b) transmitting looped-back RLC data blocks

then Mode (a) will be used.

For the 8PSK procedure described below, the initial power value of each active timeslot shall be set to a mid-range power value.

13.17.1.4.2 Test procedure

Procedure for 8PSK Frequency error and modulation accuracy measurements

a) For one transmitted burst on the last slot of the multislot configuration, the SS captures the transmitted signal by taking at least four samples per symbol. The transmitted signal is modeled by:

$$Y(t) = C1\{R(t) + D(t) + C0\}W^t$$

R(t) is defined to be an ideal transmitter signal

D(t) is the residual complex error on signal R(t)

C0 is a constant origin offset representing carrier feedthrough

C1 is a complex constant representing the arbitrary phase and output power of the transmitter

$W = e^{\alpha + j\,2\pi f}$ accounts for both a frequency offset of "$2\pi f$" radians per second phase rotation and an amplitude change of "$\alpha$" nepers per second

The symbol timing phase of Y(t) is aligned with R(t).

b) The SS shall generate the ideal transmitter signal as a reference. The ideal transmitter signal can be constructed from a priori knowledge of the transmitted symbols or from the demodulated symbols of the transmitted burst. In the latter case, unknown symbols shall be detected with an error rate sufficiently small to ensure the accuracy of the measurement equipment (see Annex 5).

c.1) The transmitted signal Y(t) is compensated in amplitude, frequency and phase by multiplying with the factor:

$$W^{-t}/C1$$

The values for W and C1 are determined using an iterative procedure. W($\alpha$,f), C1 and C0 are chosen to minimise the RMS value of EVM on a burst-by-burst basis.

c.2) After compensation, Y(t) is passed through the specified measurement filter (GSM 05.05, 4.6.2) to produce the signal

$$Z(k) = S(k) + E(k) + C0$$

where

S(k) is the ideal transmitter signal observed through the measurement filter

k = floor($t/T_s$), where $T_s$ =1/270.833kHz corresponding to the symbol times

c.3) The error vector is defined to be:

$$E(k) = Z(k) - C0 - S(k)$$

It is measured and calculated for each instant k over the useful part of the burst excluding tail bits. The RMS vector error is defined as:

$$\text{RMS EVM} = \sqrt{\sum_{k\in K}\left|E(k)\right|^2 / \sum_{k\in K}\left|S(k)\right|^2}$$

c.4) Steps c.1) to c.3) are repeated with successive approximations of W(α,f), C1 and C0 until the minimum value of RMS EVM is found. The minimised value of RMS EVM and the final values for C1, C0 and f are noted. (f represents the frequency error of the burst).

d) For each symbol in the useful part of the burst excluding tail bits, the SS shall calculate the error vector magnitude as:

$$EVM(k) = \sqrt{\frac{|E(k)|^2}{\frac{\sum_{k \in K} |S(k)|^2}{N}}}$$

The peak value of symbol EVM in the useful part of the burst, excluding tail bits, is noted.

e) The SS shall calculate the value for Origin Offset Suppression for the burst as:

$$OOS = \left( \frac{|C_o|^2}{\frac{1}{N} \sum_{k \in K} |S(k)|^2} \right)$$

f) Steps a) to e) are repeated for a total of 200 bursts.

g) The peak values of symbol EVM noted in step d) are averaged for the 200 measured bursts.

h) The origin offset suppression values derived in step e) are averaged for the 200 measured bursts. The resulting average is converted to log format.

$$OOS(dB) = -10 \log(OOS)$$

i) From the distribution of symbol EVM values calculated in step d) for the 200 measured bursts, the SS shall determine the 95:th percentile value.

j) The SS instructs the MS to its maximum power control level by setting the power control parameter ALPHA (α) to 0 and GAMMA_TN ($\Gamma_{CH}$) for each timeslot to the desired power level in the Packet Uplink Assignment or Packet Timeslot Reconfigure message (Closed Loop Control, see 05.08. Annex B.2), all other conditions remaining constant. Steps a) to i) are repeated.

k) The SS instructs the MS to the minimum power control level, all other conditions remaining constant. Steps a) to i) are repeated.

l) The MS is hard mounted on a vibration table and vibrated at the frequency/amplitudes specified in annex 1, TC4.

During the vibration steps a) to i) are repeated.

NOTE: If the call is terminated when mounting the MS to the vibration table, it will be necessary to establish the initial conditions again before repeating steps a) to i).

m) The MS is re-positioned on the vibration table in the two orthogonal planes to the plane used in step k). For each of the orthogonal planes step l) is repeated.

n) Steps a) to i) are repeated under extreme test conditions (see annex 1, TC2.2).

#### 13.17.1.5 Test Requirements

1. For all measured bursts, the frequency error, derived in step c.4), shall be less than 10E-7.

2. For all measured bursts, the RMS EVM, derived in step c.3) shall not exceed 9.0% under normal conditions and 10.0% under extreme conditions.

3. The (averaged) value of peak EVM derived in step g) shall not exceed 30%.

4. The 95:th percentile value derived in step i) shall not exceed 15%.

5. The origin offset suppression derived in Clause 13.17.1.4.2 step h) shall exceed 30dB for MS.

## 13.17.2 Frequency error under multipath and interference conditions.

### 13.17.2.1 Definition and applicability

The frequency error under multipath and interference conditions is a measure of the ability of the MS to maintain frequency synchronization with the received signal under conditions of Doppler shift, multipath reception and interference.

The requirements and this test apply to all EGPRS MSs. For multiband MS, requirements and this test apply to all applicable bands

### 13.17.2.2 Conformance requirement

1. The MS carrier frequency error for each burst shall be accurate to within 0,1 ppm for GSM 700, GSM 850, GSM 900, DCS 1800, PCS 1900 and 0,2 ppm for GSM 400 compared to signals received from the BS for signal levels down to 3 dB below the reference sensitivity level.

   1.1 Under normal conditions; GSM 05.10, 6/6.1.

   1.2 Under extreme conditions; GSM 05.10, 6/6.1; GSM 05.05 annex D D.2.1, D.2.2.

2. The MS carrier frequency error for each burst shall be accurate to within 0,1 ppm, for GSM 700, GSM 850, GSM 900, DCS 1800 and PCS 1900 and 0,2 ppm for GSM 400 compared to signals received from the BS for 3 dB less carrier to interference ratio than the reference interference ratios; GSM 05.10, 6/6.1.

### 13.17.2.3 Test purpose

1. To verify that the MS carrier frequency error at reference sensitivity, under conditions of multipath and Doppler shift does not exceed 0,1 ppm for GSM 700, GSM 850, GSM900, DCS1800 and PCS 1900 and 0,2 ppm for GSM400 + the frequency error due to the Doppler shift of the received signal and the assessment error in the MS.

   1.1 Under normal conditions.

   1.2 Under extreme conditions.

NOTE: Although the conformance requirement states that frequency synchronization should be maintained for input signals 3 dB below reference sensitivity. Due to the Radio Link Failure counter this test condition cannot be established. Hence all tests in this section are conducted at reference sensitivity level.

2. To verify that the MS carrier frequency error, under interference conditions and TUlow fading profile, does not exceed 0,1 ppm for GSM 700, GSM 850, GSM900, DCS1800 and PCS 1900 and 0,2 ppm for GSM400 + the frequency error due to the Doppler shift of the received signal and the assessment error in the MS.

NOTE: The test adds the effect of Doppler shift to the requirements as the conformance requirement refers to signals input to the MS receiver whereas the frequency reference for measurement will not take account of the Doppler shift.

### 13.17.2.4 Method of test

This test uses the same measurement process as test 13.16.1 for GMSK modulated uplink transmission and 13.17.1 for 8PSK modulated uplink transmission for the MS operating under various RF conditions.

NOTE: The BA list sent on the BCCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCH but if they are provided none will be within 5 channels of the ARFCN used for the serving BCCH or PDTCH.

EGPRS Switched Radio Loopback Mode (3GPP TS 04.14, section 5.5) shall be utilised. This is since 8PSK modulated transmission is applied in the downlink during the test and EGPRS Switched Radio Loopback Mode is the only mandatory test mode for EGPRS MS that implements different modulations between concurrent downlink and uplink transmission. This test requires such test mode capability since an EGPRS MS is also allowed to support only GMSK modulated uplink transmission.

#### 13.17.2.4.1 Initial conditions

The MS is brought into the packet idle GPRS attached state on a serving cell with BCCH in the mid ARFCN range. The level of the serving cell BCCH is set to 10 dB above the reference sensitivity level( ) and the fading function set to RA. The SS waits 30 s for the MS to stabilize to these conditions.

#### 13.17.2.4.2 Procedure

a) The SS is set up to capture the first burst transmitted by the MS during the uplink TBF. EGPRS Switched Radio Block Loop Back Mode is initiated by the SS according to the procedure defined in 3GPP TS 04.14; 5.5.1 on a channel in the mid ARFCN range. The PDTCH level is set to 10 dB above the reference sensitivity level( ) and the fading function is set to RA. 8PSK modulated downlink transmission shall be utilised.

b) The SS calculates the frequency accuracy of the captured burst as described in test 13.16.1 for MS capable of only GMSK modulated transmission in the uplink. For MS capable of both GMSK and 8PSK modulated transmission in the uplink the frequency accuracy of the captured burst shall be calculated as described in the test 13.17.1.

c) The SS sets the serving cell BCCH and PDTCH to the reference sensitivity level( ) applicable to the type of MS, still with the fading function set to RA and then waits 30 s for the MS to stabilize to these conditions.

d) The SS shall capture subsequent bursts from the traffic channel in the manner described in test 13.16.1 or 13.17.1.

NOTE: Due to the very low signal level at the MS receiver input the MS receiver is liable to error. The “looped back” bits are therefore also liable to error, and hence the SS does not know the expected bit sequence. The SS will have to demodulate the received signal to derive (error free) the transmitter burst bit pattern. Using this bit pattern the SS can calculate the expected phase trajectory according to the definition within GSM 05.04.

e) The SS calculates the frequency accuracy of the captured burst as described in test 13.16.1 or 13.17.1.

f) Steps d) and e) are repeated for 5 traffic channel bursts spaced over a period of not less than 20 s.

g) Both downlink and uplink TBFs are terminated. The initial conditions are established again and steps a) to f) are repeated but with the fading function set to HT200 for GSM400, HT120 for GSM700 and HT100 for all other bands.

h) The initial conditions are established again and steps a) to f) are repeated but with the fading function set to TU100 for GSM400, TU60 for GSM700 and TU50 for all other bands.

i) The initial conditions are established again and steps a) and b) are repeated but with the following differences:

- the levels of the BCCH and PDTCH are set to 18 dB above reference sensitivity level( ).

- two further independent 8-PSK modulated interfering signals are sent on the same nominal carrier frequency as the BCCH and PDTCH and at a level 10 dB below the level of the PDTCH and modulated with random data, including the midamble.

- the fading function for all channels is set to TUlow.

j) The SS waits 100 s for the MS to stabilize to these conditions.

k) Repeat steps d) to f), except that at step f) the measurement period must be extended to 200 s and the number of measurements increased to 20.

l) The initial conditions are established again and steps a) to k) are repeated for ARFCN in the Low ARFCN range.

m) The initial conditions are established again and steps a) to k) are repeated for ARFCN in the High ARFCN range.

n) Repeat step h) under extreme test conditions (see annex 1, TC2.2).

#### 13.17.2.5 Test requirements

The frequency error, with reference to the SS carrier frequency as measured in repeats of step e), for each measured burst shall be less than the values shown in table 13-17-1.

**Table 13-17-1: Requirements for frequency error under multipath, Doppler shift and interference conditions**

| GSM 400 | | GSM 850 & GSM 900 | | DCS 1 800 & PCS 1900 | |
|---|---|---|---|---|---|
| **Propagation condition** | **Permitted frequency error** | **Propagation condition** | **Permitted frequency error** | **Propagation condition** | **Permitted frequency error** |
| RA500 | +/- 300 Hz | RA250 | +/- 300 Hz | RA130 | +/- 400 Hz |
| HT200 | +/- 180 Hz | HT100 | +/- 180 Hz | HT100 | +/- 350 Hz |
| TU100 | +/- 160 Hz | TU50 | +/- 160 Hz | TU50 | +/- 260 Hz |
| TU6 | +/- 230 Hz | TU3 | +/- 230 Hz | TU1,5 | +/- 320 Hz |

| GSM 700 | |
|---|---|
| **Propagation condition** | **Permitted frequency error** |
| RA 300 | +/- 300 Hz |
| HT 120 | +/- 180 Hz |
| TU 60 | +/- 160 Hz |
| TU 3.6 | +/- 230 Hz |

## 13.17.3 EGPRS Transmitter output power

#### 13.17.3.1 Definition and applicability

The transmitter output power is the average value of the power delivered to an artificial antenna or radiated by the MS and its integral antenna, over the time that the useful information bits of one burst are transmitted.

Since the conformance requirement, test procedure and test requirement of GSMK modulated signal's output power are defined in section 13.16.2 for GPRS MS, being thereby defined also for all EGPRS MS in that section, only 8PSK modulated signal's output power conformance requirement, test procedure and test requirements are defined in this section.

The requirements and this test apply to all EGPRS MS capable of 8PSK modulated uplink transmission.

#### 13.17.3.2 Conformance requirement

1. The MS maximum output power for 8-PSK modulated signal shall be as defined in GSM 05.05, 4.1.1, second table, according to its power class, with a tolerances of +/-2; +/-3; +3/-4 dB defined under normal conditions in the GSM 05.05, 4.1.1, second table.

2. The MS maximum output power for 8-PSK modulated signal shall be as defined in GSM 05.05, 4.1.1, second table, according to its power class, with a tolerances of +/-2.5; +/-4; +4/-4.5 dB defined under extreme conditions in the GSM 05.05, 4.1.1, second table.

3. The power control levels for 8-PSK shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, third table (for GSM400, GSM 700, GSM 850 & GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1900), from the lowest power control level up to the maximum output power corresponding to the class of the

MS (for tolerance on maximum output power see conformance requirement 1), with a tolerance of +/-2;+/- 3, 4 or 5 dB under normal conditions; GSM 05.05, 4.1.1, third, fourth or fifth table.

4. The power control levels for 8-PSK shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, third table (for GSM 400, GSM 700, GSM 850 & GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1900), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 2), with a tolerance of +/-2.5;+/- 4, 5 or 6 dB under extreme conditions; GSM 05.05, 4.1.1, third, fourth or fifth table; GSM 05.05 annex D D.2.1, D.2.2.

5. For 8-PSK, the output power actually transmitted by the MS at consecutive power control levels shall form a monotonic sequence and the interval between power control levels shall be 2 +/- 1,5 dB; GSM 05.05, 4.1.1.

6. The transmitted power level relative to time for a normal burst shall be within the power/time template given in GSM 05.05, annex B bottom figure for 8PSK modulated signal. In the case of Multislot Configurations where the bursts in two or more consecutive time slots are actually transmitted at the same frequency, the template of annex B shall be respected during the useful part of each burst and at the beginning and the end of the series of consecutive bursts. The output power during the guard period between every two consecutive active timeslots shall not exceed the level allowed for the useful part of the first timeslot, or the level allowed for the useful part of the second timeslot plus 3 dB, whichever is the highest.

   6.1 Under normal conditions; GSM 05.05, 4.5.2.

   6.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.

#### 13.17.3.3 Test purpose

1. To verify that the maximum output power of the 8PSK modulated signal of the EGPRS MS, under normal conditions, is within conformance requirement 1.

2. To verify that the maximum output power of the 8PSK modulated signal of the EGPRS MS, under extreme conditions, is within conformance requirement 2.

3. To verify that the maximum output power of the 8-PSK modulated signal of the EGPRS MS capable of 8PSK multislot configuration in the uplink, under normal conditions, is within conformance requirement 1.

4. To verify that the maximum output power of the 8-PSK modulated signal of the EGPRS MS capable of 8PSK multislot configuration in the uplink, under extreme conditions, is within conformance requirement 2.

5. To verify that all power control levels, relevant to the power class of the EGPRS MS for 8PSK modulation, are implemented in the MS and have output power levels, under normal conditions, within conformance requirement 3.6. To verify that all power control levels, relevant to the power class of the EGPRS MS for 8PSK modulation, are implemented in the MS capable of 8PSK multislot configuration in the uplink and have the output power levels, under normal conditions, within conformance requirement 3.

7. To verify that all power control levels, relevant to the power class of the EGPRS MS for 8PSK modulation, have output power levels, under extreme conditions, within conformance requirement 4.8. To verify that all power control levels, relevant to the power class of the EGPRS MS for 8PSK modulation, have output power levels in 8PSK multislot configuration in the uplink, under extreme conditions, within conformance requirement 4.

9. To verify that the step in the output power transmitted by the EGPRS MS at consecutive power control levels for 8PSK modulated signals is within conformance requirement 5 under normal conditions.

10. To verify that the step in the output power transmitted by the EGPRS MS capable of multislot 8PSK configuration in the uplink at consecutive power control levels for 8PSK modulated signals is within conformance requirement 5.

11. To verify that the output power relative to time, when sending a normal burst of the 8-PSK modulated signal is within conformance requirement 6:

    11.1 Under normal conditions.

    11.2 Under extreme conditions.

12. To verify that the output power relative to time, when sending a normal burst of 8PSK modulated signal is within conformance requirement 6 for EGPRS MS capable of 8PSK multislot configuration in the uplink:

    12.1 Under normal conditions

    12.2 Under extreme conditions

NOTE: For EGPRS MS capable of 8PSK multislot configuration in the uplink, the tests are executed only for multislot configuration.

#### 13.17.3.4 Methods of test

Two methods of test are described, separately for:

1) equipment fitted with a permanent antenna connector and for

2) equipment fitted with an integral antenna, and which cannot be connected to an external antenna except by the fitting of a temporary test connector as a test fixture.

NOTE: The behaviour of the MS in the system is determined to a high degree by the antenna, and this is the only transmitter test in this ETS using the integral antenna. Further studies are ongoing on improved testing on the integral antenna, taking practical conditions of MS use into account.

##### 13.17.3.4.1 Method of test for equipment with a permanent antenna connector

###### 13.17.3.4.1.1 Initial conditions

The test shall be run under the default EGPRS conditions defined in section 50.

The Test Mode defined in 3GPP TS 04.14 sect. 5.4 shall be utilised. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks

Mode (b) transmitting looped-back RLC data blocks

Then Mode (a) will be used. The SS orders the MS to transmit on the uplink with 8PSK modulation, on a mid range ARFCN, power control level set to Max power and MS to operate in its highest number of uplink slots.

The SS controls the power level by setting the concerned timeslot's power control parameter ALPHA ($\alpha$) to 0 and GAMMA_TN ($\Gamma_{CH}$) to the desired power level in the Packet Uplink Assignment or Packet Time Slot Reconfigure message (Closed Loop Control, see 05.08. Annex B.2) GPRS_ MS TXPWR_MAX_CCH / MS TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

###### 13.17.3.4.1.2 Test procedure

a) Measurement of normal burst transmitter output power

   For 8PSK, power may be determined by applying the technique described for GMSK in section 13.16.2.4.1.2; step a) and then averaging over multiple bursts to achieve sufficient accuracy (see Annex 5). Alternatively, an estimation technique based on a single burst which can be demonstrated to yield the same result as the long term average may be used. The long term average or the estimate of long term average is used as the 0dB reference for the power/time template.

b) Measurement of normal burst power/time relationship. The array of power samples measured in a) are referenced in time to the centre of the useful transmitted symbols and in power to the 0 dB reference, both identified in a).

c) Steps a) to b) are repeated on each timeslot within the multislot configuration with the MS commanded to operate on each of the power control levels defined, even those not supported by the MS.

d) The SS commands the MS to the maximum power control level supported by the MS and steps a) to b) are repeated on each timeslot within the multislot configuration for ARFCN in the Low and High ranges.

e) The SS commands the MS to the maximum power control level in the first timeslot allocated within the multislot configuration and to the minimum power control level in the second timeslot allocated. Any further timeslots allocated are to be set to the maximum power control level. Steps a) to b) and corresponding measurements on each timeslot within the multislot configuration are repeated. This step is only applicable to MS which support more than one uplink time slot.

f) Steps a) to e) are repeated under extreme test conditions (annex 1, TC2.2) except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

#### 13.17.3.4.2 Method of test for equipment with an integral antenna

NOTE: If the MS is equipped with a permanent connector, such that the antenna can be disconnected and the SS be connected directly, then the method of section 13.17.3.4.1 will be applied.

The tests in this section are performed on an unmodified test sample.

##### 13.17.3.4.2.1 Initial conditions

The MS is placed in the anechoic shielded chamber (annex 1, GC5) or on the outdoor test site, on an isolated support, in the position for normal use, at a distance of at least 3 metres from a test antenna, connected to the SS.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then, in addition, it is necessary to raise/lower the test antenna through the specified height range to maximize the received power levels from both the test sample and the substitution antenna.

The initial conditions for the MS are defined in 13.17.3.4.1.1

##### 13.17.3.4.2.2 Test procedure

a) With the initial conditions set according to subclause 13.17.3.4.2.1 the test procedure in 13.17.3.4.1.2 is followed up to and including step e), except that in step a), when measurements are done at maximum power for ARFCN in the Low, Mid and High range, the measurement is made eight times with the MS rotated by n*45 degrees for all values of n in the range 0 to 7.

The measurements taken are received transmitter output power measurements rather than transmitter output power measurements, the output power measurement values can be derived as follows.

b) Assessment of test site loss for scaling of received output power measurements.

The MS is replaced by a half-wave dipole, resonating at the centre frequency of the transmit band, connected to an RF generator.

The frequency of the RF signal generator is set to the frequency of the ARFCN used for the 24 measurements in step a), the output power is adjusted to reproduce the received transmitter output power averages recorded in step a).

For each indication the power, delivered by the generator (in Watts) to the half-wave dipole, is recorded. These values are recorded in the form Pnc, where n = MS rotation and c = channel number.

For each channel number used compute:

$$\text{Pac(Watts into dipole)} = \frac{1}{8} * \sum_{n=0}^{n=7} \text{Pnc}$$

from which: Pac (Tx dBm) = $10\log_{10}$(Pac) + 30 + 2,15

The difference, for each of the three channels, between the actual transmitter output power averaged over the 8 measurement orientations and the received transmitter output power at orientation n = 0 is used to scale the received measurement results to actual transmitter output powers for all measured power control levels and ARFCN, which can then be checked against the requirements.

c) Temporary antenna connector calibration factors (transmit)

A modified test sample equipped with a temporary antenna connector is placed in a climatic test chamber and is linked to the SS by means of the temporary antenna connector.

Under normal test conditions, the power measurement and calculation parts of steps a) to e) of 13.17.3.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

NOTE: The values noted here are related to the output transmitter carrier power levels under normal test conditions, which are known after step b). Therefore frequency dependent calibration factors that account for the effects of the temporary antenna connector can be determined.

d) Measurements at extreme test conditions.

NOTE: Basically the procedure for extreme conditions is:

- the power/time template is tested in the "normal" way,
- the radiated power is measured by measuring the difference with respect to the radiated power under normal test conditions.

Under extreme test conditions steps a) to e) of 13.17.3.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

The transmitter output power under extreme test conditions is calculated for each burst type, power control level and for every frequency used by adding the frequency dependent calibration factor, determined in c), to the values obtained at extreme conditions in this step.

### 13.17.3.5 Test requirements

a) The transmitter output power for the 8-PSK modulated signals, under every combination of normal and extreme test conditions, for normal bursts, at each frequency and for each power control level applicable to the MS power class, shall be at the relevant level shown in table 13.17.3-1 or table 13.17.3-2 within the tolerances also shown in table 13.17.3-1 or table 13.17.3-2.

GSM 400, GSM 700, GSM 850 & GSM 900 beginning

**Table 13.17.3-1: GSM 400, GSM 700, GSM 850 & GSM 900 transmitter output power for different power classes**
**8PSK Modulated Signals**

| Power class | | | Power control level | Transmitter output power | Tolerances | |
|---|---|---|---|---|---|---|
| E1 | E2 | E3 | | | | |
| · | | | 5 | 33 | +/-2 dB | +/-2.5dB |
| | | | 6 | 31 | +/-3 dB | +/-4 dB |
| | | | 7 | 29 | +/-3 dB | +/-4 dB |
| | · | | 8 | 27 | +/-3 dB | +/-4 dB |
| | · | | 9 | 25 | +/-3 dB | +/-4 dB |
| | · | · | 10 | 23 | +/-3 dB | +/-4 dB |
| | · | · | 11 | 21 | +/-3 dB | +/-4 dB |
| | · | · | 12 | 19 | +/-3 dB | +/-4 dB |
| | · | · | 13 | 17 | +/-3 dB | +/-4 dB |
| | · | · | 14 | 15 | +/-3 dB | +/-4 dB |
| | · | · | 15 | 13 | +/-3 dB | +/-4 dB |
| | · | · | 16 | 11 | +/-5 dB | +/-6 dB |

GSM400, GSM 700, GSM 850 & GSM 900 - end

DCS 1 800 & PCS1900 - beginning

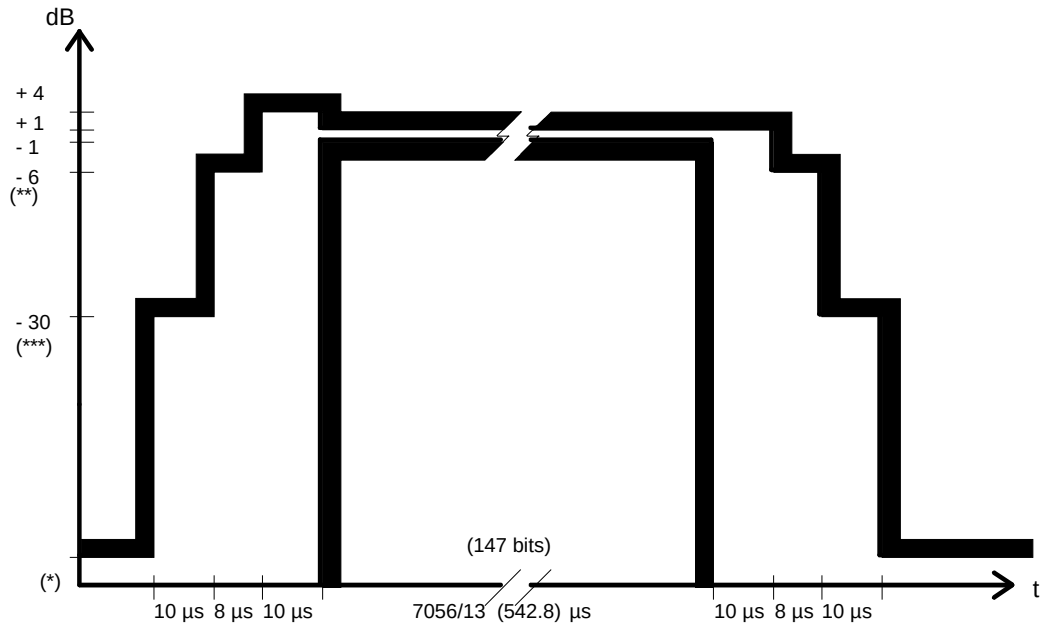
**Table 13.17.3-2: DCS1800 and PCS1900 transmitter output power for different power classes 8-PSK Modulated Signals**

| Power class | | | Power control level | Transmitter output power | Tolerances | |
|---|---|---|---|---|---|---|
| E1 | E2 | E3 | | | NORMAL | EXTREME |
| · | | | 0 | 30 | +/-3 dB | +/-4dB |
| | | | 1 | 28 | +/-3 dB | +/-4 dB |
| | · | | 2 | 26 | +/-3 dB | +/-4 dB |
| | · | | 3 | 24 | +/-3 dB | +/-4 dB |
| | · | · | 4 | 22 | +/-3 dB | +/-4 dB |
| | · | · | 5 | 20 | +/-3 dB | +/-4 dB |
| | · | · | 6 | 18 | +/-3 dB | +/-4 dB |
| | · | · | 7 | 16 | +/-3 dB | +/-4 dB |
| | · | · | 8 | 14 | +/-4 dB | +/-4 dB |
| | · | · | 9 | 12 | +/-4 dB | +/-5 dB |
| | · | · | 10 | 10 | +/-4 dB | +/-5 dB |
| | · | · | 11 | 8 | +/-4 dB | +/-5 dB |
| | · | · | 12 | 6 | +/-4 dB | +/-5 dB |
| | · | · | 13 | 4 | +/-5 dB | +/-5 dB |
| | · | · | 14 | 2 | +/-5 dB | +/-6 dB |

DCS 1 800 & PCS1900 - end

c) The difference between the transmitter output power at two adjacent power control levels, measured at the same frequency, shall not be less than 0,5 dB and not be more than 3,5 dB.

d) The power/time relationship of the measured samples for normal bursts shall be within the limits of the power time template of figure 13.17.3-1for 8-PSK at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.



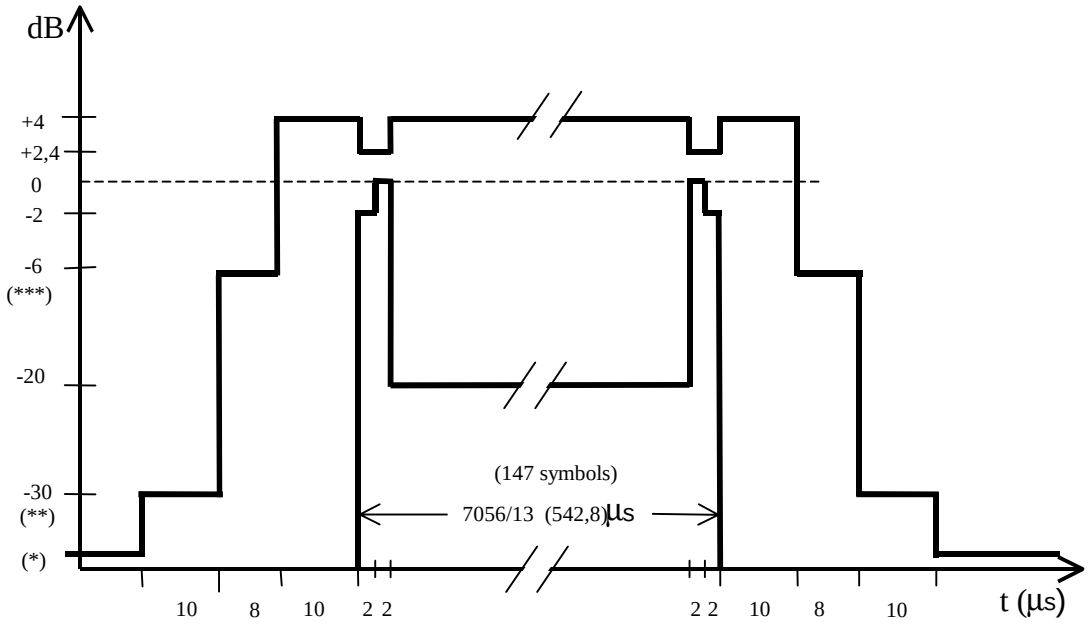


**Figure 13.17.3-1: Time mask for normal duration bursts (NB) at 8-PSK modulation**

d) All the power control levels, for the type and power class of the MS as stated by the manufacturer, shall be implemented in the MS.

f) When the transmitter is commanded to a power control level outside of the capability corresponding to the type and power class of the MS as stated by the manufacturer, then the transmitter output power shall be within the tolerances for the closest power control level corresponding to the type and power class as stated by the manufacturer.

**Table 13.17.3-3: Lowest measurement limit for power / time template**

| | | | |
|---|---|---|---|
| (*) | For GSM 400, GSM 700, GSM 850 and GSM 900 MS | : | 59 dBc or -54 dBm whichever is the highest, except for the timeslot preceding the active slot, for which the allowed level is -59 dBc or -36 dBm, whichever is the highest |
| | For DCS 1 800 MS and PCS 1900 MS | : | -48 dBc or -48 dBm, whichever is the higher. |
| | | : | no requirement below -30 dBc (see 4.5.1). |

| | For DCS 1 800 MS | | -30dBc or -20dBm, whichever is the higher. |

## 13.17.4 Output RF spectrum in EGPRS configuration

### 13.17.4.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

Since the conformance requirement, test procedure and test requirement of GSMK modulated signal's output RF spectrum are defined in section 13.16.3 for GPRS MS, being thereby defined also for all EGPRS MS in that section, only 8PSK modulated signal's RF output spectrum conformance requirement, test procedure and test requirements are defined in this section.

The requirements and this test apply to all EGPRS MSs which are capable of 8PSK modulated uplink transmission.

### 13.17.4.2 Conformance requirement

1. The level of the output RF spectrum due to 8PSK modulation shall be no more than that given in GSM 05.05, 4.2.1, with the following lowest measurement limits:

   - 36 dBm below 600 kHz offset from the carrier,
   - 51 dBm for GSM 400, GSM 700, GSM 850 & GSM 900 or -56 dBm for DCS 1 800 and PCS1900 from 600 kHz out to less than 1 800 kHz offset from the carrier,
   - 46 dBm for GSM 400, GSM 700, GSM 850 & GSM 900 or -51 dBm for DCS 1 800 and PCS1900 at and beyond 1 800 kHz offset from the carrier,

   but with the following exceptions at up to -36 dBm:

   - up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier,
   - up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.

   1.1 Under normal conditions; GSM 05.05, 4.2.1.

   1.2 Under extreme conditions; GSM 05.05, 4.2.1; GSM 05.05, annex D D.2.1, D.2.2.

2. The level of the output RF spectrum due to switching transients shall be no more than given in GSM 05.05, 4.2.2, table “a) Mobile Station:”.

   2.1 Under normal conditions; GSM 05.05, 4.2.2.

   2.2 Under extreme conditions; GSM 05.05, 4.2.2; GSM 05.05 annex D D.2.1, D.2.2.

3. When allocated a channel, the power emitted by the GSM 400, GSM 900 & DCS 1800 MS, in the band 935 to 960 MHz shall be no more than -79 dBm, in the band 925 to 935 MHz shall be no more than -67 dBm and in the band 1 805 to 1 880 MHz shall be no more than -71 dBm, except in five measurements in each of the bands 925 to 960 MHz and 1 805 to 1 880 MHz, where exceptions at up to -36 dBm are permitted. For GSM 400 mobiles, in addition, a limit of -67 dBm shall apply in the frequency bands 460.4 – 467.6 MHz and 488.8 – 496 MHz.

   For GSM 700, GSM 850 and PCS 1900, the power emitted by MS, in the band of 747 to 757 MHz shall be no more than –79 dBm, in the band of 757 to 762 MHz shall be no more than –73 dBm, in the band 869 to 894 MHz shall be no more than –79 dBm, in the band 1 930 to 1 990 MHz shall be no more than –71 dBm except in five measurements in each of the bands 747 to 762 MHz, 869 to 894 MHz and 1 930 to 1 990 MHz where exceptions at up to –36 dBm are permitted; GSM 05.05, 4.3.3.

### 13.17.4.3 Test purpose

1. To verify that the output RF spectrum due to 8PSK modulation of an EGPRS MS does not exceed conformance requirement 1.

   1.1 Under normal conditions.

   1.2 Under extreme conditions.

2. To verify that the output RF spectrum due to 8PSK modulation of an EGPRS MS does not exceed conformance requirement 1 in 8PSK uplink multislot configuration.

   1.1 Under normal conditions.

   1.2 Under extreme conditions.

3. To verify that the output RF spectrum due to switching transients of 8PSK modulated signals of an EGPRS MS does not exceed conformance requirement 2 when a reasonable margin is allowed for the effect of spectrum due to modulation.

2.1 Under normal conditions.

2.2 Under extreme conditions.

4. To verify that the output RF spectrum due to switching transients of 8PSK modulated signals of an EGPRS MS does not exceed conformance requirement 2 in 8PSK uplink multislot configuration when a reasonable margin is allowed for the effect of spectrum due to modulation.

   2.1 Under normal conditions.

   2.2 Under extreme conditions.

5. To verify that the MS spurious emissions in the MS receive band for 8PSK modulated signals of an EGPRS MS do not exceed conformance requirement 3.

6. To verify that the MS spurious emissions in the MS receive band for 8PSK modulated signals of an EGPRS MS do not exceed conformance requirement 3 in 8PSK uplink multislot configuration.

NOTE: For EGPRS MS capable of 8PSK multislot configuration in the uplink, the tests are executed only for multislot configuration.

### 13.17.4.4 Method of test

#### Initial conditions

The test shall be run under the default EGPRS conditions defined in section 50.

The Test Mode defined in 3GPP TS 04.14 Sect. 5.4 shall be utilised. If the MS I s capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks

Mode (b) transmitting looped-back RLC data blocks

then Mode (a) will be used.

The SS commands the MS to transmit with its maximum number of uplink slots, with 8PSK modulation in hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

The SS shall use a transmission level of 23 dBµVemf( ).

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to cell re-select the MS between the three channels tested at the appropriate time.

#### 13.17.4.4.2 Test procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.

b) The other settings of the spectrum analyser are set as follows:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 30 kHz
- Video averaging: may be used, depending on the implementation of the test

The video signal of the spectrum analyser is “gated” such that the spectrum generated by at least 40 of the symbols 87 to 132 of the burst in one of the active time slots is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.

d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

For GSM 400, GSM 900 and DCS 1800:

at 200 kHz intervals over the band 450-496 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 925 - 960 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1805 - 1880 MHz for each measurement over 50 bursts.

For GSM 700, GSM 850 and DCS 1900:

at 200 kHz intervals over the band 747 to 762 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 869 - 894 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1930 – 1990 MHz for each measurement over 50 bursts.

e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).

f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

| | |
|---|---|
| FT | |
| FT + 100 kHz | FT - 100 kHz |
| FT + 200 kHz | FT - 200 kHz |
| FT + 250 kHz | FT - 250 kHz |
| FT + 200 kHz * N | FT - 200 kHz * N |

where N = 2, 3, 4, 5, 6, 7, and 8

and FT = RF channel nominal centre frequency.

g) Steps a) to f) is repeated except that in step a) the spectrum analyzer is gated so that the burst of the next active time slot is measured.

h) The spectrum analyser settings are adjusted to:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 100 kHz
- Peak hold

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level in every transmitted time slot.

i) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

| | |
|---|---|
| FT + 400 kHz | FT - 400 kHz |
| FT + 600 kHz | FT - 600 kHz |
| FT + 1,2 MHz | FT - 1,2 MHz |
| FT + 1,8 MHz | FT - 1,8 MHz |

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

j) Step i) is repeated for power control levels 7 and 11.

k) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the Low ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.

l) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.

m) Steps a) b) f) h), and i) are repeated under extreme test conditions (annex 1, TC2.2). except that at step h) the MS is commanded to power control level 11.

#### 13.17.4.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 450-486 or 777 to 792 MHz or 824 to 849 MHz or 880 to 915 MHz or 1710 to 1785 MHz or 1850-1910, the temporary antenna connector coupling factor, determined according to 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 450-486 or 925 to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 400 or GSM 900 MS respectively. For a DCS 1 800 MS & PCS 1900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1805 to 1880 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for DCS 1 800 MS. For GSM 400 MS & GSM 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 747 to 762 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 700 MS. For a GSM 400, GSM 850, GSM 900, DCS 1800 or PCS 1900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 869 to 894 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 850 MS. For a GSM 400, GSM 700, GSM 900, DCS 1800 or PCS 1900 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference GSM 05.05 section 4.2.1).

a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), i), k), l) and m) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 13.17.4-1 for GSM 400, GSM 700, GSM 850 & GSM 900 or table 13.17.4-2 for DCS 1 800 & PCS 1900 MS, according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

**Table 13.17.4-1: GSM400, GSM 700, GSM 850 & GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| | power levels in dB relative to the measurement at FT | | | | |
|---|---|---|---|---|---|
| **Power level** | **Frequency offset (kHz)** | | | | |
| **(dBm)** | **0-100** | **200** | **250** | **400** | **600 to <1800** |
| 39 | +0,5 | -30 | -33 | -60 | -66 |
| 37 | +0,5 | -30 | -33 | -60 | -64 |
| 35 | +0,5 | -30 | -33 | -60 | -62 |
| <= 33 | +0,5 | -30 | -33 | -60* | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -51 |

*For equipment supporting 8PSK, the requirement for 8-PSK modulation is –54dB.

**Table 13.17.4-2: DCS 1 800/PCS 1900 Spectrum due to modulation out to less than 1 800 kHz offset**

| | power levels in dB relative to the measurement at FT | | | | |
|---|---|---|---|---|---|
| **Power level** | **Frequency offset (kHz)** | | | | |
| **(dBm)** | **0-100** | **200** | **250** | **400** | **600 to <1800** |
| <= 36 | +0,5 | -30 | -33 | -60 | -60 |
| 34 | +0.5 | -30 | -33 | -60 | -60 |
| 32 | +0.5 | -30 | -33 | -60 | -60 |
| 30 | +0.5 | -30 | -33 | -60* | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -56 |

*For equipment supporting 8-PSK, the requirement for 8-PSK modulation is –54dB.

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 13.17.4-3 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

**Table 13.17.4-3: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)**

| power levels in dB relative to the measurement at FT | | | | | | |
|---|---|---|---|---|---|---|
| GSM400, GSM 700, GSM 850 & GSM900 | | | | DCS1800 & PCS 1900 | | |
| Power level (dBm) | Frequency offset kHz | | | Power level (dBm) | Frequency offset kHz | |
| | 1800 to < 3000 | 3000 to < 6000 | >= 6000 | | 1800 to < 6000 | >= 6000 |
| 39 | -69 | -71 | -77 | 36 | -71 | -79 |
| 37 | -67 | -69 | -75 | 34 | -69 | -77 |
| 35 | -65 | -67 | -73 | 32 | -67 | -75 |
| ***<= 33*** | ***-63*** | ***-65*** | ***-71*** | 30 | -65 | |
| | | | | | | *-73* |
| | | | | 28 | -63 | |
| | | | | | | *-71* |
| | | | | 26 | -61 | |
| | | | | | | *-69* |
| | | | | <= 24 | -59 | |
| | | | | | | *-67* |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | | |
| | -46 | -46 | -46 | | -51 | -51 |

c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.

d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.

e) The MS spurious emissions in the bands 460.4 – 467.6 MHz, 488.8 – 496 MHz,

925 - 935 MHz, 935 - 960 MHz, 1 805 - 1 880 MHz and 1850-1910 MHz measured in step d), for all types of MS, shall not exceed the values shown in table 13.16.4-4 except in up to 3 measurements in the band 460.4-467.6 and 488.8-496MHz, in up to five measurements in the band 925 to 960 MHz and five measurements in the band 1 805 to 1 880 MHz where a level up to -36 dBm is permitted. For GSM 700, GSM 850 and PCS 1900 the spurious emissions in the bands 747 to 757 MHz, 757 to 762 MHz, 869 - 894 MHz and 1930 – 1990 MHz shall not exceed the values shown in table 13-17.4-4 except in up to five measurements in each of the bands 747 to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to –36 dBm is permitted.

**Table 13.17.4-4: Spurious emissions in the MS receive bands**

| Band<br><br>(MHz) | Spurious emissions level for GSM 400, GSM 900 and DCS 1800<br>(dBm) | Spurious emissions level for GSM 700, GSM 850 and PCS 1900<br>(dBm) |
|---|---|---|
| 460-496 | -67 Applicable only for GSM 400 mobiles | |
| 925 to 935<br>935 to 960<br>1805 to 1880 | -67<br>-79<br>-71 | |
| 747 to 757 | | -79 |
| 757 to762 | | -73 |
| 869 to 894 | | -79 |
| 1930 to 1990 | | -71 |
| 1850-1910 | | Comply with FCC rules for wideband PCS services (see GSM 05.05, 4.3, applicable only for PCS) |

f) For the power ramp sidebands of steps h), i) and k) the power levels must not exceed the values shown in table 13.17.4-5 for GSM 700, GSM 850 and GSM 900 or table 13.17.4-6 for DCS 1 800.

**Table 13.17.4-5: GSM700, GSM 850 and GSM 900 Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency | | | |
|---|---|---|---|---|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 39 dBm | -13 dBm | -21 dBm | -21 dBm | -24 dBm |
| 37 dBm | -15 dBm | -21 dBm | -21 dBm | -24 dBm |
| 35 dBm | -17 dBm | -21 dBm | -21 dBm | -24 dBm |
| 33 dBm | -19 dBm | -21 dBm | -21 dBm | -24 dBm |
| 31 dBm | -21 dBm | -23 dBm | -23 dBm | -26 dBm |
| 29 dBm | -23 dBm | -25 dBm | -25 dBm | -28 dBm |
| 27 dBm | -23 dBm | -26 dBm | -27 dBm | -30 dBm |
| 25 dBm | -23 dBm | -26 dBm | -29 dBm | -32 dBm |
| 23 dBm | -23 dBm | -26 dBm | -31 dBm | -34 dBm |
| <= +21 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

**Table 13.17.4-6: DCS 1 800/PCS1900 Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency | | | |
|---|---|---|---|---|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 36 dBm | -16 dBm | -21 dBm | -21 dBm | -24 dBm |
| 34 dBm | -18 dBm | -21 dBm | -21 dBm | -24 dBm |
| 32 dBm | -20 dBm | -22 dBm | -22 dBm | -25 dBm |
| 30 dBm | -22 dBm | -24 dBm | -24 dBm | -27 dBm |
| 28 dBm | -23 dBm | -25 dBm | -26 dBm | -29 dBm |
| 26 dBm | -23 dBm | -26 dBm | -28 dBm | -31 dBm |
| 24 dBm | -23 dBm | -26 dBm | -30 dBm | -33 dBm |
| 22 dBm | -23 dBm | -26 dBm | -31 dBm | -35 dBm |
| <= +20 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

NOTE 2: These figures are different from the requirements in GSM 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 13.17.3-5 and table 13.17.3-6 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at <1 800 kHz.

### 13.17.5 Void

# 14 Receiver

In this section on receiver measurements, the procedures to test equipment which is fitted with a permanent antenna connector, and the procedures to test equipment which is designed to only be used with an integral antenna, are in general combined into one single test description.

Tests on Mobile Stations fitted with an integral antenna and having no means of connecting an external antenna are specified in terms of received field strength. In order to perform tests on such Mobile Stations without the need for separated access to a calibrated test site a temporary antenna connector is used as defined in annex 1 section 1.1.3 (General Conditions).

In practice the temporary antenna connector may be used for transmitter measurements described in section 3, but the calibration factors determined in [Annex 1] will not be directly usable. The detailed calibration, when needed, for transmission tests are described in the relevant sections of 3.

Wherever in this section, for FACCH tests, the SS is required to send a Layer 3 message not requiring a Layer 3 response from the MS the message can be a TEST INTERFACE message or a STATUS message, possibly with an unknown Protocol Discriminator.

#### Testing philosophy

Certain assumptions concerning the functional mechanisms of GSM receivers have been made in order to define tests that will verify the receiver performance without excessive redundancy and excessive test times.

The receiver functions can be divided into:

- Analogue RF and IF stages that are affected by input levels, temperature and power supply levels.
- Demodulator that is affected by input levels and interfering signals.
- Decoders that are affected by the different logical channels and input levels.

The tests are designed to stress each of these blocks with a minimum of redundancy.

#### Statistical testing of receiver BER/FER performance

#### Error Definition

1) Frame Erasure Ratio (FER)

   A frame is defined as erased if the error detection functions in the receiver, operating in accordance with GSM 05.03, indicate an error (BFI = 1). For full rate or half rate speech this is the result of the 3 bit cyclic redundancy check (CRC) as well as other processing functions that cause a Bad Frame Indication (BFI). For signalling channels it is the result of the FIRE code or any other block code used. For data traffic FER is not defined.

2) Residual Bit Error Ratio (RBER)

   The Residual Bit Error Ratio is defined as the Bit Error Ratio (BER) in frames which have not been declared as erased.

3) Bit Error Ratio (BER)

   The Bit Error Ratio is defined as the ratio of the bits wrongly received to all data bits sent.

4) Unreliable Frame Ratio (UFR)

The Unreliable Frame Ratio is defined as the ratio of frames declared as erased (BFI=1), or unreliable (UFI=1), to the total number of frames transmitted. An unreliable frame is indicated by setting the UFI flag (UFI=1) and an erased frame is indicated by setting the BFI flag (BFI=1). (See GSM 06.21.)

5) Erased SID Frame Ratio (ESIDR)

   A SID Frame is erased (SID=0) when the MS does not detect a valid transmitted SID frame as a valid SID frame (SID=2), or an invalid SID frame (SID=1). The Erased SID Frame Ratio is defined as the ratio of erased SID frames (SID=0), to the total number of valid SID frames transmitted. (See GSM 06.41.)

6) Erased Valid SID Frame Ratio (EVSIDR).

   An Erased Valid SID Frame is declared when the MS does not detect a valid transmitted SID frame as a valid SID frame (SID=2) and (BFI=0 and UFI=0). The Erased Valid SID Frame Ratio is defined as the ratio of erased valid SID frames (SID=0), or (SID=1), or ((BFI or UFI)=1), to the total number of valid SID frames transmitted. (See GSM 06.41.)

### Test method

Each test is performed in the following manner:

a) Set up the required test conditions.

b) Perform the test for at least the minimum number of samples (frames, bits or bits from non erased frames) and record the number of offered samples and the number of occurred events (frame, bit or residual bit errors).

c) Terminate the test and determine the test result ("pass" or "fail") by comparing the measured error rate against the test limit error rate.

   It is permitted to run the test over more samples than the value stated for minimum number of samples. The effect of increasing the number of samples is always to give a higher probability that a good unit will pass and a lower risk that a bad unit will pass, according to the definitions of good and bad unit in this section.

### Test criteria

The limits on number of samples and test limit error rate shall be defined in order to comply with different requirements:

1) to keep reasonably low the risk of passing a bad unit for each individual test;

2) to have high probability of passing a good unit for each individual test;

3) to perform measurements with a high degree of statistical significance;

4) to keep the test time as low as possible.

The risk of passing a bad unit (point 1) should be kept lower than 0,2 %. The performance on a full rate channel, or a half rate data channel, is generally considered "bad" if its BER (or FER) performance is 1,5 times worse than that specified in AWGN (Additive White Gaussian Noise) and 1,26 times worse than that specified in multipath environment. These values have been adopted (taking into account the expected shapes of the BER performance) in order not to pass a unit with performance worse than the specifications by more than 1 dB.

The performance on a half rate speech channel, is generally considered "bad" if the BER (or FER, or UFR) is worse than that specified, multiplied by the factors given in table 14-1. These values have been adopted (taking into account the expected shapes of the BER performance) in order not to pass a unit with performance worse than the specifications by more than 1 dB.

**Table 14-1: TCH/HS "bad" unit multiplication factors**

| | GSM 400, GSM 700, GSM 850 and GSM 900 | | | | DCS 1 800 and PCS 1 900 | | | |
|---|---|---|---|---|---|---|---|---|
| **Propagation Conditions** | **TUlow (No FH)** | **TUhigh (FH/ No FH)** | **HT (No FH)** | **RA (No FH)** | **TUlow (No FH)** | **TUhigh (FH/ No FH)** | **HT (No FH)** | **RA (No FH)** |
| Reference sensitivity: | | | | | | | | |
| TCH/HS FER | | 1,7 | | | | 1,7 | | |
| TCH/HS class Ib (BFI=0) | | 2,2 | | | | 2,0 | | |
| TCH/HS class II (BFI=0) | | 1,2 | 1,2 | 1,2 | | 1,2 | 1,2 | 1,2 |
| TCH/HS UFR | | 2,0 | | | | 1,9 | | |
| TCH/HS class Ib (BFI=0 and UFI=0) | | 1,8 | | | | 1,7 | | |
| Reference interference: | | | | | | | | |
| TCH/HS FER | | 1,6 | | | | 1,6 | | |
| TCH/HS class Ib (BFI=0) | | 1,8 | | | | 1,8 | | |
| TCH/HS class II (BFI=0) | | 1,2 | | | | 1,2 | | |
| TCH/HS UFR | | 1,6 | | | | 1,6 | | |
| TCH/HS class Ib (BFI or UFI)=0 | | 1,4 | | | | 1,4 | | |
| EVSIDR | 1,2 | | | | 1,2 | | | |
| RBER (SID=2 & (BFI or UFI)=0 | 1,3 | | | | 1,3 | | | |
| ESIDR | 1,3 | | | | 1,3 | | | |
| RBER (SID=1 or SID=2) | 1,3 | | | | 1,3 | | | |

The probability of passing a good unit operating on the specification limit of performance (point 2) should be at least 99,7 %.

If the error events can be assumed to be random independent variables, outputs of stationary random processes with identical Gaussian distributions, the previous figures suggest a number of events (point 3) not lower than 200 in AWGN channel and not lower than 600 in a multipath environment, and to test a BER (or FER) performance 1,22 times worse than that specified in AWGN and 1,12 times worse than that specified in a multipath environment (this corresponds to testing a performance, at the most, 0,5 dB worse than that specified).

For multipath propagation conditions the hypothesis of stationary random processes does not generally hold. In case of non frequency hopping operation mode, the radio channel may be assumed to change 10 times per wavelength of travelled distance and to be short term stationary in between. So, in this case, the required observation time for having good statistical properties should not be lower (with some rounding) than that reported in table 14-1.

**Table 14-2: Minimum test time according to propagation profile**

| | GSM 400, GSM 700, GSM 850 and GSM 900 | | | | DCS 1 800 and PCS 1 900 | | | |
|---|---|---|---|---|---|---|---|---|
| **Propagation Conditions** | **TUlow** | **TUhigh** | **HT** | **RA** | **TUlow** | **TUhigh** | **HT** | **RA** |
| Min. test time (s) | 500 | 30 | 15 | 6 | 500 | 15 | 7,5 | 6 |

Tables 14-3 and 14-4 detail, for the different test conditions, the minimum number of samples required in order to meet points 1) to 3): the corresponding test time (point 4) can be consequently computed.

As can be seen in the tables, in some of the cases in which both FER and RBER have to be tested on the same channel, the length of time for the FER measurement has been adopted for the RBER measurement. This is longer than that required for the RBER only according to the discussed criteria, but allows the use of a test limit error rate closer to the specified error rate while maintaining the same statistical significance. When, as is normal, it is desired to perform the FER and RBER tests, the closer test limit error rate for the RBER measurement can be achieved without increasing the total test time. It is always possible to extend the length of any test and further improve the statistical significance of that test.

**Table 14-3: Test conditions for GSM 400, GSM 700, GSM 850 and GSM 900**

| Type of test | Type of channel | Propagation/ frequency conditions | Speci-fied FER/ BER % | Test limit FER/ BER % | Minimum No of samples | Prob that good unit will pass % | Bad unit BER/ FER % | Risk that bad unit will pass |

NOTE 1: α is a parameter which ranges from 1 to 1,6. The value of α for a RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions. For example, the value of α may be different for a TUhigh sensitivity test and an RA sensitivity test. The value of α is determined by dividing the measured error rate for the FER test by the value of the test limit error rate listed in the limits section of the test corresponding to α=1; if the result of the division is lower than 1, a value of α=1 shall be used, if the value of α > 1,6 the FER test has failed (the normal treatment of stimulus uncertainties applies). The probabilities that a good unit will pass and the risks that a bad unit will pass, listed in the table are valid for α=1, and would be slightly different for other values of α.

NOTE 2: In order to save time the sensitivity and co-channel rejection tests for the TCH/F2,4 channel does not comply with the above said constraints.

In fact, a bad unit which performs 2 times (instead of 1,26) worse than that specified is accounted for, so reducing the required number of events to 150, instead of 600. On the other hand, the specified RBER is in this case 10E-5 and, on the basis of simulations and hardware validation results, doubling this RBER results in a drop in performance of less than 1 dB.

# 14.1 Bad frame indication

## 14.1.1 Bad frame indication - TCH/FS

### 14.1.1.1 Bad frame indication - TCH/FS - Random RF input

#### 14.1.1.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a full rate speech TCH (TCH/FS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting speech.

#### 14.1.1.1.2 Conformance requirement

On a full rate speech TCH (TCH/FS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; GSM 05.05, 6.4 b

#### 14.1.1.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.

2. To verify that on reception of a SID frame the BFI is not set.

#### 14.1.1.1.4 Method of test

##### 14.1.1.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

##### 14.1.1.1.4.2 Procedure

a) The SS simulates a BSS in DTX mode. During the period when no transmission would occur the SS transmits a GSM carrier modulated with random data at a level 11 dB above reference sensitivity level( ). The SACCH is transmitted normally at a level 20 dB above reference sensitivity( ). The SID frame is transmitted in its correct time interval with valid information at a level 20 dB above reference sensitivity level( ). During transmission of SACCH or SID frames the random data is discontinued.

b) The SS transmits at least the minimum number of samples of frames of TCH/FS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

#### 14.1.1.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

### 14.1.1.2 Bad frame indication - TCH/FS - Frequency hopping and downlink DTX

#### 14.1.1.2.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a full rate speech TCH (TCH/FS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting speech.

#### 14.1.1.2.2 Conformance requirement

On a speech TCH (TCH/FS or TCH/HS), when DTX is activated with frequency hopping through C0 where bursts comprising SID frames, SACCH frames and dummy bursts are received at a level 20 dB above the reference sensitivity level and with no transmissions at the other bursts of the TCH, the overall reception performance shall be such that, on average less than one undetected bad speech frame (false bad frame indication BFI) shall be measured in one minute for MS. GSM 05.05, 6.4 c.

#### 14.1.1.2.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.

2. To verify that on reception of a SID frame the BFI is not set.

#### 14.1.1.2.4 Method of test

##### 14.1.1.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

##### 14.1.1.2.4.2 Procedure

a) The SS sets downlink DTX on.

b) The SS performs the measurement over at least the minimum number of samples of frames of TCH/FS information and checks the BFI of the looped back signal from the MS. The SS only transmits SID frames, SACCH frames and dummy bursts, with no transmission of TCH bursts. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

#### 14.1.1.2.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

## 14.1.2 Bad frame indication - TCH/HS

### 14.1.2.1 Bad frame indication - TCH/HS - Random RF input

#### 14.1.2.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a half rate speech TCH (TCH/HS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting half rate speech.

#### 14.1.2.1.2 Conformance requirement

On a half rate speech TCH (TCH/HS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; GSM 05.05, 6.4 b.

#### 14.1.2.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.

2. To verify that on reception of a SID frame the BFI is not set.

#### 14.1.2.1.4 Method of test

##### 14.1.2.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS commands the MS to complete traffic channel loop back A and signal frames detected with BFI=1 as erased.

NOTE 1: Test loop A is defined in clause 36. Frames detected with BFI=1 are signalled as erased on the uplink.

NOTE 2: DTX is used during the test to prevent the MS dropping the call.

##### 14.1.2.1.4.2 Procedure

a) The SS simulates a BSS in DTX mode. During the periods when no transmission would occur, the SS transmits a GSM carrier modulated with random data, at a level 11 dB above reference sensitivity level( ). The SACCH is transmitted normally, at a level 20 dB above reference sensitivity( ). The SID frame is transmitted in its correct time interval, with valid information, at a level 20 dB above reference sensitivity level( ). During transmission of SACCH or SID frames, the random data is discontinued.

b) The SS transmits at least the minimum number of samples of frames of TCH/HS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

#### 14.1.2.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

### 14.1.2.2 Bad frame indication - TCH/HS - Frequency hopping and downlink DTX

#### 14.1.2.2.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a half rate speech TCH (TCH/HS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting half rate speech.

#### 14.1.2.2.2 Conformance requirement

On a half rate speech TCH (TCH/HS), when DTX is activated with frequency hopping through C0 where bursts comprising SID frames, SACCH frames and dummy bursts are received at a level 20 dB above the reference sensitivity level and with no transmissions at the other bursts of the TCH, the overall reception performance shall be such that, on average less than one undetected bad speech frame (false bad frame indication BFI) shall be measured in one minute for MS. GSM 05.05, 6.4 c.

#### 14.1.2.2.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.

2. To verify that on reception of a SID frame the BFI is not set.

#### 14.1.2.2.4 Method of test

##### 14.1.2.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

##### 14.1.2.2.4.2 Procedure

a) The SS sets downlink DTX on.

b) The SS performs the measurement over at least the minimum number of samples of frames of TCH/HS information and checks the BFI of the looped back signal from the MS. The SS only transmits SID frames, SACCH frames and dummy bursts, with no transmission of TCH bursts. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

#### 14.1.2.2.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

### 14.1.3 Bad frame indication - TCH/FS - Frequency hopping and downlink DTX - Phase 2 MS in a phase 1 network

#### 14.1.3.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a full rate speech TCH (TCH/FS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

Annex A of GSM 05.02 requires that a phase 2 MS behave properly in a phase 1 network.

The requirements and this test only apply to MS supporting speech.

#### 14.1.3.2 Conformance requirement

On a full rate speech TCH (TCH/FS) in DTX conditions with a transmitted burst 20 dB above reference sensitivity and static conditions, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; GSM 05.05, 6.4 b.

#### 14.1.3.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.

2. To verify that on reception of a SID frame the BFI is not set.

#### 14.1.3.4 Method of test

##### 14.1.3.4.1 Initial conditions

Initial conditions 1

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|---|---|---|---|
| Dummy bursts with (BN61, BN 62,...) mapped from the TSC bits of normal bursts. See section A.2.1.3 of GSM 05.02 | Partial SID information. See section A.2.2.1 of GSM 05.02. | 0 | 0 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

Initial conditions 2

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|---|---|---|---|
| Partial SID information. See section A.2.1.4 of GSM 05.02 | Partial SID information. See section A.2.2.1 of GSM 05.02. | 1 | 1 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

Initial conditions 3

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|---|---|---|---|
| Dummy bursts with 'C0 filling training sequence'. See section A.2.1.4 of GSM 05.02 | Dummy bursts mixed bits. See section A.2.2.2 of GSM 05.02. | 1 | 1 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

#### 14.1.3.4.2 Procedure

The two following steps are repeated 3 times, once for each initial condition specified in the previous clause.

a) The SS sets downlink DTX on.

b) The SS transmits at least the minimum number of samples of frames of TCH/FS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

### 14.1.3.5 Test requirements

after each repetition of steps a) + b) the following requirements are applied:

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

## 14.1.4 Bad frame indication - TCH/HS - Frequency hopping and downlink DTX - Phase 2 MS in a phase 1 network

### 14.1.4.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a half rate speech TCH (TCH/HS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

Annex A of GSM 05.02 requires that a phase 2 MS behave properly in a phase 1 network.

The requirements and this test only apply to MS supporting half rate speech.

#### 14.1.4.2 Conformance requirement

On a half rate speech TCH (TCH/HS) in DTX conditions with a transmitted burst 20 dB above reference sensitivity and static conditions, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; GSM 05.05, 6.4 b.

#### 14.1.4.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.

2. To verify that on reception of a SID frame the BFI is not set.

#### 14.1.4.4 Method of test

##### 14.1.4.4.1 Initial conditions

Initial conditions 1

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|---|---|---|---|
| Dummy bursts with (BN61, BN 62,...) mapped from the TSC bits of normal bursts. See section A.2.1.3 of GSM 05.02 | Partial SID information. See section A.2.2.1 of GSM 05.02. | 0 | 0 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

Initial conditions 2

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|---|---|---|---|
| Partial SID information. See section A.2.1.4 of GSM 05.02 | Partial SID information. See section A.2.2.1 of GSM 05.02. | 1 | 1 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

Initial conditions 3

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|---|---|---|---|
| Dummy bursts with 'C0 filling training sequence'. See section A.2.1.4 of GSM 05.02 | Dummy bursts mixed bits. See section A.2.2.2 of GSM 05.02. | 1 | 1 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

#### 14.1.4.4.2 Procedure

The two following steps are repeated 3 times, once for each initial condition specified in the previous clause.

a) The SS sets downlink DTX on.

b) The SS transmits at least the minimum number of samples of frames of TCH/HS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

### 14.1.4.5 Test requirements

After each repetition of steps a) + b) the following requirements are applied:

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

## 14.1.5 Bad frame indication - TCH/AFS (Speech frame)

### 14.1.5.1 Bad frame indication - TCH/AFS - Random RF input

#### 14.1.5.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS. It includes the effect of the 6 bits Cyclic Redundancy Check (CRC). The BFI is measured on a full rate speech TCH (TCH/AFS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting AMR.

#### 14.1.5.1.2 Conformance requirement

On a full rate speech TCH (TCH/AFS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured;
GSM 05.05, 6.4 b

#### 14.1.5.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.

#### 14.1.5.1.4 Method of test

##### 14.1.5.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

##### 14.1.5.1.4.2 Procedure

a) The SS simulates a BSS in AMR mode. During the period when no transmission would occur the SS transmits a GSM carrier modulated with random data at a level 11 dB above reference sensitivity level. The SACCH is transmitted normally at a level 20 dB above reference sensitivity. During transmission of SACCH or frames the random data is discontinued.

b) The SS transmits at least the minimum number of samples of frames of TCH/AFS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

#### 14.1.5.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %

Minimum number of samples: 492 000 (excluding SID frames).

## 14.1.6 Bad frame indication - TCH/AHS

### 14.1.6.1 Bad frame indication - TCH/AHS - Random RF input

#### 14.1.6.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS. It includes the effect of the 14-bit Cyclic Redundancy Check (CRC). The BFI is measured on a half rate speech TCH (TCH/AHS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting AMR half rate.

#### 14.1.6.1.2 Conformance requirement

On a half rate speech TCH (TCH/AHS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; GSM 05.05, 6.4 b.

#### 14.1.6.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.

#### 14.1.6.1.4 Method of test

##### 14.1.6.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

##### 14.1.6.1.4.2 Procedure

a) The SS simulates a BSS in AMR mode. During the periods when no transmission would occur, the SS transmits a GSM carrier modulated with random data, at a level 11 dB above reference sensitivity level. The SACCH is transmitted normally, at a level 20 dB above reference sensitivity. During transmission of SACCH frames, the random data is discontinued.

b) The SS transmits at least the minimum number of samples of frames of TCH/AHS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set.

#### 14.1.6.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %

Minimum number of samples: 492 000

During loop back of SID frames no BFI shall be set.

## 14.2 Reference sensitivity

## 14.2.1 Reference sensitivity - TCH/FS

#### 14.2.1.1 Definition and applicability

The reference sensitivity is the signal level at the MS receiver input at which a certain BER and FER must be achieved.

The requirements and this test apply to MS supporting speech.

For E-GSM 900 MS this test is only performed in the P-GSM band.

#### 14.2.1.2 Conformance requirement

1. At reference sensitivity level, the TCH/FS FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.

2 At reference sensitivity level, the TCH/FS class I RBER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.

3 At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM 05.05: GSM 05.05, 6.2.

4. At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM under extreme conditions; GSM 05.05, 6.2, GSM 05.05, annex D D.2.1, D.2.2.

#### 14.2.1.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the reference sensitivity conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that the MS does not exceed conformance requirement 1 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

2. To verify that the MS does not exceed conformance requirement 2 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

3. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.

4. To verify that the MS does not exceed conformance requirement 4 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

#### 14.2.1.4 Method of test

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range 15 dBµVemf( ) to 35 dBµVemf( ).

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in section 6.

##### 14.2.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the Mid ARFCN range for GSM 400, GSM 700, GSM 850, DCS 1800 and PCS 1900 and ARFCN 70 for GSM 900, power control level set to maximum power.

NOTE: For GSM 900 ARFCN 70 is tested since this is the 73rd harmonic of the 13 MHz clock normally used internally in a MS.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create traffic channel loop back signalling erased frames.

##### 14.2.1.4.2 Procedure

a) The fading function is set to TUhigh.

b) the SS sets the amplitude of the wanted signal to reference sensitivity level ( ).

c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

d) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.

e) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.

f) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.

g) Steps a) to d) are repeated under extreme test conditions.

h) Steps a) to g) are repeated for TCH/FS with ARFCNs in the Low ARFCN range for GSM 400, GSM 700, GSM 850, DCS 1800 and PCS 1900 and ARFCN 5 for GSM 900 and the High ARFCN range.

NOTE: For GSM 900 ARFCN 5 is tested since this is the 72nd harmonic of the 13 MHz clock normally used internally in a MS.

i) Steps b) to d) are repeated with the SS fading function set in turn to RA and HT.

j) Steps b) to g) are repeated, with the SS fading function set to static and the MS is commanded by the SS into hopping mode using the hopping sequence defined in section 6.

The amplitude of the wanted signal is set according to step b). All the other time slots, except the active ones, are set to 20 dB above reference sensitivity level( ). This implicitly tests adjacent time slot rejection.

#### 14.2.1.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the test limit error rate values given in table 14-5 or 14-6:

**Table 14-5: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 sensitivity**

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | | Static conditions | |
|---|---|---|---|---|---|---|---|---|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/FS | | | | | | | | |
| FER | 6,742*α | 8900 | | | | | 0,122*α | 164000 |
| class Ib(RBER) | 0,42/α | 1000000 | | | | | 0,41/α | 20000000 |
| class II(RBER) | 8,333 | 120000 | 7,5 | 24000 | 9,333 | 60000 | 2,439 | 8200 |

**Table 14-6: Limits for DCS 1 800 and PCS 1900 sensitivity**

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | | Static conditions | |
|---|---|---|---|---|---|---|---|---|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/FS | | | | | | | | |
| FER | 4,478*α | 13400 | | | | | 0,122*α | 164000 |
| class Ib(RBER) | 0,32/α | 1500000 | | | | | 0,41/α | 20000000 |
| class II(RBER) | 8,333 | 60000 | 7,5 | 24000 | 9,333 | 30000 | 2,439 | 8200 |

where α is a parameter which can range from 1 to 1.6. The value of α for a RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions.

## 14.2.2 Reference sensitivity - TCH/HS (Speech frames)

#### 14.2.2.1 Definition and applicability

The reference sensitivity level is the signal level at the MS receiver input at which a certain BER and FER and UFR for speech frames must be achieved.

The requirements and this test apply to MS supporting half rate speech.

#### 14.2.2.2 Conformance requirement

1. At reference sensitivity level, the TCH/HS FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.

2 At reference sensitivity level, the TCH/HS class Ib RBER (BFI=0) shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05 6.2.

3 At reference sensitivity level, the TCH/HS class II RBER (BFI=0) shall meet the reference sensitivity performance of table 1 in GSM 05.05: GSM 05.05, 6.2.

4. At reference sensitivity level, the TCH/HS UFR shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05 6.2.

5. At reference sensitivity level, the TCH/HS class Ib RBER ((BFI or UFI)=0) shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.

#### 14.2.2.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under TUhigh propagation conditions with an allowance for the statistical significance of the test.

2. To verify that the MS does not exceed conformance requirement 2 under TUhigh propagation conditions with an allowance for the statistical significance of the test.

3. To verify that the MS does not exceed conformance requirement 3 under TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.

4. To verify that the MS does not exceed conformance requirement 4 under TUhigh propagation conditions with an allowance for the statistical significance of the test.

5. To verify that the MS does not exceed conformance requirement 5 under TUhigh propagation conditions with an allowance for the statistical significance of the test.

#### 14.2.2.4 Method of test

##### 14.2.2.4.1 Initial conditions

The BA list sent on the BCCH and SACCH indicates at least six surrounding cells, with at least one near to each band edge. It is not necessary to generate any of these BCCHs, but if provided, the signal strengths of BCCHs shall be in the range 15 dBµVemf( ) to 35 dBµVemf( ).

The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

##### 14.2.2.4.2 Procedure

a) The SS commands the MS to create traffic channel loop back signalling erased frames using test loop A.

NOTE: Test loop A is defined in clause 36. Frames detected with BFI=1 are signalled as erased on the uplink.

b) The fading function is set to TUhigh.

c) The SS sets the amplitude of the wanted signal to reference sensitivity level ( ).

d) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

e) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.

f) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.

g) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.

h) Steps d) and e) are repeated, with the SS fading function set in turn to RA and HT.

j) The SS increases the amplitude of the wanted signal to 20 dB above reference sensitivity level.

k) The SS commands the MS to open test loop A and close test loop D.

NOTE: Test loop D is defined in clause 36. Frames marked as erased (BFI=1) or unreliable (UFI=1) are signalled to the SS on the uplink.

l) The fading function is set to TUhigh.

m) The SS sets the amplitude of the wanted signal to reference sensitivity level ( ).

n) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the erased/unreliable frame indication.

p) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased/unreliable.

q) The SS also determines the unreliable frame events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased/unreliable.

#### 14.2.2.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, shall not exceed the test limit error rate values given in table 14-7 or 14-8:

**Table 14-7: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 sensitivity**

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | |
|---|---|---|---|---|---|---|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/HS (FER)<br>TCH/HS Class Ib (BFI=0)<br>TCH/HS Class II (BFI=0)<br>TCH/HS (UFR)<br>TCH/HS Class Ib ((BFI or UFI)=0) | 4,598<br>0,404<br>7,725<br>6,250<br>0,269 | 13050<br>148500<br>25500<br>9600<br>227000 | 8,500 | 20000 | 7,600 | 20000 |

**Table 14-8: Limits for DCS 1800 and PCS 1900 sensitivity**

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | |
|---|---|---|---|---|---|---|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/HS (FER)<br>TCH/HS Class Ib (BFI=0)<br>TCH/HS Class II (BFI=0)<br>TCH/HS (UFR)<br>TCH/HS Class Ib ((BFI or UFI)=0) | 4,706<br>0,426<br>7,725<br>6,383<br>0,291 | 12750<br>141000<br>25500<br>9400<br>206000 | 8,735 | 20000 | 7,600 | 20000 |

## 14.2.3 Reference sensitivity - FACCH/F

#### 14.2.3.1 Definition and applicability

The reference sensitivity for control channels is the signal level at the MS receiver input at which a certain FER must be achieved.

The requirements and this test apply to all types of MS.

#### 14.2.3.2 Conformance requirement.

At reference sensitivity level, the FACCH/F FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; (GSM 05.05, 6.2).

#### 14.2.3.3 Test purpose.

To verify that the MS does not exceed the conformance requirement under TUhigh propagation condition with an allowance for the statistical significance of the test.

#### 14.2.3.4 Method of test

##### 14.2.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/F with an ARFCN in the Low ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

##### 14.2.3.4.2 Procedure

a) The fading function is set to TUhigh.

b) The SS sets the amplitude of the wanted signal to reference sensitivity level ( ).

c) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the low signal level the MS may not be able to acknowledge the Layer 2 frame with an RR frame and the SS will repeat the Layer 2 frame. Each repeated L2 frame will be counted and will indicate a frame erasure event.

d) The SS determines the frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

#### 14.2.3.5 Test Requirements

The error rates measured shall not exceed the test limit error rate values given in table 14-9.

**Table 14-9: Limits for FACCH/F sensitivity**

| | | | GSM 400, GSM 700, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1900 | |
|---|---|---|---|---|---|---|
| **Channels** | **Type of measure-ments** | **Propagation** | **Test limit error rate %** | **Minimum No of samples** | **Test limit error rate %** | **Minimum No of samples** |
| FACCH/F | FER | TUhigh | 8,961 | 6696 | 4,368 | 13736 |

## 14.2.4 Reference sensitivity - FACCH/H

#### 14.2.4.1 Definition and applicability

The reference sensitivity for control channels is the signal level at the MS receiver input at which a certain FER must be achieved.

The requirements and this test apply to MS supporting half rate channels.

#### 14.2.4.2 Conformance requirement.

At reference sensitivity level, the FACCH/H FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; (GSM 05.05, 6.2).

#### 14.2.4.3 Test purpose.

To verify that the MS does not exceed the conformance requirement under TUhigh propagation condition with an allowance for the statistical significance of the test.

#### 14.2.4.4 Method of test

##### 14.2.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/H with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

##### 14.2.4.4.2 Procedure

a) The fading function is set to TUhigh.

b) The SS sets the amplitude of the wanted signal to reference sensitivity level ( ).

c) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the low signal level the MS may not be able to acknowledge the Layer 2 frame with an RR frame and the SS will repeat the Layer 2 frame. Each repeated L2 frame will be counted and will indicate a frame erasure event.

d) The SS determines the frame erasure events during at least the minimum number of samples of FACCH/H frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

#### 14.2.4.5 Test requirements

The error rates measured shall not exceed the test limit error rate values given in table 14-10.

**Table 14-10: Limits for FACCH/H sensitivity**

| | | | GSM 400, GSM 700, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1900 | |
|---|---|---|---|---|---|---|
| **Channels** | **Type of measure-ments** | **Propagation** | **Test limit error rate %** | **Minimum No of samples** | **Test limit error rate %** | **Minimum No of samples** |
| FACCH/H | FER | TUhigh | 7,728 | | 8,064 | |

## 14.2.5 Reference sensitivity - full rate data channels

#### 14.2.5.1 Definition and applicability

The reference sensitivity for data channels is the signal level at the MS receiver input at which a certain BER must be achieved.

The requirements and this test apply to MS supporting data.

#### 14.2.5.2 Conformance Requirement.

1. At reference sensitivity level, the TCH/F9,6, TCH/F4,8 and TCH/F2,4 BER shall meet the reference sensitivity performance of table 1 in GSM 05.05; (GSM 05.05, 6,2).

#### 14.2.5.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under HT propagation condition with an allowance for the statistical significance of the test.

#### 14.2.5.4 Method of test

##### 14.2.5.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range. One of the supported TCH/(F9,6, F4,8, or F2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create the traffic channel loop back signalling erased frames. (36.2.1.1.1).

##### 14.2.5.4.2 Procedure

a) The fading function is set to HT.

b) The SS sets the amplitude of the wanted signal level to reference sensitivity level ( ).

c) The SS compares transmitted data with received data for at least the minimum number of samples of consecutive bits and records every error bit as an error event.

d) The SS sets the wanted signal level to 28 dBµVemf.

e) The SS commands the MS to open the TCH loop.

f) The SS commands the MS to another of the supported data channels.

g) Steps b) to f) are repeated for all supported full rate data channels.

#### 14.2.5.5 Test requirements

The Max-events measured for different channels shall not exceed the values given in table 14-11.

**Table 14-11: Limits for full rate data channel sensitivity**

| | | | GSM 400, GSM 700, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1900 | |
|---|---|---|---|---|---|---|
| **Channels** | **Type of measure-ments** | **Propagation** | **Test limit error rate %** | **Minimum No of samples** | **Test limit error rate %** | **Minimum No of samples** |
| TCH/F9,6 | BER | HT | 0,778 | 180000 | 0,784 | 76500 |
| TCH/F4,8 | BER | HT | 0,011 | 5350000 | 0,011 | 5350000 |
| TCH/F2,4 | BER | HT | 0,001 | 11900000 | 0,001 | 11900000 |

## 14.2.6 Reference sensitivity - half rate data channels

#### 14.2.6.1 Definition and applicability

The reference sensitivity for data channels is the signal level at the MS receiver input at which a certain BER must be achieved.

The requirements and this test apply to MS supporting half rate data.

#### 14.2.6.2 Conformance Requirement.

1. At reference sensitivity level, the TCH/H4,8 and TCH/H2,4 BER shall meet the reference sensitivity performance of table 1 in GSM 05.05; (GSM 05.05, 6.2).

#### 14.2.6.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under HT propagation condition with an allowance for the statistical significance of the test.

#### 14.2.6.4 Method of test

##### 14.2.6.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range. One of the supported TCH/(H4,8 or H2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create the traffic channel loop back signalling erased frames. (36.2.1.1.1).

##### 14.2.6.4.2 Procedure

a) The fading function is set to HT.

b) The SS sets the amplitude of the wanted signal level to reference sensitivity level ( ).

c) The SS compares transmitted data with received data for at least the minimum number of samples of consecutive bits and records every error bit as an error event.

d) The SS sets the wanted signal level to 28 dBµVemf.

e) The SS commands the MS to open the TCH loop.

f) The SS commands the MS to another of the supported data channels.

g) Steps b) to f) are repeated for all supported data channels.

#### 14.2.6.5 Test requirements

The Max-events measured for different channels shall not exceed the values given in table 14-12.

**Table 14-12: Limits for half rate data channel sensitivity**

| | | | GSM 400, GSM 700, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1900 | |
|---|---|---|---|---|---|---|
| **Channels** | **Type of measure-ments** | **Propag-ation** | **Test limit error rate %** | **Minimum No of samples** | **Test limit error rate %** | **Minimum No of samples** |
| TCH/H4,8 | BER | HT | 0,778 | 180000 | - | - |
| TCH/H2,4 | BER | HT | 0,011 | 5350000 | - | - |

## 14.2.7 Reference sensitivity - TCH/EFS

#### 14.2.7.1 Definition and applicability

The reference sensitivity is the signal level at the MS receiver input at which a certain BER and FER must be achieved.

The requirements and this test apply to MS supporting speech.

For E-GSM 900 MS this test is only performed in the P-GSM band.

#### 14.2.7.2 Conformance requirement

1. At reference sensitivity level, the TCH/EFS FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.

2 At reference sensitivity level, the TCH/EFS class I RBER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.

3 At reference sensitivity level, the TCH/EFS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM 05.05: GSM 05.05, 6.2.

4. At reference sensitivity level, the TCH/EFS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM under extreme conditions; GSM 05.05, 6.2, GSM 05.05, annex D D.2.1, D.2.2.

#### 14.2.7.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the reference sensitivity conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that the MS does not exceed conformance requirement 1 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

2. To verify that the MS does not exceed conformance requirement 2 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

3. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.

4. To verify that the MS does not exceed conformance requirement 4 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

#### 14.2.7.4 Method of test

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range 15 dBmVemf( ) to 35 dBmVemf( ).

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in section 6.

##### 14.2.7.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/EFS with an ARFCN in the Mid ARFCN range for GSM 400, GSM 700, GSM 850, DCS 1800 and PCS 1900 and ARFCN 70 for GSM 900, power control level set to maximum power.

NOTE: For GSM 900 ARFCN 70 is tested since this is the 73rd harmonic of the 13 MHz clock normally used internally in a MS.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create traffic channel loop back signalling erased frames.

##### 14.2.7.4.2 Procedure

a) The fading function is set to TUhigh.

b) the SS sets the amplitude of the wanted signal to reference sensitivity level ( ).

c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

d) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.

e) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.

f) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.

g) Steps a) to d) are repeated under extreme test conditions.

h) Steps a) to g) are repeated for TCH/EFS with ARFCNs in the Low ARFCN range for GSM 400, GSM 700, GSM 850, DCS 1800 and PCS 1900 and ARFCN 5 for GSM 900 and the High ARFCN range.

NOTE: For GSM 900 ARFCN 5 is tested since this is the 72nd harmonic of the 13 MHz clock normally used internally in a MS.

i) Steps b) to d) are repeated with the SS fading function set in turn to RA and HT.

j) Steps b) to g) are repeated, with the SS fading function set to static and the MS is commanded by the SS into hopping mode using the hopping sequence defined in section 6.

The amplitude of the wanted signal is set according to step b). All the other time slots, except the active ones, are set to 20 dB above reference sensitivity level( ). This implicitly tests adjacent time slot rejection.

#### 14.2.7.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the test limit error rate values given in table 14-4 or 14-13a, 14-13b:

**Table 14-13a: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 sensitivity**

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | | Static conditions | |
|---|---|---|---|---|---|---|---|---|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/EFS | | | | | | | | |
| FER | 8,867 | 8900 | | | | | 0,122 | 164000 |
| class Ib(RBER) | 0,224 | 1000000 | | | | | 0,110 | 20000000 |
| class II (RBER) | 7,500 | 120000 | 7,500 | 24000 | 9,350 | 60000 | 2,439 | 8200 |

**Table 14-13b: Limits for DCS 1 800 and PCS 1900 sensitivity**

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | | Static conditions | |
|---|---|---|---|---|---|---|---|---|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/EFS | | | | | | | | |
| FER | 4,475 | 13400 | | | | | 0,122 | 164000 |
| class Ib(RBER) | 0,130 | 1500000 | | | | | 0,110 | 20000000 |
| class II(RBER) | 8,333 | 60000 | 7,500 | 24000 | 9,498 | 30000 | 2,439 | 8200 |

### 14.2.8 Reference sensitivity - full rate data channels in multislot configuration

#### 14.2.8.1 Definition and applicability

The reference sensitivity for data channels is the signal level at the MS receiver input at which a certain BER must be achieved.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1800 and PCS 1900 MS and any multiband MS which are capable of HSCSD multislot operation.

#### 14.2.8.2 Conformance Requirement.

1. At reference sensitivity level, the TCH/F9,6, TCH/F4,8 and TCH/F2,4 BER shall meet the reference sensitivity performance of table 1 in GSM 05.05; (GSM 05.05, 6,2).

#### 14.2.8.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 in all multislot classes under HT propagation condition with an allowance for the statistical significance of the test.

#### 14.2.8.4 Method of test

##### 14.2.8.4.1 Initial conditions

A call is set up according to the generic call set up procedure for multislot HSCSD on a TCH with an ARFCN in the Mid ARFCN range. One of the supported TCH/(F9,6, F4,8, or F2,4) shall be used.

The SS sets the MS to operate in a worst case configuration where the overlapping of the transmitting and receiving timeslots are maximized. If it needs the use of timing advance, it is set to 63. If overlapping is not possible, transmitting and receiving timeslots should be as close as possible.

The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on all the channels.

The SS commands the MS to create the loop back of the closest channel to the transmitting timeslot.

##### 14.2.8.4.2 Procedure

a) The fading function is set to HT.

b) The SS commands the MS to close the TCH loop.

c) The SS sets the amplitude of the wanted signal level to reference sensitivity level ( ) in all subchannels.

d) The SS compares transmitted data with received data in all channels for at least the minimum number of samples of consecutive bits and records every error bit as an error event.

e) The SS sets the wanted signal level to 28 dBmVemf.

f) The SS commands the MS to open the TCH loop.

g) The SS commands the MS to another of the supported data channels

h) Steps b) to g) are repeated for all supported full rate data channels.

#### 14.2.8.5 Test requirements

The Max-events measured for different channels shall not exceed the values given in table 14-15.

**Table 14-15: Limits for full rate data channel sensitivity**

| | | | GSM 400, GSM 700, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1 900 | |
|---|---|---|---|---|---|---|
| **Channels** | **Type of measure-ments** | **Propagation** | **Test limit error rate %** | **Minimum No of samples** | **Test limit error rate %** | **Minimum No of samples** |
| TCH/F9,6 | BER | HT | 0,778 | 180000 | 0,784 | 76500 |
| TCH/F4,8 | BER | HT | 0,011 | 5350000 | 0,011 | 5350000 |
| TCH/F2,4 | BER | HT | 0,001 | 11900000 | 0,001 | 11900000 |

## 14.2.9 Reference sensitivity - TCH/FS for MS supporting the R-GSM band

### 14.2.9.1 Definition and applicability

The reference sensitivity is the signal level at the MS receiver input at which a certain BER and FER must be achieved.

The requirements and this test apply to R-GSM MS supporting speech.

### 14.2.9.2 Conformance requirement

1. At reference sensitivity level, the TCH/FS FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.

2 At reference sensitivity level, the TCH/FS class I RBER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.

3 At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM 05.05: GSM 05.05, 6.2.

4. At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM under extreme conditions; GSM 05.05, 6.2, GSM 05.05, annex D D.2.1, D.2.2.

### 14.2.9.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the reference sensitivity conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that the MS does not exceed conformance requirement 1 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

2. To verify that the MS does not exceed conformance requirement 2 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

3. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.

4. To verify that the MS does not exceed conformance requirement 4 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

### 14.2.9.4 Method of test

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range 15 dBµVemf( ) to 35 dBµVemf( ).

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in section 6.

#### 14.2.9.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with ARFCN 70 for R-GSM 900, power control level set to maximum power.

NOTE: For R-GSM 900 ARFCN 70 is tested since this is the 73rd harmonic of the 13 MHz clock normally used internally in a MS.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create traffic channel loop back signalling erased frames.

#### 14.2.9.4.2 Procedure

a) The fading function is set to TUhigh.

b) the SS sets the amplitude of the wanted signal to reference sensitivity level ( ).

c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

d) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.

e) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.

f) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.

g) Steps a) to d) are repeated under extreme test conditions.

h) Steps a) to g) are repeated for TCH/FS with ARFCN 5 and 964 for R-GSM 900 and the High ARFCN range.

NOTE: For R-GSM 900 ARFCN 5 and 964 are tested since they are the 72$^{nd}$ and 71st harmonic of the 13 MHz clock normally used internally in a MS.i) Steps b) to d) are repeated with the SS fading function set in turn to RA and HT.

j) Steps b) to g) are repeated, with the SS fading function set to static and the MS is commanded by the SS into hopping mode using the hopping sequence defined in section 6.

The amplitude of the wanted signal is set according to step b). All the other time slots, except the active ones, are set to 20 dB above reference sensitivity level( ). This implicitly tests adjacent time slot rejection.

#### 14.2.9.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the test limit error rate values given in table 14-5b .

**Table 14-5b: Limits for GSM 900 sensitivity**

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | | Static conditions | |
|---|---|---|---|---|---|---|---|---|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/FS | | | | | | | | |
| FER | 6,742*α | 8900 | | | | | 0,122*α | 164000 |
| class Ib(RBER) | 0,42/α | 1000000 | | | | | 0,41/α | 20000000 |
| class II(RBER) | 8,333 | 120000 | 7,5 | 24000 | 9,333 | 60000 | 2,439 | 8200 |

## 14.3 Usable receiver input level range

### 14.3.1 Definition and applicability

The usable receiver input level range is the range of the radio frequency input level of a specified modulated signal over which bit error ratio or frame erasure ratios stay between specified limits.

The requirements and this test apply to MS supporting speech.

### 14.3.2 Conformance requirement

1. The receiver input level range requirements of GSM 05.05 section 6.1 for TCH/FS class II RBER under static and EQ propagation conditions shall be met:

   1.1 Under normal conditions.

   1.2 Under extreme conditions.

### 14.3.3 Test purpose

1. To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

   1.1 Under normal conditions.

   1.2 Under extreme conditions.

### 14.3.4 Method of test

#### 14.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the Mid ARFCN range, power control level set to maximum.

The SS transmits Standard Test Signal C1 on the TCH/FS.

The SS commands the MS to create traffic channel loop back signalling erased frames. (36.2.1.1.2).

#### 14.3.4.2 Procedure

a) The SS compares the data that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding.

   The SS tests the bit error ratio for the non-protected bits of TCH/FS class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. The number of error events is recorded.

b) Step a) is repeated with the amplitude of the wanted signal increased to an input level at the receiver input of 73 dBµVemf( ).

c) Step a) is repeated with the amplitude of the wanted signal increased to an input level at the receiver input of:

   GSM 400: 98 dBµVemf( )

   GSM 700 98 dBmVemf( )

   GSM 850 98 dBmVemf( )

   GSM 900: 98 dBµVemf( )

   DCS 1 800: 90 dBµVemf( ).

   PCS 1 900: 90 dBµVemf( ).

d) The SS fading function is set to EQ.

e) Step a) is repeated with the amplitude of the wanted signal set to respectively 20 dB above reference sensitivity level( ) and 73dBµVemf( ) at the receiver input.

f) The test is repeated under extreme test conditions.

#### 14.3.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-14. This shall apply for any combination of normal and extreme test voltages and ambient temperature, for the different propagation conditions and for any level of input signal to the receiver.

**Table 14-14: Limits for input level range**

| | GSM 400, GSM 700, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1900 | |
|---|---|---|---|---|
| **Propagation conditions** | **Test limit error rate %** | **Minimum No. of samples** | **Test limit error rate %** | **Minimum No. of samples** |
| Static <=73 dBµVemf( ) | 0,012 | 1640000 | 0,012 | 1640000 |
| Static 98 dBµVemf( ) | 0,122 | 164000 | | |
| Static 90 dBµVemf( ) | | | 0,122 | 164000 |
| EQ | 3,25 | 120000 | 3,25 | 60000 |

## 14.4 Co-channel rejection

### 14.4.1 Co-channel rejection - TCH/FS

#### 14.4.1.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to MS supporting speech.

#### 14.4.1.2 Conformance requirement

1. At reference co-channel interference the TCH/FS FER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

2. At reference co-channel interference the TCH/FS class Ib BER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

3. At reference co-channel interference the TCH/FS class II BER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

#### 14.4.1.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping with an allowance for the statistical significance of the test.

2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping, with an allowance for the statistical significance of the test.

3. To verify that the MS does not exceed conformance requirement 3 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping with an allowance for the statistical significance of the test.

#### 14.4.1.4 Method of test

##### 14.4.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

The SS commands the MS to create the traffic channel loop back, signalling erased frames. (36.1.2.1.1.1).

##### 14.4.1.4.2 Procedure

a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUlow.

b) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

c) The SS determines the number of residual bit error events for the bits of class II, by examining at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.

d) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.

e) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

f) Steps a) to e) are repeated except that in step a) both the wanted and interfering signal are TUhigh hopping and the SS commands the MS into hopping mode. A hop pattern covering at least 10 frequencies in a range not exceeding 5 MHz is used.

The hopping band is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in section 6.

#### 14.4.1.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-15.

**Table 14-15: Limits for co-channel rejection**

| Channel | Type of measure-ment | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---|---|---|---|---|
| TCH/FS | FER | TUlow/No FH | 24*α | 25000 |
| TCH/FS Class Ib | RBER | TUlow/No FH | 2,091/α | 3300000 |
| TCH/FS Class II | RBER | TUlow/No FH | 4,3 | 2000000 |
| TCH/FS | FER | TUhigh/FH | 3,371*α | 17800 |
| TCH/FS class Ib | RBER | TUhigh/FH | 0,215/α | 2000000 |
| TCH/FS class II | RBER | TUhigh/FH | 8,333 | 1200000 |

The parameter α can range from 1 to 1.6. The value of α for the RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions.

## 14.4.2 Co-channel rejection - TCH/HS

### 14.4.2.1 Definition and applicability

The requirements and this test apply to MS supporting half rate speech.

### 14.4.2.2 Conformance requirement

1. At reference cochannel interference, the TCH/HS FER (shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
2. At reference cochannel interference, the TCH/HS class Ib BER (BFI=0) shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
3. At reference cochannel interference, the TCH/HS class II BER (BFI=0) shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
4. At reference cochannel interference, the TCH/HS UFR shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
5. At reference cochannel interference, the TCH/HS class Ib RBER ((BFI or UFI)=0) shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

### 14.4.2.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1, under propagation conditions TUhigh with frequency hopping, with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 1, under propagation conditions TUhigh with frequency hopping, with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 1, under propagation conditions TUhigh with frequency hopping, with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4, under propagation condition TUhigh with frequency hopping, with an allowance for the statistical significance of the test.
5. To verify that the MS does not exceed conformance requirement 4, under propagation condition TUhigh with frequency hopping, with an allowance for the statistical significance of the test.

### 14.4.2.4 Method of test

#### 14.4.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

#### 14.4.2.4.2 Procedure

a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

   The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

b) The fading characteristic of the wanted and the interfering signal is set to TUhigh. The SS commands the MS into hopping mode. A hop pattern covering at least 10 frequencies in a range not exceeding 5 MHz is used.

   The hopping pattern is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in section 6.

c) The SS commands the MS to create traffic channel loop back signalling erased frames using test loop A.

NOTE: Test loop A is defined in clause 36. Frames marked with BFI=1 are signalled as erased on the uplink.

d) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

e) The SS determines the number of residual bit error events for the bits of class II, by examining at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.

f) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.

g) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

h) The SS commands the MS to open test loop A and close test loop D.

NOTE: Test loop D is defined in clause 36. Frames marked as erased (BFI=1), or unreliable (UFI=1), are signalled to the SS on the uplink.

j) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the erased/unreliable frame indication.

k) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased/unreliable.

l) The SS also determines the unreliable frame events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased/unreliable.

#### 14.4.2.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-16 or table 14-17.

**Table 14-16: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 co-channel rejection**

| Channel/Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---|---|---|---|
| TCH/HS FER | TUhigh/FH | 5,607 | 10700 |
| TCH/HS Class Ib RBER (BFI=0) | TUhigh/FH | 0,325 | 184700 |
| TCH/HS Class II RBER (BFI=0) | TUhigh/FH | 7,961 | 25500 |
| TCH/HS UFR | TUhigh/FH | 6,834 | 8780 |
| TCH/HS Class Ib RBER ((BFI or UFI)=0) | TUhigh/FH | 0,235 | 255000 |

**Table 14-17: Limits for DCS 1800 and PCS 1900 co-channel rejection**

| Channel/Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---|---|---|---|
| TCH/HS FER | TUhigh/FH | 5,607 | 10700 |
| TCH/HS Class Ib RBER (BFI=0) | TUhigh/FH | 0,325 | 184700 |
| TCH/HS Class II RBER (BFI=0) | TUhigh/FH | 7,961 | 25500 |
| TCH/HS UFR | TUhigh/FH | 6,834 | 8780 |
| TCH/HS Class Ib RBER ((BFI or UFI)=0) | TUhigh/FH | 0,235 | 255000 |

## 14.4.3 Co-channel rejection - TCH/HS (SID frames)

### 14.4.3.1 Definition and applicability

The requirements and this test apply to MS supporting half rate speech.

### 14.4.3.2 Conformance requirement

1. At reference cochannel interference, the TCH/HS ESIDR, for SID frames indicated as SID=0 shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
2. At reference cochannel interference, the TCH/HS RBER for SID frames indicated as SID=1 or SID=2, shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
3. At reference cochannel interference, the TCH/HS EVSIDR for SID frames indicated as (SID=0), or (SID=1), or ((BFI or UFI)=1), shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
4. At reference cochannel interference, the TCH/HS RBER for SID frames indicated as SID=2 and (BFI or UFI)=0, shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

### 14.4.3.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TUlow, with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUlow, with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under propagation condition TUlow, with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4 under propagation condition TUlow, with an allowance for the statistical significance of the test.

### 14.4.3.4 Method of test

#### 14.4.3.4.1 Initial conditions

The BCCH data indicates that uplink DTX shall be disabled.

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 no the traffic channel.

#### 14.4.3.4.2 Procedure

a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

   The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

b) The fading function is set to TUlow.

c) The SS commands the MS to create traffic channel loop back signalling erased frames using test loop E.

NOTE: Test loop E is defined in clause 36. Frames marked with (SID=0) shall be signalled as erased on the uplink.

d) The SS transmits continuously SID frames on the downlink. The SID codeword is transmitted correctly, but the SID information contains random data.

e) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

f) The SS determines the number of residual bit error events for the class 1 SID bits, which do not belong to the SID codeword, by examining sequences of at least the minimum number of samples of consecutive class 1 SID bits. Bits are taken only from those frames not signalled as erased.

g) The SS also determines the erased SID events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased. Bits comprising the SID codeword are excluded.

h) The SS commands the MS to open test loop E and close test loop F.

NOTE: Test loop F is defined in clause 36. Frames marked with (SID=0), or (SID=1), or ((BFI or UFI)=1), shall be signalled as erased on the uplink.

j) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

k) The SS determines the number of residual bit error events for the class 1 SID bits, which do not belong to the SID codeword, by examining sequences of at least the minimum number of samples of consecutive class 1 SID bits. Bits are taken only from those frames not signalled as erased.

l) The SS also determines the erased valid SID events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

#### 14.4.3.5 Test requirements

The error rates measured in this test shall not exceed the test limit error rate values given in table 14-18.

**Table 14-18: Limits for co-channel rejection**

| Channel/Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---|---|---|---|
| ESIDR | TUlow | 19,152 | 25000 |
| SID RBER (SID=1 or 2) | TUlow | 0,560 | 500000 |
| EVSIDR | TUlow | 24,000 | 25000 |
| SID RBER (SID=2 and (BFI or UFI)=0) | TUlow | 0,022 | 2678000 |

## 14.4.4 Co-channel rejection - FACCH/F

#### 14.4.4.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to all types of MS.

#### 14.4.4.2 Conformance requirement

At reference cochannel interference the FACCH/F FER shall meet the reference interference performance of table 2 in GSM 05.05; (GSM 05.05, 6.3).

#### 14.4.4.3 Test purpose

To verify that the MS does not exceed the conformance requirement under propagation condition TUlow with an allowance for the statistical significance of the test.

#### 14.4.4.4 Method of test

##### 14.4.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the mid ARFCN range. For MS supporting speech this shall be a TCH/FS. For MS not supporting speech one of the supported TCH/ (F9,6, F4,8, or F2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

##### 14.4.4.4.2 Procedure

a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

   The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

   The fading characteristic of the wanted and the interfering signal is TUlow.

d) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the co-channel interference, the MS may not be able to acknowledge the Layer 2 frame. Each repeated L2 frame indicates a frame erasure event. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

#### 14.4.4.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-14.

**Table 14-19: Limits for co-channel rejection**

| Channel | Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---|---|---|---|---|
| FACCH/F | FER | TUlow/No FH | 24 | 25000 |

## 14.4.5 Co-channel rejection - FACCH/H

#### 14.4.5.1 Definition and applicability

The requirements and this test apply to MS supporting half rate channels.

#### 14.4.5.2 Conformance requirement

At reference cochannel interference the FACCH/H FER shall meet the reference interference performance of table 2 in GSM 05.05; (GSM 05.05, 6.3).

#### 14.4.5.3 Test purpose

To verify that the MS does not exceed the conformance requirement under propagation condition TUlow with an allowance for the statistical significance of the test.

#### 14.4.5.4 Method of test

##### 14.4.5.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the mid ARFCN range. For MS supporting half rate speech this shall be a TCH/HS. For MS not supporting speech one of the supported TCH/(H4,8, or H2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

##### 14.4.5.4.2 Procedure

a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUlow.

d) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the co-channel interference, the MS may not be able to acknowledge the Layer 2 frame. Each repeated L2 frame indicates a frame erasure event. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/H frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degrade.

#### 14.4.5.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-20.

**Table 14-20: Limits for co-channel rejection**

| Channel | Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---|---|---|---|---|
| FACCH/H | FER | TUlow/No FH | 24,000 | 25000 |

## 14.4.6 Co-channel rejection - TCH/EFS

#### 14.4.6.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to MS supporting speech.

#### 14.4.6.2 Conformance requirement

1. At reference co-channel interference the TCH/EFS FER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

2. At reference co-channel interference the TCH/EFS class Ib BER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

3. At reference co-channel interference the TCH/EFS class II BER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

#### 14.4.6.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping with an allowance for the statistical significance of the test.

2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping, with an allowance for the statistical significance of the test.

3. To verify that the MS does not exceed conformance requirement 3 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping with an allowance for the statistical significance of the test.

#### 14.4.6.4 Method of test

##### 14.4.6.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/EFS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

The SS commands the MS to create the traffic channel loop back, signalling erased frames. (36.1.2.1.1.1).

##### 14.4.6.4.2 Procedure

a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

   The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

   The fading characteristic of the wanted and the interfering signal is TUlow.

b) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

c) The SS determines the number of residual bit error events for the bits of class II, by examining at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.

d) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.

e) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

f) Steps a) to e) are repeated except that in step a) both the wanted and interfering signal are TUhigh hopping and the SS commands the MS into hopping mode. A hop pattern covering at least 10 frequencies in a range not exceeding 5 MHz is used.

   The hopping band is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in section 6.

#### 14.4.6.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-21.

**Table 14-21: Limits for co-channel rejection**

| Channel | Type of measure-ment | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---|---|---|---|---|
| TCH/EFS | FER | TUlow/No FH | 24 | 25000 |
| TCH/EFS Class Ib | RBER | TUlow/No FH | 0,209 | 3300000 |
| TCH/EFS Class II | RBER | TUlow/No FH | 3,039 | 2000000 |
| TCH/EFS | FER | TUhigh/FH | 3,357 | 17800 |
| TCH/EFS class Ib | RBER | TUhigh/FH | 0,115 | 2000000 |
| TCH/EFS class II | RBER | TUhigh/FH | 8,333 | 1200000 |

### 14.4.7 Receiver performance in the case of frequency hopping and co-channel interference on one carrier

#### 14.4.7.1 Definition and applicability

The GSM receiver is specified to be able to handle one out of four carriers being strongly interefered with, if frequency hopping is applied. This is used in networks to increase the capacity.

The requirement and this test apply to all R97 MS (or later) supporting speech.

#### 14.4.7.2 Conformance Requirement

Under the following conditions:

- a useful signal, cyclic frequency hopping over four carriers under static conditions, with equal input levels 20 dB above reference sensitivity level;
- a random, continuous, GMSK-modulated interfering signal on only one of the carriers at a level 10 dB higher than the useful signal,

the FER for TCH/FS shall be less than 5%; GSM 05.05, 6.6.

#### 14.4.7.3 Test Purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

#### 14.4.7.4 Method Of Test

##### 14.4.7.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS channel in hopping mode, power control level set to maximum power. A cyclic hop pattern covering four frequencies with a minimum carrier distance of 600 kHz is used.

The SS transmits Standard Test Signal C1 on the traffic channel with a power level 20 dB above reference sensitivity level (wanted signal). No fading is applied.

The SS commands the MS to create the traffic channel loop back, signalling erased frames.

#### 14.4.7.4.2 Test Procedure

a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal) on one of the hopping frequencies of the wanted signal, and on the timeslot used by the wanted signal. The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 10 dB above that of the wanted signal. No fading characteristics are applied.

b) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

c) The SS determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

### 14.4.7.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate value given in the following table:

| Channel | Type of measurement | Propagation condition | Test limit error rate (%) | Minimum No. of samples |
|---|---|---|---|---|
| TCH/FS | FER | Static | 6.1 | 3300 |

# 14.5 Adjacent channel rejection

## 14.5.1 Adjacent channel rejection - speech channels

### 14.5.1.1 Definition and applicability

The adjacent channel selectivity is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted signal in the adjacent channel.

The adjacent channel can be adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

1) Adjacent RF channel selectivity which is specifically tested in this section.

2) Adjacent Time Slot selectivity, which is implicitly tested in test .2.1.

The requirements and this test apply to MS supporting speech.

### 14.5.1.2 Conformance requirement

1. With adjacent channel interference at 200 kHz above and below the wanted signal and signal level 9 dB above the wanted signal level:

   1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for TCH/FS shall be within the requirements of table 2 in GSM 05.05; GSM 05.05, 6.3.

   1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class Ib RBER shall be within the requirements of table 2 in GSM 05.05; GSM 05.05, 6.3.

   1.3 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class II RBER shall be within the requirements of table 2 in GSM 05.05; GSM 05.05, 6.3.

   1.4 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class II RBER shall be within the requirements of table 2 in GSM 05.05 under extreme test conditions; GSM 05.05, 6.3, GSM 05.05, annex D D.2.1, D.2.2.

2. For adjacent channel interference at 400 kHz above and below the wanted signal frequency and signal level 41 dB above the wanted signal level:

   2.1 For a TUhigh faded wanted signal and a static adjacent channel interferer, the FER for TCH/FS shall be better than:

   GSM 400, GSM 700, GSM 850 and GSM 900: 10,2*α %; GSM 05.05, 6.3

   DCS 1 800 and PCS 1 900: 5,1*α %; GSM 05.05, 6.3.

   2.2 For a TUhigh faded wanted signal and a static adjacent channel interferer, the Class Ib RBER shall be better than:

   GSM 400, GSM 700, GSM 850 and GSM 900: 0,72/α %; GSM 05.05, 6.3

   DCS 1 800 and PCS 1 900: 0,45/α %; GSM 05.05, 6.3.

   2.3 For a TUhigh faded wanted signal and a static adjacent channel interferer, the Class II RBER shall be better than:

   GSM 400, GSM 700, GSM 850 and GSM 900: 8,8 %; GSM 05.05, 6.3

   DCS 1 800 and PCS 1 900: 8,9 %; GSM 05.05, 6.3.

   2.4 For a TUhigh faded wanted signal and a static adjacent channel interferer, the Class II RBER shall be better than:

   GSM 400, GSM 700, GSM 850 and GSM 900: 8,8 %;

   DCS 1 800 and PCS 1 900: 8,9 %;.

   under extreme test conditions; GSM 05.05, 6.3, annex D D.2.1, D.2.2.

#### 14.5.1.3 Test purpose

1 To verify that with a TUhigh adjacent channel interferer at 200 kHz above and below the wanted TUhigh signal frequency and signal level 9 dB above the wanted signal level:

   1.1 Conformance requirement 1.1 is met with an allowance for the statistical significance of the test.

   1.2 Conformance requirement 1.2 is met with an allowance for the statistical significance of the test.

   1.3 Conformance requirement 1.3 is met with an allowance for the statistical significance of the test.

   1.4 Conformance requirement 1.4 is met with an allowance for the statistical significance of the test.

2. To verify that with a static adjacent channel interferer at 400 kHz above and below a TUhigh wanted signal frequency and signal level 41 dB above the wanted signal level:

   2.1 Conformance requirement 2.1 is met with an allowance for the statistical significance of the test.

   2.2 Conformance requirement 2.2 is met with an allowance for the statistical significance of the test.

   2.3 Conformance requirement 2.3 is met with an allowance for the statistical significance of the test.

   2.4 Conformance requirement 2.4 is met with an allowance for the statistical significance of the test.

#### 14.5.1.4 Method of test

##### 14.5.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS commands the MS to create the traffic channel loop back signalling erased frames.

The SS transmits Standard Test Signal C1 on the TCH (wanted signal).

#### 14.5.1.4.2 Procedure

a) In addition to the wanted signal, the SS transmits an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal.

The fading characteristic of the wanted and the unwanted signal is set to TUhigh.

The unwanted signal is transmitted at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to 9dB above that of the wanted signal.

b) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

c) The SS tests the frame erasure compliance for the TCH/FS by examining at least the minimum number of samples of consecutive frames. The number of frame erasure events is recorded.

d) The SS determines the number of residual bit error events for the bits of the class Ib and class II, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib and class II, Bits are only taken from those frames for which no bad frame indication was given.

e) The measurement of steps c) and d) is repeated with the unwanted signal on a frequency at the same displacement from, but below, the frequency of the wanted signal.

f) The measurement of steps c) to e) shall be repeated for a displacement of the unwanted signal of 400 kHz, and with the amplitude of the unwanted signal 41 dB above the level of the wanted input signal, and the unwanted signal static.

g) Steps c) to f) are repeated under extreme test conditions.

#### 14.5.1.5 Test requirements

**Table 14-22: Limits for adjacent channel selectivity**

| | | | GSM 400, GSM 700, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1 900 | |
|---|---|---|---|---|---|---|
| **Interference at** | **Channel** | **Type of measurement** | **Test limit error rate %** | **Minimum No. of samples** | **Test limit error rate %** | **Minimum No. of samples** |
| 200 kHz | TCH/FS | FER | 6,742*α | 8900 | 3,371*α | 17800 |
| | class Ib | RBER | 0,420/α | 1000000 | 0,270/α | 2000000 |
| | class II | RBER | 8,333 | 600000 | 8,333 | 1200000 |
| 400 kHz | TCH/FS | FER | 11,461*α | 8900 | 5,714*α | 10500 |
| | class Ib | RBER | 0,756/α | 1000000 | 0,483/α | 1200000 |
| | class II | RBER | 9,167 | 600000 | 9,167 | 720000 |

The error rates measured in this test shall not exceed the test limit error rate given in table 14-22. This shall apply for any combination of normal and extreme test voltages and ambient temperature, and with the interfering signals at either side of the wanted frequency.

The parameter α can range from 1 to 1,6. The value of α for the RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions.

NOTE: A static unwanted signal is used to avoid a potential problem with the implementation of the fading simulator.

## 14.5.2 Adjacent channel rejection - control channels

### 14.5.2.1 Definition and applicability

The adjacent channel selectivity is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted signal in the adjacent channel.

The adjacent channel can be the adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

1) Adjacent RF channel selectivity which is specifically tested in this section.

2) Adjacent Time Slot selectivity, which is implicitly tested in test 14.2.1.

The requirements and this test apply to MS not supporting speech.

### 14.5.2.2 Conformance requirement

1. For adjacent channel interference at 200 kHz above and below the wanted signal frequency and signal level 9 dB above the wanted signal level:

   1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for the FACCH/F does not exceed the requirements of table 2 in GSM 05.05; GSM 05.05, 6.3.

   1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for the FACCH/F does not exceed the requirements of table 2 in GSM 05.05 under extreme test conditions; GSM 05.05, 6.3, annex D D.2.1, D.2.2.

2 With adjacent channel interference at 400 kHz above and below the wanted signal frequency and signal level 41 dB above the wanted signal level:

   2.1 For a TUhigh faded wanted signal and a static adjacent channel interferer, the FER for the FACCH/F shall be better than:

   GSM 400, GSM 700, GSM 850 and GSM 900: 17,1 %; GSM 05.05, 6.3

   DCS 1 800 and PCS 1 900: 6,1 %; GSM 05.05, 6.3.

   2.2 For a TUhigh faded wanted signal and a static adjacent channel interferer, the FACCH/F shall be better than:

   GSM 400, GSM 700, GSM 850 and GSM 900: 17,1 %

   DCS 1 800 and PCS 1 900: 6,1 %.

   under extreme test conditions; GSM 05.05, 6.3, annex D D.2.1, D.2.2.

### 14.5.2.3 Test purpose

1 To verify that with TUhigh adjacent channel interference at 200 kHz above and below a TUhigh wanted signal frequency and signal level 9 dB above the wanted signal level:

   1.1 Conformance requirement 1.1 is met with an allowance for the statistical significance of the test.

   1.2 Conformance requirement 1.2 is met with an allowance for the statistical significance of the test.

2. To verify that with static adjacent channel interference at 400 kHz above and below a TUhigh wanted signal frequency and signal level 41 dB above the wanted signal level:

   2.1 Conformance requirement 2.1 is met with an allowance for the statistical significance of the test.

   2.2 Conformance requirement 2.2 is met with an allowance for the statistical significance of the test.

14.5.2.4 Method of test

14.5.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH in the mid ARFCN range. Any one of the supported TCH/(F9,6, F4,8, or F2,4) shall be used.

The SS transmits the Standard Test Signal C1 on the TCH (wanted signal).

14.5.2.4.2 Procedure

a) In addition to the wanted signal, the SS transmits an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

   The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. The fading characteristic of the wanted and the unwanted signal is TUhigh.

   The unwanted signal is transmitted at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to 9dB above that of the wanted signal.

b) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the adjacent channel interference, the MS may not be able to acknowledge the Layer 2 frame. Each repeated L2 frame indicates a frame erasure event. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

c) The measurement of step b) is repeated with the unwanted signal on a frequency at the same displacement from, but below, the frequency of the wanted signal.

d) The measurement of steps a) to c) is repeated for a displacement of the unwanted signal of 400 kHz, and with the amplitude of the unwanted signal 41 dB above the level of the wanted input signal, and the unwanted signal static.

e) Steps a) to d) are repeated under extreme test conditions.

14.5.2.5 Test requirements

**Table 14-23: Limits for adjacent channel selectivity**

| | | | GSM 400, GSM 700, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1 900 | |
|---|---|---|---|---|---|---|
| Interference at | Channel | Type of measurement | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| 200 kHz | FACCH/F | FER | 10,640 | 5639 | 3,808 | 15756 |
| 400 kHz | FACCH/F | FER | 19,152 | 3133 | 6,832 | 8782 |

The error rates measured in this test shall not exceed the test limit error rates given in table 14-23. This shall apply for any combination of normal and extreme test voltages and ambient temperature, and with the interfering signals at either side of the wanted frequency.

NOTE: A static unwanted signal is used to avoid a potential problem with the noise floor of the fading simulator.

# 14.6 Intermodulation rejection

## 14.6.1 Intermodulation rejection - speech channels

### 14.6.1.1 Definition and applicability

The intermodulation rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship to the wanted signal frequency.

The requirements and this test apply to MS supporting speech.

For E-GSM 900 and R-GSM 900 MS this test is only performed in the P-GSM band.

### 14.6.1.2 Conformance requirement

In the presence of two unwanted signals with a specific frequency relationship to the wanted signal frequency the Class II RBER for TCH/FS shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 5.3.

### 14.6.1.3 Test purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

### 14.6.1.4 Method of test

NOTE: The measurements address the third order intermodulation, which represents the most serious case.

#### 14.6.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

#### 14.6.1.4.2 Procedure

a) The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level (see table 14-24).

b) The SS commands the MS to create the loop back facility signalling erased frames.

c) The SS produces a static wanted signal, and two static interfering (unwanted) signals at the same time. There is no correlation in the modulation between the signals.

   The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above that of the receiver. This signal is static and unmodulated.

   The second interfering signal is on an ARFCN eight above that of the receiver. This signal is static, continuous and modulated by random data.

   The amplitude of both the interfering signals is set according to table 14-24.

d) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

   The SS tests the RBER compliance of class II bits by examining at least the minimum number of samples of consecutive bits. Bits only taken from those frames which do not signal frame erasure. The number of error events is recorded.

e) The measurement of step d) is repeated with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.

f) Steps b) to e), are repeated but with the receiver operating on an ARFCN in the Low ARFCN range.

g) Steps b) to e), are repeated but with the receiver operating on an ARFCN in the High ARFCN range.

h) Steps a) to g) are repeated under extreme test conditions.

**Table 14-24: Intermodulation test signal levels**

| | GSM 400, GSM 700, | | | | |
|---|---|---|---|---|---|
| | GSM 850 and GSM 900 | | DCS 1 800 | | PCS 1 900 |
| | Small MS | Other MS | Class 1 & 2 | Class 3 | |
| WANTED SIGNAL dBµVemf( ) | 15 | 13 | 17 | 15 | 15 |
| FIRST INTERFERER dBµVemf( ) | 64 | 74 | 64 | 68 | 64 |
| SECOND INTERFERER dBµVemf( ) | 63 | 63 | 64 | 68 | 64 |

NOTE: Some of the levels in table 14-24 are different to those specified in GSM 05.05 due to the consideration of the effect of modulation sideband noise from the second interferer.

#### 14.6.1.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-25.

This shall apply under normal condition and under any combination of normal and extreme test voltages and ambient temperature, and with the two interfering signals at either side of the wanted frequency.

**Table 14-25: Limits for intermodulation rejection**

| Channel | Propagation conditions | Type of measurement | Test limit error rate % | Minimum No. of samples |
|---|---|---|---|---|
| TCH/FS Class II | Static | RBER | 2,439 | 8200 |

## 14.6.2 Intermodulation rejection - control channels

#### 14.6.2.1 Definition and applicability

The intermodulation rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship to the wanted signal frequency.

The requirements and this test apply to MS not supporting speech.

For E-GSM 900 and R-GSM 900 MS this test is only performed in the P-GSM band.

#### 14.6.2.2 Conformance requirement

In the presence of two unwanted signals with a specific frequency relationship to the wanted signal frequency the FER for FACCH/F shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 5.3.

#### 14.6.2.3 Test purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

#### 14.6.2.4 Method of test

NOTE: The measurements address the third order intermodulation, which represents the most serious case.

##### 14.6.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range, power control level set to maximum.

The SS transmits Standard Test Signal C1 on the traffic channel. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level (see table 14-25).

##### 14.6.2.4.2 Procedure

a) The SS produces a TUhigh wanted signal, and two static interfering (unwanted) signals at the same time. There is no correlation in the modulation between the signals.

   The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above that of the receiver. This signal is static and unmodulated.

   The second interfering signal is on an ARFCN eight above that of the receiver. This signal is static, continuous and modulated by random data.

   The amplitude of both the interfering signals is set according to table 14-26.

b) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

c) The measurement of step b) is repeated with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.

d) Steps a) to c), are repeated but with the receiver operating on an ARFCN in the Low ARFCN range.

e) Steps a) to c), are repeated but with the receiver operating on an ARFCN in the High ARFCN range.

f) Steps a) to e) are repeated under extreme test conditions.

**Table 14-26: Intermodulation test signal levels**

| | GSM 400, GSM 700, | | | | |
|---|---|---|---|---|---|
| | GSM 850 and GSM 900 | | DCS 1 800 | | PCS 1 900 |
| | Small MS | Other MS | Class 1 & 2 | Class 3 | |
| WANTED SIGNAL dBµVemf( ) | 15 | 13 | 17 | 15 | 15 |
| FIRST INTERFERER dBµVemf( ) | 64 | 74 | 64 | 68 | 64 |
| SECOND INTERFERER dBµVemf( ) | 63 | 63 | 64 | 68 | 64 |

NOTE: Some of the levels in table 14-26 are different to those specified in GSM 05.05 due to the consideration of the effect of modulation sideband noise from the second interferer.

#### 14.6.2.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-27.

This shall apply under normal condition and under any combination of normal and extreme test voltages and ambient temperature, and with the two interfering signals at either side of the wanted frequency.

**Table 14-27: Limits for intermodulation rejection**

| | | | GSM 400, GSM 700, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1 900 | |

## 14.7 Blocking and spurious response

### 14.7.1 Blocking and spurious response - speech channels

#### 14.7.1.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to MS supporting speech.

#### 14.7.1.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in GSM 05.05 section 5.1.

   The reference sensitivity performance as specified in table 1 of GSM 05.05 shall be met when the following signals are simultaneously input to the receiver:

   - a useful signal at frequency $f_0$, 3 dB above the reference sensitivity level as specified in GSM 05.05 section 6.2;

- a continuous, static sine wave signal at a level as in the table of GSM 05.05 section 5.1 and at a frequency (f) which is an integer multiple of 200 kHz.

  with the following exceptions, called spurious response frequencies:

  a) GSM 700, GSM 850 and GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group);

     DCS 1 800: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group);

     PCS 1 900: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group);

     GSM 400: in band, for a maximum of three occurrences;

  b) out of band, for a maximum of 24 occurrences (which if below $f_0$ and grouped shall not exceed three contiguous occurrences per group).

  where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dBµV (emf) (i.e. -43 dBm). GSM 05.05, 5.1.

#### 14.7.1.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.

2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in GSM 05.05, are allowed to ensure a fair test of the MS.

#### 14.7.1.4 Method of test

##### 14.7.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

The SS commands the MS to create traffic channel loop back signalling erased frames.

##### 14.7.1.4.2 Procedure

a) The SS produces a static wanted signal and a static interfering signal at the same time. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level.

b) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turn on the subset of frequencies calculated in step c) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

   However, frequencies in the range FR +/- 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where n = 2, 3, 4, 5, etc.

c) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) below:-

   i) The total frequency range formed by:-

GSM 400 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +3,6 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 3,6 MHz).

GSM 700 the frequencies between Flo + (IF1 + IF2 + ... +IFn +7,5 MHz)

and Flo - (IF1 + IF2 + ... + IFn + 7,5 MHz).

GSM 850 and P-GSM 900 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +12,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 12,5 MHz).

E-GSM 900 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +17,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 17,5 MHz).

DCS 1 800 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +37,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 37,5 MHz).

PCS 1 900 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +30,0 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 30,0 MHz).

and

the frequencies + 100 MHz and - 100 MHz from the edge of the relevant receive band.

Measurements are made at 200 kHz intervals.

ii) The three frequencies $IF_1$, $IF_1$ + 200 kHz, $IF_1$ - 200 kHz.

iii) The frequencies:

$mF_{lo}$ + $IF_1$,

$mF_{lo}$ - $IF_1$,

mFR,

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:-

$F_{lo}$ - local oscillator applied to first receiver mixer

$IF_1$ ... $IF_n$ - are the n intermediate frequencies

$F_{lo}$, $IF_1$, $IF_2$ ... $IF_n$ shall be declared by the manufacturer in the PIXIT statement GSM 11.10 annex 3.

d) The level of the unwanted signal is set according to table 14-28.

**Table 14-28a: Level of unwanted signals**

| | GSM 900 | | DCS 1 800 |
|---|---|---|---|
| | Small MS | Other MS | |
| FREQUENCY | LEVEL IN dBµVemf( ) | | |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 | 75 | 70 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 | 80 | 70 |
| FR +/- 1,6 MHz to FR +/- 3 MHz | 80 | 90 | 80 |
| 915 MHz to FR - 3 MHz | 90 | 90 | - |
| FR + 3 MHz to 980 MHz | 90 | 90 | - |
| 1785 MHz to FR - 3 MHz | - | - | 87 |
| FR + 3 MHz to 1920 MHz | - | - | 87 |
| 835 MHz to <915 MHz | 113 | 113 | |
| >980 MHz to 1000 MHz | 113 | 113 | |
| 100 kHz to <835 MHz | 90 | 90 | |
| >1000 MHz to 12,75 GHz | 90 | 90 | |
| 100 kHz to 1705 MHz | - | - | 113 |
| >1705 MHz to <1785 MHz | - | - | 101 |
| >1920 MHz to 1980 MHz | - | - | 101 |
| >1980 MHz to 12,75 GHz | - | - | 90 |

**Table 14-28b: Level of unwanted signals**

| | GSM 450 | | GSM 480 | |
|---|---|---|---|---|
| | Small MS | Other MS | Small MS | Other MS |
| FREQUENCY | LEVEL IN dBµVemf( ) | | | |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 | 75 | 70 | 75 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 | 80 | 70 | 80 |
| FR +/- 1,6 MHz to FR +/- 3 MHz | 80 | 90 | 80 | 90 |
| 457,6 to FR – 3 MHz | 90 | 90 | - | - |
| FR + 3 MHz to 473,6 MHz | 90 | 90 | - | - |
| 486 to FR – 3 MHz | - | - | 90 | 90 |
| FR + 3 MHz to 502 MHz | - | - | 90 | 90 |
| 100 kHz to <457,6 MHz | 113 | 113 | - | - |
| >473,6 MHz to 12,75 GHz | 113 | 113 | - | - |
| 100 kHz to <486 MHz | - | - | 113 | 113 |
| >502 MHz to 12,75 GHz | - | - | 113 | 113 |

**Table 14-28c: Level of unwanted signals**

| | PCS 1 900 |
|---|---|
| FREQUENCY | LEVEL IN dBµVemf( ) |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 |
| FR +/- 1,6 MHz to FR +/- 3 MHz | 80 |
| 1910 MHz to FR – 3 MHz | 87 |
| FR + 3 MHz to 2010 MHz | 87 |
| 100 kHz to 1830 MHz | 113 |
| >1830 MHz to <1910 MHz | 101 |
| >2010 MHz to 2070 MHz | 101 |
| >2070 MHz to 12,75 GHz | 90 |

**Table 14-28d: Level of unwanted signals**

| | GSM 750 | GSM 850 |
|---|---|---|
| **FREQUENCY** | **LEVEL IN dBµVemf( )** | |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 | 70 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 | 70 |
| FR +/- 1,6 MHz to FR +/- 3 MHz | 80 | 80 |
| 727 to FR – 3 MHz | 90 | - |
| FR + 3 MHz to 782 MHz | 90 | - |
| 849 MHz to FR – 3 MHz | - | 90 |
| FR + 3 MHz to 914 MHz | - | 90 |
| 100 kHz to <727 MHz | 113 | - |
| >782 MHz to 12,75 GHz | 113 | - |
| 100 kHz to <849 MHz | - | 113 |
| >914 MHz to 12,75 GHz | - | 113 |

NOTE 1: These values differ from GSM 05.05 because of practical generator limits in the SS.

NOTE 2: For an E-GSM 900 MS the level of the unwanted signal in the band 905 MHz to <915 MHz is relaxed to 108 dBuVemf( ).

NOTE 3: For a GSM 450 small MS the level of the unwanted signal in the band 450,4 MHz to <457,6 MHz is relaxed to 108 dBuVemf( ). For a GSM 480 small MS the level of the unwanted signal in the band 478,8 MHz to <486 MHz is relaxed to 108 dBuVemf( ).

e) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

The SS tests the RBER compliance for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II, where bits are taken only from those frames for which no bad frame indication was given. The number of error events is recorded.

If a failure is indicated it is noted and counted towards the allowed exemption totals.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also tested. This process is repeated until all channels constituting the group of failures is known.

### 14.7.1.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-29.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

**Table 14-29: Limits for blocking**

| Channel | Type of measurement | Test limit error rate % | Minimum number of samples |
|---|---|---|---|
| TCH/FS Class II | RBER | 2,439 | 8200 |

The following exceptions are allowed:

GSM 450: A maximum of three failures in the frequency band 457,6 MHz to 473,6 MHz.

A maximum of 24 failures in the combined bands 100 kHz to 457,6 MHz and 473,6 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 480: A maximum of three failures in the frequency band 486 MHz to 502 MHz.

A maximum of 24 failures in the combined bands 100 kHz to 486 MHz and 502 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 750: A maximum of six failures in the frequency band 727 MHz to 782 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 727 MHz and 782 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 850: A maximum of six failures in the frequency band 849 MHz to 914 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 849 MHz and 914 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 900: A maximum of six failures in the frequency band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

DCS 1 800: A maximum of twelve failures in the band 1785 MHz to 1920 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1785 MHz and 1920 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

PCS 1 900: A maximum of twelve failures in the band 1910 MHz to 2010 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1910 MHz and 2010 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.1.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dBµVemf( ) and the performance requirement is once again that that stated in the table above.

The number Error rate measured in this test shall not exceed the test limit error rate values given in table 14-29.

No failures are allowed at this lower unwanted signal level.

## 14.7.2 Blocking and spurious response - control channels

### 14.7.2.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to MS not supporting speech.

### 14.7.2.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in GSM 05.05 section 5.1.

   The reference sensitivity performance as specified in table 1 of GSM 05.05 shall be met when the following signals are simultaneously input to the receiver:

   - a useful signal at frequency $f_0$, 3 dB above the reference sensitivity level as specified in GSM 05.05 section 6.2;

   - a continuous, static sine wave signal at a level as in the table of GSM 05.05 section 5.1 and at a frequency (f) which is an integer multiple of 200 kHz.

     with the following exceptions, called spurious response frequencies:-

a) GSM 700, GSM 850 or GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group),

DCS 1 800: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group).

PCS 1 900: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group).

GSM 400: in band, for a maximum of three occurrences;

b) out of band, for a maximum of 24 occurrences (which if below $f_0$ and grouped shall not exceed three contiguous occurrences per group).

where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dBµV (emf) (i.e. -43 dBm). GSM 05.05, 5.1.

#### 14.7.2.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.

2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in GSM 05.05, are allowed to ensure a fair test of the MS.

#### 14.7.2.4 Method of test

##### 14.7.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

##### 14.7.2.4.2 Procedure

a) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to interfering signals, the MS may not be able to acknowledge the Layer 2 frame. Frame erasures are indicated by repeated L2 frames.

b) The SS is set to produce a TUhigh wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level.

c) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turn on the subset of frequencies calculated at step f) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR +/- 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where n = 2, 3, 4, 5, etc.

d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

i) The total frequency range formed by:-

GSM 400 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +3,6 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 3,6 MHz).

GSM 700 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ + 7,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 7,5 MHz).

GSM 850 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ + 12,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 12,5 MHz).

P-GSM 900 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +12,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 12,5 MHz).

E-GSM 900 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +17,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 17,5 MHz).

DCS 1 800 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +37,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 37,5 MHz).

PCS 1 900 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +30,0 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 30,0 MHz).

and

the frequencies + 100 MHz and - 100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies $IF_1$, $IF_1$ + 200 kHz, $IF_1$ - 200 kHz.

iii) The frequencies:

$mF_{lo}$ + $IF_1$,

$mF_{lo}$ - $IF_1$,

mFR,

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:-

$F_{lo}$ - local oscillator applied to first receiver mixer

$IF_1$ ... $IF_n$ - are the n intermediate frequencies

$F_{lo}$, $IF_1$, $IF_2$ ... $IF_n$ shall be declared by the manufacturer in the PIXIT statement GSM 11.10 annex 3.

e) The level of the unwanted signal is set according to table 14-30.

**Table 14-30a: Level of unwanted signals**

| | GSM 900 | | DCS 1 800 |
|---|---|---|---|
| | Small MS | Other MS | |
| **FREQUENCY** | **LEVEL IN dBµVemf( )** | | |

| 100 kHz to <849 MHz | - | 113 |
| >914 MHz to 12,75 GHz | - | 113 |

NOTE 1: These values differ from GSM 05.05 because of practical generator limits in the SS.

NOTE 2: For an E-GSM 900 MS the level of the unwanted signal in the band 905 MHz to < 915 MHz is relaxed to 108 dBuVemf( ).

NOTE 3: For a GSM 450 small MS the level of the unwanted signal in the band 450,4 MHz to <457,6 MHz is relaxed to 108 dBuVemf( ). For a GSM 480 small MS the level of the unwanted signal in the band 478,8 MHz to <486 MHz is relaxed to 108 dBuVemf( ).

f) The SS determines the number of frame erasure events during at least the minimum number of samples. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

### 14.7.2.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate given in table 14-31.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

**Table 14-31: Limits for blocking**

| | | GSM 400 and GSM 900 | | DCS 1 800 and PCS 1 900 | |
|---|---|---|---|---|---|
| **Channel** | **Type of measurement** | **Test limit error rate** | **Minimum No. of samples** | **Test limit error rate** | **Minimum No. of samples** |
| FACCH/F | FER | 8,961 | 6696 | 4,368 | 13736 |

The following exceptions are allowed:

GSM 450: A maximum of three failures in the frequency band 457,6 MHz to 473,6 MHz.

A maximum of 24 failures in the combined bands 100 kHz to 457,6 MHz and 473,6 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 480: A maximum of three failures in the frequency band 486 MHz to 502 MHz.

A maximum of 24 failures in the combined bands 100 kHz to 486 MHz and 502 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 750: A maximum of six failures in the frequency band 727 MHz to 782 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 727 MHz and 782 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 850: A maximum of six failures in the frequency band 849 MHz to 914 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 849 MHz and 914 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 900: A maximum of six failures in the band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

DCS 1 800: A maximum of twelve failures in the band 1785 MHz to 1 920 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1785 MHz and 1 920 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

PCS 1 900: A maximum of twelve failures in the band 1910 MHz to 2010 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1910 MHz and 2010 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.2.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dBµVemf( ) and the performance requirement is once again that stated above.

The number of Error Events recorded in this test shall not exceed the test limit error rate values given above, when using the maximum number of samples.

No failures are allowed at this lower unwanted signal level.

## 14.7.3 Blocking and spurious response - speech channels for MS supporting the R-GSM band

### 14.7.3.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to R-GSM MS supporting speech.

### 14.7.3.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in GSM 05.05 section 5.1.

   The reference sensitivity performance as specified in table 1 of GSM 05.05 shall be met when the following signals are simultaneously input to the receiver:

   - a useful signal at frequency $f_0$, 3 dB above the reference sensitivity level as specified in GSM 05.05 section 6.2;

   - a continuous, static sine wave signal at a level as in the table of GSM 05.05 section 5.1 and at a frequency (f) which is an integer multiple of 200 kHz.

     With the following exceptions, called spurious response frequencies:

     a) R-GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group);

b) out of band, for a maximum of 24 occurrences (which if below $f_0$ and grouped shall not exceed three contiguous occurrences per group).

Where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dBµV (emf) (i.e. -43 dBm). GSM 05.05, 5.1.

#### 14.7.3.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.

2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in GSM 05.05, are allowed to ensure a fair test of the MS.

#### 14.7.3.4 Method of test

##### 14.7.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

The SS commands the MS to create traffic channel loop back signalling erased frames.

##### 14.7.3.4.2 Procedure

a) The SS produces a static wanted signal and a static interfering signal at the same time. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level.

b) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turnon the subset of frequencies calculated in step c) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR +/- 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where n = 2, 3, 4, 5, etc.

c) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) below:-

i) The total frequency range formed by:-

R-GSM 900 the frequencies between $F_{lo} + (IF_1 + IF_2 + ... + IF_n + 19{,}5$ MHz)

and $F_{lo} - (IF_1 + IF_2 + ... + IF_n + 19{,}5$ MHz).

And the frequencies + 100 MHz and - 100 MHz from the edge of the relevant receive band.

Measurements are made at 200 kHz intervals.

ii) The three frequencies $IF_1$, $IF_1$ + 200 kHz, $IF_1$ - 200 kHz.

iii) The frequencies:

$mF_{lo} + IF_1$,

$mF_{lo} - IF_1$,

mFR,

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:-

$F_{lo}$ - local oscillator applied to first receiver mixer

$IF_1$ ... $IF_n$ - are the n intermediate frequencies

$F_{lo}$, $IF_1$, $IF_2$ ... $IF_n$ shall be declared by the manufacturer in the PIXIT statement GSM 11.10 annex 3.

d) The level of the unwanted signal is set according to table 14-28b.

**Table 14-28b: Level of unwanted signals for R-GSM MS**

| | R-GSM 900 | |
|---|---|---|
| | Small MS | Other MS |
| FREQUENCY | LEVEL IN dBµVemf( ) | |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 | 75 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 | 80 |
| FR +/- 1,6 MHz to FR +/- 3 MHz | 80 | 90 |
| 915 MHz to FR - 3 MHz | 90 | 90 |
| FR + 3 MHz to 980 MHz | 90 | 90 |
| 1785 MHz to FR - 3 MHz | - | - |
| FR + 3 MHz to 1920 MHz | - | - |
| 835 MHz to <876 MHz | 113 | 113 |
| 876 MHz to 880 MHz | 106 | 113 |
| 880 MHz to 915 MHz | 106 | 108 |
| >980 MHz to 1000 MHz | 113 | 113 |
| 100 kHz to <835 MHz | 90 | 90 |
| >1000 MHz to 12,75 GHz | 90 | 90 |

NOTE: These values differ from GSM 05.05 because of practical generator limits in the SS.

e) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

The SS tests the RBER compliance for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II, where bits are taken only from those frames for which no bad frame indication was given. The number of error events is recorded.

If a failure is indicated it is noted and counted towards the allowed exemption totals.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also tested. This process is repeated until all channels constituting the group of failures is known.

### 14.7.3.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-29b.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

**Table 14-29b: Limits for blocking**

| Channel | Type of measurement | Test limit error rate % | Minimum number of samples |
|---|---|---|---|
| TCH/FS Class II | RBER | 2,439 | 8200 |

The following exceptions are allowed:

R-GSM 900: A maximum of six failures in the frequency band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.3.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dBµVemf( ) and the performance requirement is once again that that stated in the table above.

The number Error rate measured in this test shall not exceed the test limit error rate values given in table 14-29b.

No failures are allowed at this lower unwanted signal level.

## 14.7.4 Blocking and spurious response - control channels for MS supporting the R-GSM band

### 14.7.4.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to R-GSM MS not supporting speech.

### 14.7.4.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in GSM 05.05 section 5.1.

   The reference sensitivity performance as specified in table 1 of GSM 05.05 shall be met when the following signals are simultaneously input to the receiver:

   - a useful signal at frequency $f_0$, 3 dB above the reference sensitivity level as specified in GSM 05.05 section 6.2;
   - a continuous, static sine wave signal at a level as in the table of GSM 05.05 section 5.1 and at a frequency (f) which is an integer multiple of 200 kHz.

     With the following exceptions, called spurious response frequencies:-

     a) R-GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group),

     b) out of band, for a maximum of 24 occurrences (which if below $f_0$ and grouped shall not exceed three contiguous occurrences per group).

   Where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dBµV (emf) (i.e. -43 dBm). GSM 05.05, 5.1.

### 14.7.4.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.

2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in GSM 05.05, are allowed to ensure a fair test of the MS.

### 14.7.4.4 Method of test

#### 14.7.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

#### 14.7.4.4.2 Procedure

a) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to interfering signals, the MS may not be able to acknowledge the Layer 2 frame. Frame erasures are indicated by repeated L2 frames.

b) The SS is set to produce a TUhigh wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level.

c) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turn on the subset of frequencies calculated at step f) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR +/- 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where n = 2, 3, 4, 5, etc.

d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

i) The total frequency range formed by:-

R-GSM 900 the frequencies between $F_{lo} + (IF_1 + IF_2 + ... + IF_n + 19{,}5$ MHz)

and $F_{lo} - (IF_1 + IF_2 + ... + IF_n + 19{,}5$ MHz).

and

the frequencies + 100 MHz and - 100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies $IF_1$, $IF_1$ + 200 kHz, $IF_1$ - 200 kHz.

iii) The frequencies:

$mF_{lo} + IF_1$,

$mF_{lo} - IF_1$,

mFR,

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:-

$F_{lo}$ - local oscillator applied to first receiver mixer

$IF_1$ ... $IF_n$ - are the n intermediate frequencies

$F_{lo}$, $IF_1$, $IF_2$ ... $IF_n$ shall be declared by the manufacturer in the PIXIT statement GSM 11.10 annex 3.

e) The level of the unwanted signal is set according to table 14-30b.

**Table 14-30b: Level of unwanted signals**

| | GSM 900 | |
|---|---|---|
| | Small MS | Other MS |
| FREQUENCY | LEVEL IN dBµVemf( ) | |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 | 75 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 | 80 |
| FR +/- 1,6 MHz to FR +/- 3 MHz | 80 | 90 |
| 915 MHz to FR - 3 MHz | 90 | 90 |
| FR + 3 MHz to 980 MHz | 90 | 90 |
| 835 MHz to <876 MHz | 113 | 113 |
| 876 MHz to 880 MHz | 106 | 113 |
| 880 MHz to 915 MHz | 106 | 108 |
| >980 MHz to 1000 MHz | 113 | 113 |
| 100 kHz to <835 MHz | 90 | 90 |
| >1000 MHz to 12,75 GHz | 90 | 90 |

NOTE: These values differ from GSM 05.05 because of practical generator limits in the SS.

f) The SS determines the number of frame erasure events during at least the minimum number of samples. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

### 14.7.4.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate given in table 14-31b.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

**Table 14-31b: Limits for blocking**

| | | GSM 900 | | DCS 1 800 | |
|---|---|---|---|---|---|
| Channel | Type of measurement | Test limit error rate | Minimum No. of samples | Test limit error rate | Minimum No. of samples |
| FACCH/F | FER | 8,961 | 6696 | 4,368 | 13736 |

The following exceptions are allowed:

R-GSM 900: A maximum of six failures in the band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.4.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dBµVemf( ) and the performance requirement is once again that stated above.

The number of Error Events recorded in this test shall not exceed the test limit error rate values given above, when using the maximum number of samples.

No failures are allowed at this lower unwanted signal level.

# 14.8 AM suppression

## 14.8.1 AM suppression - speech channels

### 14.8.1.1 Definition and applicability

AM suppression is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted TDMA modulated interferer.

The requirements and this test apply to MS supporting speech.

### 14.8.1.2 Conformance requirement

The reference sensitivity performance as specified in table 1 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency $f_0$, 3 dB above the reference sensitivity level as specified in GSM 05.05 section 5.2.
- a single frequency (f), in the relevant receive band, $|f - f_0| \geq 6$MHz, which is an integer multiple of 200 kHz, a GSM TDMA signal modulated by any 148-bits subsequence of the 511-bits pseudo random bit sequence, defined in CCITT Recommendation O.153 fascicle IV.4, at a level as defined in the table below. The interferer shall have one timeslot active and the frequency shall be at least 2 channels separated from any identified spurious responses. The transmitted bursts shall be synchronized to but, delayed in time between 61 and 86 bit periods relative to the bursts of the wanted signal. GSM 05.05, 5.2.

| MS type | Signal level |
|---|---|
| GSM400 | -31 dBm |
| GSM 700 | -31 dBm |
| GSM 850 | -31 dBm |
| GSM900 | -31 dBm |
| DCS1800 | -29 / -31 * dBm |
| PCS1900 | -31 dBm |

* The –31 dBm level shall apply to DCS1800 class 1 and class 2 MS meeting the –102 dBm reference sensitivity level requirement according to GSM 05.05, 6.2.

### 14.8.1.3 Test purpose

To verify that the AM suppression performance of the MS meets the conformance requirement with an allowance for the statistical significance of the test.

### 14.8.1.4 Method of test

#### 14.8.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure, on a TCH/FS with an ARFCN in the mid ARFCN range. The power control level is set to maximum power.

The SS transmits standard Test Signal C1 on the traffic channel (TCH frequency FR).

The SS commands the MS to create traffic channel loop back signalling erased frames.

This test is performed after test 14.7.

#### 14.8.1.4.2 Procedure

a) The SS produces a static wanted signal with an amplitude 4 dB above reference sensitivity level.

b) The SS produces an interfering signal as described below:

- static fading profile;

- at an in band frequency greater than 6 MHz separated from FR and separated by at least two ARFCNs from any spurious responses.

NOTE: Spurious responses are identified by test cases 14.7.1 and 14.7.2.

- at a level as described in table 14-32.

- GSM TDMA modulated by random data with one timeslot active.

- synchronized to, but delayed between 61 and 86 bit periods to the bursts of the wanted signal.

**Table 14-32: Interferer signal level**

| MS type | Signal level (dBμVemf) |
|---|---|
| GSM400 | 82 |
| GSM 700 | 82 |
| GSM 850 | 82 |
| GSM900 | 82 |
| DCS1800 | 82/84 |
| PCS1900 | 82 |

* The 82 dBμVemf (ie. –31 dBm) level shall apply to DCS1800 class 1 and class 2 MS meeting the –102 dBm reference sensitivity level requirement according to GSM 05.05, 6.2.

c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

d) The SS tests the RBER compliance of class II bits by examining at least the minimum number of samples of consecutive bits. Bits only taken from those frames which do not signal frame erasure. The number of error events is recorded.

#### 14.8.1.5 Test requirements

The error rates measured in this test shall not exceed the test limit error rate values given in table 14.27.

**Table 14-33: Limits for AM suppression**

| Channel | Propagation conditions | Type of measurement | Test limit error rate % | Minimum No. of samples |
|---|---|---|---|---|
| TCH/FS Class II | Static | RBER | 2,439 | 8200 |

## 14.8.2 AM suppression - control channels

#### 14.8.2.1 Definition and applicability

AM suppression is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted TDMA modulated interferer.

The requirements and this test apply to MS not supporting speech.

#### 14.8.2.2 Conformance requirement

The reference sensitivity performance as specified in table 1 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency $f_0$, 3 dB above the reference sensitivity level as specified in GSM 05.05 section 5.2.
- a single frequency (f), in the relevant receive band, $|f - f_0| \geq 6$MHz, which is an integer multiple of 200 kHz, a GSM TDMA signal modulated by any 148-bits subsequence of the 511-bits pseudo random bit sequence, defined in CCITT Recommendation O.153 fascicle IV.4, at a level as defined in the table below. The interferer shall have one timeslot active and the frequency shall be at least 2 channels separated from any identified spurious responses. The transmitted bursts shall be synchronized to but, delayed in time between 61 and 86 bit periods relative to the bursts of the wanted signal. GSM 05.05, 5.2.

| MS type | Signal level |
|---|---|
| GSM400 | -31 dBm |
| GSM 700 | -31 dBm |
| GSM 850 | -31 dBm |
| GSM900 | -31 dBm |
| DCS1800 | -29 / -31 * dBm |
| PCS1900 | -31 dBm |

* The –31 dBm level shall apply to DCS1800 class 1 and class 2 MS meeting the –102 dBm reference sensitivity level requirement according to GSM 05.05, 6.2.

#### 14.8.2.3 Test purpose

To verify that the AM suppression performance of the MS meets the conformance requirement with an allowance for the statistical significance of the test.

#### 14.8.2.4 Method of test

##### 14.8.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure, on a TCH with an ARFCN in the mid ARFCN range. The power control level is set to maximum power.

The SS transmits standard Test Signal C1 on the traffic channel (TCH frequency FR).

This test is performed after test 14.7.

##### 14.8.2.4.2 Procedure

a) The SS produces a TUhigh wanted signal with an amplitude 4 dB above reference sensitivity level.

b) The SS produces an interfering signal as described below:

- static fading profile;
- t an in band frequency greater than 6 MHz separated from FR and separated by at least two ARFCNs from any spurious responses.

NOTE: Spurious responses are identified by test cases 14.7.1 and 14.7.2.

- at a level as described in table 14-34.
- GSM TDMA modulated by random data with one timeslot active.
- synchronized to, but delayed between 61 and 86 bit periods to the bursts of the wanted signal.

**Table 14-34: Interferer signal level**

| MS type | Signal level (dBμVemf) |
|---|---|
| GSM400 | 82 |
| GSM 700 | 82 |
| GSM 850 | 82 |
| GSM900 | 82 |
| DCS1800 | 82/84 |
| PCS1900 | 82 |

* The 82 dBμVemf (ie. –31 dBm) level shall apply to DCS1800 class 1 and class 2 MS meeting the –102 dBm reference sensitivity level requirement according to GSM 05.05, 6.2.

c) The SS sends the status message. Due to interfering signals, the MS may not be able acknowledge the Layer 2 frame. Frame erasures are indicated by repeated L2 frames.

d) The SS determines the number of frame erasure events during at least the minimum number of samples. If a failure is indicated, it is noted and counted towards the allowed exemption total.

#### 14.8.2.5 Test requirements

The error rates measured in this test shall not exceed the test limit error rate values given in table 14.35.

**Table 14-35: Limits for AM suppression**

| | | | GSM 400, GSM 700, GSM 850 and GSM 900 | | DCS 1 800 and PCS 1 900 | |
|---|---|---|---|---|---|---|
| Channel | Propagation conditions | Type of measurement | Test limit error rate % | Minimum No. of max-samples | Test limit error rate % | Min No. of max-samples |
| FACCH/F | TUhigh/No FH | FER | 8,961 | 6696 | 4,368 | 13736 |

## 14.9 Paging performance at high input levels

### 14.9.1 Definition and applicability

The paging performance at high input levels is the signal level at the MS receiver input at which a certain FER for the PCH must be achieved.

The requirements and this test apply to all types of MS.

### 14.9.2 Conformance requirement

The paging performance at high input levels requirements of GSM 05.05 section 6.5 a) for PCH under static propagation conditions shall be met from 20 dB above reference sensitivity level up to -15 dBm for GSM 400, GSM 700, GSM 850 and GSM900 and -23 dBm for DCS1800 and PCS1900.

### 14.9.3 Test purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

### 14.9.4 Method of test

#### 14.9.4.1 Initial conditions

System Simulator:

1 cell, Tx-Integer = 3, MAX RETRANS is set to minimum. The CCCH is combined with SDCCH. BS_PA_MFRMS = 9 to achieve worst case sleep mode (DRX). The signal level at the receiver input is set to:

GSM 400:-15 dBm
GSM 700:-15 dBm
GSM 850:-15 dBm
GSM 900:-15 dBm
DCS 1800: -23 dBm.
PCS 1900: -23 dBm

Mobile Station:

The MS has a valid TMSI. It is "idle updated". The MS should have been powered up immediately before running the test, i.e. if a Location update is necessary the MS must be switched off and on again.

#### 14.9.4.2 Procedure

The MS is paged and the SS starts timer T3113. If a CHANNEL REQUEST is received before expiry of T3113 the SS sends an IMMEDIATE ASSIGNMENT REJECT. The sequence is performed 4 times.

Between two consecutive executions the SS must wait for an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

### 14.9.5 Test requirements

If the MS answers all pagings with a CHANNEL REQUEST the requirements are met.

NOTE: The probability for a good MS to fail this test is less than 1%.

## 14.10 (void)

## 14.16 GPRS receiver tests

Statistical testing of receiver BLER performance

Error Definition

Block Error Ratio (BLER):

The Block Error Ratio is the ratio of blocks received in error to the total number of received blocks, where a block is defined as received in error if the error detection functions in the receiver, operating in accordance with GSM 05.03, indicate an error as a the result of the Block Check Sequence (BCS).

For USF the Block Error Ratio is the ratio of incorrectly interpreted USF to the total number of received USF.

Test criteria

In the receiver tests for circuit switched channels, test error rates have been defined in order not to pass MS with a performance worse than the specification by 1 dB, with tests to to be performed at the sensitivity and interference levels defined in GSM 05.05. For circuit switched channels GSM 05.05 defines the error rates at a fixed sensitivity or interference level.

For packet switched channels GSM 05.05 defines the receive or interference level at which a fixed Block Error Ratio is met. Therefore, for GPRS the receiver is tested with a 1 dB offset in the receive level and the interference level.

If the error events can be assumed to be random independent variables, outputs of stationary random processes with identical Gaussian distributions, the previous figures suggest a number of events not lower than 200 in AWGN channel and not lower than 600 in a multipath environment.

For multipath propagation conditions the hypothesis of stationary random processes does not generally hold. In case of non frequency hopping operation mode, the radio channel may be assumed to change 10 times per wavelength of travelled distance and to be short term stationary in between. So, in this case, the required observation time for having good statistical properties should not be lower (with some rounding) than that reported in table 14.16-1.

**Table 14.16-1: Minimum test time according to propagation profile**

| | GSM 400, GSM 700, GSM 850 and GSM 900 | | | | DCS 1 800 and PCS 1900 | | | |
|---|---|---|---|---|---|---|---|---|
| **Propagation Conditions** | **TUlow** | **TUhigh** | **HT** | **RA** | **TUlow** | **TUhigh** | **HT** | **RA** |
| Min. test time (s) | 500 | 30 | 15 | 6 | 500 | 15 | 7,5 | 6 |

Table 14.16-2 details, for the different test conditions, the minimum number of blocks required in order to meet points 1) to 3): the corresponding test time (point 4) can be consequently computed.

**Table 14.16-2: Test conditions**

| Type of test | Type of channel | Propagation/ frequency conditions | Speci-fied BLER % | Minimum No of blocks |
|---|---|---|---|---|
| Sensitivity | PDTCH/CS-1 | static | 10 | 2000 |

## 14.16.1 Minimum Input level for Reference Performance

### 14.16.1.1 Definition and applicability

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

The requirements and this test apply to MS supporting packet channels.

14.16.1.2 Conformance requirement

1. The block error rate (BLER) performance shall not exceed 10 % at input levels according to the Table below.

| Type of channel | | Propagation conditions static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
|---|---|---|---|---|---|---|
| **GSM 400, GSM 700, GSM 850 and GSM 900** | | | | | | |
| PDTCH/CS-1 | dBm | -104 | -104 | -104 | -104 | -103 |
| PDTCH/CS-2 | dBm | -104 | -100 | -101 | -101 | -99 |
| PDTCH/CS-3 | dBm | -104 | -98 | -99 | -98 | -96 |
| PDTCH/CS-4 | dBm | -101 | -90 | -90 | * | * |
| **DCS 1 800 and PCS 1900** | | | | | | |
| PDTCH/CS-1 | dBm | -104 | -104 | -104 | -104 | -103 |
| PDTCH/CS-2 | dBm | -104 | -100 | -100 | -101 | -99 |
| PDTCH/CS-3 | dBm | -104 | -98 | -98 | -98 | -94 |
| PDTCH/CS-4 | dBm | -101 | -88 | -88 | * | * |

The input levels given in the above Table are referenced to normal GSM 900 MS, and have to be corrected by the following values for other MS:

GSM 400, GSM 700, GSM 850 and GSM 900 small MS +2 dB

DCS 1800 class 1 or 2 MS +4 dB

DCS 1800 class 3 and PCS 1900 class 1 or 2 MS +2 dB

PCS 1900 class 3 MS 0 dB

GSM 05.05, Table 1a; GSM 05.05, 6.2.

2 The block error rate (BLER) performance shall not exceed 1 % at input levels according to the Table below.

| Type of channel | | Propagation conditions static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
|---|---|---|---|---|---|---|
| **GSM 400, GSM 700, GSM 850 and GSM 900** | | | | | | |
| USF/CS-1 | dBm | < -104 | -103 | -104 | -104 | -104 |
| USF/CS-2 to 4 | dBm | < -104 | -104 | -104 | -104 | -104 |
| **DCS 1 800 and PCS 1900** | | | | | | |
| USF/CS-1 | dBm | < -104 | -104 | -104 | -104 | -104 |
| USF/CS-2 to 4 | dBm | < -104 | -104 | -104 | -104 | -104 |

The input levels given in the above Table are referenced to normal GSM 900 MS, and have to be corrected by the following values for other MS:

GSM 400, GSM 700, GSM 850 and GSM 900 small MS +2 dB

DCS 1800 class 1 or 2 MS +4 dB

DCS 1800 class 3 and PCS 1900 class 1 or 2 MS +2 dB

PCS 1900 class 3 MS 0 dB

GSM 05.05, Table 1a; GSM 05.05, 6.2.

3. The BLER shall not exceed the the conformance requirements given in 1. - 2. under extreme conditions; GSM 05.05, 6.2, GSM 05.05, annex D D.2.1, D.2.2.

4. The reference sensitivity performance specified above need not be met in the following cases:

for MS at the static channel, if the received level on either of the two adjacent timeslots to the wanted exceed the wanted timeslot by more than 20 dB;

for MS on a multislot configuration, if the received level on any of the timeslots belonging to the same multislot configuration as the wanted time slot, exceed the wanted time slot by more than 6 dB.

The interfering adjacent time slots shall be static with valid GSM signals in all cases.

GSM 05.05, 6.2.

5) For an MS allocated a USF on a PDCH with a random RF input or a valid PDCH signal with a random USF not equal to the allocated USF, the overall reception shall be such that the MS shall detect the allocated USF in less than 1% of the radio blocks. This requirement shall be met for all input levels up to –40 dBm.

GSM 05.05, 6.4

#### 14.16.1.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the minimum input level for reference BLER performance conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that that the MS sends a Packet Not Acknowledge in the Packet Downlink Ack/Nack in case of a the Block Check Sequence indicating a Block Error.

2. To verify that the MS does not exceed conformance requirement 1 for CS-3 and CS-4 under STATIC, TUhigh, HT and RA propagation conditions with an allowance for the statistical significance of the test.

3. To verify that the MS does not exceed conformance requirement 2 under HT propagation conditions with an allowance for the statistical significance of the test.

4. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, HT and RA propagation conditions for the PDTCH, and HT propagation conditions for the USF, with an allowance for the statistical significance of the test.

5. To verify that the MS meets the conformance requirements also 1 and 2 for the conditions allowed by conformance requirement 4, with an allowance for the statistical significance of the test.

6. To verify that the MS meets conformance requirement 5, with an allowance for the statistical significance of the test.

#### 14.16.1.4 Method of test

##### 14.16.1.4.1 Initial conditions

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range 15 dBµVemf( ) to 35 dBµVemf( ). Surrounding cell signal levels and cell reselection parameters are set so that the MS will not try a cell reselection

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in section 6.

NOTE 4: The PSI1 message is included in the PACCH when the MS is in packet transfer mode. The PBCCH_CHANGE_MARK value in PSI1 is not changed. This, together with preventing cell reselection as per Note 1, ensures that the MS is highly unlikely to suspend the TBF (GSM 04.60 clause 5.5.1.4.2 Suspension of operation to receive system operation), and thus making the effect of TBF suspension statistically insignificant for the test result.

A call is set up according to the generic call set up procedure for packet switched on an ARFCN in the Mid range, on the maximum number of receive timeslots, with the MS transmitting at maximum power.

For the ACK/NACK BLER and the BCS BLER parts of the test case, a downlink TBF will be established.

For the USF BLER parts of the test case the Test Mode defined in GSM Rec. 4.14 (para 5.4) will be used for uplink TBF. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks

Mode (b) transmitting looped-back RLC data blocks

then Mode (a) will be used.

If Mode (b) is used then the SS sends the psuedo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

#### 14.16.1.4.2 Procedure

a) The SS transmits packets under TU50 propagation conditions, using CS-3 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.

b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using CS-3 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.

c) The SS counts the number of blocks transmitted with CS-3 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionaly miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

d) Once the number of blocks transmitted with CS-3 as counted in step c) reaches or exceeds the minimum number of blocks as given in Table 14-16.2, the SS calculates the Block error ratio. The SS resets both counters.

e) The SS repeats step b) to d) with the following four fading conditions and hopping modes: TUhigh/noFH, TUhigh/FH, HT/noFH and RA/noFH. For these tests with fading channels , the SS does not transmit on the timeslots not allocated to the MS.

f) The SS repeats steps b) to e) using CS-4 coding without RA/noFH.

g) The SS repeats steps b) to f) under extreme test conditions.

h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:

- P0 = 14 dBm
- BTS_PWR_CTRL_MODE = Mode A
- PR_MODE = B

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH.

j) The SS sets the value of the USF/CS-1 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.

k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

l) Once the number of USF/CS-1 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in Table 14-16.2, the SS calculates the Block error ratio. The SS resets both counters.

m) The SS repeats steps j) to l) using USF/CS2 to 4 coding.

n) The SS repeats steps i) to m) under extreme test conditions.

o) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/CS-1 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2000 blocks.

#### 14.16.1.5 Test requirements

In step a) the Packet Downlink Ack/Nack as sent by the MS shall indicate every block transmitted by the SS with incorrect BCS as not acknowledged.

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

In step o) the MS shall transmit no more than 25 times.

In the case when downlink power control is not used and the output power used on the transmitted blocks is not equal to (BCCH level – Pb) then the MS is not required to fulfil GSM 05.05 requirements for the first 25 blocks addressed to this MS. (GSM 05.08, 10.2.2)

NOTE: This is stated in the Rel 99 version of GSM 05.08.

## 14.16.2 Co-channel rejection

### 14.16.2.1 Co-channel rejection for packet channels

#### 14.16.2.1.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to MS supporting packet channels.

14.16.2.1.2 Conformance requirement

1. The block error rate (BLER) performance shall not exceed 10 % at co-channel interference ratios ($C/I_c$) exceeding those according to the Table below.

| Type of channel | | Propagation conditions | | | |
|---|---|---|---|---|---|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| **GSM 400, GSM 700, GSM 850 and GSM 900** | | | | | |
| PDTCH/CS-1 | dB | 13 | 10 | 9 | 9 |
| PDTCH/CS-2 | dB | 15 | 14 | 13 | 13 |
| PDTCH/CS-3 | dB | 16 | 16 | 15 | 16 |
| PDTCH/CS-4 | dB | 21 | 24 | 23 | - |
| **DCS 1 800 and PCS 1900** | | | | | |
| PDTCH/CS-1 | dB | 13 | 9 | 9 | 9 |
| PDTCH/CS-2 | dB | 15 | 13 | 13 | 13 |
| PDTCH/CS-3 | dB | 16 | 16 | 16 | 16 |
| PDTCH/CS-4 | dB | 21 | 27 | 25 | - |

GSM 05.05, Table 2a; GSM 05.05, 6.2.

2 The block error rate (BLER) performance shall not exceed 1 % at co-channel interference ratios ($C/I_c$) exceeding those according to the Table below.

| Type of channel | | Propagation conditions | | | |
|---|---|---|---|---|---|
| | | TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| **GSM 400, GSM 700, GSM 850 and GSM 900** | | | | | |
| USF/CS-1 | dB | 19 | 12 | 10 | 10 |
| USF/CS-2 to 4 | dB | 18 | 10 | 9 | 8 |
| **DCS 1 800 and PCS 1900** | | | | | |
| USF/CS-1 | dB | 19 | 10 | 10 | 10 |
| USF/CS-2 to 4 | dB | 18 | 9 | 9 | 7 |

14.16.2.1.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TUlow/no FH, TUhigh/noFH, TUhigh/FH and RA/no FH with an allowance for the statistical significance of the test.

2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh/noFH, with an allowance for the statistical significance of the test.

14.16.2.1.4 Method of test

14.16.2.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1.

In addition to this wanted signal (C), the SS produces an independent, uncorrelated interfering signal (I).

This unwanted signal is random, continuous and GSM-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

For the ACK/NACK BLER and the BCS BLER parts of the test case, a downlink TBF will be established.

For the USF BLER parts of the test case the Test Mode defined in GSM Rec. 4.14 (para 5.4) will be used for uplink TBF. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks

Mode (b) transmitting looped-back RLC data blocks

then Mode (a) will be used.

If Mode (b) is used then the SS sends the psuedo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

#### 14.16.2.1.4.2 Procedure

a) The SS transmits packets using CS-1 coding to the MS on all allocated timeslots.

b) The fading characteristic of the wanted and the interfering signal is TUlow, no FH applies.

c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.

d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionaly miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in Table 14-x, the SS calculates the Block error ratio. The SS resets both counters.

f) In the case of CS-1 the SS repeats step c) to e) with the following three fading conditions and hopping modes: TUhigh/noFH, TUhigh/FH, and RA/noFH.
In the case of CS-2 the SS repeats step c) to e) with the fading condition and hopping mode RA/no FH only.

In the case of CS-3 the SS repeats step c) to e) with the fading condition and hopping mode TUhigh/FH only.
In the case of CS-4 the SS repeats step c) to e) with the fading condition and hopping modes: TUhigh/noFH,.

g) The SS repeats the steps b) to f) for each of the coding schemes CS-2, CS-3 and CS-4.

h) h) The SS establishes the normal test conditions, and sets the fading function to TUhigh/noFH.

i) The SS sets the value of the USF/CS-1 such as to allocate the uplink to the MS, using a co-channel interference level of 1 dB above the level given in the table in conformance requirement 2.

j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

k) Once the number of USF/CS-1 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in Table 14-x, the SS calculates the Block error ratio. The SS resets both counters.

l) The SS repeats steps i) to k) using USF/CS2 coding.

#### 14.16.2.1.5 Test requirements

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

# 14.18 EGPRS receiver tests

Statistical testing of receiver BLER performance

Error Definition

Block Error Ratio (BLER):

The Block Error Ratio is the ratio of blocks received in error to the total number of received blocks, where a block is defined as received in error if the error detection functions in the receiver, operating in accordance with GSM 05.03, indicate an error as the result of the Block Check Sequence (BCS).

For USF the Block Error Ratio is the ratio of incorrectly interpreted USF to the total number of received USF.

Test criteria

In the receiver tests for circuit switched channels, test error rates have been defined in order not to pass MS with a performance worse than the specification by 1 dB, with tests to to be performed at the sensitivity and interference levels defined in GSM 05.05. For circuit switched channels GSM 05.05 defines the error rates at a fixed sensitivity or interference level.

For packet switched channels GSM 05.05 defines the receive or interference level at which a fixed Block Error Ratio is met. Therefore, for EGPRS the receiver is tested with a 1 dB offset in the receive level and the interference level.

If the error events can be assumed to be random independent variables, outputs of stationary random processes with identical Gaussian distributions, the previous figures suggest a number of events not lower than 200 in AWGN channel and not lower than 600 in a multipath environment.

For multipath propagation conditions the hypothesis of stationary random processes does not generally hold. In case of non frequency hopping operation mode, the radio channel may be assumed to change 10 times per wavelength of travelled distance and to be short term stationary in between. So, in this case, the required observation time for having good statistical properties should not be lower (with some rounding) than that reported in table 14.18-1

**Table 14.18-1: Minimum test time according to propagation profile**

| | GSM400, GSM 700, GSM 850 & GSM 900 | | | | DCS 1 800&PCS1900 | | | |
|---|---|---|---|---|---|---|---|---|
| **Propagation Conditions** | **TUlow** | **TUhigh** | **HT** | **RA** | **TUlow** | **TUhigh** | **HT** | **RA** |
| Min. test time (s) | 500 | 30 | 15 | 6 | 500 | 15 | 7,5 | 6 |

Table 14.18-2 details, for the different test conditions, the minimum number of blocks required in order to meet points 1) to 3): the corresponding test time (point 4) can be consequently computed.

**Table 14.18-2: Test conditions**

| Type of test | Type of channel | Propagation/ frequency conditions | Specified BLER % | Minimum No of RLC blocks |
|---|---|---|---|---|
| Sensitivity | PDTCH/MCS-1 to 4 | static | 10 | 2000 |

Notes:

1. For MCS-7,8 & 9 the BLER of 10% or 30% is specified in the conformance requirements. For MCS-5 to 6 a BLER of 10% is always applied.

2. Under fading conditions the number of RLC blocks indicated above shall be transmitted on each timeslot of the multislot configuration.

## 14.18.1 Minimum Input level for Reference Performance

### 14.18.1.1 Definition and applicability

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

### 14.18.1.2 Conformance requirement

1. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % at input levels according to the Table 14.18-3a; and for PDTCH/MCS5 to 9 shall not exceed 10% or 30% depending on Coding Schemes at input levels according to the Table 14.18-3b below.

**Table 14.18-3a: PDTCH Sensitivity Input Level for GMSK modulation**

| Type of Channel | | Propagation conditions | | | | |
|---|---|---|---|---|---|---|
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| **GSM 400, GSM 700, GSM 850 and GSM 900** | | | | | | |
| PDTCH/MCS-1 | dBm | -104 | -102.5 | -103 | -103 | -102 |
| PDTCH/MCS-2 | dBm | -104 | -100.5 | -101 | -100.5 | -100 |
| PDTCH/MCS-3 | dBm | -104 | -96.5 | -96.5 | -92.5 | -95.5 |
| PDTCH/MCS-4 | dBm | -101.5 | -91 | -91 | * | * |
| **DCS 1 800 and PCS 1900** | | | | | | |
| PDTCH/MCS-1 | dBm | -104 | -102.5 | -103 | -103 | -101.5 |
| PDTCH/MCS-2 | dBm | -104 | -100.5 | -101 | -100.5 | -99.5 |
| PDTCH/MCS-3 | dBm | -104 | -96.5 | -96.5 | -92.5 | -94.5 |
| PDTCH/MCS-4 | dBm | -101.5 | -90.5 | -90.5 | * | * |

The input levels given in the above Table are applicable to GSM400, GSM 700, GSM 850, GSM 900 and PCS 1900 MS, and have to be corrected by the following values for the following classes of MS:

GSM 400 small MS +2 dB

GSM 700, GSM 850, GSM 900 small MS +2 dB

DCS 1800 class 1 or 2 MS +4 dB

DCS 1800 class 3 MS +2 dB

PCS 1900 class 1 or 2 MS +2 dB

Note: PDTCH/MCS-4 can not meet the reference performance for some propagation conditions (*)

GSM 05.05, Table 1a; GSM 05.05, 6.2.

**Table 14.18-3b: PDTCH Sensitivity Input Level for MS for 8-PSK modulation**

| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
|---|---|---|---|---|---|---|
| Type of channel | | Propagation conditions | | | | |
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| PDTCH/MCS-5 | dBm | -98 | -93 | -94 | -93 | -92 |
| PDTCH/MCS-6 | dBm | -96 | -91 | -91.5 | -88 | -89 |
| PDTCH/MCS-7 | dBm | -93 | -84 | -84 | * | -83** |
| PDTCH/MCS-8 | dBm | -90.5 | -83** | -83** | * | * |
| PDTCH/MCS-9 | dBm | -86 | -78.5** | -78.5** | * | * |
| **DCS 1 800 and PCS 1900** | | | | | | |
| Type of channel | | Propagation conditions | | | | |
| | | static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| PDTCH/MCS-5 | dBm | -98 | -93.5 | -93.5 | -93 | -89.5 |
| PDTCH/MCS-6 | dBm | -96 | -91 | -91 | -88 | -83.5 |
| PDTCH/MCS-7 | dBm | -93 | -81.5 | -80.5 | * | * |
| PDTCH/MCS-8 | dBm | -90.5 | -80** | -80** | * | * |
| PDTCH/MCS-9 | dBm | -86 | * | * | * | * |
| NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TUhigh (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz. | | | | | | |
| NOTE 2: PDTCH for MCS-x can not meet the reference performance for some propagation conditions (*). | | | | | | |
| NOTE 3: Performance is specified at 30% BLER for some cases(**) | | | | | | |

The input levels given in the above Table are applicable to Class 4 or Class 5 MS for GSM400, GSM 700, GSM 850 & GSM 900 and to Class 1 or Class 2 MS for DCS1800 & PCS 1900. For all other MS the input levels have to be corrected by the value of –2dB.

GSM 05.05, Tables 1c; GSM 05.05, 6.2

2. The block error rate (BLER) performance for USF/MCS1 to 9 shall not exceed 1 % at input levels according to the Tables 14.18-4a & 14.18-4b below.

**Table 14.18-4a: USF Sensitivity Input Level for GMSK modulation**

| Type of channel | | Propagation conditions static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
|---|---|---|---|---|---|---|
| **GSM 400, GSM 700, GSM 850 and GSM 900** | | | | | | |
| USF/MCS-1 to 4 | dBm | -104 | -102.5 | -104 | -104 | -102.5 |
| **DCS 1 800 and PCS1900** | | | | | | |
| USF/MCS-1 to 4 | dBm | -104 | -104 | -104 | -104 | -102.5 |

The input levels given in the above Table are applicable to GSM 400, GSM 700, GSM 850, GSM 900and PCS1900 MS, and have to be corrected by the following values for the following classes of MS:

GSM 400 small MS +2 dB

GSM 700, GSM 850 & GSM 900 small MS +2 dB

DCS 1800 class 1 or 2 MS +4 dB

DCS 1800 class 3 MS +2 dB

PCS1900 class 1 or 2 MS +2 dB

GSM 05.05, Table 1a; GSM 05.05, 6.2.

**Table 14.18-4b: USF Sensitivity Input Level for 8-PSK modulation**

| Type of Channel | | Propagation conditions static | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
|---|---|---|---|---|---|---|
| **GSM 400, GSM 700, GSM 850 and GSM 900** | | | | | | |
| USF/MCS-5 to 9 | dBm | -102 | -97.5 | -99 | -100 | -99 |
| **DCS 1 800 and PCS1900** | | | | | | |
| USF/MCS-5 to 9 | dBm | -102 | -99 | -99 | -100 | -99 |

The input levels given in the above Table are applicable to Class 4 or Class 5 MS for GSM400, GSM 700, GSM 850 & GSM 900 and to Class 1 or Class 2 MS for DCS1800 & PCS 1900. For all other MS the input levels have to be corrected by the value of –2dB.

GSM 05.05, Table 1c; GSM 05.05, 6.2

3. The BLER shall not exceed the conformance requirements given in 1. - 2. under extreme conditions; GSM 05.05, 6.2, GSM 05.05, annex D D.2.1, D.2.2.

4. The reference sensitivity performance specified above need not be met in the following cases:

   For MS at the static channel, if the received level on either of the two adjacent timeslots to the wanted exceed the wanted timeslot by more than 20 dB.

   For MS on a multislot configuration, if the received level on any of the timeslots belonging to the same multislot configuration as the wanted time slot, exceed the wanted time slot by more than 6 dB.

   The interfering adjacent time slots shall be static with valid GSM signals in all cases.

   GSM 05.05, 6.2.

5. For an MS allocated a USF on a PDCH with a random RF input or a valid PDCH signal with a random USF not equal to the allocated USF, the overall reception shall be such that the MS shall detect the allocated USF in less than 1% of the radio blocks for GMSK modulated signals and 1% for 8-PSK modulated signals. This requirement shall be met for all input levels up to –40 dBm for GMSK modulated signals and up to -40 dBm for 8-PSK modulated signals.

GSM 05.05, 6.4

#### 14.18.1.3 Test purpose

1. To verify that the MS sends a Packet Not Acknowledge in the Packet Downlink Ack/Nack in case of the Block Check Sequence indicating a Block Error.

2. To verify that the MS does not exceed conformance requirement 1 for PDTCH with different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.

3. To verify that the MS does not exceed conformance requirement 2 under HT propagation conditions with an allowance for the statistical significance of the test.

4. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, HT and RA propagation conditions for the PDTCH, and under HT propagation conditions for the USF, with an allowance for the statistical significance of the test.

5. To verify that the MS meets the conformance requirements also 1 and 2 for the conditions allowed by conformance requirement 4, with an allowance for the statistical significance of the test.

6. To verify that the MS meets conformance requirement 5, with an allowance for the statistical significance of the test.

#### 14.18.1.4 Method of test

##### Initial conditions

NOTE 1: The BA list sent on the BCCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range 15 dBµVemf( ) to 35 dBµVemf( ). Surrounding cell signal levels and cell reselection parameters are set so that the MS will not try a cell reselection**.**

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in section 6.

NOTE 4: The PSI1 message is included in the PACCH when the MS is in packet transfer mode. The PBCCH_CHANGE_MARK value in PSI1 is not changed. This, together with preventing cell reselection as per Note 1, ensures that the MS is highly unlikely to suspend the TBF (GSM 04.60 clause 5.5.1.4.2 Suspension of operation to receive system operation), and thus making the effect of TBF suspension statistically insignificant for the test result.

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in section 40 for packet switched on an ARFCN in the Mid range. The SS shall transmit on the maximum number of receive timeslots. The SS commands the MS to transmit at maximum power.

##### Test procedure

For GMSK Modulation:

a) The SS transmits packets under TUhigh propagation conditions, using MCS-4 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.

b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using MCS-4 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.

c) The SS counts the number of blocks transmitted with MCS-4 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

d) Once the number of blocks transmitted with MCS-4 as counted in step c) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels , the SS does not transmit on the timeslots not allocated to the MS.

f) The SS repeats steps b) to d) using MCS-3 coding with RA/No FH, MCS-2 coding with HT/No FH and MCS-1 coding with TUhigh/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.

g) The SS repeats steps b) to e) under extreme test conditions for MCS-4 coding only.

h) This step is only performed for a multislot MS. The SS establishes the normal test conditions, and repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.

j) The SS sets the value of the USF/MCS-1 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.

k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

l) Once the number of USF/MCS-1 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters

m) The SS repeats steps j) to l) using USF/MCS2 to 4 coding.

n) The SS repeats steps i) to l) under extreme test conditions for MCS-4 coding only.

o) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/MCS-1 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2000 blocks.

For 8-PSK Modulation:

a) The SS transmits packets under TUhigh propagation conditions, using MCS-8 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.

b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using MCS-8 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.

c) The SS counts the number of blocks transmitted with MCS-8 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionaly miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

d) Once the number of blocks transmitted with MCS-8 as counted in step c) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.

f) The SS repeats steps b) to d) using MCS-9 with static condition, MCS-7 with TUhigh/FH, MSC-6 with HT/No FH and MSC-5 with RA/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.

g) The SS repeats steps b) to e) under extreme test conditions for MCS-8 coding only.

h) This step is only performed for a multislot MS. The SS establishes the normal test conditions, and repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.

j) The SS sets the value of the USF/MCS-5 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.

k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

l) Once the number of USF/MCS-5 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

m) The SS repeats steps j) to l) using USF/MCS-6 to 9 coding.

n) The SS repeats steps j) to l) under extreme test conditions for MCS-9 coding only.

o) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/MCS-5 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2000 blocks.

#### 14.18.1.5 Test requirements

In step a) the Packet Downlink Ack/Nack as sent by the MS shall indicate every block transmitted by the SS with incorrect BCS as not acknowledged.

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

In step o) for both GMSK modulation and 8-PSK modulation the MS shall transmit no more than 25 times

## 14.18.2 Co-channel rejection

#### 14.18.2.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver. “Wanted signal” in this test is the signal generated by the transmitted RLC data blocks.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

14.18.2.2 Conformance requirement

1. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % at co-channel interference ratios ($C/I_c$) exceeding those according to the Table 14.18-5a; and for PDTCH/MCS5 to 9 shall not exceed 10% or 30% depending on Coding Schemes at co-channel interference ratios (C/Ic) exceeding those according to the Table 14.18-5b below.

**Table 14.18-5a: PDTCH Co-channel Interference Ratio for GMSK modulation**

| Type of channel | | Propagation conditions TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
|---|---|---|---|---|---|
| **GSM 400, GSM 700, GSM 850 and GSM 900** | | | | | |
| PDTCH/MCS-1 | dB | 13 | 10.5 | 9.5 | 10 |
| PDTCH/MCS-2 | dB | 15 | 12.5 | 12 | 12 |
| PDTCH/MCS-3 | dB | 16.5 | 17 | 17 | 19 |
| PDTCH/MCS-4 | dB | 19 | 22 | 22 | * |
| **DCS 1 800 and PCS1900** | | | | | |
| PDTCH/MCS-1 | dB | 13 | 10 | 9.5 | 10 |
| PDTCH/MCS-2 | dB | 15 | 12 | 12 | 12 |
| PDTCH/MCS-3 | dB | 16.5 | 17 | 18 | 19 |
| PDTCH/MCS-4 | dB | 19 | 23 | 23 | * |

Note: PDTCH/MCS-4 can not meet the reference performance for some propagation condition (*)

GSM 05.05, Table 2a; GSM 05.05, 6.3.

**Table 14.18-5b: Cochannel interference ratio for MS at reference performance for 8-PSK modulation**

| GSM 400, GSM 700, GSM 850 and GSM900 | | | | | |
|---|---|---|---|---|---|
| Type of channel | | Propagation conditions TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/MCS-5 | dB | 19.5 | 15.5 | 14.5 | 16.5 |
| PDTCH/MCS-6 | dB | 21.5 | 18 | 17.5 | 21 |
| PDTCH/MCS-7 | dB | 26.5 | 25 | 24.5 | * |
| PDTCH/MCS-8 | dB | 30.5 | 25.5** | 25.5** | * |
| PDTCH/MCS-9 | dB | 25.5** | 30.5** | 30.5** | * |
| **DCS 1800 and PCS 1900** | | | | | |
| Type of channel | | Propagation conditions TUlow (no FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |

| USF/MCS-5 to 9 | dB | 17 | 10 | 9 | 9 |

GSM 05.05, Tables 2c.

### 14.18.2.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 for different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh/noFH, with an allowance for the statistical significance of the test.

### 14.18.2.4 Method of test

#### Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in section 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits EGPRS RLC data blocks containing random data. In addition to these data blocks, the SS produces an independent, uncorrelated interfering signal (I1).

#### Test procedure

For GMSK Modulation:

a) The SS transmits packets on PDTCH using MCS-4 coding to the MS on all allocated timeslots.

b) The fading characteristic of the wanted signal and the interfering signal is TUlow, no FH applies.

c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.

d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionaly miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

f) The SS repeats step c) to e) with the TUhigh/noFH fading condition

g) The SS repeats the steps b) to e) for the coding schemes MCS-3 with TUhigh/noFH, MCS-2 with TUhigh/FH and MCS-1 with RA/noFH.

h) The SS establishes the normal test conditions, and sets the fading function to TUhigh/noFH. An uplink TBF shall be established.

i) The SS sets the value of the USF/MCS-4 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.

j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

k) Once the number of USF/MCS-4 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

l) The SS repeats steps i) to k) for each of the coding scheme MCS-1 to 3.

For 8-PSK Modulation:

a) The SS transmits packets on PDTCH using MCS-8 coding to the MS on all allocated timeslots.

b) The fading characteristic of the wanted signal and the interfering signal is TUlow, no FH applies.

c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.

d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionaly miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

f) The SS repeats step c) to e) with the TUhigh/noFH fading condition.

g) The SS repeats steps c) to e) for MCS-9 with TUlow/NoFH, MCS-7 with TUhigh/noFH, MCS-6 with TUhigh/FH and MSC-5 with RA/noFH.
h) The SS establishes the normal test conditions, and sets the fading function to TUhigh/noFH. An uplink TBF shall be established.

i) The SS sets the value of the USF/MCS-9 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.

j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

k) Once the number of USF/MCS-9 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

l) The SS repeats steps i) to k) using USF/MCS-5,6,7 & 8 coding.

#### 14.18.2.5 Test requirements

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

## 14.18.3 Adjacent channel rejection

#### 14.18.3.1 Definition and applicability

The adjacent channel selectivity is a measure of the capability of the receiver to receive wanted data packets without exceeding a given degradation due to the presence of an interfering signal (I1) in the adjacent channel. “Wanted signal” in this test is the signal generated by the transmitted RLC data blocks.

The adjacent channel can be the adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

1) Adjacent RF channel selectivity which is specifically tested in this section.

2) Adjacent Time Slot selectivity, which is implicitly tested in test 14.18.2.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

#### 14.18.3.2 Conformance requirement

1. For GMSK modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/Ia1) exceeding C/Ic – 18dB where C/Ic is the co-channel interference ratio specified in Table 14.18-5a for PDTCH and Table 14.18-6a for USF channels.

   1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-1 to 4 shall not exceed 10%; GSM 05.05, 6.2.

   1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-1 to 4 shall not exceed 1 %; GSM 05.05, 6.2.

   For 8-PSK modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/Ia1) specified in Table 14.18-7a

   1.3 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-5 to 9 shall not exceed 10% or 30% depending on Coding Scheme; GSM 05.05, 6.2.

   1.4 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-5 to 9 shall not exceed 1 %; GSM 05.05, 6.2.

**Table 14.18-7a: Adjacent channel interference ratio for MS at reference performance for 8-PSK modulation**

| GSM 400, GSM 700, GSM 850 and GSM 900 | | | | | | |
|---|---|---|---|---|---|---|
| Type of channel | | Propagation conditions | | | | |
| | | TUlow (no FH) | TUlow (ideal FH) | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) |
| PDTCH/MCS-5 | dB | 2.5 | -2 | -1 | -2 | 1 |
| PDTCH/MCS-6 | dB | 5.5 | 0.5 | 2 | 1 | 6.5 |
| PDTCH/MCS-7 | dB | 10.5 | 8 | 10 | 9 | * |
| PDTCH/MCS-8 | dB | 15.5 | 9** | 11** | 10.5** | * |

| | | | | | | |
|---|---|---|---|---|---|---|
| PDTCH/MCS-9 | dB | 10** | 12.5** | 17** | 15.5** | * |
| USF/MCS-5 to 9 | dB | -1 | -8.5 | -8 | -9.5 | -9 |
| **DCS 1 800 and PCS 1900** | | | | | | |
| **Type of channel** | | **Propagation conditions** | | | | |
| | | **TUlow (no FH)** | **TUlow (ideal FH)** | **TUhigh (no FH)** | **TUhigh (ideal FH)** | **RA (no FH)** |
| PDTCH/MCS-5 | dB | 2.5 | -2 | -2 | -1.5 | 1 |
| PDTCH/MCS-6 | dB | 5.5 | 0.5 | 1.5 | 1.5 | 6.5 |
| PDTCH/MCS-7 | dB | 10.5 | 8 | 12.5 | 12 | * |
| PDTCH/MCS-8 | dB | 15.5 | 9** | 16** | 15.5** | * |
| PDTCH/MCS-9 | dB | 10** | 12.5** | * | * | * |
| USF/MCS-5 to 9 | dB | -1 | -8.5 | -9 | -9.5 | -9 |
| Note1: PDTCH for MCS-x can not meet the reference performance for some propagation conditions (*). | | | | | | |
| Note 2: Performance is specified at 30% BLER for some cases(**), | | | | | | |

GSM 05.05, Table2g; GSM 05.05, 6.3.

2 For both GMSK and 8-PSK modulations, under adjacent channel interference conditions with interfering signals at 400 kHz above and below the wanted signal frequency and at the adjacent interference ratio (C/Ia2) exceeding C/Ic – 50dB

2.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-1 to 4 shall not exceed 10% for GMSK modulation; and for PDTCH/MCS-5 to 9 shall not exceed 10% or 30% depending on Coding Schemes; GSM 05.05, 6.2.

2.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-1 to 9 shall not exceed 1 %; GSM 05.05, 6.2.

C/Ic is the co-channel interference ratio. For a PDTCH with GMSK modulation C/Ic is specified in Table 14.18-5a; for a PDTCH with 8-PSK modudulation C/Ic is specified in Table 14.18-5b, for a USF with GMSK modulation C/Ic is specified in Tables 14.18-6a; and for USF with 8-PSK modulation C/Ic is specified in Table 14.18-6b. GSM 05.05, 6.3.

3. The BLER shall not exceed the conformance requirements given in 1. - 2. under extreme conditions; GSM 05.05, 6.2, GSM 05.05, annex D D.2.1, D.2.2.

### 14.18.3.3 Test purpose

1 To verify that the conformance requirements 1.1, 1.2, 1.3 and 1.4 are met with an allowance for the statistical significance of the test in the presence of a GMSK modulated adjacent channel interferer under propagation condition TUhigh at 200 kHz above and below the wanted signal frequency.

2 To verify that the conformance requirements 2.1 and 2.2 are met with an allowance for the statistical significance of the test in the presence of a GMSK modulated adjacent channel interferer under propagation condition TUhigh at 400 kHz above and below the wanted signal frequency.

3. To verify that Conformance Requirements are met under extreme conditions.

### 14.18.3.4 Method of test

#### Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in section 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power. The SS transmits EGPRS RLC data blocks containing random data. In addition to the wanted test signal, the SS transmits an independent, uncorrelated interfering signal Standard Test Signal (I1). This unwanted signal is random, continuous and GMSK-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUhigh.

Test procedure

For GMSK Modulation:

a) The SS transmits packets on PDTCH using MCS-1 coding to the MS on all allocated timeslots.

b) The SS transmits the unwanted signal at a nominal frequency 200kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionaly miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

e) The SS repeats steps c) & d) with the unwanted signal transmitted at a nominal frequency 200kHz below the nominal frequency of the wanted signal. & its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

f) The SS repeats steps c) & d) with the unwanted signal transmitted at a nominal frequency 400kHz above the nominal frequency of the wanted signal & its amplitude is set to to achieve the adjacent interference ratio as specified in the conformance requirements.

g) The SS repeats steps c) & d) with the unwanted signal transmitted at a nominal frequency 400kHz below the nominal frequency of the wanted signal & its amplitude is set to to achieve the adjacent interference ratio as specified in the conformance requirements.

h) The SS repeats steps b) to g) for each of the coding schemes MCS-2 to 4.

i) The SS repeats steps a) to g) under extreme test conditions for MCS-4 coding scheme only.

j) The SS establishes the normal test conditions. An uplink TBF shall be established.

k) The SS sets the value of the USF/MCS-1 such as to allocate the uplink to the MS.

l) The SS transmits the unwanted signal at a nominal frequency 200kHz above the nominal frequency of the wanted signal. Its amplitude is set to to achieve the adjacent interference ratio as specified in the conformance requirements.

m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

n) Once the number of USF/MCS-1 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in Table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.

o) The SS repeats steps m) & n) with the unwanted signal transmitted at a nominal frequency 200kHz below the nominal frequency of the wanted signal & its amplitude is set at to achieve the adjacent interference ratio as specified in the conformance requirements.

p) The SS repeats steps m) & n) with the unwanted signal transmitted at a nominal frequency 400kHz above the nominal frequency of the wanted signal & its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

q) The SS repeats steps m) & n) with the unwanted signal transmitted at a nominal frequency 400kHz below the nominal frequency of the wanted signal & its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

r) The SS repeats steps k) to q) for each of the coding schemes USF/MCS-2 to 4.

s) The SS repeats steps k) to q) under extreme test conditions for coding scheme USF/MCS-4 only.

For 8-PSK Modulation:

a) The SS transmits packets on PDTCH using MCS-5 coding to the MS on all allocated timeslots.

b) The SS transmits the unwanted signal at a nominal frequency 200kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

e) The SS repeats steps c) & d) with the unwanted signal transmitted at a nominal frequency 200kHz below the nominal frequency of the wanted signal & its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

f) The SS repeats steps c) & d) with the unwanted signal transmitted at a nominal frequency 400kHz above the nominal frequency of the wanted signal & its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

g) The SS repeats steps c) & d) with the unwanted signal transmitted at a nominal frequency 400kHz below the nominal frequency of the wanted signal & its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

h) The SS repeats steps b) to g) for each of the coding schemes MCS-6 to 8 and for the coding scheme MCS-9 with the TU low fading condition for both the wanted and the interfering signal.

i) The SS repeats steps a) to h) under extreme test conditions for coding scheme MCS-9 only.

j) The SS establishes the normal test conditions. An uplink TBF shall be established.

k) The SS sets the value of the USF/MCS-5 such as to allocate the uplink to the MS.

l) The SS transmits the unwanted signal at a nominal frequency 200kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

n) Once the number of USF/MCS-5 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

o) The SS repeats steps m) & n) with the unwanted signal transmitted at a nominal frequency 200kHz below the nominal frequency of the wanted signal & its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

p) The SS repeats steps m) & n) with the unwanted signal transmitted at a nominal frequency 400kHz above the nominal frequency of the wanted signal & its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

q) q) The SS repeats steps m) & n) with the unwanted signal transmitted at a nominal frequency 400kHz below the nominal frequency of the wanted signal & its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.

r) The SS repeats steps k) to q) for each of the coding schemes MCS-6 to 9.

s) The SS repeats steps k) to r) under extreme test conditions for coding scheme MCS-9 only.

#### 14.18.3.5 Test requirements

The block error ratio, as calculated by the SS for different channels with different coding schemes and under TUhigh propagation condition, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

## 14.18.4 Intermodulation rejection

#### 14.18.4.1 Definition and applicability

The intermodulation rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship to the wanted signal frequency. “Wanted signal” in this test is the signal generated by the transmitted RLC data blocks.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

#### 14.18.4.2 Conformance requirement

In the presence of two unwanted signals with a specific frequency relationship to the wanted signal

frequency in both GMSK and 8-PSK modulations

1. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % and for PDTCH/MCS5 to 9 shall not exceed 10% or 30% depending on Coding Schemes; GSM 05.05, 6.2.
2. The block error rate (BLER) performance for USF/MSC-1 to 9 shall not exceed 1 %; GSM 05.05, 6.2.
3. The BLER shall not exceed the conformance requirements given in 1. - 2. under extreme conditions; GSM 05.05, 6.2, GSM 05.05, annex D D.2.1, D.2.2.

#### 14.18.4.3 Test purpose

1. To verify that the MS does not exceed the conformance requirements for different channels and coding schemes under the static condition with an allowance for the statistical significance of the test.
2. To verify that Conformance Requirements are met under extreme conditions.

#### 14.18.4.4 Method of test

NOTE: The measurements address the third order intermodulation, which represents the most serious case.

##### Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in section 40 for packet switched with an ARFCN in the Mid ARFCN range, power control level set to maximum.

The SS transmits EGPRS RLC data blocks containing random data. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level with appropriate correction value as specified in Table 14.18-3a for GMSK modulation and Table 14.18-3b for 8-PSK modulation for PDTCH channel and in Tables 14.18-4a for GMSK modulation & 14.18-4b for 8-PSK modulation for USF channel.

In addition to the static wanted test signal, the SS transmits two static interfering (unwanted) signals at the same time. There is no correlation in the modulation between the signals.

### Test procedure

For GMSK modulation:

a) The SS transmits packets on PDTCH using MCS-4 coding to the MS on all allocated timeslots.

b) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continous and unmodulated.

c) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

f) The SS repeats steps d) & e) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.

g) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the Low ARFCN.

h) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the High ARFCN range.

i) The SS repeats steps a) to f) for each of the coding schemes MCS-1 to 3.

j) Steps a) to h) are repeated under extreme test conditions for MCS-4 only.

k) The SS establishes the normal test conditions. An uplink TBF shall be established.

l) The SS sets the value of the USF/MCS-4 such as to allocate the uplink to the MS.

m) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.

n) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

o) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

p) Once the number of USF/MCS-4 allocating the uplink for the MS as counted in step o) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

q) The SS repeats steps o) & p) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.

r) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the Low ARFCN.

s) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the High ARFCN range.

t) The SS repeats steps l) to q) for each of the coding schemes MCS-1 to 3 with the receiver operating on an ARFCN in the Middle ARFCN range.

u) The SS repeats steps l) to s) under extreme test conditions for MCS-4 only.

For 8-PSK Modulation:

a) The SS transmits packets on PDTCH using MCS-9 coding to the MS on all allocated timeslots.

b) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continous and unmodulated.

c) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in Table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.

f) The SS repeats steps d) & e) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.

g) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the Low ARFCN.

h) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the High ARFCN range.

i) The SS repeats steps a) to f) for each of the coding schemes MCS-5,6,7 & 8 with the receiver operating on an ARFCN in the Middle ARFCN range.

j) The SS repeats steps a) to h) under extreme test conditions for MCS-9 only.

k) The SS establishes the normal test conditions. An uplink TBF shall be established.

l) The SS sets the value of the USF/MCS-9 such as to allocate the uplink to the MS.

m) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static,continuous and unmodulated.

n) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

o) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

p) Once the number of USF/MCS-9 allocating the uplink for the MS as counted in step o) reaches or exceeds the minimum number of blocks as given in Table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.

q) The SS repeats steps o) & p) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.

r) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the Low ARFCN

s) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the High ARFCN range.

t) The SS repeats steps l) to q) for each of the coding schemes MCS-5,6,7 & 8 with the receiver operating on an ARFCN in the Middle ARFCN range.

u) The SS repeats steps l) to s) under extreme test conditions for MCS-9 only.

**Table 14.18-8: Intermodulation intefering test signal levels**

| | GSM400, GSM 700, GSM 850, GSM900, PCS1900 | | DCS1800 | |
|---|---|---|---|---|
| | Small MS | Other MS | Class 1 & 2 | Class 3 |
| FIRST INTERFERER dBµVemf( ) | 64 | 74 | 64 | 68 |
| SECOND INTERFERER dBµVemf( ) | 63 | 63 | 64 | 68 |

NOTE: Some of the levels in table 14.18-8 are different to those specified in GSM 05.05 due to the consideration of the effect of modulation sideband noise from the second interferer.

#### 14.18.4.5 Test requirements

The block error ratio, as calculated by the SS for different channels with different coding schemes and under static condition, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

## 14.18.5 Blocking and spurious response

#### 14.18.5.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation. “Wanted signal” in this test is the signal generated by the transmitted RLC data blocks.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

#### 14.18.5.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in GSM 05.05 section 5.1.

2. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % and for PDTCH/MCS5 to 9 shall not exceed 10% or 30% depending on Coding Schemes and for USF/MCS1 to 9 shall not exceed 1% when the following signals are simultaneously input to the receiver; GSM 05.05, 6.2.:

   - a useful signal at frequency $f_0$, 3 dB above the reference sensitivity level specified in Table 14.18-3a for GMSK modulation and Table 14.18-3b for 8-PSK modulation for PDTCH channels; and in Tables 14.18-4a for GMSK modulation & 14.18-4b for 8-PSK modulation for USF channel with correction values as specified in GSM 05.05 section 6.2;

   - a continuous, static sine wave unwanted signal at a level as in the table 14.18-9 below and at a frequency (f) which is an integer multiple of 200 kHz.

     with the following exceptions, called spurious response frequencies:-

     a) GSM 400: inband, for a maximum of three occurences. GSM05.05, Section 5.1.

        GSM 700, GSM 850 or GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group). GSM05.05, Section 5.1.

DCS 1 800 & PCS 1900: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group). GSM05.05, Section 5.1.

b) out of band, for a maximum of 24 occurrences (which if below $f_0$ and grouped shall not exceed three contiguous occurrences per group). GSM05.05, Section 5.1.

where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dBµV (emf) (i.e. -43 dBm). GSM 05.05, 5.1.

#### 14.18.5.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.

2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in GSM 05.05, are allowed to ensure a fair test of the MS.

#### 14.18.5.4 Method of test

##### Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in section 40 for packet switched, except the BCCH frequency list shall be empty, on an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits EGPRS RLC data blocks containing random data.

In addition to the wanted Test Signal, the SS transmit a static unmodulated continuous interfering signal (Standard Test Signal I0).

##### Test procedure

For GMSK Modulation:

a) The SS is set to produce a TUhigh GMSK wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level specified in Table 14.18-3a for PDTCH channel and in Table 14.18-4a for USF channel with correction values as specified in GSM 05.05 section 6.2;

b) The SS transmits packets on PDTCH using MSC-4 coding to MS on all allocated timeslots.

c) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR +/- 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where n = 2, 3, 4, 5, etc.

d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

i) The total frequency range formed by:

GSM 400 the frequencies between $F_{lo} + (IF_1 + IF_2 + ... + IF_n + 3{,}6$ MHz)

and $F_{lo} - (IF_1 + IF_2 + ... + IF_n + 3{,}6$ MHz).

GSM 700 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ + 7,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 7,5 MHz).

GSM 850 the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ + 12,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 12,5 MHz).

P-GSM 900: the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +12,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 12,5 MHz).

E-GSM 900: the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +17,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 17,5 MHz).

DCS 1 800: the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +37,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 37,5 MHz).

PCS 1900: the frequencies between Flo + (IF1 + IF2 + ... +IFn +30 MHz)

and Flo - (IF1 + IF2 + ... + IFn + 30 MHz).

and

the frequencies + 100 MHz and - 100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies $IF_1$, $IF_1$ + 200 kHz, $IF_1$ - 200 kHz.

iii) The frequencies:

$mF_{lo}$ + $IF_1$,

$mF_{lo}$ - $IF_1$,

mFR,

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

| | |
|---|---|
| $F_{lo}$ - | local oscillator applied to first receiver mixer |
| $IF_1$ ... $IF_n$ - | are the n intermediate frequencies |
| $F_{lo}$, $IF_1$, $IF_2$ ... $IF_n$ | shall be declared by the manufacturer in the PIXIT statement GSM 11.10 annex 3. |

e) The level of the unwanted signal is set according to table 14.18-9.

**Table 14.18-9a: Level of unwanted signals**

| | GSM450 | | GSM480 | | GSM900 | | DCS 1 800 | PCS 1900 |
|---|---|---|---|---|---|---|---|---|
| | Small MS | Other MS | Small MS | Other MS | Small MS | Other MS | | |
| FREQUENCY | LEVEL IN dBµVemf( ) | | | | | | | |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 | 75 | 70 | 75 | 70 | 75 | 70 | 70 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 | 80 | 70 | 80 | 70 | 80 | 70 | 70 |

| 1830MHz to <1910MHz | - | - | - | - | - | - | - | 101 |
| >2010 to 2070MHz | - | - | - | - | - | - | - | 101 |
| >2070MHz to 12,750MHz | - | - | - | - | - | - | - | 113 |

**Table 14-18-9b: Level of unwanted signals**

| | GSM 750 | GSM 850 |
|---|---|---|
| FREQUENCY | LEVEL IN dBµVemf( ) | |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 | 70 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 | 70 |
| FR +/- 1,6 MHz to FR +/- 3 MHz | 80 | 80 |
| 727 to FR – 3 MHz | 90 | - |
| FR + 3 MHz to 782 MHz | 90 | - |
| 849 MHz to FR – 3 MHz | - | 90 |
| FR + 3 MHz to 914 MHz | - | 90 |
| 100 kHz to <727 MHz | 113 | - |
| >782 MHz to 12,75 GHz | 113 | - |
| 100 kHz to <849 MHz | - | 113 |
| >914 MHz to 12,75 GHz | - | 113 |

NOTE 1: For E-GSM 900 MS the level of the unwanted signal in the band 905 MHz to 915 MHz is relaxed to 108 dBuVemf( ). GSM05.05, Section 5.1

NOTE 2: a) For R-GSM 900 MS the level of the unwanted signal in the band 880 MHz to 915 MHz is relaxed to 108 dBuVemf( ). GSM05.05, Section 5.1

b) For R-GSM 900 small MS the level of the unwanted signal in the band 876 MHz to 915 MHz is relaxed to 106 dBuVemf( ). GSM05.05, Section 5.1

NOTE 3: a) For GSM 450 small MS the level of the unwanted signal in the band 450.4 MHz to 457.6 MHz is relaxed to 108 dBuVemf( ). GSM05.05, Section 5.1

b) For GSM 480 small MS the level of the unwanted signal in the band 478.8 MHz to 486 MHz is relaxed to 108 dBuVemf( ). GSM05.05, Section 5.1

f) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionaly miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

g) Once the number of blocks transmitted with the current coding scheme as counted in step f) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

If a failure is indicated, it is noted and counted towards the allowed exemption total. In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

h) The SS sets the value of the USF/MCS-4 such as to allocate the uplink to the MS.

i) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR +/- 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where n = 2, 3, 4, 5, etc.

j) The level of the unwanted signal is set according to table 14.18-9.

k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

l) Once the number of USF/MCS-4 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

For 8-PSK Modulation:

a) The SS is set to produce a static 8-PSK wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level specified in Table 14.18-3b for PDTCH channel and in Table 14.18-4b for USF channel with correction values as specified in GSM 05.05 section 6.2;

b) The SS transmits packets on PDTCH using MSC-9 coding to MS on all allocated timeslots.

c) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR +/- 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where n = 2, 3, 4, 5, etc.

d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

i) The total frequency range formed by:

GSM 400 the frequencies between Flo + (IF1 + IF2 + ... +IFn +3,6 MHz)

and Flo - (IF1 + IF2 + ... + IFn + 3,6 MHz).

GSM 700 the frequencies between Flo + (IF1 + IF2 + ... +IFn + 7,5 MHz)

and Flo - (IF1 + IF2 + ... + IFn + 7,5 MHz).

GSM 850 the frequencies between Flo + (IF1 + IF2 + ... +IFn + 12,5 MHz)

and Flo - (IF1 + IF2 + ... + IFn + 12,5 MHz).

P-GSM 900: the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +12,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 12,5 MHz).

E-GSM 900: the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +17,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 17,5 MHz).

DCS 1 800: the frequencies between $F_{lo}$ + ($IF_1$ + $IF_2$ + ... +$IF_n$ +37,5 MHz)

and $F_{lo}$ - ($IF_1$ + $IF_2$ + ... + $IF_n$ + 37,5 MHz).

PCS 1900: the frequencies between Flo + (IF1 + IF2 + ... +IFn +30 MHz)

and Flo - (IF1 + IF2 + ... + IFn + 30 MHz).

and

the frequencies + 100 MHz and - 100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies $IF_1$, $IF_1$ + 200 kHz, $IF_1$ - 200 kHz.

iii) The frequencies:

$mF_{lo}$ + $IF_1$,

$mF_{lo}$ - $IF_1$,

mFR,

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

$F_{lo}$ - local oscillator applied to first receiver mixer

$IF_1$ ... $IF_n$ -are the n intermediate frequencies

$F_{lo}$, $IF_1$, $IF_2$ ... $IF_n$ shall be declared by the manufacturer in the PIXIT statement GSM 11.10 annex 3.

e) The level of the unwanted signal is set according to table 14.18-9.

f) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionaly miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

g) Once the number of blocks transmitted with the current coding scheme as counted in step f) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

h) The SS sets the value of the USF/MCS-9 such as to allocate the uplink to the MS.

j) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR +/- 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where n = 2, 3, 4, 5, etc.

k) The level of the unwanted signal is set according to table 14.18-9.

l) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

m) Once the number of USF/MCS-9 allocating the uplink for the MS as counted in step l) reaches or exceeds the minimum number of blocks as given in Table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

#### 14.18.5.5 Test requirements

The block error ratio as calculated by the SS for different channels and coding schemes shall not exceed the conformance requirement.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

The following exceptions are allowed:

GSM 400: A maximum of three failures in the band 457.6 MHz to 473.6 MHz for GSM450 and in the band 486.0 MHz to 502.0 MHz for GSM480

A maximum of 24 in the combined bands 100 kHz to 457.6 MHz & 473.6 MHz to 12,75 GHz for GSM450 and in the combined bands 100 kHz to 486.0 MHz & 502.0 MHz to 12,75 GHz for GSM480 (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 750: A maximum of six failures in the frequency band 727 MHz to 782 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 727 MHz and 782 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 850: A maximum of six failures in the frequency band 849 MHz to 914 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 849 MHz and 914 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 900: A maximum of six failures in the band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

DCS 1 800: A maximum of twelve failures in the band 1785 MHz to 1 920 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1785 MHz and 1 920 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

PCS 1900: A maximum of twelve failures in the band 1910 MHz to 2010 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1910 MHz and 2010 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.18.5.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dBuVemf( ) and the performance requirement is once again that stated above.

The number of Error Events recorded in this test shall not exceed the test limit error rate values given above, when using the maximum number of samples.

No failures are allowed at this lower unwanted signal level.

## 14.18.6 EGPRS Usable receiver input level range

### 14.18.6.1 Definition and applicability

The usable receiver input level range is the range of the radio frequency input level of a specified modulated signal over which bit error ratio stay between specified limits.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

### 14.18.6.2 Conformance requirement

1. The receiver input level range requirements of GSM 05.05 section 6.1 for raw data bits of GMSK modulation under static and EQ propagation conditions shall be met:

   1.1 Under normal conditions.

   1.2 Under extreme conditions.

2. The receiver input level range requirements of GSM 05.05 section 6.1 for raw data bits of 8PSK modulation under static condition shall be met:

   2.1 Under normal conditions.

   2.2 Under extreme conditions.

3. The receiver input level range requirements of GSM 05.05 section 6.1 for raw data bits of 8PSK modulation with random frequency offset under static condition shall be met:

3.1 Under normal conditions.

3.2 Under extreme conditions.

#### 14.18.6.3 Test purpose

1. To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

   1.1 Under normal conditions.

   1.2 Under extreme conditions.

#### 14.18.6.4 Test Method

##### Initial Conditions

The MS is assumed to be EGPRS attached.

The SS establishes a downlink TBF on one timeslot.

The SS commands the MS to request an establishment of the TBF Uplink and to create a channel loop back after demodulation and before decoding. This is achieved using the EGPRS test mode by transmitting a EGPRS TEST_CMD (see 04.14, section TBD)

##### Test Procedure

For GMSK Modulation:

a) The SS shall transmit the pseudo-random data using the standard GMSK-modulated test signal in the Mid ARFCN range and the input level at the receiver input shall be 20dB above the Reference Sensitivity Level.

b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.

   The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.

c) Step b) is repeated with the input level at the receiver input increased to 73 dBµVemf().

d) Step b) is repeated with the input level at the receiver input increased to the following values:

   For GSM400 & GSM900: 98 dBµVemf().

   For DCS1800 & PCS1900: 90 dBµVemf().

e) The SS fading function is set to EQ.

f) Step b) is repeated with the input level at the receiver input set to 20dB above the reference sensitivity level() and then increased to 73 dBµVemf().

g) Steps a) to f) are repeated under extreme test conditions.

For 8PSK Modulation:

a) The SS shall transmit the pseudo-random data using the standard 8PSK-modulated test signal in the Mid ARFCN range and the input level at the receiver input shall be 20dB above the Reference Sensitivity Level. For the EGPRS Class A MS, the standard GMSK-modulated test signal will be used for UL transmission.

b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.

   The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.

c) Step b) is repeated with the input level at the receiver input increased to 73 dBµVemf().

d) Step b) is repeated with the input level at the receiver input increased to 87 dBµVemf().

e) Steps a) to d) are repeated under extreme test conditions.

For 8PSK Modulation with random frequency offset:

a) The SS shall transmit the pseudo-random data using the standard 8PSK-modulated test signal with random frequency offset within 0.1ppm in the Mid ARFCN range and the input level at the receiver input shall be 20dB above the Reference Sensitivity Level. For the EGPRS Class A MS, the standard GMSK-modulated test signal will be used for UL transmission.

b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.

The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.

c) Step b) is repeated with the input level at the receiver input increased to 73 dBµVemf().

d) Step a) to c) are repeated under extreme test conditions.

#### 14.18.6.5 Test Requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14.18-10. This shall apply for any combination of normal and extreme test voltages and ambient temperature, for the different propagation conditions and for any level of input signal to the receiver.

**Table 14.18-10: Limits for input level range**

| | | | GSM400 & 900 | | DCS1800 & PCS1900 | |
|---|---|---|---|---|---|---|
| **Type of test signals** | **Type of measurement** | **Propaga-tion Conditions** | **Test limit Error rate %** | **Minimum No. of samples** | **Test limit Error rate %** | **Minimum No. of samples** |
| **GMSK** | **BER** | Static <= 73dBµVemf() | 0.012 | 1640000 | 0.012 | 1640000 |
| | | Static <= 98dBµVemf() | 0.122 | 164000 | 0.122 | 164000 |
| | | Static <= 90dBµVemf() EQ | 3.25 | 120000 | 3.25 | 120000 |
| **8PSK** | **BER** | Static<= 73dBµVemf() | 0.012 | 1640000 | 0.012 | 1640000 |
| | | Static <= 87dBµVemf() | 0.122 | 164000 | 0.122 | 164000 |
| **8PSK with frequency offset within 0.1ppm** | **BER** | Static <= 73dBµVemf() | 0.012 | 1640000 | 0.122 | 164000 |

## 14.18.7 Incremental Redundancy Performance

### 14.18.7.1 Definition and applicability

In Incremental Redundancy RLC mode, soft information from multiple, differently punctured versions of an RLC data block may be used when decoding the RLC data block. This significantly increases the link performance.

The requirements and this test apply to all EGPRS MS.

### 14.18.7.2 Conformance requirement

An EGPRS capable MS shall, under the conditions stated in the table below, achieve a long-term throughput of 20 kbps per time slot (see NOTE) measured between LLC and RLC/MAC layer.

| | |
|---|---|
| Propagation conditions | Static, input level –97,0 dBm |
| Modulation and Coding Scheme | MCS-9 |
| Acknowledgements polling period | 32 RLC data blocks |
| Roundtrip time | 120 ms |
| Number of timeslots | Maximum capability of the MS |
| Transmit window side | Maximum for the MS timeslot capability |

NOTE: This corresponds to an equivalent block error rate of approximately 0.66 using the prescribed MCS-9.

GSM 05.05, 6.7. (3GPP 45.005, 6.7)

### 14.18.7.3 Test purpose

To verify that the EGPRS MS operating in Incremental Redundancy RLC mode achieves a long-term throughput of 20 kbps per timeslot, measured between LLC and RLC/MAC layer, under the conditions defined in conformance requirement.

### 14.18.7.4 Method of test

The SS establishes a downlink TBF in Incremental Redundancy RLC mode, on a Mid ARFCN Range, under the conditions defined in the conformance requirement. The downlink data transfer is proceeded according the Incremental Redundancy RLC mode procedures using MCS-9. The throughput between LLC and RLC/MAC layer is determined by the SS on the basis of the amount of successfully delivered LLC data, i.e. the amount of data bits in acknowledged RLC data blocks representing LLC or higher layer data. The long-term throughput is determined as an average of data throughput measurements performed in Low, Mid and High ARFCN ranges, with three averaged data throughput measurements performed on each frequency range.

#### 14.18.7.4.1 Initial conditions

The SS establishes a downlink EGPRS TBF in Incremental Redundancy RLC mode according to the generic procedures defined in sect. 50, on a Mid ARFCN Range. For the TBF, the SS allocates the maximum number of timeslots according to the multislot capability of the MS under test, applies MCS-9 as the Modulation and Coding Scheme and the maximum transmit window size the number of used time slots allow for the data transfer. The SS commands the MS to use maximum transmit power in the uplink, decreases the transmit power to –96 dBm in the downlink and preserves the fading conditions as static.

#### 14.18.7.4.2 Procedure

a) Using MSC-9 with Puncturing Scheme 1 (PS1), the SS continues the EGPRS TBF in the downlink by transmitting RLC data blocks with valid Block Sequence Numbers (BSN) within the transmit window of maximum size according to MS's multislot class, and polls the MS for acknowledgements after every polling period of 32 RLC data blocks.

b) The SS updates its associated acknowledge state array V(B) according to the ack/nack bitmap in the EGPRS Downlink Ack/Nack message transmitted by the MS as a response to polling.

c) While continuing the transmission of further RLC data blocks with PS1, the SS retransmits, after a delay that corresponds to a round trip time of 120ms, all unacknowledged RLC data blocks with PS2 starting from the oldest unacknowledged RLC blocks.

d) The SS repeats the steps a) to c). For retransmissions of RLC data blocks that have already been retransmitted with PS2, the SS applies PS3 for such blocks and further again PS1 and PS2 in cyclic manner if necessary.

e) Steps a) to d) are repeated until either all RLC data block of valid BSNs within the transmit window are transmitted and acknowledged or the LA/IR bit in the EGPRS Packet Ack/Nack message is set by the MS to indicate the memory run out for IR operation.

f) The SS calculates the data throughput per time slot between RLC/MAC and LLC layers on the basis of successfully transmitted LLC-data during steps a) to e).

g) Steps a) to f) are repeated three times. The SS calculates the average LLC data throughput over these three test runs.

h) Steps a) to g) are repeated at Low and High ARFCN ranges. The SS calculates the average throughput of LLC data over the test runs on Low, Mid and High ARFCN ranges.

### 14.18.7.5 Test requirements

The average long-term throughput per time slot as a result of step h) of the test procedure 14.18.7.4.2 shall equal or exceed 20kbps.

# 15 Timing advance and absolute delay

## 15.1 Definition and applicability

Timing advance (TA) is a time offset in bits as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

NOTE: For normal or dummy bursts, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

## 15.2 Conformance requirement

1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of +/- 1 bit period.

   GSM 05.10, 6.4; GSM 05.10, 6.6.

2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of +/- 1 bit period.

   GSM 05.10, 6.4.

3) When the MS receives a new value of TA on the SACCH, it shall implement the new value of TA at the first TDMA frame belonging to the next reporting period, after the SACCH frame containing the new TA value.

   GSM 05.10, 6.5.

4) The MS shall signal the used TA to the BS, in the L1 header of the uplink SACCH message.

   GSM 05.10, 6.4, GSM 04.04, 7.2.

## 15.3 Test purpose

1) To verify that the MS uses a TA value of 0 for the access burst.

2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.

3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts.

4) To verify that the MS implements a new timing advance value as signalled on the SACCH as in the requirement.

5) To verify that the MS sends the TA used on the uplink SACCH as in the requirement.

## 15.4 Method of test

### 15.4.1 Initial conditions

The SS sends "MAXRETRANS = 7" and "TX-INTEGER = 3" on the BCCH.

The MS is brought into MM state "idle, updated".

### 15.4.2 Procedure

a) The SS pages the MS after 10 s.

b) The SS does not respond to the first 7 CHANNEL REQUEST messages from the MS. The SS responds to the 8th CHANNEL REQUEST from the MS on the RACH by sending an IMMEDIATE ASSIGNMENT message, with TA set to 0.

c) The SS continues to set up a call according to the generic call set up procedure.

d) The SS signals the TA values 10, 20, 30, 40, 50, 60, 63, and one random value other than these values to the MS in consecutive SACCH blocks.

   For GSM 400 MS, the SS signals the TA values 35, 70, 105, 140, 175, 210, 219, and one random value other than these values to the MS in consecutive SACCH blocks.

   The SS determines the TA value set in the L1 header on the uplink SACCH for each timing advance.

   The SS measures the absolute delay for all bursts.

## 15.5 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of +/- 1 bit period:

access bursts: 3 timeslots (= 45/26 ms)

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

The MS shall use the new timing advance at the first TDMA frame belonging to the next reporting period after the SACCH frame containing the new TA value.

The TA field in the uplink SACCH L1 header shall contain to the most recently ordered TA value.

## 15.6 GPRS Timing advance and absolute delay

### 15.6.1 Definition and applicability

Timing advance (TA) is a time offset in bits as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

The timing advance procedure is used to derive the correct value for timing advance that the MS has to use for the uplink transmission of radio blocks.

The timing advance procedure comprises two parts:

- initial timing advance estimation;
- continuous timing advance update.

NOTE: For normal or dummy bursts, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MS supporting GPRS.

### 15.6.2 Conformance requirement

1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of +/- 1 bit period.

   GSM 05.10, 6.4; GSM 05.10, 6.6.

2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of +/- 1 bit period. In case of a multislot configuration, the MS shall use a common timebase for transmission of all channels. In this case, the MS may optionally use a timeslot length of 157 bit periods on timeslots TN = 0 and 4, and 156 bit periods on timeslots with TN = 1, 2, 3, 5, 6 and 7, rather than 156,25 bit periods on all timeslots. In case of a packet switched multislot configuration the common timebase shall be derived from all timeslots monitored by the MS. In this case, the MS may assume that the BTS uses a timeslot length of 156,25 bit periods on all timeslots

   GSM 05.10, 6.4.

3) For an MS in Packet transfer mode, except MS class A in dedicated mode:

   Within the packet resource assignments (see GSM 04.08 and GSM 04.60) for uplink or downlink messages the MS gets the Timing Advance Index (TAI). The MS shall send access bursts on the subchannel defined by the TAI on the PTCCH using TA=0.

   GSM 05.10 6.5.2

4) For an MS in Packet transfer mode, except MS class A in dedicated mode:

   When the MS receives the updated value of TA from the BTS on the downlink PTCCH, it shall always use the last received TA value for the uplink transmission.

   GSM 05.10 6.5.2

5) For an MS in Packet transfer mode, except MS class A in dedicated mode:

   Upon initiation of the continuous timing advance procedure the MS shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.

   GSM 05.10 6.5.2

6) For an MS in Packet transfer mode, except MS class A in dedicated mode:

   The network may request the MS to send 4 access bursts to calculate a new TA value. For this purpose the network sets the system information element CONTROL_ACK_TYPE to indicate that the MS is to respond with a PACKET_CONTROL_ACKNOWLEDGEMENT consisting of 4 access bursts (see GSM 04.60), and sends a PACKET_POLLING_REQUEST to the MS. In this case, the MS shall transmit 4 consecutive access bursts on the assigned resources.

   GSM 05.10 6.5.2

7) For an MS in Packet transfer mode, except MS class A in dedicated mode:

   If the MS receives a resource assignment or power control/timing advance message (see GSM 04.60), the MS shall use the included TA value until it receives a new value on PTCCH.

   GSM 05.10 6.5.2

8) For an MS in Packet transfer mode, except MS class A in dedicated mode:

   If the MS receive a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure, the MS shall start the packet transfer after the TA value is received on the PTCCH.

   GSM 05.10 6.5.2

9) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating that a default timing advance shall be used, the MS shall not use the continuous timing advance procedure.

GSM 05.10 6.5.2

10) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives a new or updated TA value on the downlink PTCCH or downlink PACCH, the MS shall be ready to transmit using the new TA value within 40 ms of the end of the last timeslot of the message block containing the new TA value.

GSM 05.10, 6.9

NOTE: A MS class A in dedicated mode has to follow the procedures described in GSM 05.10 subclause 6.5.1.

### 15.6.3 Test purpose

1) To verify that the MS uses a TA value of 0 for the access burst.

2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.

3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts.

4) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, when it receives an updated value of TA from the BTS on the downlink PTCCH, uses the last received TA value for the uplink transmission, respecting conformance requirement 10.

5) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, upon initiation of the continuous timing advance procedure shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.

6) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet polling message as defined in conformance requirement 6, sends 4 access bursts on a network assigned uplink resource.

7) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a resource assignment or power control/timing advance message (see GSM 04.60), uses the included TA value until it receives a new value on PTCCH.

8) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure, it starts the packet transfer after the TA value is received on the PTCCH respecting conformance requirement 10.

9) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating that a default timing advance shall be used, does not use the continuous timing advance procedure.

### 15.6.4 Method of test

#### 15.6.4.1 Initial conditions

The test shall be run under the default GPRS conditions defined in section 40.

The SS sets the Packet System Infomation 1 parameter CONTROL_ACK_TYPE to "0".

The MS is brought into packet idle mode.

The Test Mode defined in GSM Rec. 4.14 (para 5.4) will be used for uplink TBF. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks

Mode (b) transmitting looped-back RLC data blocks

then Mode (a) will be used.

If Mode (b) is used then the SS sends the psuedo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

#### 15.6.4.2 Procedure

a) The SS pages MS on the PPCH. The SS measures the receive/transmit delay for each burst.

b) The MS is brought into packet transfer mode. The SS transmits a packet ressource assignment to the MS with a valid TAI. The SS transmits a TA value on the PTCCH for this TAI which is not 0 nor 1. The SS measures the receive/transmit delay for each burst.

c) The SS transmits a number of different TA values on the PTCCH for the TAI assigned to the MS. The SS also changes the TA values on the PTCCH for the other TAI in such a way that there is no correlation between TA values. The SS measures the receive/transmit delay for each burst.

d) The SS transmits a new TA value, different by more than 1 from the previously transmitted one, in such a way that the MS can only correctly receive the last (4th) occurrence of the new TA value. The SS measures the receive/transmit delay for each burst.

e) The MS is made to send a Packet Channel Request. The SS responds with a Packet Queuing Notification. After 10 s the SS sends a Packet Polling, addressing the MS with its Temporary Queuing Identity. The SS measures the receive/transmit delay for each burst.

NOTE: The 10 s is an arbitrary value.

f) The SS sends a Packet Uplink Assignment to the MS with valid TIMING_ADVANCE_INDEX, TIMING_ADVANCE_TIMESLOT_NUMBER, and TIMING_ADVANCE_VALUE. As part of the subsequent continuous timing advance update procedure, the SS sends a timing advance value on the downlink PTCCH for the MS, that is different from the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for each burst.

g) The SS sends a Packet Uplink Assignment to the MS with valid TIMING_ADVANCE_INDEX and TIMING_ADVANCE_TIMESLOT_NUMBER corresponding to the PTCCH, and with the TIMING_ADVANCE_VALUE field not present. The SS allocates uplink resources to the MS in such a way that the allocated uplink resources occur before the uplink PTCCH allocated to the MS. The SS measures the receive/transmit delay for each burst.

h) The SS sends a Packet Uplink Assignment to the MS with TIMING_ADVANCE_VALUE set to a value different from the last one ordered on the PTCCH, and the TIMING_ADVANCE_INDEX and TIMING_ADVANCE_TIMESLOT_NUMBER fields not present. The SS continues to transmit TA values on the PTCCH. These shall be different from the TA value TIMING_ADVANCE_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for each burst.

### 15.6.5 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of +/- 1 bit period.

access bursts: 3 timeslots (= 45/26 ms)

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

In step a) the MS shall transmit an access burst on the PRACH.

In step b) the MS shall send access bursts on the PTCCH on the subchannel defined by the TAI with TA = 0.

In step c) the MS shall use the updated TA values.

In step d) the MS shall use the updated TA value.

In step e) the MS shall transmit 4 access bursts.

In step f) the MS shall use the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment first, and change to the Timing Advance value transmitted on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

After step h) the MS shall not transmit on the allocated resources before it received a Timing Advance value on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

In step h) the last TA value received from the SS is the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment.

# 15.7 ECSD Timing advance and absolute delay

## 15.7.1 Definition and applicability

Timing advance (TA) is a time offset in symbols as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

NOTE: For normal bursts for GMSK modulation, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For normal bursts for 8-PSK modulation, the common burst reference point is defined to be the transition from symbol 13 to symbol 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

The requirement and this test apply to all types of MSs supporting ECSD.

## 15.7.2 Conformance requirement

1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of +/- 1 symbol period.

   GSM 05.10, 6.4; GSM 05.10, 6.6.

2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of +/- 1 symbol period. In case of a multislot configuration, the MS shall use a common timebase for transmission of all channels. In this case, the MS may optionally use a timeslot length of 157 symbol periods on timeslots TN = 0 and 4, and 156 symbol periods on timeslots with TN = 1, 2, 3, 5, 6 and 7, rather than 156,25 symbol periods on all timeslots. In case of a circuit switched multislot configuration, the common timebase shall be derived from the main channel and the TA values received on other channels shall be neglected.

   GSM 05.10, 6.4.

3) When the MS receives a new value of TA on the SACCH, it shall implement the new value of TA at the first TDMA frame belonging to the next reporting period, after the SACCH frame containing the new TA value.

   GSM 05.10, 6.5.1

4) The MS shall signal the used TA to the BS, in the L1 header of the uplink SACCH message.

   GSM 05.10, 6.5.1, GSM 04.04, 7.2.

## 15.7.3 Test purpose

1) To verify that the MS uses a TA value of 0 for the access burst.

2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.

3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts.

4) To verify that the MS implements a new timing advance value as signalled on the SACCH as in the requirement.

5) To verify that the MS sends the TA used on the uplink SACCH as in the requirement.

6) To verify that a multislot capable MS operates in accordance with the conformance requirement 2.

### 15.7.4 Method of test

#### Initial conditions

The SS sends "MAXRETRANS = 7" and "TX-INTEGER = 3" on the BCCH.

The MS is brought into MM state "idle, updated".

#### Procedure

a) The SS pages the MS after 10 s.

b) The SS does not respond to the first 7 CHANNEL REQUEST messages from the MS. The SS responds to the 8th CHANNEL REQUEST from the MS on the RACH by sending an IMMEDIATE ASSIGNMENT message, with TA set to 0.

c) The SS continues to set up a call according to the generic call set up procedure for ECSD. In the case of a multislot cabable MS, the call is set up according to the generic call set up procedure for multislot configuration for ECSD and the SS commands the MS to operate with maximum number of both uplink and downlink timeslots according to the multislot class of the MS. In the case of class A ECSD MS, 8-PSK modulated channels shall be used in the downlink. In the case of class B ECSD MS, GMSK modulated channels shall be used in the downlink and 8-PSK modulated channels in the uplink.

d) The SS signals the TA values 10, 20, 30, 40, 50, 60, 63, and one random value other than these values to the MS in consecutive SACCH blocks.

   For GSM 400 MS, the SS signals the TA values 35, 70, 105, 140, 175, 210, 219, and one random value other than these values to the MS in consecutive SACCH blocks.

   In the case of a multislot capable MS, the TA values defined above are signalled on the main channel of the multislot configuration, and on the subchannels TA values different from those ones are signalled.

   The SS determines the TA value set in the L1 header on the uplink SACCH for each timing advance.

   The SS measures the absolute delay for all bursts.

### 15.7.5 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of +/- 1 symbol period:

access bursts: 3 timeslots (= 45/26 ms)

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

The MS shall use the new timing advance at the first TDMA frame belonging to the next reporting period after the SACCH frame containing the new TA value.

The TA field in the uplink SACCH L1 header shall contain to the most recently ordered TA value.

The multislot capable MS shall use a common TA value for all uplink channels, derived from the main downlink channel of the multislot configuration. The TA value in the uplink SACCH L1 header shall be that one.

# 15.8 EGPRS timing advance and absolute delay

## 15.8.1 Definition and applicability

Timing advance (TA) is a time offset in symbols as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

The timing advance procedure is used to derive the correct value for timing advance that the MS has to use for the uplink transmission of radio blocks.

The timing advance procedure comprises two parts:

- initial timing advance estimation;
- continuous timing advance update.

NOTE: For normal bursts for GMSK modulation, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For normal bursts for 8-PSK modulation, the common burst reference point is defined to be the transition from symbol 13 to symbol 14 of the midamble For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

The requirement and this test apply to all types of MSs supporting EGPRS.

## 15.8.2 Conformance requirement

1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of +/- 1 symbol period.

   GSM 05.10, 6.4; GSM 05.10, 6.6.

2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of +/- 1 symbol period. In case of a multislot configuration, the MS shall use a common timebase for transmission of all channels. In this case, the MS may optionally use a timeslot length of 157 symbol periods on timeslots TN = 0 and 4, and 156 symbol periods on timeslots with TN = 1, 2, 3, 5, 6 and 7, rather than 156,25 symbol periods on all timeslots. In case of a packet switched multislot configuration the common timebase shall be derived from all timeslots monitored by the MS. In this case, the MS may assume that the BTS uses a timeslot length of 156,25 symbol periods on all timeslots

   GSM 05.10, 6.4.

3) For an MS in Packet transfer mode, except MS class A in dedicated mode:

   Within the packet resource assignments (see GSM 04.08 and GSM 04.60) for uplink or downlink messages the MS gets the Timing Advance Index (TAI). The MS shall send access bursts on the subchannel defined by the TAI on the PTCCH using TA=0.

   GSM 05.10 6.5.2

4) For an MS in Packet transfer mode, except MS class A in dedicated mode:

   When the MS receives the updated value of TA from the BTS on the downlink PTCCH, it shall always use the last received TA value for the uplink transmission.

   GSM 05.10 6.5.2

5) For an MS in Packet transfer mode, except MS class A in dedicated mode:

Upon initiation of the continuous timing advance procedure the MS shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.

GSM 05.10 6.5.2

6) For an MS in Packet transfer mode, except MS class A in dedicated mode:

The network may request the MS to send 4 access bursts to calculate a new TA value. For this purpose the network sets the system information element CONTROL_ACK_TYPE to indicate that the MS is to respond with a PACKET_CONTROL_ACKNOWLEDGEMENT consisting of 4 access bursts (see GSM 04.60), and sends a PACKET_POLLING_REQUEST to the MS. In this case, the MS shall transmit 4 consecutive access bursts on the assigned resources.

GSM 05.10 6.5.2

7) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a resource assignment or power control/timing advance message (see GSM 04.60), the MS shall use the included TA value until it receives a new value on PTCCH.

GSM 05.10 6.5.2

8) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receive a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure, the MS shall start the packet transfer after the TA value is received on the PTCCH.

GSM 05.10 6.5.2

9) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating that a default timing advance shall be used, the MS shall not use the continuous timing advance procedure.

GSM 05.10 6.5.2

10) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives a new or updated TA value on the downlink PTCCH or downlink PACCH, the MS shall be ready to transmit using the new TA value within 40 ms of the end of the last timeslot of the message block containing the new TA value.

GSM 05.10, 6.9

Note: A MS class A in dedicated mode has to follow the procedures described in GSM 05.10 subclause 6.5.1.

### 15.8.3 Test purpose

1) To verify that the MS uses a TA value of 0 for the access burst.

2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.

3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts in accordance with the conformance requirement 2.

4) To verify that an MS in Packet transfer mode, except for aMS Class A in dedicated mode, when it receives an updated value of TA from the BTS on the downlink PTCCH, uses the last received TA value for the uplink transmission, respecting conformance requirement 10.

5) To verify that an MS in Packet transfer mode, except for aMS Class A in dedicated mode, upon initiation of the continuous timing advance procedure shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.

6) To verify that an MS in Packet transfer mode, except for a MS Class A in dedicated mode, if it receives a packet polling message as defined in conformance requirement 6, sends 4 access bursts on a network assigned uplink resource.

7) To verify that an MS in Packet transfer mode, except for a MS Class A in dedicated mode, if it receives a resource assignment or power control/timing advance message (see GSM 04.60), uses the included TA value until it receives a new value on PTCCH.

8) To verify that an MS in Packet transfer mode, except for a MS Class A in dedicated mode, if it receives a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure, it starts the packet transfer after the TA value is received on the PTCCH respecting conformance requirement 10.

9) To verify that an MS in Packet transfer mode, except for a MS Class A in dedicated mode, if it receives a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating that a default timing advance shall be used, does not use the continuous timing advance procedure.

### 15.8.4 Method of test

#### Initial conditions

The SS sets the Packet System Infomation 1 parameter CONTROL_ACK_TYPE to "0".

The MS is brought into packet idle mode.

#### Procedure

a) The SS pages MS on the PPCH. The SS measures the receive/transmit delay for each burst.

b) The SS brings the MS into packet transfer modeand orders the MS to transmit on the uplink for the duration of the test. This is achieved using the EGPRS test mode by transmitting a EGPRS TEST_CMD (see GSM 04.14). Maximum number of uplink and downlink PDTCHs is allocated according to the multislot class of the MS. In case of class A EGPRS MS, 8-PSK modulated PDTCHs are used in the downlink. In case of class B EGPRS MS, GMSK modulated PDTCHs are used in the downlink and 8-PSK modulated PDTCHs are used in the uplink. The SS transmits a packet resource assignment to the MS with a valid TAI. The SS transmits a TA value on the PTCCH for this TAI which is not 0 nor 1. The SS measures the receive/transmit delay for each burst.

c) The SS transmits a number of different TA values on the PTCCH for the TAI assigned to the MS. The SS also changes the TA values on the PTCCH for the other TAI in such a way that there is no correlation between TA values. For multislot capable MS, the TA values are transmitted on arbitrary downlink channels allocated for the MS. The SS measures the receive/transmit delay for each burst.

d) The SS transmits a new TA value, different by more than 1 from the previously transmitted one, in such a way that the MS can only correctly receive the last (4th) occurrence of the new TA value. The SS measures the receive/transmit delay for each burst. The uplink TBF is terminated.

e) The MS is made to send a Packet Channel Request by transmitting a EGPRS_TEST_CMD. The SS responds with a Packet Queuing Notification. After 10 s the SS sends a Packet Polling, addressing the MS with its Temporary Queuing Identity. The SS measures the receive/transmit delay for each burst.

Note: The 10 s is an arbitrary value.

f) The SS sends a Packet Uplink Assignment to the MS with valid TIMING_ADVANCE_INDEX, TIMING_ADVANCE_TIMESLOT_NUMBER, and TIMING_ADVANCE_VALUE. As part of the subsequent continuous timing advance update procedure, the SS sends a timing advance value on the downlink PTCCH for the MS, that is different from the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for each burst.

g) The SS sends a Packet Uplink Assignment to the MS with valid TIMING_ADVANCE_INDEX and TIMING_ADVANCE_TIMESLOT_NUMBER corresponding to the PTCCH, and with the TIMING_ADVANCE_VALUE field not present. The SS allocates uplink resources to the MS in such a way that the allocated uplink resources occur before the uplink PTCCH allocated to the MS. The SS measures the receive/transmit delay for each burst.

h) The SS sends a Packet Uplink Assignment to the MS with TIMING_ADVANCE_VALUE set to a value different from the last one ordered on the PTCCH, and the TIMING_ADVANCE_INDEX and TIMING_ADVANCE_TIMESLOT_NUMBER fields not present. The SS continues to transmit TA values on the PTCCH. These shall be different from the TA value TIMING_ADVANCE_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for each burst.

#### 15.8.4.3 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of +/- 1 symbol period.

access bursts: 3 timeslots (= 45/26 ms)

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

In step a) the MS shall transmit an access burst on the PRACH.

In step b) the MS shall send access bursts on the PTCCH on the subchannel defined by the TAI with TA = 0.

In step c) the MS shall use the updated TA values on all of the allocated uplink channels.

In step d) the MS shall use the updated TA value.

In step e) the MS shall transmit 4 access bursts.

In step f) the MS shall use the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment first, and change to the Timing Advance value transmitted on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

After step h) the MS shall not transmit on the allocated resources before it received a Timing Advance value on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

In step h) the last TA value received from the SS is the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment.

# 16 Reception time tracking speed

## 16.1 Definition and applicability

Reception time tracking speed is the speed at which the MS adapts its transmit time to a change in the timing of the received signal.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

## 16.2 Conformance requirement

If the MS determines that the timing difference with signals received from the BS exceeds 2 μs, the MS shall adjust its timebase in steps of 1/4 bit period, in intervals not less than 1 s and not greater than 2 s until the timing difference is less than 1/2 bit period at 3 dB below reference sensitivity and 3 dB less carrier to interference ratio than the reference interference ratios.

GSM 05.10, 6/6.2.

## 16.3 Test purpose

1) To verify that the MS adapts its transmit time to the timing of the received signal as in the conformance requirement under TUHigh propagation conditions at 2 dB above reference sensitivity level( ).

2) To verify that the MS adapts its transmit time to the timing of the received signal as in the conformance requirement under RA propagation conditions at 2 dB above reference sensitivity level( ).

NOTE: This test is performed at a level higher than in the conformance requirement because of test implementation problems.

## 16.4 Method of test

### 16.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a channel in the Mid ARFCN range.

The SS sets TUHigh.

### 16.4.2 Procedure

a) After 10 s the SS sets the input signal level to 2 dB above reference sensitivity level( ).

b) For the last second before step c) the SS takes an average receive/transmit delay of all bursts in that 1 s.

c) The SS increases the delay of the transmitted signal to the MS by a 2 bit step (about 7,4 μs) and keeps this delay for 20 s.

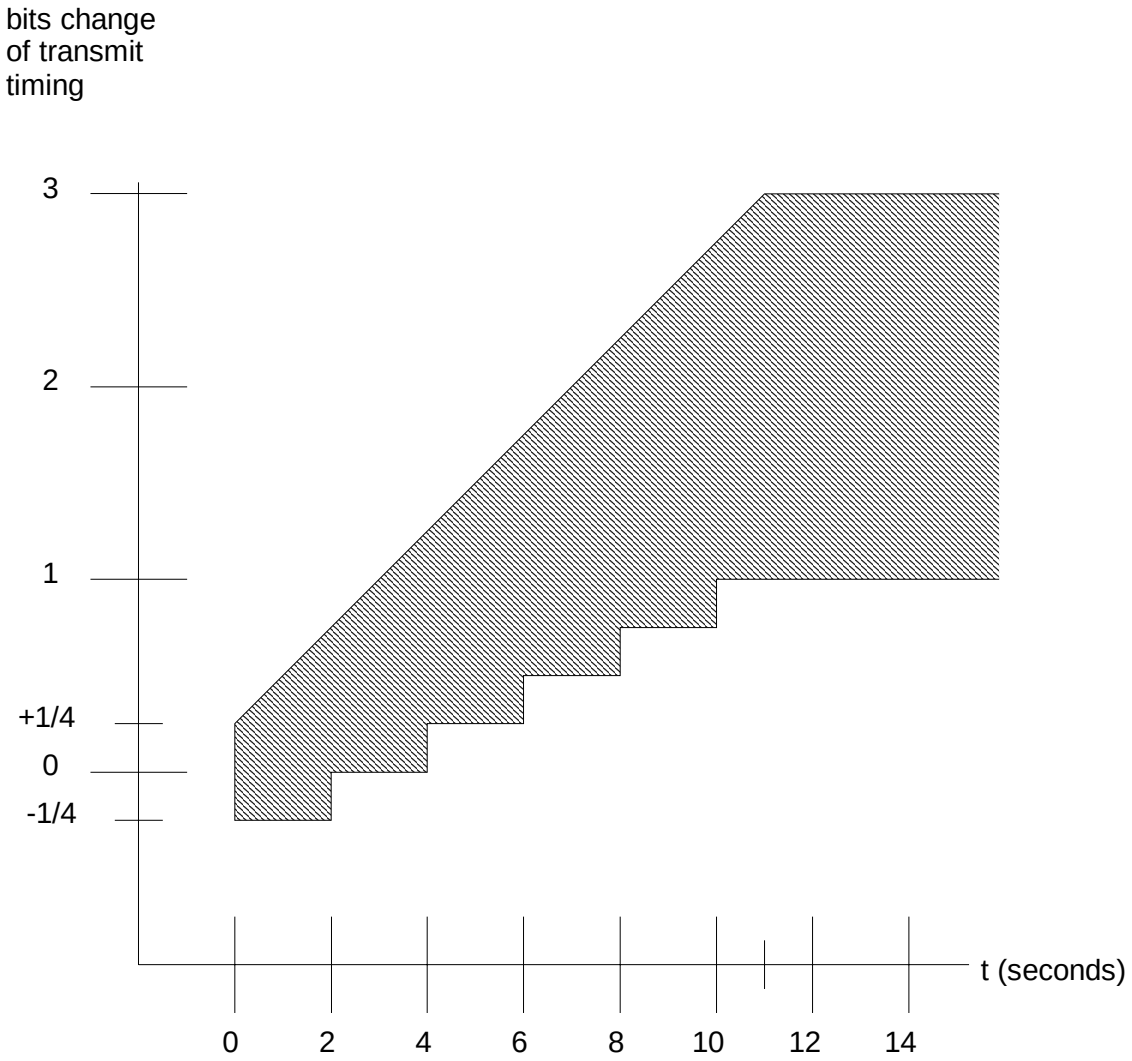
d) The SS measures the absolute receive/transmit delay for each burst.

e) The SS increases the input signal level to 5 dB above reference sensitivity level( ) and sets propagation condition RA.

f) The SS repeats steps a) to d).

16.5 Test requirement

The MS shall adjust the timing of its transmit burst back to the correct receive/transmit timing delay. All burst timings shall be within the shaded part of 16.1.



t=0 is the time at which the SS makes the transmission timing step change in c) of subclause 16.4.2.

**Figure 16.1**

# 17 Access times during handover

## 17.1 Intra cell channel change

### 17.1.1 Definition and applicability

The access times are:

- the time between either receipt by the MS of the last timeslot of the message block containing an ASSIGNMENT COMMAND or HANDOVER COMMAND and the time it has to be ready to transmit on the new channel, and
- the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS. For E-GSM 900 and R-GSM 900 MS this test is performed in the P-GSM band (ref. table 3.3 P-GSM 900ARFCN ranges).

### 17.1.2 Conformance requirement

1) When for an intracell channel change, the MS receives an ASSIGNMENT COMMAND command or a HANDOVER COMMAND it shall be ready to transmit on the new channel within 120 ms of the last timeslot of the message block containing the command.

   GSM 05.10, 6.8.

2) For an intracell channel change, the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms.

   GSM 05.10, 6.8.

### 17.1.3 Test purpose

1) To verify that the MS, when commanded to perform an intracell channel change to a new ARFCN and/or a new timeslot number within the same cell, if the starting time is not used in the ASSIGNMENT COMMAND, is ready to transmit on the new channel within 120 ms of the last timeslot containing the ASSIGNMENT COMMAND.

2) To verify that the MS, when commanded to perform an intracell channel change to a new ARFCN and/or a new timeslot number within the same cell, if the starting time is not used in the ASSIGNMENT COMMAND, is ready to transmit on the new channel within 20 ms of the last complete speech/data frame or message block sent on the old channel.

### 17.1.4 Method of test

#### 17.1.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a channel in the Low ARFCN range on timeslot 1.

#### 17.1.4.2 Procedure

a) The SS sends an ASSIGNMENT COMMAND to the MS allocating a channel in the high ARFCN range on timeslot 2, and with a power command of 7. These old and new carriers have a relative frequency tolerance of 0, and a relative timing tolerance of 1/4 bit.

b) The SS, after it has sent the ASSIGNMENT COMMAND, measures the reception time of bursts received on the new channel, and the time at which transmission ceases on the old channel.

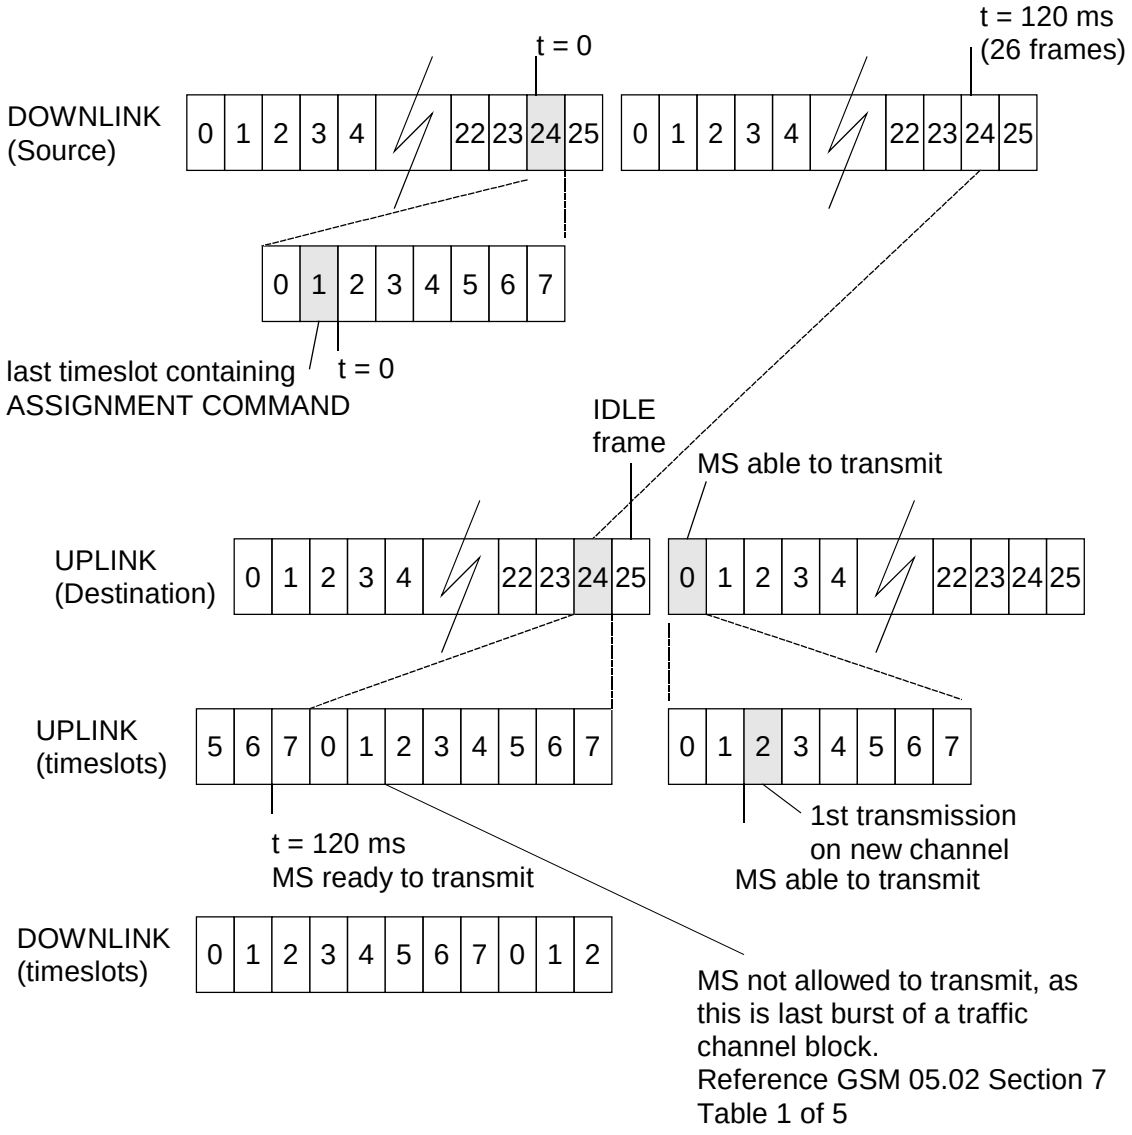


**Figure 17-1: Access time - Intra cell channel change (Test Requirement 1)**

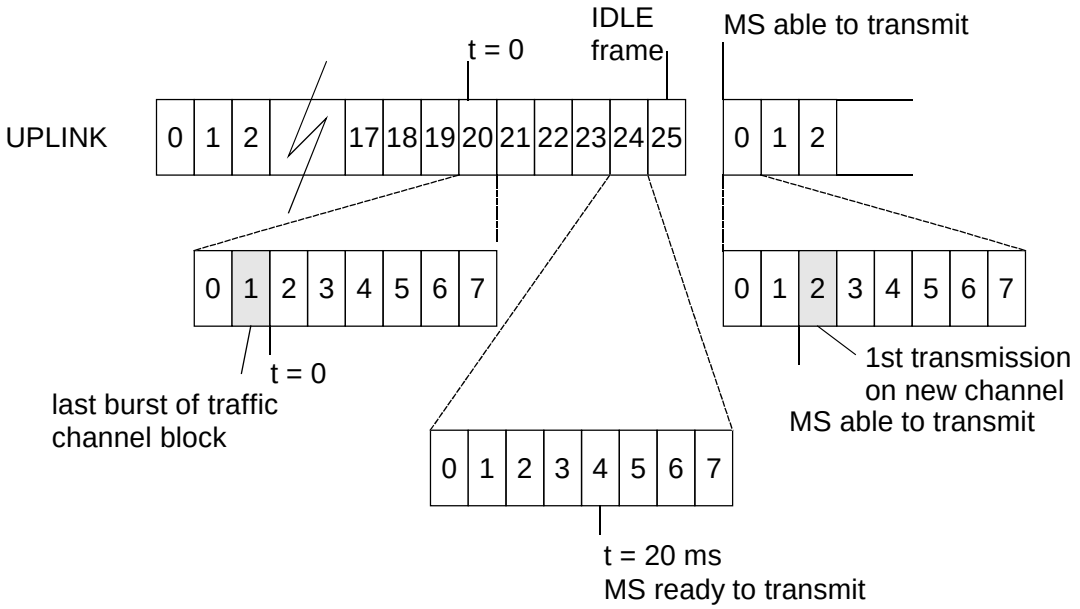

**Figure 17-2: Access time - Intra cell channel change (Test Requirement 2)**

### 17.1.5 Test requirement

1) The MS shall transmit its first burst on the new channel within 131 ms from the last timeslot of the message block containing the ASSIGNMENT COMMAND.

NOTE 1: The requirement time of 120 ms, at which the MS shall be ready to transmit, will expire right at the beginning of a new downlink burst on timeslot 2, which will be the last burst of a traffic channel block, The following frame could be an IDLE frame and the MS would then transmit in the next frame. Taking into account the 3 timeslot shift between up and downlink, and the 1/4 bit relative timing tolerance between the carriers, means that the MS may first transmit on the new channel after 131 ms (120 ms + 2 frames + 3 timeslots + 1/4 bit period). See figure 17-1.

2) The MS shall transmit its first burst on the new channel within 27,7 ms from the last complete speech or data frame or message block sent on the old channel.

NOTE 2: The requirement time of 20 ms, at which the MS shall be ready to transmit, will expire at just over 4 frames after the sending of the last bit on the old channel. The next frame could be an IDLE frame and the MS would then transmit in the following frame. This equates to 6 frames so in the worst case, including the 1/4 bit relative timing tolerance between the carriers, the MS may take 27,7 ms before starting transmissions on the new channel.

## 17.2 Inter cell handover

### 17.2.1 Definition and applicability

The access times are:

- the time between receipt by the MS of the last timeslot of the message block containing a HANDOVER COMMAND and the time it has to be ready to transmit on the new channel, and

- the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

### 17.2.2 Conformance requirement

1) When the MS receives a HANDOVER COMMAND it shall be ready to transmit on the new channel within 120 ms of the last timeslot of the message block containing the HANDOVER COMMAND.

   GSM 05.10, 6.8

2) The time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms.

   GSM 05.10, 6.8.

3) When the MS receives a new TA value in response to a handover access burst, the MS shall be ready to transmit using the new TA value within 40 ms of the end of the last timeslot of the message block containing the new TA.

   GSM 05.10, 6.9.

4) The MS shall use a TA value of 0 for the handover access bursts sent.

   GSM 05.10, 6.6.

### 17.2.3 Test purpose

1) To verify that the MS, when commanded to handover on a new ARFCN and a new timeslot number in a new, not synchronized cell, starting time not used in the HANDOVER COMMAND, will be ready to transmit on the new channel within 120 ms of the last timeslot containing the HANDOVER COMMAND.

2) To verify that the MS, when commanded to handover on a new ARFCN and a new timeslot number in a new, not synchronized cell, starting time not used in the HANDOVER COMMAND, will be ready to transmit on the new channel within 20 ms of the last complete speech or data frame or message block sent on the old channel.

3) To verify that the MS, when it receives a new TA value in response to a handover access burst, is ready to transmit using the new TA value within 50 ms of the end of the last timeslot of the message block containing the new TA value.

4) To verify that the MS uses a TA value of 0 for the handover access burst sent.

### 17.2.4 Method of test

#### 17.2.4.1 Initial conditions

The SS establishes two non-synchronized cells, A and B, under ideal radio conditions. A is the old cell and B is the target for the handover.

The SS uses two traffic channels with the following properties:

| | | GSM900 | DCS1800 | PCS 1900 |
|---|---|---|---|---|
| Cell A | TN | 2 | 2 | 2 |
| | ARFCN | 1 | 512 | 512 |
| | offset | +267 Hz | +320 Hz | +366 Hz |
| Cell B | TN | 0 | 0 | 0 |
| | ARFCN | 124 | 885 | 810 |
| | offset | –267 Hz | –320 Hz | –366 Hz |

| | | GSM450 | GSM480 |
|---|---|---|---|
| Cell A | TN | 2 | 2 |
| | ARFCN | 259 | 306 |
| | offset | +240 Hz | +260 Hz |
| Cell B | TN | 0 | 0 |
| | ARFCN | 293 | 340 |
| | offset | –240 Hz | –260 Hz |

| | | GSM750 | GSM850 |
|---|---|---|---|
| Cell A | TN | 2 | 2 |
| | ARFCN | 438 | 128 |
| | offset | +250 Hz | +252 Hz |
| Cell B | TN | 0 | 0 |
| | ARFCN | 511 | 251 |
| | offset | –250 Hz | –252 Hz |

NOTE: This offset is representing worst cases for Doppler shift at 500 km/h, 300km/h, 250 km/h, 250 km/h and 130 km/h for GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 respectively, and a frequency inaccuracy of 0,05 ppm.

The BCCH for the two cells have the following differences in timing:

Timer T1 50

Timer T2 15

Timer T3 40

1/4 bit number 17

Timeslots 2

The SS sets up a call according to the generic call set up procedure on the channel in cell A.

#### 17.2.4.2 Procedure

a) The SS sends a HANDOVER COMMAND on the main DCCH on cell A ordering the MS to go to the channel in cell B. The power command is set to 7.

b) After the SS has sent HANDOVER COMMAND it measures the reception time of bursts received on the new channel and the time at which transmission ceases on the old channel.

c) The SS also measures the absolute transmit/receive delay for the access bursts on the new channel.

d) The SS sends the PHYSICAL INFORMATIONwith TA set to 50. The SS then measures the reception time and absolute delay of the bursts transmitted on the new cell.

### 17.2.5 Test requirement

1) The MS shall transmit its first burst on cell B within 142,6 ms from the last timeslot of the message block containing the HANDOVER COMMAND.

NOTE 1: The requirement time of 120 ms, at which the MS shall be ready to transmit, will expire right at the end of the last burst of a downlink traffic channel block on the old channel. Due to the two timeslot difference in cell timing, the two timeslots difference in the channel allocation and the 15 frames difference in multiframe timing, this point could occur 2,5 frames before the end of the last burst of a downlink traffic channel block on the new channel. The following frame could be an IDLE frame and the MS would then transmit in the next frame. Taking into account the three timeslot shift between up and downlink, and the 17 1/4 bit periods timing difference between the two carriers, means that the MS may first transmits on the new channel after 142,6 ms (120 ms + 2,5 frames + 2 frames + 3 timeslots + 17 1/4 bit periods).

2) The MS shall transmit its first burst on cell B within 39,2 ms from the last complete speech or data frame or message block sent on cell A.

NOTE 2: The requirement time of 20 ms, at which the MS shall be ready to transmit, will expire at just over 4 frames after the sending of the last bit on the old channel. Due to the two timeslot difference in cell timing, the two timeslots difference in the channel allocation and the 15 frames difference in multiframe timing, this point could occur 2 frames before the end of the last burst of an uplink traffic channel block on the new channel. The following frame could be an IDLE frame and the MS would then transmit in the next frame. This equates to 8,5 frames so in the worst case the MS may take 39,2 ms between cessation of transmission on the old channel and transmission beginning on the new channel.

3) The MS shall transmit using the TA value in the PHYSICAL INFORMATIONwithin 50 ms from the end of the last timeslot of the message block containing the new TA value.

4) The measured absolute delay for the access bursts in steps c) and d) shall equal 3 timeslots (=45/26 ms), with an absolute tolerance of +/- 1 bit.

# 18 Temporary reception gaps

## 18.1 Temporary reception gaps, single slot

### 18.1.1 Definition and applicability

A temporary reception gap is a limited period of time in which the RF reception is interrupted. During this gap the MS shall maintain the frequency and timing of its transmission within specifications.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 MS and PCS 1900, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

### 18.1.2 Conformance requirement

1) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS. The MS shall use the same frequency source for both RF frequency generation and clocking the timebase.

   GSM 05.10, 6.7; GSM 05.10 6.1.

2) The MS shall time its transmissions to the BTS according to signals received from the BTS. The MS transmissions to the BTS, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, where TA is the last timing advance received from the current serving BTS.

   GSM 05.10, 6.4.

3) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS.

   GSM 05.10, 6.7.

### 18.1.3 Test purpose

1) To verify that, during a temporary total loss of signal of up to 63 SACCH block periods, the MS carrier frequency is accurate to within 0,2 ppm of the signals previously received from the BTS.

2) To verify that, the MS transmissions to the BTS, measured at the MS antenna, is 3 timeslots behind the transmissions received from the BTS, with a tolerance of +/-1 bit period.

3) To verify that, during a temporary total loss of signal, of up to 63 SACCH block periods, the MS transmission timing may have drifted resulting in an error not greater than +/- 6,048 µs (0,2 ppm of 63 SACCH blocks).

### 18.1.4 Method of test

#### 18.1.4.1 Initial conditions

The SS signals RADIO_LINK_TIMEOUT = 64 and "DTX OFF" on the BCCH.

The MS is brought into MM state "idle, updated".

After 10 s, the SS continues to set up a call according to the generic call set up procedure.

#### 18.1.4.2 Procedure

a) The SS, in a TDMA frame immediately following the transmission of a complete SACCH block, removes the downlink signal for 63 SACCH blocks.

NOTE: This gives the maximum temporary reception gap.

b) The SS measures the frequency and timing of the MS transmissions immediately before, and at least 5 times at approximately equally spaced intervals during the gap, one of these measurements being at the end of the gap.

c) The SS resumes transmission for a period sufficient to allow the MS reception of 1 SACCH block.

d) The SS again removes downlink transmission for a period equal to at least 3 SACCH blocks. The SS measures the frequency and timing of the MS transmissions immediately before and during this second reception gap.

### 18.1.5 Test requirement

1) The MS carrier frequency shall be accurate to within 0,2 ppm compared to signals received from the SS.

2) The receive/transmit delay timing shall be 3 timeslots +/- 1 bit.

3) During the second reception gap the MS shall maintain transmission for a period up to but not exceeding 3 SACCH blocks.

4) During the first, maximum, reception gap the MS transmission timing may have drifted resulting in an error of not greater than +/- 6,048 µs.

NOTE: The SS determines the error at the start of the reception gap from the first measurement of MS transmission frequency and timing.

## 18.2 Temporary reception gaps in HSCSD multislot configurations

### 18.2.1 Definition and applicability

A temporary reception gap is a limited period of time in which the RF reception is interrupted. During this gap the MS shall maintain the frequency and timing of its transmission within specifications.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800, PCS 1 900 MS and any multiband MS which are capable of HSCSD multislot operation, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

### 18.2.2 Conformance requirement

1) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS. The MS shall use the same frequency source for both RF frequency generation and clocking the timebase.

   GSM 05.10, 6.7; GSM 05.10 6.1.

2) The MS shall time its transmissions to the BTS according to signals received from the BTS. The MS transmissions to the BTS, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, where TA is the last timing advance received from the current serving BTS.

   GSM 05.10, 6.4.

3) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS.

   GSM 05.10, 6.7.

### 18.2.3 Test purpose

1) To verify that, during a temporary total loss of signal of up to 63 SACCH block periods on the main multislot channel, the MS carrier frequency is accurate to within 0,2 ppm of the signals previously received from the BTS.

2) To verify that, the MS transmissions to the BTS, measured at the MS antenna, is 3 timeslots behind the transmissions received from the BTS, with a tolerance of +/-1 bit period.

3) To verify that, during a temporary total loss of signal, of up to 63 SACCH block periods on the main multislot channel, the MS transmission timing may have drifted resulting in an error not greater than +/- 6,048 µs (0,2 ppm of 63 SACCH blocks).

4) To verify that, during a temporary loss of more than 64 SACCH block periods on other than the main channel in symmetric configuration, the MS meet the requirements 1, 2 and 3.

### 18.2.4 Method of test

#### 18.2.4.1 Initial conditions

The SS signals RADIO_LINK_TIMEOUT = 64 and "DTX OFF" on the BCCH.

The MS is brought into MM state "idle, updated".

After 10 s, the SS continues to set up a call according to the generic call set up procedure for multislot HSCSD.

The SS commands the MS to operate in a highest possible asymmetric configuration, with a maximum number of downlink timeslots.

#### 18.2.4.2 Procedure

a) The SS, in a TDMA frame immediately following the transmission of a complete SACCH block, removes the downlink signal for 63 SACCH blocks of the main channel.

NOTE: This gives the maximum temporary reception gap.

b) The SS measures the frequency and timing of the MS transmissions immediately before, and at least 5 times at approximately equally spaced intervals during the gap, one of these measurements being at the end of the gap.

c) The SS resumes transmission for a period sufficient to allow the MS reception of 1 SACCH block.

d) The SS again removes downlink transmission for a period equal to at least 3 SACCH blocks of the main channel. The SS measures the frequency and timing of the MS transmissions immediately before and during this second reception gap.

e) SS signals RADIO_LINK_TIMEOUT=64 and commands the MS to operate in a highest possible symmetric multislot configuration, with a maximum number of uplink timeslots.

f) For a symmetric multislot configuration steps a) and b) are repeated with the exception that a 69 SACCH blocks are removed from a channel other than the main channel.

### 18.2.5 Test requirement

1) The MS carrier frequency shall be accurate to within 0,2 ppm compared to signals received from the SS.

2) The receive/transmit delay timing shall be 3 timeslots +/- 1 bit.

3) During the second reception gap the MS shall maintain transmission for a period up to but not exceeding 3 SACCH blocks.

4) During the first, maximum, reception gap the MS transmission timing may have drifted resulting in an error of not greater than +/- 6,048 µs.

5) During the last reception gap, the MS shall maintain transmission.

NOTE: The SS determines the error at the start of the reception gap from the first measurement of MS transmission frequency and timing.

# 19 Channel release after unrecoverable errors

NOTE: It is not possible to explicitly verify the correct functioning of all aspects of the radio link failure algorithm in the MS. Therefore 3 tests are used to implicitly verify correct implementation.

## 19.1 Channel release after unrecoverable errors -1

### 19.1.1 Definition and applicability

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

### 19.1.2 Conformance requirement

1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO_LINK_TIMEOUT. If S reaches 0 a radio link failure shall be declared.

   GSM 05.08, 5.2.

2) The MS shall continue transmitting as normal on the uplink until S reaches 0.

   GSM 05.08, 5.2.

3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO_LINK_TIMEOUT.

   GSM 05.08, 5.2.

4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see GSM 04.08) has been established.

   GSM 05.08, 5.2.

### 19.1.3 Test purpose

1) To verify correct handling of the radio link counter S.

2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.

3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO_LINK_TIMEOUT.

4) To verify that the MS declares RADIO_LINK_FAILURE, and clears the RR connection when S = 0.

### 19.1.4 Method of test

#### 19.1.4.1 Initial conditions

The SS sends a randomly chooses value N for the parameter RADIO_LINK_TIMEOUT on the BCCH. CALL RE-ESTABLISHMENT is not allowed.

#### 19.1.4.2 Procedure

a) A MS originated call is set up according to the generic call set up procedure.

b) The SS sends 32 error free SACCH messages, followed by N SACCH messages that contain unrecoverable errors, and then continuously sends error free SACCH messages.

NOTE: The SS shall continue sending error free SACCH messages for a time that allows the MS to release the RR connection.

c) The SS sets N to a different but randomly chosen value, and broadcasts this on the BCCH. The SS repeats steps a) to b).

### 19.1.5 Test requirement

After receiving the N SACCH messages with unrecoverable errors, the MS shall abort the RR-connection, i.e. there is no more MS activity on the SACCH channel.

## 19.2 Channel release after unrecoverable errors - 2

### 19.2.1 Definition and applicability

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

### 19.2.2 Conformance requirement

1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO_LINK_TIMEOUT. If S reaches 0 a radio link failure shall be declared.

   GSM 05.08, 5.2.

2) The MS shall continue transmitting as normal on the uplink until S reaches 0.

   GSM 05.08, 5.2.

3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO_LINK_TIMEOUT.

   GSM 05.08, 5.2.

4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see GSM 04.08) has been established.

   GSM 05.08, 5.2.

### 19.2.3 Test purpose

1) To verify correct handling of the radio link counter S.

2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.

3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO_LINK_TIMEOUT.

### 19.2.4 Method of test

#### 19.2.4.1 Initial conditions

The SS sends a randomly chooses value N for the parameter RADIO_LINK_TIMEOUT on the BCCH. CALL RE-ESTABLISHMENT is not allowed.

#### 19.2.4.2 Procedure

a) A MS originated call is set up according to the generic call set up procedure.

b) The SS sends 2 SACCH messages with unrecoverable errors followed by one error free SACCH message. This step is repeated 64 times.

c) The SS sets N to a different but randomly chosen value, and broadcasts this on the BCCH. The SS repeats steps a) to b).

### 19.2.5 Test requirement

The MS shall not abort the RR-connection.

## 19.3 Channel release after unrecoverable errors - 3

### 19.3.1 Definition and applicability

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

### 19.3.2 Conformance requirements

1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO_LINK_TIMEOUT. If S reaches 0 a radio link failure shall be declared.

   GSM 05.08, 5.2.

2) The MS shall continue transmitting as normal on the uplink until S reaches 0.

   GSM 05.08, 5.2.

3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO_LINK_TIMEOUT.

   GSM 05.08, 5.2.

4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see GSM 04.08) has been established.

   GSM 05.08, 5.2.

### 19.3.3 Test purpose

1) To verify correct handling of the radio link counter S.

2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.

3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO_LINK_TIMEOUT.

4) To verify that the MS declares RADIO_LINK_FAILURE, and clears the RR connection when S = 0.

### 19.3.4 Method of test

#### 19.3.4.1 Initial conditions

The SS sends a randomly chooses value N for the parameter RADIO_LINK_TIMEOUT on the BCCH. CALL RE_ESTABLISHMENT is not allowed.

#### 19.3.4.2 Procedure

a) A MS originated call is set up according to the generic call set up procedure.

b) The SS sends 32 error free SACCH messages, followed by 3 SACCH messages with unrecoverable errors, and the sends 1 error free SACCH message. This step is repeated N - 2 times.

c) The SS shall continuously send error free SACCH messages.

NOTE: The SS shall continue sending error free SACCH messages for a time that allows the MS to release the RR connection.

d) The SS sets N to a different but randomly chosen value, and broadcasts this on the BCCH. The SS repeats steps a) to c).

### 19.3.5 Test requirement

After receiving the 3 * (N - 2) erroneous SACCH messages the MS shall abort the RR-connection, i.e. there is no more activity on the SACCH channel.

# 20 Cell selection and reselection

In the following paragraphs some explanatory text is given concerning the nature of the tests in this section and the general behaviour of the SS is described.

Since the conformance requirements of most of the tests in this section cannot be tested explicitly, testing is done implicitly by testing the MS behaviour from its responses to the SS.

The SS transmits one BCCH carrier per cell as indicated in the initial conditions for each test. These are referred to as carrier 1, carrier 2, etc. Each of these cell control channels are non-combined with SDCCHs. It is assumed that the SS can simultaneously transmit seven BCCH carriers and monitor three random access channels. For multiband tests it is assumed that at least one of the BCCH carriers and one of the monitored random access channels is in a different frequency band from the others. In some cases, a test is performed in multiple stages in order that the requirements can be tested within the above constraints.

For any MS all the carriers are in its supported band(s) of operation. For an E-GSM mobile station at least one of the carriers is in the extension band and one of the carriers is in the primary band.

Unless otherwise stated in the method of test, in all of the tests of this section:

- The SS is continuously paging the MS on all carriers at the start of the test and does not respond to RACH requests from the MS. Where a test specifies that the MS is not paged on a particular carrier, only idle paging is transmitted according to GSM 04.08, 3.2.2.2.

- The default values of the system information data fields given in table 20.1 are used.
- The SIM is in the idle updated state in the default location area with a TMSI assigned at the beginning of each test.
- The ARFCNs used for the carriers in each test are chosen from those in table 20.1 with adjacent carriers separated by a minimum of three channels.

The absolute accuracy of the MS signal level measurements is assumed to be +/-6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1 or C2 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be +/-3 dB for the signal levels used in the tests of this section, except for section 20.20, where the relative accuracy is assumed to be +/-5 dB if the measurements are on different frequency bands. A difference of at least 5 dB is allowed for cases of discrimination between C1 or C2 values on different carriers, except for section 20.20, where a difference of at least 10 dB is allowed if the measurements are on different frequency bands.

NOTE 1: The accuracy of MS signal level measurements is specified in GSM 05.08. For all of the tests in this section, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in GSM 05.08 is +/-10 % except for PENALTY_TIME where it is +/-2 seconds. In the tests of this section, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is +/-2 % and the SS tolerance on power level +/-1 dB.

**Table 20.1: Default values of the system information fields**

| Parameter | GSM 04.08 reference | Abbr. | Normal Setting |
|---|---|---|---|
| Cell channel description | 10.5.2.1 | - | Any values |
| MAX retrans | 10.5.2.29 | - | 1 |

# 20.1 Cell selection

## 20.1.1 Definition and applicability

Cell selection is a process in which a MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

## 20.1.2 Conformance requirement

1. The MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 seconds of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; GSM 05.08, 6.1.

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

   2.1 (i) It should be a cell of the selected PLMN

   2.2 (ii) It should not be "barred" (see section 3.5.1)

   2.3 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in section 3.6.

   GSM 03.22, 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; GSM 03.22, 3.2.1.

4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; GSM 05.08, 6.4.

### 20.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that:

   2.1 The MS does not select a cell of a PLMN which is not the selected PLMN.

   2.2 The MS does not select a cell which is "barred".

   2.3 The MS does not select a cell with C1<0.
3. To verify that the MS selects suitable cells in descending order of received signal strength.
4. To verify that the MS does not select a cell with C1<0.

### 20.1.4 Method of test

#### 20.1.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 48 / -65 | 38 / -75 | 43 / -70 | 33 / -80 | 28 / -85 | OFF |
| CBA | 1 | 0 | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -67 | -90 | -88 | -98 | |
| MNC | | | 01 (011 for PCS 1900) | | | |
| MCC | | | 002 | | | |
| C1 | 25 | -8 | 20 | 8 | 13 | |
| C2 | 25 | -8 | 20 | 8 | 13 | |

For an E-GSM MS carrier 2 and carrier 4 ARFCNs are chosen in the E-GSM band, carrier 1 and carrier 3 ARFCNs in the P-GSM band.

#### 20.1.4.2 Procedure

a) The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.

b) The MS is switched on.

c) The MS is switched off.

d) The SS monitors carriers 1 and 3 for RA requests from the MS

e) The MS is switched on.

### 20.1.5 Test requirements

1) After step b), the first response from the MS shall be on carrier 4 within 33 seconds. There shall be no response from the MS on carrier 2.

2) After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 seconds.

## 20.2 Cell selection with varying signal strength values

### 20.2.1 Definition and applicability

For definition see conformance requirement.

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.2.2 Conformance requirement

1. The MS shall:

   The MS shall search all RF channels in the system (35 for GSM 450, 35 for GSM 480, 74 for GSM 750, 124 for GSM 850, 124 for GSM, 174 for E-GSM, 374 for DCS 1 800 and 299 for PCS 1900), take readings of received RF signal strength on each RF channel, and calculate the received level average for each. The averaging is based on at least five measurement samples per RF carrier spread over 3 to 5 s, the measurement samples from the different RF carriers being spread evenly during this period. GSM 05.08, 6.2.

   1.1 The MS shall search all RF channels in the system (35 for GSM 450, 35 for GSM 480, 74 for GSM 750, 124 for GSM 700, 124 for GSM, 174 for E-GSM, 374 for DCS 1 800 and 299 for PCS 1900), take readings of received RF signal strength on each RF channel, and calculate the received level average for each.

   1.2 The averaging is based on at least five measurement samples per RF carrier spread over Tav (3 to 5 s).

   1.3 The measurement samples from the different RF carriers being spread evenly during this period.

2. These quantities are termed the "receive level averages", shall be unweighted averages of the received signal strengths measured in dBm. GSM 05.08, 6.1.

### 20.2.3 Test purpose

1. To verify that:

   1.1 The MS meets conformance requirement 1.1.

   1.2 The MS meets conformance requirement 1.2.

   1.3 The MS meets conformance requirement 1.3.

2. To verify that the MS meets conformance requirement 2.

### 20.2.4 Method of test

#### 20.2.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 23 / -90 | 58 / -55 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 13 / -100 | 13 / -100 | | | | |
| C1 | 10 | 53 | | | | |

For an E-GSM MS carrier 1 ARFCN is chosen in the E-GSM band.

The manufacturer of the equipment shall declare his averaging time Tav. This time is the time between the first and the last measurement sample taken on one carrier during one averaging period.

#### 20.2.4.2 Procedure

a) The SS transmits on carriers 1 and 2. After a period of b*Tav carrier 2 reduces its transmit level to -85 dBm (28 dBµV emf( )). After a further period of a*Tav, carrier 2 increases its transmit level again to -55 dBm (58 dBµV emf( )). Switching of carrier 2 continues with these levels and duty cycle until the end of the test.

   Tav is the averaging time declared by the manufacturer.

   The parameters a and b are chosen according to the following rules:

(a + b) * Tav > Tav

0 < a * Tav < 2/3 * Tav

0,5 * Tav < b * Tav < Tav

In the equations < and > means at least one TDMA frame less or greater than the given value.

While satisfying the conditions given above:

a is chosen to be as close as possible to 2/3.

b is chosen to be as close as possible to 0,5.

b) The MS is switched on.

c) The SS monitors all RA requests from MS on carriers 1 and 2.

### 20.2.5 Test requirements

In step c), the first response from the MS shall be on carrier 2 within 33 seconds.

NOTE 1: With the selected duty cycle it can be guaranteed that a "good" MS passes the test even at the worst case situations. The minimum averaged value of carrier 2 is in any case higher or equal to -75 dBm which is still 6 dB above carrier 1's level (for a "good" MS).

NOTE 2: With the selected levels and duty cycle the probability that a "bad" MS (i.e. MS that averages over shorter period than 3 s) fails the test is maximized. However, it can not be guaranteed that all the MSs not fulfilling the conformance requirement of averaging or uniform sampling will fail this test.

## 20.3 Basic cell reselection

### 20.3.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MSs.

### 20.3.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

   1.1 (iii) The cell camped on (current serving cell) has become barred.

   1.2 (iv) There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

   The MS will then reselect a new cell in order to fulfil the process goal.; GSM 03.22, 4.5.

NOTE 1: Criterion (i) is tested in section 20.8 (Cell reselection when C1(serving cell) < 0 for 5 seconds).

NOTE 2: Criterion (ii) is tested section 20.16 (Downlink signalling failure).

NOTE 3: Criterion (v) is tested in section 20.6 (Cell reselection timings).

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

   2.1 (ii) It should not be "barred".

   2.2 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. GSM 03.22, 3.2.1.

NOTE 4: Criterion (i) is not relevant for cell reselection and for cell selection it is tested in section 20.1.

NOTE 5: Criterion (iv) refers to the C1 parameter.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; GSM 05.08, 6.4.

4. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

   i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high.

   ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds, except in the case of the new cell being in a different location area in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds. This indicates that it is a better cell. GSM 05.08, 6.6.2.

5. The MS shall attempt to decode the full BCCH data of the serving cell at least every 30 seconds; GSM 05.08, 6.6.1.

### 20.3.3 Test purpose

1. To verify that:

   1.1 The MS meets conformance requirement 1.1.

   1.2 The MS meets conformance requirement 1.2.

2. To verify that:

   2.1 The MS does not reselect a cell which is barred.

   2.2 The MS does not reselect a cell which has a C1<0.

3. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are not used.

4. To verify that the MS takes into account the CELL_RESELECT_HYSTERESIS parameter when reselecting a cell in a different location area.

5. To verify that the MS decodes the CELL_BAR_ACCESS and CELL_BAR_QUALIFY parameters from the BCCH every 30 seconds.

### 20.3.4 Method of test

#### 20.3.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43 / -70 | 33 / -80 | 43 / -70 | 38 / -75 | 38 / -75 | |
| RXLEV_ACCESS_MIN (dBm) | -85 | -90 | -90 | -85 | -67 | |
| CRH | 10 dB | | | | | |
| LAC | | | different from other carriers | | | |
| CBA | | | | 1 | | |
| CBQ | | | | 0 | | |
| C1 | 15 | 10 | 20 | 10 | -8 | |
| C2 | 15 | 10 | 20 | 10 | -8 | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

#### 20.3.4.2 Procedure

a) The SS activates carriers 1, 2, 4 and 5. The MS is not paged on carrier 1. The SS monitors carriers 2, 4 and 5 for RA requests from the MS.

b) The MS is switched on.

c) The SS stops paging on all carriers except carrier 2. The level of carrier 2 is increased to 43 dBµVemf (C2 becomes 20 dB), and the SS monitors carrier 2 for RA requests from the MS.

d) When the SS receives a response from the MS on carrier 2, it stops paging the MS on this carrier.

e) The MS is switched off.

f) The SS is reconfigured and sets CBA = 1 on carriers 1 and 5.

g) The MS is switched on.

h) After 33 seconds, the SS starts paging continuously on carrier 1 and sets CBA=1 on carrier 2 and CBA=0 on carriers 1, 4 and 5.

i) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 seconds. (The MS should reselect and camp onto carrier 1).

j) The SS activates carrier 3, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.

k) The SS increases the level of carrier 3 to 53 dBµVemf (C2 increases to 30 dB.).

### 20.3.5 Test requirements

1) After step b), there shall be no response from the MS on carriers 2, 4, or 5 within 50 seconds.

2) In step c), the MS shall respond on carrier 2 within 20 seconds of increasing the level of carrier 2.

NOTE 1: 5 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 18,4 seconds, allow 20 seconds.

3) In step h), the MS shall respond on carrier 1 within 50 seconds of setting CBA=1 on carrier 2.

NOTE 2: 33 seconds for the MS to read the BCCH of carrier 2 (30 seconds + 10 %), 15 seconds for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 seconds.

4) After step j), there shall be no response from the MS within 50 seconds.

5) After step k), the MS shall respond on carrier 3 within 20 seconds.

## 20.4 Cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters

### 20.4.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs

### 20.4.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; GSM 05.08, 6.4.

### 20.4.3 Test purpose

1. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are used.

2. To verify DCS 1 800 and PCS 1 900 MS correctly calculate the C2 parameter when the POWER_OFFSET parameter is present.

### 20.4.4 Method of test

#### 20.4.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 53 / -60 | 43 / -70 | 48 / -65 | 48 / -65 | | |
| RXLEV_ACCESS_MIN (dBm) | -80 | -100 | -85 | -85 | | |
| PT | | 11111 | 40 s | 60 s | | |
| CRO | | 16 dB | 20 dB | 20 dB | | |
| TO | | | 20 dB | 20 dB | | |
| K = 1 | | | | | | |
| C1 | 20 | 30 | 20 | 20 | | |
| C2 | 20 | 14 | 20 -> 40 | 20 -> 40 | | |
| K = 2 (DCS1800 Class 3 MS only) | | | | | | |
| POWER_OFFSET | 0 | 2 | 6 | 6 | | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

#### 20.4.4.2 Procedure

For testing of GSM MS, the test procedure is performed for execution counter K = 1.

For testing of DCS 1 800 MS, the test procedure is performed for execution counter K = 1 and 2

On execution counter K = 1, the POWER_OFFSET Parameter is not present.

On execution counter K = 2, the POWER_OFFSET parameter is present.

a) The SS activates carriers 1 and 2. The MS is not paged on carrier 1. The SS monitors carrier 2 for RA requests from the MS.

b) The MS is switched on.

c) The SS increases the level of carrier 2 to 54 dBµVemf (C2 becomes 25 dB).

d) When the SS receives a response on carrier 2, the SS stops paging on that carrier and waits for 20 seconds (The MS should reselect and camp onto carrier 2).

e) The SS activates carriers 3 and 4 and continuously pages the MS on these carriers. The SS monitors carriers 3 and 4 for RA requests from the MS.

#### 20.4.4.3 Requirements

For execution counter K = 1 and K = 2.

1) After step b), there shall be no response from the MS on carrier 2 within 50 seconds.

2) After step c), the MS shall respond on carrier 2 within 20 seconds of increasing the level of carrier 2.

3) After step e), there shall be no response from the MS on carrier 3 within 38 seconds of activating the carriers but, the MS shall respond on carrier 3 within 90 seconds. The response on carrier 3 shall be before any response on carrier 4.

NOTE: Minimum time of 38 seconds set by penalty timer on carrier 3 less 2 second tolerance. Maximum time, total of 33 seconds to read BCCH of carrier 3, 42 seconds for expiry of penalty timer on carrier 3, 15 seconds for reselection, since the MS will already have running averages on carriers 3 and 4, when the penalty timers expire, allow 90 seconds.

## 20.5 Cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages

### 20.5.1 Definition and applicability

System information (SI) type 7 and 8 are transmitted on the BCCH Ext when the system information type 4 message does not contain all information needed for cell selection.

The system information type 2 bis message is used when the system information type 2 message does not contain all neighbour cell ARFCNs.

The system information type 2 ter message is used when system information type 2 messages broadcast by one cell which are system information 2 or both system information 2 and 2bis do not contain all neighbour cell ARFCNs.

Test purposes 1 and 3 are applicable to all types of GSM 400, GSM 700, GSM 850, GSM900, DCS1800 and PCS 1 900 MS.

Test purpose 2 is only applicable for E-GSM, DCS 1 800 and PCS 1 900 MS. This is reflected in initial conditions step d).

Test purpose 4 is only applicable to an E-GSM MS. This is reflected in initial conditions step f), test procedures d) and e) and test requirements clause 3).

### 20.5.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection. GSM 05.08, 6.4.

2 Whilst in idle mode, an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation. GSM 05.08, 6.6.1.

3 Mobile stations shall treat all ARFCNs in the set {0, 1, 2 ... 1023} as valid ARFCN values even if the mobile station is unable to transmit or receive on that ARFCN. GSM 04.08, 10.5.2.1b.

4 An E-GSM MS shall correctly decodes parameters transmitted in the system information type 2 ter message. GSM 04.08, 9.1.34:

### 20.5.3 Test purpose

1. To verify that the MS correctly calculates the C2 criterion when the parameters affecting cell reselection are transmitted in the system information type 7 and 8 messages.

2. To verify that E-GSM, DCS 1 800 and PCS 1 900 MS decode parameters transmitted in the system information type 2 bis message.

3. To verify that the MS treats ARFCNs as valid ARFCNs even if the MS is unable to transmit or receive on that ARFCN.

4. To verify that an E-GSM mobile correctly decode parameters transmitted in the system information type 2 ter message.

### 20.5.4 Method of test

#### 20.5.4.1 Initial conditions

a) Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 *) | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 53 / -60 | 32 / -81 | 40 / -73 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 23 / -90 | 23 / -90 | 30 / -83 | | | |
| BS_AG_BLKS_RES | 1 | 1 | 1 | | | |
| PT | | 0 | 0 | | | |
| CRO | | 16 dB | 10 dB | | | |
| TO | | 0 dB | 0 dB | | | |
| C1 | 30 | 9 | 10 | | | |
| C2 | 30 | 25 | 20 | | | |

*) : Carrier 3 is off for P-GSM, DCS 1800 and PCS 1 900 MS. Carrier 3 is only required for E-GSM MS.

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test and the ARFCNs specified in d) below.

b) The ARFCNs of carriers 1, 2 and 3 are chosen from those in table 20.1.

c) The cell reselection parameters PENALTY_TIME, CELL_RESELECT_OFFSET and TEMPORARY_OFFSET are transmitted in the SI3, SI7 and SI8 messages on carrier 2. They are not transmitted in SI4 and the ADDITIONAL RESELECT PARAM IND parameter is set to 1.

d) The SI2bis message is transmitted on carrier 1 and contains the ARFCN of carrier 2 and ARFCNs 43, 70, 500, 550, 990 and 995. For an E-GSM MS, a DCS 1 800 and PCS 1 900 MS, the ARFCN of carrier 2 is not transmitted in the SI2 message.

e) Carriers 1 and 2 are synchronized, but staggered in frame number so that the transmission of the SI3 message on carrier 2, coincides with the paging block which the MS is listening to on carrier 1.

NOTE: Under these conditions, the MS can only decode the parameters affecting cell reselection from the SI7 or SI8 messages.

To achieve this, the following conditions are used:

BS_PA_MFRMS = 4

IMSI mod 1000 = 12

FN carrier 1 = FN carrier 2-21, for simultaneously transmitted frames.

f) For an E-GSM MS, the SI3 message on carrier 2 indicates that SI2ter is used on carrier 2. SI2ter message contains the ARFCN of carrier 3 and ARFCNs 45, 76, 891, 905. The ARFCN of carrier 3 is transmitted neither in the SI2 nor in the SI2bis messages on carriers 1 and 2.

#### 20.5.4.2 Test Procedure

a) The SS activates the channels. The MS is not paged on carrier 1.

b) The MS is switched on.

c) After 50 seconds, the SS increases the level of carrier 2 to 42 dBµVemf( ).

d) For an E-GSM MS only, when the SS receives a response on carrier 2, the SS stops paging on that carrier and after 30 seconds, the SS increases the level of carrier 3 to 60 dBµVemf( ).

### 20.5.5 Test Requirements

1) After step b), there shall be no response from the MS on carrier 2. For an E-GSM MS there shall also be no response on carrier 3.

2) After increasing the level of carrier 2 in step c), the MS shall respond on carrier 2 within 20 seconds.

3) After increasing the level of carrier 3 in step d), an E-GSM mobile shall respond on carrier 3 within 20 seconds.

## 20.6 Cell reselection timings

### 20.6.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.6.2 Conformance requirement

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

   1.1 ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds,

   1.2 Cell reselection for any other reason (see GSM 03.22) shall take place immediately, but the cell that the MS was camped on shall not be returned to within 5 seconds if another suitable cell can be found.;

   GSM 05.08, 6.6.2.

### 20.6.3 Test purpose

1. To verify that:

   1.1 The MS does not perform a cell reselection when the C2 value for a non serving cell does not exceed the C2 value of the serving cell for a period of at least 5 seconds.

   1.2 When the MS performs an immediate cell reselection due to an unsuccessful random access attempt, the cell that the MS was camped onto is not returned to within 5 seconds when another suitable cell exists.

### 20.6.4 Method of test

#### 20.6.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 56 / -57 | 46 / -67 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 29 / -84 | 33 / -80 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

Below is an alternative table of parameters for use with test equipment that cannot reach the upper RF levels as specified in the table above. These carrier levels are reduced by 5 dB and will not effect the purpose of the test case:

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 51 / -62 | 41 / -72 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 24 / -89 | 28 / -85 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

The BA(BCCH) list only contains 5 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 5 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=5 (default value) the MS will maintain a running average on surrounding cells over a period of 5 seconds.

#### 20.6.4.2 Procedure

a) The SS activates the channels. The MS is not paged on any of the carriers.

b) The MS is switched on.

c) After 50 seconds, the SS starts paging continuously on carriers 1 and 2 for 20 seconds. The SS monitors carriers 1 and 2 for RA requests from the MS.

d) The SS stops paging on carriers 1 and 2 and waits for 20 seconds. (The MS should revert to carrier 1 due to cell reselection.)

e) The SS starts paging continuously on carrier 2.

f) The SS increases the transmit level of carrier 2 by 20 dB for a period of 4 s and then reduces the level back to the original value.

g) The SS increases the transmit level of carrier 2 by 20dB and waits for the MS to access on carrier 2.

### 20.6.5 Test requirements

1) In step c), the MS shall transmit 2 RA requests on carrier 1 followed by 2 RA requests on carrier 2. Subsequent RA requests on either carrier shall not occur within 4,5 s of the second RA request on that carrier.

2) In step f), there shall be no access on carrier 2 within 34 seconds of increasing the level of carrier 2.

3) After step g), the MS shall respond on carrier 2.

# 20.7 Priority of cells

## 20.7.1 Definition and applicability

In general, cell prioritization is a means of encouraging MSs to select some suitable cells in preference to others.

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

## 20.7.2 Conformance requirement

1. During cell selection a cell with low priority indication will only be selected if a suitable cell of normal priority cannot be found; GSM 03.22, 3.5.2.1.

2. Table 1a. Parameters affecting cell priority for cell selection

| CELL_BAR_QUALIFY | CELL_BAR_ACCESS | Cell selection priority | Status for cell reselection |
|---|---|---|---|
| 0 | 0 | normal | normal |
| 0 | 1 | barred | barred |
| 1 | 0 | low | normal (see note 2) |
| 1 | 1 | low | normal (see note 2) |

GSM 05.08, table 1.a

3. If all the following conditions are met then the "Cell selection priority" and the "Status for cell reselection" shall be set to normal:

   - the cell belongs to the MS HPLMN

   - the MS is in cell test operation mode

   - the CELL_BAR_ACCESS is set to "1"

   - the CELL_BAR_QUALIFY is set to "0"

   - the Access Control class 15 is barred

   GSM 05.08, table 1.a

## 20.7.3 Test purpose

1. To verify that the MS does not select a cell of low priority when a suitable cell of normal priority exists with a lower received signal strength.

2. To verify that the MS takes into account CELL_BAR_ACCESS and CELL BAR _QUALIFY when performing cell selection and reselection.

3. To verify that the MS meets conformance requirement 3.

### 20.7.4 Method of test

#### 20.7.4.1 Initial conditions

Parameters changed from Default values table 20.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 33 / -80 | 43 / -70 | 33 / -80 | 23 / -90 | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 3 / -110 | 23 / -90 | 13 / -100 | 13 / -100 | | |
| CBA | 0 | 1 | 1 | 0 | | |
| CBQ | 1 | 1 | 0 | 0 | | |
| Access class 15 | barred | barred | barred | barred | | |
| C1 | 30 | 20 | 20 | 10 | | |

#### 20.7.4.2 Procedure

a) The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 4.

b) The MS is switched on.

c) The MS is switched off. The SS deactivates the carriers.

d) The MS is placed in cell test operation mode.

NOTE: Cell test mode is a mode of operation defined in SIM administrative data field.

e) The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 3.

f) The MS is switched on.

### 20.7.5 Test requirements

1) After step b), the first response from the MS shall be on carrier 4 within 33 seconds, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 seconds.

2) After step f), the first response from the MS shall be on carrier 3 within 33 seconds, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 seconds.

## 20.8 Cell reselection when C1 (serving cell) < 0 for 5 seconds

### 20.8.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.8.2 Conformance requirement

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

   i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high. GSM 05.08, 6.6.2.

2. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

   (i) The path loss criterion parameter C1 (see section 3.6) indicates that the path loss to the cell has become too high.; GSM 03.22, 4.5.

### 20.8.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that the MS meets conformance requirement 2.

### 20.8.4 Method of test

#### 20.8.4.1 Initial conditions

Parameters changed from Default values table 20.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 63 / -50 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 43 / -70 | 23 / -90 | | | | |
| CRO | 30 dB | | | | | |
| TO | 0 | | | | | |
| PT | 0 | | | | | |
| C1 | 20 | 10 | | | | |
| C2 | 50 | 10 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9s.

#### 20.8.4.2 Procedure

a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.

b) The MS is switched on.

c) The SS reduces signal level on carrier 1 to -80 dBm / 33 dBµV emf() for 4 s. Then, the SS raises the level back to -50 dBm / 63 dBµV emf(). (C1 becomes -10 dB and C2, 20 dB during this period).

d) The SS reduces signal level on carrier 1 to -80 dBm / 33 dBµV emf()

### 20.8.5 Test requirements

1) After step b), there shall be no access on carrier 1 or carrier 2, within 50 seconds.

2) After step c), there shall be no access on carrier 2 within 30 seconds.

3) After step d), the MS shall access on carrier 2 within 20 seconds.

# 20.9 Running average of the surrounding cell BCCH carrier signal levels

## 20.9.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

## 20.9.2 Conformance requirement

1. Whilst in idle mode an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation (BA - See table 1). A running average of received level in the preceding 5 to

   Max. {5, ((5 * N + 6) DIV 7) * BS_PA_MFRMS / 4}

   seconds shall be maintained for each carrier in the BCCH allocation. N is the number of non-serving cell BCCH carriers in BA and the parameter BS_PA_MFRMS is defined in GSM 05.02; GSM 05.08, 6.6.1.

2. The same number of measurement samples shall be taken for all non-serving cell BCCH carriers of the BA list, and the samples allocated to each carrier shall as far as possible be uniformly distributed over each evaluation period.; GSM 05.08, 6.6.1

## 20.9.3 Test purpose

1. To verify that if the MS calculates a received level average (over 5 seconds) for a non-serving suitable cell which results in the value of C2 exceeding the value of C2 for the serving cell, then cell reselection takes place to the non-serving cell.

2. To verify that by using suitable varying levels of signal strength for non serving cells, the MS samples on non serving cell BCCH carriers are as far as possible distributed uniformly over each evaluation period.

## 20.9.4 Method of test

### 20.9.4.1 Initial conditions

Parameters changed from Default values table 20.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

BS_PA_MFRMS is set to 4 for this test.

The BA(BCCH) list only contains 7 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 7 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=4 the MS will maintain a running average on surrounding cells over a period of 5 seconds.

### 20.9.4.2 Procedure

a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.

b) The MS is switched on.

c) The SS starts switching the level of carrier 2 between -80 dBm and -57 dBm every 2,7 seconds and continues to do so until the end of the test.

d) The SS decreases the level of carrier 1 to -76 dBm.

NOTE: As a result of the switching in levels, the running average on carrier 2 will be between -66dBm and -71dBm, assuming that samples are distributed over five consecutive paging blocks.

### 20.9.5 Test requirements

1) After step b), there shall be no access from the MS on carrier 1 or carrier 2, within 50 seconds..

2) After step c), there shall be no access from the MS on carrier 1 or 2 within 25 seconds

NOTE: Any potential access on is likely to occur within 20 seconds.

3) After step d), the MS shall access on carrier 2 within 20 seconds.

## 20.10 Running average of the serving cell BCCH carrier signal level

### 20.10.1 Definition and applicability

The MS is required to monitor continuously the BCCH carrier signal level of the serving cell (and to compare it to the BCCH carrier signal levels of the non-serving cells) to guarantee that it is camped on the most suitable cell.

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.10.2 Conformance requirement

1. For the serving cell, receive level measurement samples shall be taken at least for each paging block of the MS. The receive level average shall be a running average determined using samples collected over a period of 5 s or five consecutive paging blocks of that MS, whichever is the greater period. New receiving level average values shall be calculated as often as possible.; GSM 05.08, 6.6.1.

### 20.10.3 Test purpose

1. To verify that by using suitable varying levels of signal strength for the serving cell, the MS performs a running average over 5 consecutive paging blocks.

### 20.10.4 Method of test

#### 20.10.4.1 Initial conditions

Parameters changed from Default values table 20.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level (dBµV emf() / dBm) | 63 / -50 | 39 / -74 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| C1 | 40 | 16 | | | | |
| C2 | 40 | 16 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9s.

#### 20.10.4.2 Procedure

a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.

b) The MS is switched on.

c) After 50 seconds the SS starts switching the level of carrier 1 between -80 dBm and -50 dBm every 3 seconds.

NOTE: As a result of the switching in levels, the running average on carrier 1 will be between -62 dBm and -68 dBm over five consecutive paging blocks.

d) The SS increases the level of carrier 2 to -56 dBm.

### 20.10.5 Test requirement

1) After step c), the MS shall not access on carrier 2, within 25 seconds.

2) After step d), the MS shall access on carrier 2, within 30 seconds.

NOTE 1: 13,75 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 27,15 seconds, allow 30 seconds.

## 20.11 Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list

### 20.11.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.11.2 Conformance requirement

1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; GSM 05.08, 6.6.1.

2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 seconds; GSM 05.08, 6.6.1.

### 20.11.3 Test purpose

1. To verify that MS meets conformance requirement 1.

2. To verify that MS meets conformance requirement 2.

### 20.11.4 Method of test

#### 20.11.4.1 Initial conditions

Six BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|---|---|---|---|---|---|---|---|
| RF signal level (dBµV emf ( )/dBm) | 53 / -60 | 48 /-65 | 43 / -70 | 38 / -75 | 33 / -80 | 33 /-80 | 38 / -75 |
| RXLEV_ACCESS_MIN | -90 | -90 | -90 | -90 | -90 | -90 | -110 |
| C1 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |
| C2 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

BS_PA_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS_PA_MFRMS = 3 leads to averaging time of 5 seconds. Hence 5 seconds is also the updating time of the list of six strongest neighbour carriers.

#### 20.11.4.2 Procedure

a) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.

b) The MS is switched on.

c) After 60 seconds, the SS activates carrier 7 and pages the MS continuously on this carrier. The SS monitors carrier 7 for RA requests from the MS.

### 20.11.5 Test requirements

1) The MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 seconds to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 seconds (+10 %)), 33 seconds to read BCCH, 15 seconds for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 seconds.

## 20.12 Decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers

### 20.12.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.12.2 Conformance requirement

1. The MS shall attempt to decode the BCCH data block that contains the parameters affecting cell reselection for each of the 6 strongest non-serving cell BCCH carriers at least every 5 minutes; GSM 05.08, 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in section 20.3.

### 20.12.3 Test purpose

1. To verify that the MS decodes the BCCH data block that contains the parameters affecting cell reselection for a non-serving cell BCCH carrier, (which is in the list of six strongest neighbour cells), at least every 5 minutes. This is achieved by changing the BCCH data such that the value of C2 for the non serving cell exceeds the value of C2 for the serving cell, and observing that the MS performs cell reselection within 5 minutes plus the time allowed for cell reselection after the change of the BCCH data.

### 20.12.4 Method of test

#### 20.12.4.1 Initial conditions

Parameters changed from Default values table 20.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level (dBµV emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

#### 20.12.4.2 Procedure

a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.

b) The MS is switched on.

c) The SS changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

### 20.12.5 Test requirements

1) After step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 seconds.

2) After step c), the MS shall access on carrier 2 within 345 s of the change in the BCCH data of carrier 2.

NOTE: 330 s for decode of BCCH of carrier 2 (300 s +10 %), 15 seconds for reselection of carrier 2, since the MS already has a running average on carrier 2.

## 20.13 Decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers

### 20.13.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.13.2 Conformance requirement

1. The MS shall attempt to check the BSIC for each of the 6 strongest non-serving cell BCCH carriers at least every 30 seconds, to confirm that it is monitoring the same cell. If a change of BSIC is detected then the carrier shall be treated as a new carrier and the BCCH data redetermined; GSM 05.08, 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in section 20.3.

### 20.13.3 Test purpose

1. To verify that the MS will check the BSIC of the non-serving cell, which is in the list of six strongest neighbour cells, by changing the BSIC and the BCCH data of the non-serving cell such that the value of C2 for that cell exceeds the value of C2 of the serving cell, and observing that the MS performs cell reselection within the time allowed to check the BSIC, redetermine the BCCH data and perform cell reselection.

### 20.13.4 Method of test

#### 20.13.4.1 Initial conditions

Parameters changed from Default values table 20.1 are below:

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level (dBμV emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

#### 20.13.4.2 Procedure

a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.

b) The MS is switched on.

c) The SS changes the BSIC of carrier 2 by changing the Base Station Colour Code (BCC) part of the BSIC. The SS also changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change to the BCCH data the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

### 20.13.5 Test requirements

1) In step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 seconds.

2) After step c), the MS shall access on carrier 2 within 85 s of the change in the BSIC value (and BCCH data) of carrier 2.

NOTE: 33 seconds for check of BSIC on carrier 2, 33 seconds for decode of BCCH of carrier 2, 15 seconds for reselection of carrier 2, since the MS already has a running average on carrier 2, allow 85 seconds.

## 20.14 Emergency calls

### 20.14.1 Definition and applicability

This test is applicable for GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs supporting speech.

### 20.14.2 Conformance requirement

1. When in a limited service state, the MS shall be able to initiate emergency calls; GSM 05.08, 6.8.

2. When in a limited service state and if not camped on a cell, the MS shall monitor the signal strength of all 35 (GSM 450), all 35 (GSM 480), all 74 (for GSM 750), all 124 (for GSM 850), all 124 (for GSM), all 174 (for E-GSM), all 374 (for DCS 1 800) or all 299 (for PCS 1 900) RF channels, and search for a BCCH carrier which has C1>0 and which is not barred. When such a carrier is found, the MS shall camp on that cell, irrespective of the PLMN identity; GSM 05.08, 6.8.

3. The MS shall perform cell reselection at least among the cells of the PLMN of the cell on which the MS has camped, according to the algorithm of GSM 03.22, 4.5 & 3.7, except that a zero value of CELL_RESELECT_HYSTERESIS shall be used; GSM 05.08, 6.8.

### 20.14.3 Test purpose

1. To verify that the MS shall be able to initiate emergency calls when no suitable cells of the selected PLMN are available, but at least one acceptable cell is available.

2. To verify that the MS selects a cell with C1>0 and CBA = 0 when no suitable cells of the selected PLMN are available.

3. To verify that the MS, when performing cell reselection in the limited service state, uses CELL_RESELECT_HYSTERESIS = 0.

### 20.14.4 Method of test

#### 20.14.4.1 Initial conditions

Parameters changed from Default values table 20.1 are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level (dBµV emf() / dBm) | 38 / -75 | 33 / -80 | 33 / -80 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 23 / -90 | 43 / -70 | 23 / -90 | | | |
| CELL_BAR_ACCESS | 1 (barred) | 0 | 0 | | | |
| MCC,MNC | forbidden | forbidden | forbidden | | | |
| CELL_RESELECT_HYST | 0 | 0 | 14 dB | | | |
| C1 | 15 | -10 | 10 | | | |

NOTE: All the BCCH carriers belong to the same PLMN, which is not the MS's home PLMN and is in the SIM's forbidden PLMN's list.

#### 20.14.4.2 Procedure

a) The SS activates the carriers. The SS monitors for RA attempts from the MS on carriers 1, 2 and 3 for the duration of the test. In order to prevent the MS from answering to paging only idle-paging is sent on all channels.

b) The MS is switched on.

c) 50 seconds after switch on, an emergency call is initiated on the MS.

d) The SS changes the CBA of carrier 1 to 0.

NOTE: The MS should reselect to carrier 1 because it should not take into account the CELL_RESELECT_HYST value of 14 but use 0 instead.

e) After 345 s an emergency call is initiated on the MS.

NOTE: 330 seconds to detect change of BCCH data, 15 seconds to perform reselection of carrier 1, since the MS already has a running average on carrier 1.

### 20.14.5 Test requirements

1) In step c), the first access by the MS shall be on carrier 3.

2) In step e), the first access from the MS shall be on carrier 1.

## 20.15 Cell reselection due to MS rejection "LA not allowed"

### 20.15.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This process goes on while camping on a cell which pertains to an LA which is placed in the list of "forbidden LAIs for regional provision of service".

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.15.2 Conformance requirement

1. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS stores this LAI in a list of "forbidden LAIs for regional provision of service", to prevent repeated attempts to access a cell of the forbidden LA, GSM 03.22, 3.3.

2. If the MS has received the cause 'LA not allowed', it shall ignore this fact when selecting a cell to camp on, i.e. it shall not reject a cell for camping on because that cell is part of a LA where this cause has been received, GSM 03.22, 3.5.4.

3. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection, GSM 03.22, 4.4.2

4. A new LU attempt shall only be performed when a new LA (or new PLMN) is entered according to the cell reselection procedure, GSM 03.22, 3.3 & figure 4.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

### 20.15.3 Test purpose

1. To verify that if an LU is rejected with cause "LA not allowed" that the LAI of that cell is written into a forbidden list which prevents the MS from performing LU onto another cell in that LA. This is verified indirectly in test purposes 2,3 and 4.

2. To verify that the MS will not reject a cell for camping on because that cell is part of a LA in the list of "forbidden LAIs for regional provision of service". This is verified indirectly by making the MS attempt an emergency call and checking that the channel request message is transmitted on the correct cell.

3. To verify that the MS when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection:

   Cell reselection is triggered if there is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter). GSM 03.22, 3.4 & 4.5.

4. To verify that a new LU attempt will be performed when a new LA (or new PLMN) is entered, GSM 03.22, 3.3 & figure 4.

### 20.15.4 Method of test

#### 20.15.4.1 Initial conditions

Parameters changed from Default values table (table 20.1)

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 63 / -50 | 54 / -59 | 44 / -69 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 53 / -60 | 35 / -78 | 29 / -84 | | | |
| CRH | 14 | 0 | 10 | | | |
| LAC | H1111 | H2222 | H1111 | | | |
| ATT | 1 | 1 | 1 | | | |
| C1 | 10 | 19 | 15 | | | |
| C2 | 10 | 19 | 15 | | | |

#### 20.15.4.2 Procedure

a) The SS activates the carriers. The SS monitors all RA requests from MS on carriers 1, 2 & 3 until step e) has been completed. Only idle-paging is sent on all channels.

b) The MS is switched on.

c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "LA not allowed"

d) 30 seconds after the MS has returned to idle mode (channel release after LU reject), the MS is manually commanded to set up an emergency call.

NOTE 1: C2 of carrier 3>C2 of carrier 1. Carriers 1 and 3 belong to the same LA.

e) The SS rejects the CM service request from the MS, with a CM service reject message with cause value #17 (Network Failure).

NOTE 2: Cause values #4 (IMSI unknown in VLR) or #6 (Illegal ME) lead to unwanted behaviour of the mobile.

f) 10 seconds after the MS has returned to idle mode (channel release after CM service reject), the SS increases the level of carrier 2 to 65 dBµV emf().

NOTE 3: C2 of carrier 2 = 30, now larger than C2 of carrier 3 + CRH.

g) The SS shall accept any LU on carrier 2.

### 20.15.5 Test requirements

1) After step b), the MS shall respond on carrier 1 within 33 s.

2) In step d), the MS shall access on carrier 3 with a channel request message, within 15 seconds of being commanded to set up the emergency call.

3) After increasing the level of carrier 2 in step f), the MS shall reselect and access onto carrier 2 requesting an LU within 30 seconds.

NOTE 1: 13,75 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 27,15 seconds, allow 30 seconds.

# 20.16 Downlink signalling failure

## 20.16.1 Definition and applicability

See conformance requirement.

## 20.16.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. When the MS camps on a cell, DSC shall be initialized to a value equal to the nearest integer to 90/N where N is the BS_PA_MFRMS parameter for that cell (see GSM 05.02).

2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1,(however never beyond the nearest integer to 90/N).

3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.

4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, GSM 03.22, 4.5 (ii) and GSM 05.08, 6.5.

NOTE: The network sends the paging subchannel for a given MS every BS_PA_MFRMS multiframes. The requirement for network transmission on the paging subchannel is specified in GSM 04.08. The MS is required to attempt to decode a message every time its paging subchannel is sent.

## 20.16.3 Test purpose

1. To verify that the MS initializes the DSC counter in accordance with the conformance requirement. This is verified indirectly.

2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to 90/N). This is verified indirectly.

3 To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.

4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

## 20.16.4 Method of test

### 20.16.4.1 Initial conditions

Two BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table (table 20.1) are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level (dBµV emf() / dBm) | 43 / -70 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 = C2 | 20 | 10 | | | | |

NOTE: The DSC counter will have a value 18 (90/5).

#### 20.16.4.2 Procedure

a) The MS is switched on. On carrier 1 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS (idle paging). On carrier 2 the MS is paged continuously in all paging blocks.

b) After 40 s the SS sends corrupted data (using random data, wrong parity bits see GSM 05.03, 4.3 & 4.1.2 or other lower layer error) in four successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on four successive paging blocks should decrease the DSC to 2.

c) The SS monitors all accesses on both carriers for 30 s.

d) The SS sends corrupted data in five successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 2: Sending random, data on five successive paging blocks should decrease the DSC to < 0 and cause a cell reselection.

e) The SS monitors all accesses on both carriers for 30 s.

### 20.16.5 Test requirements

1) There shall be no access to carrier 2 in test steps a) and c).

2) The MS shall access on carrier 2 at test step e) within 15 seconds.

## 20.17 Cell selection if no suitable cell found in 10 s

### 20.17.1 Definition and applicability

See conformance requirement.

### 20.17.2 Conformance requirement

If no suitable cell is found in cell reselection process within 10 seconds, the cell selection algorithm of GSM 03.22 shall be performed, GSM 05.08; 6.6.2.

### 20.17.3 Test purpose

To verify that the MS fulfils the conformance requirement

### 20.17.4 Method of test

#### 20.17.4.1 Initial conditions

One BCCH carrier is established with the system information contents of table 20.1.

Parameters changed from Default values table (table 20.1) are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level<br>(dBµV emf() / dBm)<br>C1 = C2 | 43 / -70<br><br>20 | OFF | OFF | OFF | OFF | OFF |

#### 20.17.4.2 Procedure

a) The MS is switched on. Idle paging is sent on carrier 1.

b) After the MS indicates service the SS reduces the transmit level of carrier 1 to 13 dBµV emf() (so that C1 of carrier 1 becomes -10) and turns on a new carrier (carrier 2) at a level of 33 dBµV emf(). Carrier 2 shall not be in the MS BA list (i.e. it shall not be one of the carriers that MS has been monitoring after camped on carrier 1)

c) The SS shall monitor all accesses on carriers 1 and 2 for 60 s.

NOTE: The access on carrier 2 should not take longer than 50 s. (5 seconds to rxlev averages, 5 s for C1<0 duration, 10 s for searching another suitable cell, 30 s for cell selection), 60 s is a safe time to wait.

### 20.17.5 Test requirements

The MS shall access on carrier 2 at test step c) within 60 s.

## 20.18 Cell reselection due to MS rejection "Roaming not allowed in this LA"

### 20.18.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

The MS looks for suitable neighbour cells which satisfies 4 constraints including that It should not be in an LA which is in the list of "forbidden LAs for roaming".

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.18.2 Conformance requirement

1. To prevent repeated attempts to have roaming service on a not allowed LA, when the MS is informed that an LA is forbidden, the LA is added to a list of "forbidden LAs for roaming" which is stored in the MS, GSM 03.22; 3.1.

2. If the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure shall be started, GSM 03.22; 4.3.3 L3, GSM 04.08; 4.4.4.7.

3. The MS can only perform camping on a suitable cell, which:

   - should not be in an LA which is in the list of "forbidden LAs for roaming" GSM 03.22, 3.2.1.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

### 20.18.3 Test purpose

1. To verify that if an LU is rejected with cause "Roaming not allowed in this LA", that the LAI of that cell is written into a forbidden list which prevents the MS from camping onto any cell in that LA.

2. To verify that if the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure is initiated. This is verified indirectly by test purpose 3, in that the new LA is accessed as part of cell selection, hence CRH is disregarded.

3. To verify that if an LU is rejected, when attempting LU in a LA with LAI = LAI1, with cause "Roaming not allowed in this LA" and only cells of the selected PLMN are available, the MS will only camp and attempt LU in any LA with LAI <> LAI1.

20.18.4 Method of test

20.18.4.1 Initial conditions

Parameters changed from Default values table (table 20.1)

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBμV emf() / dBm) | 63 / -50 | 53 / -60 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| MNC | MNC <> HPLMN | MNC <> HPLMN | | | | |
| MCC | MCC of HPLMN | MCC of HPLMN | | | | |
| CRH | 0 | 0 | | | | |
| LAC | H1111 | H2222 | | | | |
| ATT | 1 | 1 | | | | |
| C1 | 40 | 30 | | | | |
| C2 | 40 | 30 | | | | |

20.18.4.2 Procedure

a) The MS is switched on. Idle paging is sent on all carriers.

b) The SS monitors all RA requests from MS on carriers 1 & 2.

c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "Roaming not allowed in this LA".

d) The SS shall accept any LU on carrier 2.

e) The SS monitors all RA requests from MS on carriers 1 to 2.

20.18.5 Test requirements

1) The MS should respond on carrier 1 within 33 s of switch on.

2) After LU reject, the MS shall initiate the Network Selection Procedure and access onto Carrier 2 as part of cell selection within 33 seconds from returning to idle mode after the LU reject.

NOTE: The timing requirement in b) is given only for testing purposes only. No timing requirements are defined for the Network Selection Procedure, but the time allowed for cell selection (see 20.1) should be adequate.

3) After the LU reject on carrier 1, there shall be no more access attempts on this carrier.

# 20.19 Cell selection on release of SDCCH and TCH

20.19.1 Definition and applicability

20.19.2 Conformance requirement

1. When the SS releases a TCH or SDCCH and returns to idle mode, it shall, as quickly as possible camp on the BCCH carrier of the cell whose channel has just been released. If the full BCCH data for that cell was not decoded in the preceding 30s, the MS shall then attempt to decode the full BCCH data. Until the MS has decoded the BCCH data required for determining the paging group, it shall also monitor all paging blocks on timeslot 0 of the BCCH carrier for possible paging messages that might address it. If the MS receives a page before having decoded the full BCCH data for the cell, the MS shall store the page and respond once the full BCCH data has been decoded, provided that the cell is not barred and the MSs access class is allowed. GSM 05.08, 6.7.

### 20.19.3 Test purpose

1. To verify that on release of a TCH or an SDCCH, the MS camps as quickly as possible on the BCCH carrier of the cell whose channel has just been released.

NOTE: This is implicitly tested by the MS responding to a paging request. The decoding of BCCH data cannot be explicitly tested. However, the MS shall monitor for paging messages which may address it if it decodes the BCCH.

### 20.19.4 Method of test

#### 20.19.4.1 Initial conditions

a) Parameters changed from default values in table 20.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBmV emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBmV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| BS_PA_MFRMS | 2 | 2 | | | | |
| ATT | 1 | | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

b) Carrier 1 is configured to have a combined control channel.

c) Carrier 2 is configured to have a non combined control channel.

#### 20.19.4.2 Test procedure

a) The SS activates the carriers. No paging messages are transmitted on carrier 1 or carrier 2.

b) The MS is switched on.

c) In response to the MS access for IMSI attach, the SS allocates a combined SDDCH/4, accepts the IMSI attach procedure and then releases the link. After 0,5 seconds but within 1 second of transmitting the UA frame on completion of the IMSI attach procedure, the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1.

d) When the MS responds to paging, the SS establishes a call on a traffic channel.

e) The SS increases the level of carrier 2 to 63 dBmV emf().

f) After 10 seconds the SS performs a handover to another TCH, with the parameters of carrier 2 indicated in the CELL DESCRIPTION information element of the HANDOVER COMMAND message.

g) After a further 10 seconds, the SS clears down the call. After 0,5 seconds but within 1 second of transmitting the UA frame, the SS transmits a single PAGING REQUEST on carrier 2 in the appropriate paging block of the MS.

### 20.19.5 Test requirements

1) After step b) the MS shall access in order to commence an IMSI attach procedure on carrier 1 within 33 seconds.

2) In step c), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

# 20.20 Multiband cell selection and reselection

## 20.20.1 Multiband cell selection and reselection / Cell Selection

### 20.20.1.1 Definition and applicability

Multiband cell selection is a process in which a multiband MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on, irrespective of frequency band. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

This test is applicable for any multiband MSs supporting simultaneous multiband operation.

### 20.20.1.2 Conformance requirement

1. A multiband MS shall search all channels within its bands of operation (35 for GSM 450, 35 for GSM 480, 74 for GSM 750, 124 for GSM 850, 124 for P-GSM, 174 for E-GSM and 374 for DCS). The number of channels searched will be the sum of channels on each band of operation; GSM 05.08, 6.2.

2. The MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 seconds of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; GSM 05.08, 6.1.

3. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

   3.1 (i) It should be a cell of the selected PLMN

   3.2 (ii) It should not be "barred" (see section 3.5.1)

   3.3 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in section 3.6.

   GSM 03.22, 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection

4. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; GSM 03.22, 3.2.1.

5. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; GSM 05.08, 6.4.

### 20.20.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.

2. To verify that the MS meets conformance requirement 2 in a multiband environment.

3. To verify that:

   3.1 The MS does not select a cell of a PLMN which is not the selected PLMN.

   3.2 The MS does not select a cell which is "barred".

   3.3 The MS does not select a cell with C1<0.

4. To verify that the MS selects suitable cells in descending order of received signal strength, irrespective of frequency band.

5. To verify that the MS does not select a cell with C1<0.

20.20.1.4 Method of test

20.20.1.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBmV emf() / dBm) | 48 / -65 | 36 / -77 | 43 / -70 | 33 / -80 | 23 / -90 | OFF |
| CBA | 1 | 0 | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -69 | -90 | -88 | -98 | |
| MNC | | | 01 | | | |
| MCC | | | 002 | | | |
| MS_TXPWR_MAX_CCH | 7 | 7 | | 7 | | |
| C1 | 25 | -8 | 20 | 8 | 8 | |
| C2 | 25 | -8 | 20 | 8 | 8 | |

Carrier 1, carrier 2 and carrier 4 ARFCNs are chosen in the lower band, carrier 3 and carrier 5 ARFCNs in the higher band.

20.20.1.4.2 Procedure

a) The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.

b) The MS is switched on.

c) The MS is switched off.

d) The SS monitors carriers 1 and 3 for RA requests from the MS

e) The MS is switched on.

f) The MS is switched off.

g) The SS is reconfigured and sets MCC of carrier 3 to 001 (same as the other carriers).

h) The SS activates the carriers and monitors carriers 3, 4 and 5 for RA requests from the MS.

i) The MS is switched on.

j) The MS is switched off.

k) For multiband MS supporting three or more bands all combinations of two bands shall be tested using the steps from a) to j).

20.20.1.4.3 Related PICS/PIXIT statement(s)

Support for stored list cell selection Yes/No.

20.20.1.5 Test requirements

1) After step b), the first response from the MS shall be on carrier 4 within 33 seconds. If the MS supports stored list cell selection MS may be also on carrier 5. There shall be no response from the MS on carrier 2.

2) After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 seconds.

3) After step i), the first response from the MS shall be on carrier 3 within 33 seconds. If the MS supports stored list cell selection the first response may be also on carrier 4 or carrier 5.

## 20.20.2 Multiband cell selection and reselection / Cell reselection

### 20.20.2.1 Definition and applicability

While camped on a cell of the selected PLMN the multiband MS may need to select a different cell (irrespective of frequency band used) in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This test is applicable for any multiband MS supporting simultaneous multiband operation.

### 20.20.2.2 Conformance requirement

1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; GSM 05.08, 6.6.1.

2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 seconds; GSM 05.08, 6.6.1.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; GSM 05.08, 6.4.

### 20.20.2.3 Test purpose

1. To verify that MS meets conformance requirement 1.

2. To verify that MS meets conformance requirement 2.

3. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, and PENALTY_TIME parameters are used to give different priorities to different frequency bands.

### 20.20.2.4 Method of test

#### 20.20.2.4.1 Initial conditions

Six BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1 are below:

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|---|---|---|---|---|---|---|---|
| RF signal level (dBmV emf ( )/dBm) | 53 / -60 | 48 /-65 | 43 / -70 | 38 / -75 | 33 / -80 | 33 /-80 | 43 / -70 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 | -90 | -90 | -110 |
| PT | | | | | | | 11111 |
| CRO | | | | | | | 20 dB |
| MS_TXPWR_MAX_CCH | 7 | 7 | 7 | | | | |
| C1 | 30 | 25 | 20 | 15 | 10 | 10 | 40 |
| C2 | 30 | 25 | 20 | 15 | 10 | 10 | 20 |

Carrier 1, 2 and 3 ARFCNs are chosen in the lower band, carrier 4, 5, 6 and 7 ARFCNs in the higher band.

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

BS_PA_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS_PA_MFRMS = 3 leads to averaging time of 5 seconds. Hence 5 seconds is also the updating time of the list of six strongest neighbour carriers.

#### 20.20.2.4.2 Procedure

a) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.

b) The MS is switched on.

c) After 60 seconds, the SS deactivates carrier 4 and activates carrier 7 and pages the MS continuously on carrier 7. The SS monitors carrier 7 for RA requests from the MS.

d) The MS is switched off.

e) The SS is reconfigured and sets PT = 0 and CRO = 0 on carrier 7 (thus increasing C2 to 40 dB).

f) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.

g) The MS is switched on.

h) After 60 seconds, the SS deactivates carrier 4 and activates carrier 7 and pages the MS continuously on carrier 7. The SS monitors carrier 7 for RA requests from the MS.

i) 20 seconds after receiving an RA request on carrier 7 the SS sets PT = 11111 and CRO = 20 dB on carrier 7 (thus decreasing C2 to 20dB), stops paging on carrier 7, and pages the MS continuously on carrier 1. The SS monitors carrier 1 for RA requests from the MS.

j) The MS is switched off.

k) For multiband MS supporting three or more bands all combinations of two bands shall be tested using the steps from a) to j).

#### 20.20.2.5 Test requirements

1) After step c) there shall be no response from the MS on carrier 7 within 55 s of activating carrier 7.

2) After step h) the MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 seconds to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 seconds (+10 %)), 33 seconds to read BCCH, 15 seconds for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 seconds.

3) After step i) the MS shall access on carrier 1 within 55 s of setting PT and CRO on carrier 7.

## 20.21 R-GSM cell selection and reselection

This clause is applicable for the MS supporting R-GSM band except when otherwise stated.

In the following paragraphs some explanatory text is given concerning the nature of the tests in this section and the general behaviour of the SS is described.

Since the conformance requirements of most of the tests in this section cannot be tested explicitly, testing is done implicitly by testing the MS behaviour from its responses to the SS.

The SS transmits one BCCH carrier per cell as indicated in the initial conditions for each test. These are referred to as carrier 1, carrier 2, etc. It is assumed that the SS can simultaneously transmit seven BCCH carriers and monitor three random access channels. For multiband tests it is assumed that at least one of the BCCH carriers and one of the monitored random access channels is in a different frequency band from the others. In some cases, a test is performed in multiple stages in order that the requirements can be tested within the above constraints.

For any MS all the carriers are in its supported band(s) of operation. For an R-GSM mobile station at least one of the carriers is chosen between ARFCN 955-974 and one of the carriers is in the primary band.

Unless otherwise stated in the method of test, in all of the tests of this section:

- The SS is continuously paging the MS on all carriers at the start of the test and does not respond to RACH requests from the MS. Where a test specifies that the MS is not paged on a particular carrier, only idle paging is transmitted according to GSM 04.08, 3.2.2.2.

- The default values of the system information data fields given in table 20.21.1 are used.

- The SIM is in the idle updated state in the default location area with a TMSI assigned at the beginning of each test.

- The ARFCNs used for the carriers in each test are chosen from those in table 20.21.1 with adjacent carriers separated by a minimum of three channels.

The absolute accuracy of the MS signal level measurements is assumed to be +/-6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1 or C2 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be +/-3 dB for the signal levels used in the tests of this section, except for section 20.20, where the relative accuracy is assumed to be +/-5 dB if the measurements are on different frequency bands. A difference of at least 5 dB is allowed for cases of discrimination between C1 or C2 values on different carriers, except for section 20.20, where a difference of at least 10 dB is allowed if the measurements are on different frequency bands.

NOTE 1: The accuracy of MS signal level measurements is specified in GSM 05.08. For all of the tests in this section, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in GSM 05.08 is +/-10 % except for PENALTY_TIME where it is +/-2 seconds. In the tests of this section, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is +/-2 % and the SS tolerance on power level +/-1 dB.

**Table 20.21.1: Default values of the system information fields**

| Parameter | GSM 04.08 reference | Abbr. | Normal Setting |
|---|---|---|---|
| Cell channel description | 10.5.2.1 | - | Any values |
| MAX retrans | 10.5.2.29 | - | 1 |
| TX-integer | 10.5.2.29 | - | Any value |

## 20.21.1 R-GSM cell selection

### 20.21.1.1 Definition and applicability

Cell selection is a process in which a MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and

with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

#### 20.21.1.2 Conformance requirement

1. The MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 seconds of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; GSM 05.08, 6.1.

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

   2.1 (i) It should be a cell of the selected PLMN

   2.2 (ii) It should not be "barred" (see section 3.5.1)

   2.3 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in section 3.6.

   GSM 03.22, 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; GSM 03.22, 3.2.1.

4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; GSM 05.08, 6.4.

#### 20.21.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.

2. To verify that:

   2.1 The MS does not select a cell of a PLMN which is not the selected PLMN.

   2.2 The MS does not select a cell which is "barred".

   2.3 The MS does not select a cell with C1<0.

3. To verify that the MS selects suitable cells in descending order of received signal strength.

4. To verify that the MS does not select a cell with C1<0.

#### 20.21.1.4 Method of test

##### 20.21.1.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 48 / -65 | 38 / -75 | 43 / -70 | 33 / -80 | 28 / -85 | OFF |
| CBA | 1 | 0 | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -67 | -90 | -88 | -98 | |
| MNC | | | 01 | | | |
| MCC | | | 002 | | | |
| C1 | 25 | -8 | 20 | 8 | 13 | |
| C2 | 25 | -8 | 20 | 8 | 13 | |

Carrier 2 and carrier 4 are chosen between ARFCN 955 - 974.Carrier 1 is chosen between 975 - 1023, 0; and carrier 3 remains in the P-GSM band.

#### 20.21.1.4.2 Procedure

a) The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.

b) The MS is switched on.

c) The MS is switched off.

d) The SS monitors carriers 1 and 3 for RA requests from the MS

e) The MS is switched on.

### 20.21.1.5 Test requirements

1) After step b), the first response from the MS shall be on carrier 4 within 33 seconds. There shall be no response from the MS on carrier 2.

2) After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 seconds.

## 20.21.2 R-GMS cell selection with varying signal strength values

### 20.21.2.1 Definition and applicability

For definition see conformance requirement.

### 20.21.2.2 Conformance requirement

1. The MS shall:

   The MS shall search all RF channels in the system (194 ARFCNs for R-GSM), take readings of received RF signal strength on each RF channel, and calculate the received level average for each. The averaging is based on at least five measurement samples per RF carrier spread over 3 to 5 s, the measurement samples from the different RF carriers being spread evenly during this period. GSM 05.08, 6.2.

   1.1 The MS shall search all RF channels in the system (194 ARFCNs for R-GSM), take readings of received RF signal strength on each RF channel, and calculate the received level average for each.

   1.2 The averaging is based on at least five measurement samples per RF carrier spread over Tav (3 to 5 s).

   1.3 The measurement samples from the different RF carriers being spread evenly during this period.

2. These quantities are termed the "receive level averages", shall be unweighted averages of the received signal strengths measured in dBm. GSM 05.08, 6.1.

### 20.21.2.3 Test purpose

1. To verify that:

   1.1 The MS meets conformance requirement 1.1.

   1.2 The MS meets conformance requirement 1.2.

   1.3 The MS meets conformance requirement 1.3.

2 To verify that the MS meets conformance requirement 2.

### 20.21.2.4 Method of test

#### 20.21.2.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 23 / -90 | 58 / -55 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 13 / -100 | 13 / -100 | | | | |
| C1 | 10 | 53 | | | | |

Carrier 1 is chosen between ARFCN 955 - 974.

The manufacturer of the equipment shall declare his averaging time Tav. This time is the time between the first and the last measurement sample taken on one carrier during one averaging period.

#### 20.21.2.4.2 Procedure

a) The SS transmits on carriers 1 and 2. After a period of b*Tav carrier 2 reduces its transmit level to -85 dBm (28 dBµV emf( )). After a further period of a*Tav, carrier 2 increases its transmit level again to -55 dBm (58 dBµV emf( )). Switching of carrier 2 continues with these levels and duty cycle until the end of the test.

   Tav is the averaging time declared by the manufacturer.

   The parameters a and b are chosen according to the following rules:

   $(a + b) * Tav > Tav$

   $0 < a * Tav < 2/3 * Tav$

   $0,5 * Tav < b * Tav < Tav$

   In the equations < and > means at least one TDMA frame less or greater than the given value.

   While satisfying the conditions given above:

   a is chosen to be as close as possible to 2/3.

   b is chosen to be as close as possible to 0,5.

b) The MS is switched on.

c) The SS monitors all RA requests from MS on carriers 1 and 2.

### 20.21.2.5 Test requirements

In step c), the first response from the MS shall be on carrier 2 within 33 seconds.

NOTE 1: With the selected duty cycle it can be guaranteed that a "good" MS passes the test even at the worst case situations. The minimum averaged value of carrier 2 is in any case higher or equal to -75 dBm which is still 6 dB above carrier 1's level (for a "good" MS).

NOTE 2: With the selected levels and duty cycle the probability that a "bad" MS (i.e. MS that averages over shorter period than 3 s) fails the test is maximized. However, it can not be guaranteed that all the MSs not fulfilling the conformance requirement of averaging or uniform sampling will fail this test.

## 20.21.3 R-GSM basic cell reselection

### 20.21.3.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

### 20.21.3.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

   1.1 (iii) The cell camped on (current serving cell) has become barred.

   1.2 (iv) There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

   The MS will then reselect a new cell in order to fulfil the process goal.; GSM 03.22, 4.5.

NOTE 1: Criterion (i) is tested in section 20.21.8 (Cell reselection when C1(serving cell) < 0 for 5 seconds).

NOTE 2: Criterion (ii) is tested section 20.21.16 (Downlink signalling failure).

NOTE 3: Criterion (v) is tested in section 20.21.6 (Cell reselection timings).

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

   2.1 (ii) It should not be "barred".

   2.2 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. GSM 03.22, 3.2.1.

NOTE 4: Criterion (i) is not relevant for cell reselection and for cell selection it is tested in section 20.21.1.

NOTE 5: Criterion (iv) refers to the C1 parameter.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; GSM 05.08, 6.4.

4. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

   i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high.

   ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds, except in the case of the new cell being in a different location area in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds. This indicates that it is a better cell. GSM 05.08, 6.6.2.

5. The MS shall attempt to decode the full BCCH data of the serving cell at least every 30 seconds; GSM 05.08, 6.6.1.

### 20.21.3.3 Test purpose

1. To verify that:

   1.1 The MS meets conformance requirement 1.1.

   1.2 The MS meets conformance requirement 1.2.

2. To verify that:

   2.1 The MS does not reselect a cell which is barred.

   2.2 The MS does not reselect a cell which has a C1<0.

3. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are not used.

4. To verify that the MS takes into account the CELL_RESELECT_HYSTERESIS parameter when reselecting a cell in a different location area.

5. To verify that the MS decodes the CELL_BAR_ACCESS and CELL_BAR_QUALIFY parameters from the BCCH every 30 seconds.

### 20.21.3.4 Method of test

#### 20.21.3.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43 / -70 | 33 / -80 | 43 / -70 | 38 / -75 | 38 / -75 | |
| RXLEV_ACCESS_MIN (dBm) | -85 | -90 | -90 | -85 | -67 | |
| CRH | 10 dB | | | | | |
| LAC | | | different from other carriers | | | |
| CBA | | | | 1 | | |
| CBQ | | | | 0 | | |
| C1 | 15 | 10 | 20 | 10 | -8 | |
| C2 | 15 | 10 | 20 | 10 | -8 | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

#### 20.21.3.4.2 Procedure

a) The SS activates carriers 1, 2, 4 and 5. The MS is not paged on carrier 1. The SS monitors carriers 2, 4 and 5 for RA requests from the MS.

b) The MS is switched on.

c) The SS stops paging on all carriers except carrier 2. The level of carrier 2 is increased to 43 dBµVemf (C2 becomes 20 dB), and the SS monitors carrier 2 for RA requests from the MS.

d) When the SS receives a response from the MS on carrier 2, it stops paging the MS on this carrier.

e) The MS is switched off.

f) The SS is reconfigured and sets CBA = 1 on carriers 1 and 5.

g) The MS is switched on.

h) After 33 seconds, the SS starts paging continuously on carrier 1 and sets CBA=1 on carrier 2 and CBA=0 on carriers 1, 4 and 5.

i) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 seconds. (The MS should reselect and camp onto carrier 1).

j) The SS activates carrier 3, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.

k) The SS increases the level of carrier 3 to 53 dBµVemf (C2 increases to 30 dB.).

#### 20.21.3.5 Test requirements

1) After step b), there shall be no response from the MS on carriers 2, 4, or 5 within 50 seconds.

2) In step c), the MS shall respond on carrier 2 within 20 seconds of increasing the level of carrier 2.

NOTE 1: 5 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 18,4 seconds, allow 20 seconds.

3) In step h), the MS shall respond on carrier 1 within 50 seconds of setting CBA=1 on carrier 2.

NOTE 2: 33 seconds for the MS to read the BCCH of carrier 2 (30 seconds + 10 %), 15 seconds for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 seconds.

4) After step j), there shall be no response from the MS within 50 seconds.

5) After step k), the MS shall respond on carrier 3 within 20 seconds.

## 20.21.4 R-GSM cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters

### 20.21.4.1 Definition and applicability

### 20.21.4.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; GSM 05.08, 6.4.

### 20.21.4.3 Test purpose

1. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are used.

2. To verify DCS 1 800 MS correctly calculate the C2 parameter when the POWER_OFFSET parameter is present.

### 20.21.4.4 Method of test

#### 20.21.4.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 53 / -60 | 43 / -70 | 48 / -65 | 48 / -65 | | |
| RXLEV_ACCESS_MIN (dBm) | -80 | -100 | -85 | -85 | | |
| PT | | 11111 | 40 s | 60 s | | |
| CRO | | 16 dB | 20 dB | 20 dB | | |
| TO | | | 20 dB | 20 dB | | |
| K = 1 | | | | | | |
| C1 | 20 | 30 | 20 | 20 | | |
| C2 | 20 | 14 | 20 -> 40 | 20 -> 40 | | |
| K = 2 (DCS1800 Class 3 MS only) | | | | | | |
| POWER_OFFSET | 0 | 2 | 6 | 6 | | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

#### 20.21.4.4.2 Procedure

For testing of GSM MS, the test procedure is performed for execution counter K = 1.

For testing of DCS 1 800 MS, the test procedure is performed for execution counter K = 1 and 2

On execution counter K = 1, the POWER_OFFSET Parameter is not present.

On execution counter K = 2, the POWER_OFFSET parameter is present.

a) The SS activates carriers 1 and 2. The MS is not paged on carrier 1. The SS monitors carrier 2 for RA requests from the MS.

b) The MS is switched on.

c) The SS increases the level of carrier 2 to 54 dBµVemf (C2 becomes 25 dB).

d) When the SS receives a response on carrier 2, the SS stops paging on that carrier and waits for 20 seconds (The MS should reselect and camp onto carrier 2).

e) The SS activates carriers 3 and 4 and continuously pages the MS on these carriers. The SS monitors carriers 3 and 4 for RA requests from the MS.

#### 20.21.4.4.3 Requirements

For execution counter K = 1 and K = 2.

1) After step b), there shall be no response from the MS on carrier 2 within 50 seconds.

2) After step c), the MS shall respond on carrier 2 within 20 seconds of increasing the level of carrier 2.

3) After step e), there shall be no response from the MS on carrier 3 within 38 seconds of activating the carriers but, the MS shall respond on carrier 3 within 90 seconds. The response on carrier 3 shall be before any response on carrier 4.

NOTE: Minimum time of 38 seconds set by penalty timer on carrier 3 less 2 second tolerance. Maximum time, total of 33 seconds to read BCCH of carrier 3, 42 seconds for expiry of penalty timer on carrier 3, 15 seconds for reselection, since the MS will already have running averages on carriers 3 and 4, when the penalty timers expire, allow 90 seconds.

### 20.21.5 R-GSM cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages

#### 20.21.5.1 Definition and applicability

System information (SI) type 7 and 8 are transmitted on the BCCH Ext when the system information type 4 message does not contain all information needed for cell selection.

The system information type 2 bis message is used when the system information type 2 message does not contain all neighbour cell ARFCNs.

The system information type 2 ter message is used when system information type 2 messages broadcast by one cell which are system information 2 or both system information 2 and 2bis do not contain all neighbour cell ARFCNs.

#### 20.21.5.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection. GSM 05.08, 6.4.

2 Whilst in idle mode, an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation. GSM 05.08, 6.6.1.

3 Mobile stations shall treat all ARFCNs in the set {0, 1, 2 ... 1023} as valid ARFCN values even if the mobile station is unable to transmit or receive on that ARFCN. GSM 04.08, 10.5.2.1b.

4 The MS shall correctly decodes parameters transmitted in the system information type 2 ter message. GSM 04.08, 9.1.34:

### 20.21.5.3 Test purpose

1. To verify that the MS correctly calculates the C2 criterion when the parameters affecting cell reselection are transmitted in the system information type 7 and 8 messages.
2. To verify that the MS decodes parameters transmitted in the system information type 2 bis message.
3. To verify that the MS treats ARFCNs as valid ARFCNs even if the MS is unable to transmit or receive on that ARFCN.
4. To verify that the MS correctly decodes parameters transmitted in the system information type 2 ter message.

### 20.21.5.4 Method of test

#### 20.21.5.4.1 Initial conditions

a) Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 53 / -60 | 32 / -81 | 40 / -73 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 23 / -90 | 23 / -90 | 30 / -83 | | | |
| BS_AG_BLKS_RES | 1 | 1 | 1 | | | |
| PT | | 0 | 0 | | | |
| CRO | | 16 dB | 10 dB | | | |
| TO | | 0 dB | 0 dB | | | |
| C1 | 30 | 9 | 10 | | | |
| C2 | 30 | 25 | 20 | | | |

b) The ARFCNs of carriers 1, 2 and 3 are chosen from those in table 20.21.1 with carrier 3 chosen between ARFCN 955 - 974.

c) The cell reselection parameters PENALTY_TIME, CELL_RESELECT_OFFSET and TEMPORARY_OFFSET are transmitted in the SI3, SI7 and SI8 messages on carrier 2. They are not transmitted in SI4 and the ADDITIONAL RESELECT PARAM IND parameter is set to 1.

d) The SI2bis message is transmitted on carrier 1 and contains the ARFCN of carrier 2 and ARFCNs 43, 70, 500, 550, 958, 963, 990 and 995. The ARFCN of carrier 2 is not transmitted in the SI2 message.

e) Carriers 1 and 2 are synchronized, but staggered in frame number so that the transmission of the SI3 message on carrier 2, coincides with the paging block which the MS is listening to on carrier 1.

NOTE: Under these conditions, the MS can only decode the parameters affecting cell reselection from the SI7 or SI8 messages.

To achieve this, the following conditions are used:

BS_PA_MFRMS = 4

IMSI mod 1000 = 12

FN carrier 1 = FN carrier 2-21, for simultaneously transmitted frames.

f) The SI3 message on carrier 2 indicates that SI2ter is used on carrier 2. SI2ter message contains the ARFCN of carrier 3 and ARFCNs 45, 76, 891, 905. The ARFCN of carrier 3 is transmitted neither in the SI2 nor in the SI2bis messages on carriers 1 and 2.

#### 20.21.5.4.2 Test Procedure

a) The SS activates the channels. The MS is not paged on carrier 1.

b) The MS is switched on.

c) After 50 seconds, the SS increases the level of carrier 2 to 42 dBμVemf( ).

d) When the SS receives a response on carrier 2, the SS stops paging on that carrier and after 30 seconds, the SS increases the level of carrier 3 to 60 dBμVemf( ).

### 20.21.5.5 Test Requirements

1) After step b), there shall be no response from the MS on carrier 2. There shall also be no response on carrier 3.

2) After increasing the level of carrier 2 in step c), the MS shall respond on carrier 2 within 33 seconds.

3) After increasing the level of carrier 3 in step d), the mobile shall respond on carrier 3 within 35 seconds.

## 20.21.6 R-GSM cell reselection timings

### 20.21.6.1 Definition and applicability

### 20.21.6.2 Conformance requirement

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

   1.1 ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds,

   1.2 In case ii) above, cell reselection shall not take place if there was a cell reselection within the previous 15 seconds.

   1.3 Cell reselection for any other reason (see GSM 03.22) shall take place immediately, but the cell that the MS was camped on shall not be returned to within 5 seconds if another suitable cell can be found.;

   GSM 05.08, 6.6.2.

### 20.21.6.3 Test purpose

1. To verify that:

   1.1 The MS does not perform a cell reselection when the C2 value for a non serving cell does not exceed the C2 value of the serving cell for a period of at least 5 seconds.

   1.2 The MS meets conformance requirement 1.2 with an allowance for the uncertainty of the test.

   1.3 When the MS performs an immediate cell reselection due to an unsuccessful random access attempt, the cell that the MS was camped onto is not returned to within 5 seconds when another suitable cell exists.

### 20.21.6.4 Method of test

#### 20.21.6.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 56 / -57 | 46 / -67 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 29 / -84 | 33 / -80 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

Below is an alternative table of parameters for use with test equipment that cannot reach the upper RF levels as specified in the table above. These carrier levels are reduced by 5 dB and will not effect the purpose of the test case:

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 51 / -62 | 41 / -72 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 24 / -89 | 28 / -85 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

The BA(BCCH) list only contains 5 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 5 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=5 (default value) the MS will maintain a running average on surrounding cells over a period of 5 seconds.

#### 20.21.6.4.2 Procedure

a) The SS activates the channels. The MS is not paged on any of the carriers.

b) The MS is switched on.

c) After 50 seconds, the SS starts paging continuously on carriers 1 and 2 for 20 seconds. The SS monitors carriers 1 and 2 for RA requests from the MS.

d) The SS stops paging on carriers 1 and 2 and waits for 20 seconds. (The MS should revert to carrier 1 due to cell reselection.)

e) The SS starts paging continuously on carrier 2.

f) The SS increases the transmit level of carrier 2 by 20 dB for a period of 4 s and then reduces the level back to the original value.

g) The SS increases the transmit level of carrier 2 by 20dB and waits for the MS to access on carrier 2. The SS records the time t from the increase in the level of carrier 2 to the first response from the MS.

h) The SS stops paging on carrier 2 and decreases the transmit level of carrier 2 back to the original value.

j) The SS waits 20 seconds. (The MS should revert to carrier 1 due to cell reselection.)

k) The SS increases the transmit level of carrier 2 by 20 dB. After t+2 seconds, the SS starts paging continuously on carrier 1 and reduces the level of carrier 2 back to the original level.

#### 20.21.6.5 Test requirements

1) In step c), the MS shall transmit 2 RA requests on carrier 1 followed by 2 RA requests on carrier 2. Subsequent RA requests on carrier 1 shall not occur within 4,5 s of the second RA request on carrier 1.

2) In step f), there shall be no access on carrier 2 within 34 seconds of increasing the level of carrier 2.

3) After step g), the MS shall respond on carrier 2.

4) In step k), there shall be no response on carrier 1 within 11 seconds after the level of carrier 2 is reduced back to the original level.

NOTE: The 11 seconds is derived from (t+15) seconds minimum cell reselection timer minus (t+2) seconds from the start of step k) up to the reduction of the level of carrier 2. A further 2 seconds are subtracted to cover for any uncertainty introduced by the RA process occurring after step g).

## 20.21.7 R-GSM priority of cells

### 20.21.7.1 Definition and applicability

In general, cell prioritization is a means of encouraging MSs to select some suitable cells in preference to others.

### 20.21.7.2 Conformance requirement

1. During cell selection a cell with low priority indication will only be selected if a suitable cell of normal priority cannot be found; GSM 03.22, 3.5.2.1.

2. Table 1a. Parameters affecting cell priority for cell selection

| CELL_BAR_QUALIFY | CELL_BAR_ACCESS | Cell selection priority | Status for cell reselection |
|---|---|---|---|
| 0 | 0 | normal | normal |
| 0 | 1 | barred | barred |
| 1 | 0 | low | normal (see note 2) |
| 1 | 1 | low | normal (see note 2) |

GSM 05.08, table 1.a

3. If all the following conditions are met then the "Cell selection priority" and the "Status for cell reselection" shall be set to normal:

   - the cell belongs to the MS HPLMN
   - the MS is in cell test operation mode
   - the CELL_BAR_ACCESS is set to "1"
   - the CELL_BAR_QUALIFY is set to "0"
   - the Access Control class 15 is barred

   GSM 05.08, table 1.a

### 20.21.7.3 Test purpose

1. To verify that the MS does not select a cell of low priority when a suitable cell of normal priority exists with a lower received signal strength.

2. To verify that the MS takes into account CELL_BAR_ACCESS and CELL BAR _QUALIFY when performing cell selection and reselection.

3. To verify that the MS meets conformance requirement 3.

### 20.21.7.4 Method of test

#### 20.21.7.4.1 Initial conditions

Parameters changed from Default values table 20.21.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 33 / -80 | 43 / -70 | 33 / -80 | 23 / -90 | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 3 / -110 | 23 / -90 | 13 / -100 | 13 / -100 | | |
| CBA | 0 | 1 | 1 | 0 | | |
| CBQ | 1 | 1 | 0 | 0 | | |
| Access class 15 | barred | barred | barred | barred | | |
| C1 | 30 | 20 | 20 | 10 | | |

#### 20.21.7.4.2 Procedure

a) The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 4.

b) The MS is switched on.

c) The MS is switched off. The SS deactivates the carriers.

d) The MS is placed in cell test operation mode.

NOTE: Cell test mode is a mode of operation defined in SIM administrative data field.

e) The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 3.

f) The MS is switched on.

### 20.21.7.5 Test requirements

1) After step b), the first response from the MS shall be on carrier 4 within 33 seconds, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 seconds.

2) After step f), the first response from the MS shall be on carrier 3 within 33 seconds, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 seconds.

## 20.21.8 R-GSM cell reselection when C1 (serving cell) < 0 for 5 seconds

### 20.21.8.1 Definition and applicability

### 20.21.8.2 Conformance requirement

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

   i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high. GSM 05.08, 6.6.2.

2. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

   (i) The path loss criterion parameter C1 (see section 3.6) indicates that the path loss to the cell has become too high.; GSM 03.22, 4.5.

### 20.21.8.3 Test purpose

1. To verify that the MS meets conformance requirement 1.

2. To verify that the MS meets conformance requirement 2.

20.21.8.4 Method of test

20.21.8.4.1 Initial conditions

Parameters changed from Default values table 20.21.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 63 / -50 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 43 / -70 | 23 / -90 | | | | |
| CRO | 30 dB | | | | | |
| TO | 0 | | | | | |
| PT | 0 | | | | | |
| C1 | 20 | 10 | | | | |
| C2 | 50 | 10 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9s.

20.21.8.4.2 Procedure

a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.

b) The MS is switched on.

c) The SS reduces signal level on carrier 1 to -80 dBm / 33 dBµV emf() for 4 s. Then, the SS raises the level back to -50 dBm / 63 dBµV emf(). (C1 becomes -10 dB and C2, 20 dB during this period).

d) The SS reduces signal level on carrier 1 to -80 dBm / 33 dBµV emf()

20.21.8.5 Test requirements

1) After step b), there shall be no access on carrier 1 or carrier 2, within 50 seconds.

2) After step c), there shall be no access on carrier 2 within 30 seconds.

3) After step d), the MS shall access on carrier 2 within 20 seconds.

## 20.21.9 R-GSM running average of the surrounding cell BCCH carrier signal levels

20.21.9.1 Definition and applicability

20.21.9.2 Conformance requirement

1. Whilst in idle mode an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation (BA - See table 1). A running average of received level in the preceding 5 to

   Max. {5, ((5 * N + 6) DIV 7) * BS_PA_MFRMS / 4}

   seconds shall be maintained for each carrier in the BCCH allocation. N is the number of non-serving cell BCCH carriers in BA and the parameter BS_PA_MFRMS is defined in GSM 05.02; GSM 05.08, 6.6.1.

2. The same number of measurement samples shall be taken for all non-serving cell BCCH carriers of the BA list, and the samples allocated to each carrier shall as far as possible be uniformly distributed over each evaluation period.; GSM 05.08, 6.6.1

#### 20.21.9.3 Test purpose

1. To verify that if the MS calculates a received level average (over 5 seconds) for a non-serving suitable cell which results in the value of C2 exceeding the value of C2 for the serving cell, then cell reselection takes place to the non-serving cell.

2. To verify that by using suitable varying levels of signal strength for non serving cells, the MS samples on non serving cell BCCH carriers are as far as possible distributed uniformly over each evaluation period.

#### 20.21.9.4 Method of test

##### 20.21.9.4.1 Initial conditions

Parameters changed from Default values table 20.21.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

BS_PA_MFRMS is set to 4 for this test.

The BA(BCCH) list only contains 7 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 7 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=4 the MS will maintain a running average on surrounding cells over a period of 5 seconds.

##### 20.21.9.4.2 Procedure

a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.

b) The MS is switched on.

c) The SS starts switching the level of carrier 2 between -80 dBm and -57 dBm every 2,7 seconds and continues to do so until the end of the test.

d) The SS decreases the level of carrier 1 to -76 dBm.

NOTE: As a result of the switching in levels, the running average on carrier 2 will be between -66dBm and -71dBm, assuming that samples are distributed over five consecutive paging blocks.

#### 20.21.9.5 Test requirements

1) After step b), there shall be no access from the MS on carrier 1 or carrier 2, within 50 seconds..

2) After step c), there shall be no access from the MS on carrier 1 or 2 within 25 seconds

NOTE: Any potential access on is likely to occur within 20 seconds.

3) After step d), the MS shall access on carrier 2 within 20 seconds.

## 20.21.10 R-GSM running average of the serving cell BCCH carrier signal level

#### 20.21.10.1 Definition and applicability

The MS is required to monitor continuously the BCCH carrier signal level of the serving cell (and to compare it to the BCCH carrier signal levels of the non-serving cells) to guarantee that it is camped on the most suitable cell.

#### 20.21.10.2 Conformance requirement

1. For the serving cell, receive level measurement samples shall be taken at least for each paging block of the MS. The receive level average shall be a running average determined using samples collected over a period of 5 s or five consecutive paging blocks of that MS, whichever is the greater period. New receiving level average values shall be calculated as often as possible.; GSM 05.08, 6.6.1.

#### 20.21.10.3 Test purpose

1. To verify that by using suitable varying levels of signal strength for the serving cell, the MS performs a running average over 5 consecutive paging blocks.

#### 20.21.10.4 Method of test

##### 20.21.10.4.1 Initial conditions

Parameters changed from Default values table 20.21.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level (dBµV emf() / dBm) | 63 / -50 | 39 / -74 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| C1 | 40 | 16 | | | | |
| C2 | 40 | 16 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9s.

##### 20.21.10.4.2 Procedure

a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.

b) The MS is switched on.

c) After 50 seconds the SS starts switching the level of carrier 1 between -80 dBm and -50 dBm every 3 seconds.

NOTE: As a result of the switching in levels, the running average on carrier 1 will be between -62 dBm and -68 dBm over five consecutive paging blocks.

d) The SS increases the level of carrier 2 to -56 dBm.

#### 20.21.10.5 Test requirement

1) After step c), the MS shall not access on carrier 2, within 25 seconds.

2) After step d), the MS shall access on carrier 2, within 30 seconds.

NOTE 1: 13,75 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 27,15 seconds, allow 30 seconds.

## 20.21.11 Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list

#### 20.21.11.1 Definition and applicability

#### 20.21.11.2 Conformance requirement

1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; GSM 05.08, 6.6.1.

2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 seconds; GSM 05.08, 6.6.1.

#### 20.21.11.3 Test purpose

1. To verify that MS meets conformance requirement 1.

2. To verify that MS meets conformance requirement 2.

#### 20.21.11.4 Method of test

##### 20.21.11.4.1 Initial conditions

Six BCCH carriers are established with the system information contents of table 20.21.1.

Parameters changed from Default values table 20.21.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|---|---|---|---|---|---|---|---|
| RF signal level (dBµV emf ( )/dBm) | 53 / -60 | 48 /-65 | 43 / -70 | 38 / -75 | 33 / -80 | 33 /-80 | 38 / -75 |
| RXLEV_ACCESS_MIN | -90 | -90 | -90 | -90 | -90 | -90 | -110 |
| C1 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |
| C2 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

BS_PA_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS_PA_MFRMS = 3 leads to averaging time of 5 seconds. Hence 5 seconds is also the updating time of the list of six strongest neighbour carriers.

##### 20.21.11.4.2 Procedure

a) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.

b) The MS is switched on.

c) After 60 seconds, the SS activates carrier 7 and pages the MS continuously on this carrier. The SS monitors carrier 7 for RA requests from the MS.

#### 20.21.11.5 Test requirements

1) The MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 seconds to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 seconds (+10 %)), 33 seconds to read BCCH, 15 seconds for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 seconds.

## 20.21.12 R-GSM decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers

#### 20.21.12.1 Definition and applicability

#### 20.21.12.2 Conformance requirement

1. The MS shall attempt to decode the BCCH data block that contains the parameters affecting cell reselection for each of the 6 strongest non-serving cell BCCH carriers at least every 5 minutes; GSM 05.08, 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in section 20.21.3.

#### 20.21.12.3 Test purpose

1. To verify that the MS decodes the BCCH data block that contains the parameters affecting cell reselection for a non-serving cell BCCH carrier, (which is in the list of six strongest neighbour cells), at least every 5 minutes. This is achieved by changing the BCCH data such that the value of C2 for the non serving cell exceeds the value of C2 for the serving cell, and observing that the MS performs cell reselection within 5 minutes plus the time allowed for cell reselection after the change of the BCCH data.

#### 20.21.12.4 Method of test

##### 20.21.12.4.1 Initial conditions

Parameters changed from Default values table 20.21.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level (dBμV emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

##### 20.21.12.4.2 Procedure

a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.

b) The MS is switched on.

c) The SS changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

#### 20.21.12.5 Test requirements

1) After step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 seconds.

2) After step c), the MS shall access on carrier 2 within 345 s of the change in the BCCH data of carrier 2.

NOTE: 330 s for decode of BCCH of carrier 2 (300 s +10 %), 15 seconds for reselection of carrier 2, since the MS already has a running average on carrier 2.

## 20.21.13 R-GSM decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers

#### 20.21.13.1 Definition and applicability

#### 20.21.13.2 Conformance requirement

1. The MS shall attempt to check the BSIC for each of the 6 strongest non-serving cell BCCH carriers at least every 30 seconds, to confirm that it is monitoring the same cell. If a change of BSIC is detected then the carrier shall be treated as a new carrier and the BCCH data redetermined; GSM 05.08, 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in section 20.21.3.

#### 20.21.13.3 Test purpose

1. To verify that the MS will check the BSIC of the non-serving cell, which is in the list of six strongest neighbour cells, by changing the BSIC and the BCCH data of the non-serving cell such that the value of C2 for that cell exceeds the value of C2 of the serving cell, and observing that the MS performs cell reselection within the time allowed to check the BSIC, redetermine the BCCH data and perform cell reselection.

#### 20.21.13.4 Method of test

##### 20.21.13.4.1 Initial conditions

Parameters changed from Default values table 20.21.1 are below:

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level (dBµV emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

##### 20.21.13.4.2 Procedure

a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.

b) The MS is switched on.

c) The SS changes the BSIC of carrier 2 by changing the Base Station Colour Code (BCC) part of the BSIC. The SS also changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change to the BCCH data the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

#### 20.21.13.5 Test requirements

1) In step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 seconds.

2) After step c), the MS shall access on carrier 2 within 85 s of the change in the BSIC value (and BCCH data) of carrier 2.

NOTE: 33 seconds for check of BSIC on carrier 2, 33 seconds for decode of BCCH of carrier 2, 15 seconds for reselection of carrier 2, since the MS already has a running average on carrier 2, allow 85 seconds.

## 20.21.14 R-GSM emergency calls

#### 20.21.14.1 Definition and applicability

This test is applicable for R-GSM MSs supporting speech.

#### 20.21.14.2 Conformance requirement

1. When in a limited service state, the MS shall be able to initiate emergency calls; GSM 05.08, 6.8.

2. When in a limited service state and if not camped on a cell, the MS shall monitor the signal strength of all 194 RF channels, and search for a BCCH carrier which has C1>0 and which is not barred. When such a carrier is found, the MS shall camp on that cell, irrespective of the PLMN identity; GSM 05.08, 6.8.

3. The MS shall perform cell reselection at least among the cells of the PLMN of the cell on which the MS has camped, according to the algorithm of GSM 03.22, 4.5 & 3.7, except that a zero value of CELL_RESELECT_HYSTERESIS shall be used; GSM 05.08, 6.8.

#### 20.21.14.3 Test purpose

1. To verify that the MS shall be able to initiate emergency calls when no suitable cells of the selected PLMN are available, but at least one acceptable cell is available.

2. To verify that the MS selects a cell with C1>0 and CBA = 0 when no suitable cells of the selected PLMN are available.

3. To verify that the MS, when performing cell reselection in the limited service state, uses CELL_RESELECT_HYSTERESIS = 0.

#### 20.21.14.4 Method of test

##### 20.21.14.4.1 Initial conditions

Parameters changed from Default values table 20.21.1 are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level (dBµV emf() / dBm) | 38 / -75 | 33 / -80 | 33 / -80 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 23 / -90 | 43 / -70 | 23 / -90 | | | |
| CELL_BAR_ACCESS | 1 (barred) | 0 | 0 | | | |
| MCC,MNC | forbidden | forbidden | forbidden | | | |
| CELL_RESELECT_HYST | 0 | 0 | 14 dB | | | |
| C1 | 15 | -10 | 10 | | | |

NOTE: All the BCCH carriers belong to the same PLMN, which is not the MS's home PLMN and is in the SIM's forbidden PLMN's list.

##### 20.21.14.4.2 Procedure

a) The SS activates the carriers. The SS monitors for RA attempts from the MS on carriers 1, 2 and 3 for the duration of the test.

b) The MS is switched on.

c) 50 seconds after switch on, an emergency call is initiated on the MS.

d) The SS changes the CBA of carrier 1 to 0.

NOTE: The MS should reselect to carrier 1 because it should not take into account the CELL_RESELECT_HYST value of 14 but use 0 instead.

e) After 345 s an emergency call is initiated on the MS.

NOTE: 330 seconds to detect change of BCCH data, 15 seconds to perform reselection of carrier 1, since the MS already has a running average on carrier 1.

#### 20.21.14.5 Test requirements

1) In step c), the first access by the MS shall be on carrier 3.

2) In step e), the first access from the MS shall be on carrier 1.

## 20.21.15 R-GSM cell reselection due to MS rejection "LA not allowed"

#### 20.21.15.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This process goes on while camping on a cell which pertains to an LA which is placed in the list of "forbidden LAIs for regional provision of service".

### 20.21.15.2 Conformance requirement

1. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS stores this LAI in a list of "forbidden LAIs for regional provision of service", to prevent repeated attempts to access a cell of the forbidden LA, GSM 03.22, 3.3.

2. If the MS has received the cause 'LA not allowed', it shall ignore this fact when selecting a cell to camp on, i.e. it shall not reject a cell for camping on because that cell is part of a LA where this cause has been received, GSM 03.22, 3.5.4.

3. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection, GSM 03.22, 4.4.2

4. A new LU attempt shall only be performed when a new LA (or new PLMN) is entered according to the cell reselection procedure, GSM 03.22, 3.3 & figure 4.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

### 20.21.15.3 Test purpose

1. To verify that if an LU is rejected with cause "LA not allowed" that the LAI of that cell is written into a forbidden list which prevents the MS from performing LU onto another cell in that LA. This is verified indirectly in test purposes 2,3 and 4.

2. To verify that the MS will not reject a cell for camping on because that cell is part of a LA in the list of "forbidden LAIs for regional provision of service". This is verified indirectly by making the MS attempt an emergency call and checking that the channel request message is transmitted on the correct cell.

3. To verify that the MS when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection:

   Cell reselection is triggered if there is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter). GSM 03.22, 3.4 & 4.5.

4. To verify that a new LU attempt will be performed when a new LA (or new PLMN) is entered, GSM 03.22, 3.3 & figure 4.

### 20.21.15.4 Method of test

#### 20.21.15.4.1 Initial conditions

Parameters changed from Default values table (table 20.21.1)

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 63 / -50 | 54 / -59 | 44 / -69 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 53 / -60 | 35 / -78 | 29 / -84 | | | |
| CRH | 14 | 0 | 10 | | | |
| LAC | H1111 | H2222 | H1111 | | | |
| ATT | 1 | 1 | 1 | | | |
| C1 | 10 | 19 | 15 | | | |
| C2 | 10 | 19 | 15 | | | |

#### 20.21.15.4.2 Procedure

a) The SS activates the carriers. The SS monitors all RA requests from MS on carriers 1, 2 & 3 until step e) has been completed. Only idle-paging is sent on all channels.

b) The MS is switched on.

c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "LA not allowed"

d) 30 seconds after the MS has returned to idle mode (channel release after LU reject), the MS is manually commanded to set up an emergency call.

NOTE 1: C2 of carrier 3>C2 of carrier 1. Carriers 1 and 3 belong to the same LA.

e) The SS rejects the CM service request from the MS, with a CM service reject message with cause value #17 (Network Failure).

NOTE 2: Cause values #4 (IMSI unknown in VLR) or #6 (Illegal ME) lead to unwanted behaviour of the mobile.

f) 10 seconds after the MS has returned to idle mode (channel release after CM service reject), the SS increases the level of carrier 2 to 65 dBµV emf().

NOTE 3: C2 of carrier 2 = 30, now larger than C2 of carrier 3 + CRH.

g) The SS shall accept any LU on carrier 2.

#### 20.21.15.5 Test requirements

1) After step b), the MS shall respond on carrier 1 within 33 s.

2) In step d), the MS shall access on carrier 3 with a channel request message, within 15 seconds of being commanded to set up the emergency call.

3) After increasing the level of carrier 2 in step f), the MS shall reselect and access onto carrier 2 requesting an LU within 30 seconds.

NOTE 1: 13,75 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 27,15 seconds, allow 30 seconds.

## 20.21.16 R-GSM downlink signalling failure

#### 20.21.16.1 Definition and applicability

See conformance requirement.

#### 20.16.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. When the MS camps on a cell, DSC shall be initialized to a value equal to the nearest integer to 90/N where N is the BS_PA_MFRMS parameter for that cell (see GSM 05.02).

2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1,(however never beyond the nearest integer to 90/N).

3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.

4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, GSM 03.22, 4.5 (ii) and GSM 05.08, 6.5.

NOTE: The network sends the paging subchannel for a given MS every BS_PA_MFRMS multiframes. The requirement for network transmission on the paging subchannel is specified in GSM 04.08. The MS is required to attempt to decode a message every time its paging subchannel is sent.

#### 20.21.16.3 Test purpose

1. To verify that the MS initializes the DSC counter in accordance with the conformance requirement. This is verified indirectly.

2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to 90/N). This is verified indirectly.

3 To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.

4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

### 20.21.16.4 Method of test

#### 20.21.16.4.1 Initial conditions

Two BCCH carriers are established with the system information contents of table 20.21.1.

Parameters changed from Default values table (table 20.21.1) are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level (dBµV emf() / dBm) | 43 / -70 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 = C2 | 20 | 10 | | | | |

NOTE: The DSC counter will have a value 18 (90/5).

#### 20.21.16.4.2 Procedure

a) The MS is switched on. On carrier 1 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS (idle paging). On carrier 2 the MS is paged continuously in all paging blocks.

b) After 40 s the SS sends corrupted data (using random data, wrong parity bits see GSM 05.03, 4.3 & 4.1.2 or other lower layer error) in four successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on four successive paging blocks should decrease the DSC to 2.

c) The SS monitors all accesses on both carriers for 30 s.

d) The SS sends corrupted data in five successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 2: Sending random, data on five successive paging blocks should decrease the DSC to < 0 and cause a cell reselection.

e) The SS monitors all accesses on both carriers for 30 s.

### 20.21.16.5 Test requirements

1) There shall be no access to carrier 2 in test steps a) and c).

2) The MS shall access on carrier 2 at test step e) within 15 seconds.

## 20.21.17 R-GSM cell selection if no suitable cell found in 10 s

### 20.21.17.1 Definition and applicability

See conformance requirement.

### 20.21.17.2 Conformance requirement

If no suitable cell is found in cell reselection process within 10 seconds, the cell selection algorithm of GSM 03.22 shall be performed, GSM 05.08; 6.6.2.

### 20.21.17.3 Test purpose

To verify that the MS fulfils the conformance requirement

#### 20.21.17.4 Method of test

##### 20.21.17.4.1 Initial conditions

One BCCH carrier is established with the system information contents of table 20.21.1.

Parameters changed from Default values table (table 20.21.1) are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF signal level<br>(dBµV emf() / dBm)<br>C1 = C2 | 43 / -70<br><br>20 | OFF | OFF | OFF | OFF | OFF |

##### 20.21.17.4.2 Procedure

a) The MS is switched on. Idle paging is sent on carrier 1.

b) After the MS indicates service the SS reduces the transmit level of carrier 1 to 13 dBµV emf() (so that C1 of carrier 1 becomes -10) and turns on a new carrier (carrier 2) at a level of 33 dBµV emf(). Carrier 2 shall not be in the MS BA list (i.e. it shall not be one of the carriers that MS has been monitoring after camped on carrier 1)

c) The SS shall monitor all accesses on carriers 1 and 2 for 60 s.

NOTE: The access on carrier 2 should not take longer than 50 s. (5 seconds to rxlev averages, 5 s for C1<0 duration, 10 s for searching another suitable cell, 30 s for cell selection), 60 s is a safe time to wait.

#### 20.21.17.5 Test requirements

The MS shall access on carrier 2 at test step c) within 60 s.

### 20.21.18 R-GSM cell reselection due to MS rejection "Roaming not allowed in this LA"

#### 20.21.18.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

The MS looks for suitable neighbour cells which satisfies 4 constraints including that It should not be in an LA which is in the list of "forbidden LAs for roaming".

#### 20.21.18.2 Conformance requirement

1. To prevent repeated attempts to have roaming service on a not allowed LA, when the MS is informed that an LA is forbidden, the LA is added to a list of "forbidden LAs for roaming" which is stored in the MS, GSM 03.22; 3.1.

2. If the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure shall be started, GSM 03.22; 4.3.3 L3, GSM 04.08; 4.4.4.7.

3. The MS can only perform camping on a suitable cell, which:

   - should not be in an LA which is in the list of "forbidden LAs for roaming" GSM 03.22, 3.2.1.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

#### 20.21.18.3 Test purpose

1. To verify that if an LU is rejected with cause "Roaming not allowed in this LA", that the LAI of that cell is written into a forbidden list which prevents the MS from camping onto any cell in that LA.

2. To verify that if the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure is initiated. This is verified indirectly by test purpose 3, in that the new LA is accessed as part of cell selection, hence CRH is disregarded.

3. To verify that if an LU is rejected, when attempting LU in a LA with LAI = LAI1, with cause "Roaming not allowed in this LA" and only cells of the selected PLMN are available, the MS will only camp and attempt LU in any LA with LAI <> LAI1.

### 20.21.18.4 Method of test

#### 20.21.18.4.1 Initial conditions

Parameters changed from Default values table (table 20.21.1)

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 63 / -50 | 53 / -60 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBµV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| MNC | MNC <> HPLMN | MNC <> HPLMN | | | | |
| MCC | MCC of HPLMN | MCC of HPLMN | | | | |
| CRH | 0 | 0 | | | | |
| LAC | H1111 | H2222 | | | | |
| ATT | 1 | 1 | | | | |
| C1 | 40 | 30 | | | | |
| C2 | 40 | 30 | | | | |

#### 20.21.18.4.2 Procedure

a) The MS is switched on. Idle paging is sent on all carriers.

b) The SS monitors all RA requests from MS on carriers 1 & 2.

c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "Roaming not allowed in this LA".

d) The SS shall accept any LU on carrier 2.

e) The SS monitors all RA requests from MS on carriers 1 to 2.

### 20.21.18.5 Test requirements

1) The MS should respond on carrier 1 within 33 s of switch on.

2) After LU reject, the MS shall initiate the Network Selection Procedure and access onto Carrier 2 as part of cell selection within 33 seconds from returning to idle mode after the LU reject.

NOTE: The timing requirement in b) is given only for testing purposes only. No timing requirements are defined for the Network Selection Procedure, but the time allowed for cell selection (see 20.21.1) should be adequate.

3) After the LU reject on carrier 1, there shall be no more access attempts on this carrier.

# 20.21.19 R-GSM cell selection on release of SDCCH and TCH

## 20.21.19.1 Definition and applicability

## 20.21.19.2 Conformance requirement

1. When the SS releases a TCH or SDCCH and returns to idle mode, it shall, as quickly as possible camp on the BCCH carrier of the cell whose channel has just been released. If the full BCCH data for that cell was not decoded in the preceding 30s, the MS shall then attempt to decode the full BCCH data. Until the MS has decoded the BCCH data required for determining the paging group, it shall also monitor all paging blocks on timeslot 0 of the BCCH carrier for possible paging messages that might address it. If the MS receives a page before having decoded the full BCCH data for the cell, the MS shall store the page and respond once the full BCCH data has been decoded, provided that the cell is not barred and the MSs access class is allowed.
GSM 05.08, 6.7.

## 20.21.19.3 Test purpose

1. To verify that on release of a TCH or an SDCCH, the MS camps as quickly as possible on the BCCH carrier of the cell whose channel has just been released.

NOTE: This is implicitly tested by the MS responding to a paging request. The decoding of BCCH data cannot be explicitly tested. However, the MS shall monitor for paging messages which may address it if it decodes the BCCH.

## 20.21.19.4 Method of test

### 20.21.19.4.1 Initial conditions

a) Parameters changed from default values in table 20.21.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBmV emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBmV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| BS_PA_MFRMS | 2 | 2 | | | | |
| ATT | 1 | | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

b) Carrier 1 is configured to have a combined control channel.

c) Carrier 2 is configured to have a non combined control channel.

### 20.21.19.4.2 Test procedure

a) The SS activates the carriers. No paging messages are transmitted on carrier 1 or carrier 2.

b) The MS is switched on.

c) In response to the MS access for IMSI attach, the SS allocates a combined SDDCH/4, accepts the IMSI attach procedure and then releases the link. After 0,5 seconds but within 1 second of transmitting the UA frame on completion of the IMSI attach procedure, the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1.

d) When the MS responds to paging, the SS establishes a call on a traffic channel.

e) The SS increases the level of carrier 2 to 63 dBmV emf().

f) After 10 seconds the SS performs a handover to another TCH, with the parameters of carrier 2 indicated in the CELL DESCRIPTION information element of the HANDOVER COMMAND message.

g) After a further 10 seconds, the SS clears down the call. After 0,5 seconds but within 1 second of transmitting the UA frame, the SS transmits a single PAGING REQUEST on carrier 2 in the appropriate paging block of the MS.

#### 20.21.19.5 Test requirements

1) After step b) the MS shall access in order to commence an IMSI attach procedure on carrier 1 within 33 seconds.

2) In step c), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

## 20.22 GPRS Cell Selection and Reselection

The absolute accuracy of the MS signal level measurements is assumed to be +/-6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1, C31, C32 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be +/-3 dB for the signal levels used in the tests of this section. A difference of at least 5 dB is allowed for cases of discrimination between C1 and C31 and C32 values on different carriers.

NOTE 1: The accuracy of MS signal level measurements is specified in GSM 05.08. For all of the tests in this section, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in GSM 05.08 is +/-10 % except for PENALTY_TIME where it is +/-2 seconds. In the tests of this section, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is +/-2 % and the SS tolerance on power level +/-1 dB.

The cell re-selection tests defined in the sections 20.22.2 to 20.22.7 apply to the MSs attached to GPRS if a PBCCH exists in the serving cell. The cell re-selection test defined in the section 20.22.9 applies to the MSs attached to GPRS when no PBCCH exists in the serving cell. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of GSM 05.08 and therefore tests defined in section 20 of TS 51.010 apply.

The support of GPRS shall be indicated in SYSTEM INFORMATION TYPE 3 message. In addition, the support of GPRS shall be indicated in either SYSTEM INFORMATION TYPE 4 or SYSTEM INFORMATION TYPE 7 and 8 messages. If GPRS is supported, SYSTEM INFORMATION TYPE 13 message shall be sent. SI 13 message shall not be sent if GPRS is not supported (GSM 04.08, 3.2.2.1. Additional requirements for the broadcast of system information in a cell supporting GPRS are specified in GSM 04.60. The GPRS support is indicated by the presence of the field GPRS Indicator in the SI Rest Octets (GSM 04.08, 10.5.2.34; 10.5.2.35; 10.5.2.36; 10.5.2.37).

The following definitions are applicable to tests 20.22.1 to 20.22.28:

- Carrier X supports GPRS : the SS includes the field GPRS Indicator in SI 3 Rest Octets and in SI 4 Rest Octets.

- The SS enables GPRS on carrier X : the SS starts including the field GPRS Indicator in SI 3 Rest Octets and in SI 4 Rest Octets.

- The SS disables GPRS on carrier X : the SS stops including the field GPRS Indicator in SI 3 Rest Octets and in SI 4 Rest Octets.

Unless otherwise stated in the method of test, in all of the tests of this section:

- The SIM is in the idle updated state in the default registration area with a PTMSI assigned at the beginning of each test.

- All carriers support GPRS on BCCH without a separate PBCCH channel

- The Scheduling of Packet System information should be such that a complete set of consistent PSI messages can be decoded within 8 multiframes (8 * 52 frames).

- The Scheduling of System Information should be such that a complete set of consistent SI messages, including SI13 were applicable, can be decoded within 8 multiframes (8 * 51 frames).

- The MS is configured to automatically attach to GPRS at switch on by using the PICS/PIXIT Statement "Automatic GPRS attach procedure at switch on or power on Yes/No" as in GPRS Attach procedure tests (see section 44.2.1). For MS that does attach at power on, the SS shall accept access request with cause MM procedure in determining test verdict.

**Table 20.22.1: Default values of the system information fields**

| Parameter | GSM 04.60 reference | Abbr. | Normal Setting |
|---|---|---|---|
| PRIORITY_CLASS | 11.2.20 | PC | 1 |

| | | | For GSM1900 ARFCNs 512, 543, 568, 589, 602, 629, 641, 653, 662, 683, 696, 711, 727, 732, 754, 777, 794, 809 broadcast in SYSTEM INFORMATION TYPE 2 |

## 20.22.1 Cell selection

### 20.22.1.1 Definition and applicability

Cell selection is a process in which an MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

### 20.22.1.2 Conformance requirement

1. The MS shall be able to select the strongest cell within 30 seconds of switch on. This assumes a valid SIM, with PIN disabled and ideal radio conditions, GSM 05.08, 6.1.

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

   2.1 (i) It should be a cell of the selected PLMN

   2.2 (ii) It should not be "barred" (see section 3.5.1)

   2.3 (iii) It should not be in an LA which is in the list of "forbidden LAs for roaming";

   2.4 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in section 3.6. GSM 03.22, 3.2.1.

NOTE: Criteria 2.3 (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it, GSM 03.22, 3.2.1.

4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection, GSM 05.08, 6.4.

### 20.22.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1. even when one of the other cells supports GPRS.

2. To verify that:

   2.1 The MS does not select a cell of a PLMN, which is not the selected PLMN.

   2.2 The MS does not select a cell which is "barred".

   2.4 The MS does not select a cell with C1<0.

3. To verify that the MS selects suitable cells in descending order of received signal strength.

4. To verify that the MS does not select a cell with C1<0.

20.22.1.4 Method of test

20.22.1.4.1 Initial conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBm) | -75 | -80 | -70 | -60 | -70 | -80 |
| CBA | 0 | 0 | 0 | 1 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | | -90 | -90 | -60 | |
| GPRS_RXLEV_ACCESS_MIN | | -90 | | | | -90 |
| MNC | | | 01 (011 for PCS 1900) | | | |
| MCC | | | 002 | | | |
| C1 | 15 | 10 | 20 | 30 | -10 | |

NOTE 1: For an E-GSM MS carrier 1 and carrier 5 ARFCNs are chosen in the E-GSM band, carrier 3 and carrier 4 ARFCNs in the P-GSM band.

NOTE 2: Carrier 2 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 6.)

NOTE 3: Carriers 1,3,4 and 5 do not support GPRS.

20.22.1.4.2 Procedure

a) The SS activates and pages on the MS on all carriers. All Carriers are monitored for RA requests from the MS.

b) The MS is switched on.

20.22.1.5 Test requirements

1) After step b), the first response from the MS shall be on carrier 1 within 33 seconds. There shall be no response from the MS on any other carrier

## 20.22.2 Cell reselection in Packet Idle mode

20.22.2.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

20.22.2.2 Conformance requirement

1. At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2 The MS shall make a cell re-selection if:

(i) The path loss criterion parameter (C1) for the serving cell falls below zero.

(ii) A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among

- those cells that have the highest PRIORITY_CLASS among those that fulfil the criterion C31 ≥ 0, or

all cells, if no cells fulfil the criterion C31 ≥ 0.

If the parameter C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area: GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

#### 20.22.2.3 Test purpose

To verify that the MS reselects the correct cell based on the C32 parameter when GPRS_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are transmitted in the System information messages.

1. To verify MS does not reselect on the basis of C31 as there are no HCS threshold values transmitted in the System information messages.

#### 20.22.2.4 Method of test

##### 20.22.2.4.1 Initial conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|---|---|---|---|---|---|
| RF Signal Level (dBm) | -70 | -60 | -70 | -65 | -60 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -100 | -85 | -90 |
| GPT | | | | 40 s | |
| GRO | | | -20 dB | 20 dB | |
| GTO | | | | 20 dB | |
| C1 | 20 | | 30 | 20 | 30 |
| C32 | 20 | | 10 | 20-40 | 30 |

NOTE 1: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test.

NOTE 2: The HCS structure is omitted from the packet system information messages .

NOTE 3: Carrier 5 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 2.)

##### 20.22.2.4.2 Procedure

a) The SS activates carriers 1, 2 and 5. The MS is paged on Carriers 1 and 2. The SS starts monitoring carriers 1 and 2 for RA requests from the MS.

b) The MS is switched on.

c) The SS activates carriers 3 and 4. The MS is paged on both carriers. The SS monitors carriers 3 and 4 for RA requests from the MS.

#### 20.22.2.5 Test Requirements

1) After step b) there should be a response on carrier 2 within 33 seconds.

NOTE: The SS should ensure that the MS final state is in Packet Idle mode on carrier 2.

2) After step c) there should be no response on carrier 4 within 38 seconds plus Max{5s, 5 consecutive paging blocks of that MS} of activating the carrier but MS should respond on carrier 4 within 50 seconds of activating the carrier.

NOTE: Minimum time of 38 seconds set by penalty timer on carrier 4 less 2 second tolerance. Maximum time includes 40 seconds + 2 second tolerance plus Max{5s, 5 consecutive paging blocks of that MS for expiry of penalty timer on carrier 4, 2 seconds to decode BCCH, 1 second for reselection, since the MS will already have running averages on carrier 4, when the penalty timers expire, additional time for update of NB-list in mobile, allow at least 50 seconds plus Max{5s, 5 consecutive paging blocks of that MS}.

## 20.22.3 Priority of cells

#### 20.22.3.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

#### 20.22.3.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2 The MS shall make a cell re-selection if:

(i) The path loss criterion parameter (C1) for the serving cell falls below zero.

(ii) A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among

- those cells that have the highest PRIORITY_CLASS among those that fulfil the criterion $C31 \geq 0$, or
- all cells, if no cells fulfil the criterion $C31 \geq 0$.

If the parameter C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area: GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

#### 20.22.3.3 Test purpose

1. To verify that the MS reselects to the correct cell by calculating C31 correctly when C31_HYST is set on the network.

#### 20.22.3.4 Method of Test

##### 20.22.3.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBm) | -60 | -60 | -80 | -64 | -70 | -70 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -100 | -92 | -100 | -102 |
| C31_HYST = 1 | | | | | | |
| Priority Class | 3 | | 3 | 3 | 3 | 1 |
| GRO | | | 10 | 4 | 10 | 14 |
| HCS_THR | -90 | | -70 | -80 | -86 | -86 |
| GCRH | 6 | | | | | |
| C1 | 40 to 15 | | 20 | 28 | 30 | 32 |
| C31 | 30 to 5 | | -16 | 10 | 10 | 10 |
| C32 | 40 to 15 | | 24 | 26 | 34 | 40 |

NOTE 1: GRO = GPRS_RESELECT_OFFSET, GCRH = GPRS_CELL_RESELECT_HYSTERESIS, RARH = RA_RESELECT_HYSTERESIS.

NOTE 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

NOTE 3: Carrier 1 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 2.)

##### 20.22.3.4.2 Procedure

a) The MS is switched on and brought into Packet Transfer Mode on carrier 2

b) The SS waits 10 seconds.

c) The RF level of Carriers 1 & 2 are reduced to -85 dBm (C1=decreases to 15)

#### 20.22.3.5 Test Requirements

After step c) the MS should respond on carrier 5 within 10 seconds. (Carrier 3 should be rejected as C31 <0, Carrier 6 has a lower priority class than Carrier 4 and Carrier 5 so is rejected, even though C32= 40, out of carrier 4 and 5, Carrier 5 has highest C32 value.

Note: Time allowed includes 5 sec for MS to determine C32 on neighbour cell is higher, 2 seconds to decode BCCH and 1 sec for re-selection.

## 20.22.4 Cell re-selection with cells in different routing area

#### 20.22.4.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

#### 20.22.4.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2 The MS shall make a cell re-selection if:

(i) The path loss criterion parameter (C1) for the serving cell falls below zero.

(ii) A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among

- those cells that have the highest PRIORITY_CLASS among those that fulfil the criterion C31 ≥ 0, or
- all cells, if no cells fulfil the criterion C31 ≥ 0.

If the parameter C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area: GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

### 20.22.4.3 Test purpose

To verify that the MS reselects to the correct cell by calculating C32 correctly when one of the cells is in a different routing area.

### 20.22.4.4 Method of Test

#### 20.22.4.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBm) | -60 | -60 | -70 | -70 | -70 | -70 |
| RA COLOUR | | | | | | Different |
| GPRS_RXLEV_ACCESS_MIN (dBm) | | -100 | | -100 | -100 | |
| GRO | | | 4 | 4 | 6 | 4 |
| GCRH | 4 | | | | | |
| RARH | 14 | | | | | |
| C1 | 40 | | | 30 | 30 | |
| C32 | | 40 | | 34 | 22 | |

Note 1: GRO = GPRS_RESELECT_OFFSET, GCRH = GPRS_CELL_RESELECT_HYSTERESIS, RARH = RA_RESELECT_HYSTERESIS.

Note 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

Note 3: Carrier 1 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 2.)
Carrier 3 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 4.)
Carrier 6 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 5.)

#### 20.22.4.4.2 Procedure

a) The MS is switched on and completes GPRS Attach procedure (ready timer deactivated) on carrier 2

b) The SS waits 10 seconds.

c) The RF level of Carriers 1 & 2 are reduced to -85 dBm (C1=decreases to 15)

### 20.22.4.5 Test Requirements

After step c) the MS should respond on carrier 4 within 10 seconds. (Carrier 5 C32=22 if RA_RESELECT_HYSTERESIS is used correctly by MS otherwise it will be 36 and MS will select carrier 5 incorrectly)

Note: Time allowed includes 5 sec for MS to determine C32 on neighbour cell is higher, 2 seconds to decode BCCH, 2 sec to decode PBCCH and 1 sec for re-selection.

## 20.22.5 Network controlled Cell re-selection in Transfer Mode

### 20.22.5.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

### 20.22.5.2 Conformance requirement

1. A cell re-selection command may be sent from the network to an MS. When the MS receives the command, it shall immediately re-select the cell according to the included cell description and change the network control mode according to the command (GSM 04. 60, GSM05.08: 10.1.4).

### 20.22.5.3 Test purpose

To verify the MS can correctly interpret the network control commands and reselect to the correct cell.

### 20.22.5.4 Method of Test

#### 20.22.5.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|---|---|---|---|---|---|
| RF Signal Level (dBm) | -60 | -60 | -80 | -70 | -70 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -100 | -100 | -100 |
| NEWORK_CONTROL_ORDER | NC2 | NC2 | NC0 | NC2 | NC2 |
| NC_REPORTING PERIOD_T (s) | 0.96 | 0.96 | | 0.96 | 0.96 |
| C1 | 40-20 | | 20-40 | 30 | |
| C32 | 40-20 | | 20-40 | 30 | |

Note 1: The HCS structure is omitted from the packet system information messages on all the cells. Therefore C31 is not used.

Note 2: Carrier 1 is a BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 2.) and Carrier 4 is a BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 5.)

#### 20.22.5.4.2 Procedure

a) The MS is switched on and completes GPRS Attach procedure (ready timer deactivated) on carrier 2.

b) The RF level of carriers 1 and 2 are reduced to –80dBm. (C32 becomes 20).

c) The SS waits 15 seconds after the RF level of carriers 1and 2 are reduced before sending Packet Cell Change Order, with the IMMEDIATE_REL bit set to FALSE, to the MS to select carrier 4. The MS shall complete Cell Update procedure on carrier 4.

d) The RF level of carrier 3 is increased to –60dBm. (C32 becomes 40).

e) The SS waits 15 seconds after increasing the RF level of carrier 3 before the Network Control Order is changed to NC0 on carriers 4 and 5 by sending Packet Measurement Order.

#### 20.22.5.5 Test Requirements

1) After step b) there should be no response on carriers 3, 4 or 5.

2) After step c) there should be a response on carrier 4 within 10 seconds of the re-select command. (The 10s = 2s for BCCH decoding + 2s for PBCCH decoding + 5s for re-selection (as the IMMEDIATE_REL=0) + tolerance)

3) After step d) there should be no response on carriers 1, 2, 3.

4) After step e) there should be a response on carrier 3 within 3 seconds of the SS sending the Packet Measurement Order. (The 3s = 2s for BCCH decoding + 1s for re-selection + tolerance).

## 20.22.6 Cell reselection timings

#### 20.22.6.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

#### 20.22.6.2 Conformance requirement

At least for every sample or every second, whichever is greatest, the MS shall calculate the value of C1, C31 and C32 for the serving cell and recalculate C1, C31 and C32 values for non serving cells (if necessary). The MS shall make a cell re-selection if:

i) The path loss criterion parameter (C1) for the serving cells falls below zero.

#### 20.22.6.3 Test purpose

1. To verify that the MS meets conformance requirement 6.2 (i) within time allowed.

#### 20.22.6.4 Method of Test

##### 20.22.6.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBm) | -60 | -60 | -70 | -70 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -100 | -100 |
| GRO | | | -28 | |
| SPLIT_PG_CYCLE | 4 | 4 | 4 | 4 |
| C1 | 30 | | 30 | |
| C32 | 30 | | 2 | |

Note 1: The HCS structure is omitted from the system information messages on all the cells. Therefore C31 is not used.

Note 2: The RLA_P should be updated every 3.84 seconds with SPLIT_PG_CYCLE=4

Note 3: Carriers 1 and 3 are the BCCH carriers which broadcast the position of the PBCCH channel in the cell (Carriers 2 and 4)

#### 20.22.6.4.2 Procedure

a) The SS activates all carriers and pages the MS on carrier 4. The SS starts to monitor carriers 3 and 4 for responses from the MS.

b) The MS is switched on.

c) The SS waits 30s before the RF level of carriers 1 & 2 are reduced to –100 dBm for 8 seconds. (During this period C1 becomes –10). Then the SS raises the level back to –60 dBm.The SS waits 20 seconds.

d) The SS reduces the RF level on carriers 1 & 2 to –100dBm.

#### 20.22.6.5 Test Requirements

1) After step c) there shall be no access on carrier 3 or carrier 4.

2) After step d) there shall be access on carrier 4 within 25 seconds (allow 20s for c1 average to reach –10 + 2s to decode BCCH + 2s to decode PBCCH)

## 20.22.7 Downlink signalling failure

#### 20.22.7.1 Definition and applicability

This test is applicable for all types of GPRS MSs.

#### 20.22.7.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. If DRX period split is supported, DSC shall be initialised to a value equal to the nearest integer to max(10,90/64*SPLIT_PG_CYCLE) where SPLIT_PG_CYCLE is an parameter defined at GPRS attach (see 05.02)

2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1, however never beyond the max value defined in 1.

3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.

4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, GSM 03.22, 4.5 (ii) and GSM 05.08, 6.5

NOTE: The network sends the paging subchannel for a given MS every 64/SPLIT_PG_CYCLE multiframes . The requirement for network transmission on the paging subchannel is specified in GSM 04.08. The MS is required to attempt to decode a message every time its paging subchannel is sent.

#### 20.22.7.3 Test purpose

1. To verify that the MS initialises the DSC counter in accordance with the conformance requirement. This is verified indirectly.

2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to max defined in 16.2.1). This is verified indirectly.

3 To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.

4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

#### 20.22.7.4 Method of Test

##### 20.22.7.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | -65 | -65 | -60 | -60 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -95 | -95 | -100 | -100 |
| SPLIT_PG_CYCLE | 4 | 4 | 4 | 4 |
| C1 | 30 | | 40 | |
| C32 | 30 | | 40 | |

Note 1: The HCS structure is omitted from the system information messages on all the cells. Therefore C31 is not used.

Note 2: With SPLIT_PG_CYCLE=4 DSC should be set to 10, Paging blocks occur every 832 frames or 3.84 seconds.

Note 3: Carrier 1 and 3 are BCCH carriers which broadcast the position of the PBCCH channel in the cell (Carrier 2 and 4.)

##### 20.22.7.4.2 Procedure

a) The MS is switched on. On carrier 4 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS. On carrier 2 the MS is paged continuously in all paging blocks.

b) After 40s the SS sends corrupted data (using random data, wrong parity bits see GSM 05.03, 4.3 & 4.1.2 or other lower layer error) in 2 successive paging blocks on carrier 4 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on 2 successive paging blocks should decrease the DSC to 2.

c) The SS monitors all accesses on both carriers for 40 s. (Allows the DSC counter to go back to maximum of 10, paging block every 3.84 secs)

d) The SS sends corrupted data in 3 successive paging blocks on carrier 4 and then reverts to sending normal data..

NOTE 2: Sending corrupted, data on 3 successive paging blocks should decrease the DSC to < 0 (-2) and cause a cell reselection.

e) The SS monitors all accesses on both carriers for 30s

#### 20.22.7.5 Test requirements

1) There shall be no access on carriers 1 or 2 after step b).

2) The MS shall access on carrier 2 at test step e) within 5 seconds. (The time should be measured from the transmission of the complete 3rd successive paging block with errors and allows 4 secs for decoding BCCH and PBCCH).

## 20.22.8 Cell selection when the best cell does not support GPRS

#### 20.22.8.1 Definition and applicability

Cell selection is a process in which an MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. The support of GPRS is not a condition to select a cell. Once the MS is camped on a cell, access to the network is allowed.

This test is applicable for all types of GPRS MSs.

### 20.22.8.2 Conformance requirement

1. The MS shall be able to select the strongest cell within 30 seconds of switch on. This assumes a valid SIM, with PIN disabled and ideal radio conditions, GSM 05.08, 6.1.

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

   2.1 (i) It should be a cell of the selected PLMN

   2.2 (ii) It should not be "barred" (see section 3.5.1)

   2.3 (iii) It should not be in an LA which is in the list of "forbidden LAs for roaming";

   2.4 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in section 3.6. GSM 03.22, 3.2.1.

NOTE: Criteria 2.3 (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it, GSM 03.22, 3.2.1.

4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection, GSM 05.08, 6.4.

### 20.22.8.3 Test purpose

1. To verify that the MS meets conformance requirement 1. even when one of the other cells supports GPRS.

2. To verify that:

   2.1 The MS does not select a cell of a PLMN, which is not the selected PLMN.

   2.2 The MS does not select a cell which is "barred".

   2.4 The MS does not select a cell with C1<0.

3. To verify that the MS selects suitable cells in descending order of received signal strength.

4. To verify that the MS does not select a cell with C1<0.

### 20.22.8.4 Method of test

#### 20.22.8.4.1 Initial conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|---|---|---|---|---|---|
| RF Signal Level (dBm) | -75 | -80 | -70 | -60 | -70 |
| CBA | 0 | 0 | 0 | 1 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 | -60 |
| GPRS_RXLEV_ACCESS_MIN | | | | | |
| MNC | | | 01 (011 for PCS 1900) | | |
| MCC | | | 002 | | |
| C1 | 15 | 10 | 20 | 30 | -10 |

Note 1: For an E-GSM MS carrier 1 and carrier 5 ARFCNs are chosen in the E-GSM band, carrier 3 and carrier 4 ARFCNs in the P-GSM band.

Note 2: Carrier 2 supports GPRS without PBCCH channel in the cell.

Note 3: Carriers 1, 3, 4 and 5 do not support GPRS.

#### 20.22.8.4.2 Procedure

a) The SS activates and pages on the MS on all carriers. All Carriers are monitored for RA requests from the MS.

b) The MS is switched on.

#### 20.22.8.5 Test requirements

1) After step b), the first response from the MS shall be on carrier 1 within 33 seconds. There shall be no response from the MS on any other carrier

## 20.22.9 Cell reselection when the best cell does not support GPRS

#### 20.22.9.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. The target cell should be reselected despite it does not support GPRS.

This test is applicable for all types of GPRS MSs.

#### 20.22.9.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

   1.1 (iii) The cell camped on (current serving cell) has become barred.

   1.2 (iv) There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

   The MS will then reselect a new cell in order to fulfil the process goal.; GSM 03.22, 4.5.

NOTE 1: Criterion (i) is tested in section 20.8 (Cell reselection when C1(serving cell) < 0 for 5 seconds).

NOTE 2: Criterion (ii) is tested section 20.16 (Downlink signalling failure).

NOTE 3: Criterion (v) is tested in section 20.6 (Cell reselection timings).

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

   2.1 (ii) It should not be "barred".

   2.2 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. GSM 03.22, 3.2.1.

NOTE 4: Criterion (i) is not relevant for cell reselection and for cell selection it is tested in section 20.1.

NOTE 5: Criterion (iv) refers to the C1 parameter.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; GSM 05.08, 6.4.

4. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

   i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high.

   ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds, except in the case of the new cell being in a different location area in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds. This indicates that it is a better cell. GSM 05.08, 6.6.2.

5. The MS shall attempt to decode the full BCCH data of the serving cell at least every 30 seconds; GSM 05.08, 6.6.1.

### 20.22.9.3 Test purpose

1. To verify that:

   1.1 The MS meets conformance requirement 1.1.

   1.2 The MS meets conformance requirement 1.2.

   1.3 The MS meets conformance requirement 1.3.

2. To verify that:

   2.1 The MS does not reselect a cell which is barred.

   2.2 The MS does not reselect a cell which has a C1<0.

   2.3 The MS does reselect a cell even if does not support GPRS.

   2.4 The MS keeps camping on the serving cell despite it does not support GPRS and there is a non-serving suitable cell with a lower C2 that supports GPRS.

   2.5 The MS does not attempt to attach to GPRS when camping on a cell that does not support GPRS despite there is a non-serving suitable cell with a lower C2 that supports GPRS.

3. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are not used.

4. To verify that the MS takes into account the CELL_RESELECT_HYSTERESIS parameter when reselecting a cell in a different location area, whether the this cell supports GPRS or not.

5. To verify that the MS decodes the CELL_BAR_ACCESS and CELL_BAR_QUALIFY parameters from the BCCH every 30 seconds.

### 20.22.9.4 Method of test

#### 20.22.9.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|---|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43 / -70 | 33 / -80 | 43 / -70 | 38 / -75 | 38 / -75 |
| RXLEV_ACCESS_MIN (dBm) | -85 | -90 | -90 | -85 | -67 |
| CRH | 10 dB | | | | |
| LAC | | | different from other carriers | | |
| CBA | | | | 1 | |
| CBQ | | | | 0 | |
| C1 | 15 | 10 | 20 | 10 | -8 |
| C2 | 15 | 10 | 20 | 10 | -8 |

Note 1: Carrier 1 and 3 support GPRS without PBCCH channel in the cell.

Note 2: Carriers 2, 4 and 5 do not support GPRS.

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

20.22.9.4.2 Procedure

a) The SS activates carriers 1, 2, 4 and 5. The MS is paged on carriers 1, 2, 4 and 5. The SS monitors carriers 2, 4 and 5 for RA requests from the MS.

b) The MS is switched on.

c) When the SS receives a response on carrier 1, it stops paging the MS on this carrier and waits for 25 seconds. (The MS should reselect and camp onto carrier 1).

d) The SS disables GPRS on carrier 1 and enables GPRS on carrier 2.

e) The SS enables GPRS on carrier 1 and disables GPRS on carrier 2.

f) The SS stops paging on all carriers except carrier 2. The level of carrier 2 is increased to 43 dBµVemf (C2 becomes 20 dB), and the SS monitors carrier 2 for RA requests from the MS.

g) When the SS receives a response from the MS on carrier 2, it stops paging the MS on this carrier.

h) The MS is switched off then on and the MS is paged on carriers 1, 4 and 5. The SS monitors carrier 1, 4 and 5 for RA requests from the MS.

i) The MS is switched off.

j) The SS is reconfigured and sets CBA = 1 on carriers 1 and 5, enables GPRS on carrier 2 and disables GPRS on carrier 1.

k) The MS is switched on.

l) After 33 seconds, the SS starts paging continuously on carrier 1 and sets CBA=1 on carrier 2 and CBA=0 on carriers 1, 4 and 5.

m) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 seconds. (The MS should reselect and camp onto carrier 1).

n) The SS activates carrier 3, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.

o) The SS increases the level of carrier 3 to 53 dBµVemf (C2 increases to 30 dB.).

p) The MS is switched off. The SS is reconfigured and sets CBA = 1 on carriers 1 and 5, disables GPRS on carrier 3 and enables GPRS on carrier 1.

q) The SS deactivates carrier 3. The MS is switched on.

r) After 33 seconds, the SS starts paging continuously on carrier 1 and sets CBA=1 on carrier 2 and CBA=0 on carriers 1, 4 and 5.

s) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 seconds. (The MS should reselect and camp onto carrier 1).

t) The SS activates carrier 3 at 43 dBµVemf, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.

u) The SS increases the level of carrier 3 to 53 dBµVemf (C2 increases to 30 dB.).

20.22.9.5 Test requirements

1) After step c), there shall be no response from the MS on carriers 2, 4, or 5 within 50 seconds.

NOTE 1: 33 seconds for the MS to read the BCCH of carrier 2 (30 seconds + 10 %), 15 seconds for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 seconds.

2) After step d), there shall be no response from the MS on carriers 2, 4, or 5 within 50 seconds.

3) After step e), there shall be no response from the MS on carriers 2, 4, or 5 within 50 seconds.

4) In step f), the MS shall respond on carrier 2 within 20 seconds of increasing the level of carrier 2.

NOTE 2: 5 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 18,4 seconds, allow 20 seconds.

5) After step h), there shall be no response from the MS on carriers 1, 4, or 5 within 50 seconds.

6) In step l), the MS shall respond on carrier 1 within 50 seconds of setting CBA=1 on carrier 2.

7) After step n), there shall be no response from the MS within 50 seconds.

8) After step o), the MS shall respond on carrier 3 within 20 seconds.

9) In step r), the MS shall respond on carrier 1 within 50 seconds of setting CBA=1 on carrier 2.

NOTE 2: 33 seconds for the MS to read the BCCH of carrier 2 (30 seconds + 10 %), 15 seconds for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 seconds.

10) After step t), there shall be no response from the MS within 50 seconds.

11) After step u), the MS shall respond on carrier 3 within 20 seconds.

## 20.22.10 Cell Selection-Search for Suitable Cell/ cell priority

### 20.22.10.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

### 20.22.10.2 Conformance requirement

For normal service, the MS has to camp on suitable cell.The choice of such a suitable cell for the purpose of receiving normal service is referred to as “normal camping”.If a suitable cell is found,the MS camps on it and performs any registration necessary.Cells can have two levels of priority, suitable cells which are of low priority are only camped on if there are no other suitable cells of normal priority.(GSM 03.22, 3.5.2)

### 20.22.10.3 Test purpose

To verify that the MS selects cells of Normal priority even though there is a stronger suitable cell of low priority. Thus it verifies that PBCCH presence does not degrade the MS functionality.

### 20.22.10.4 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
|---|---|---|---|---|
| RF Signal Level | -70 | -70 | -80 | -80 |
| RXLEV_ACCESS_MI N | -90 | | -90 | |
| GPRS_RXLEV_ACCE SS_MIN | | -90 | | -90 |
| CELL_BAR_QUALIFY | 1 | | 0 | |
| C1 | 20 | 20 | 10 | 10 |

Note 1: Carrier 1 and Carrier 3 are the BCCH Carriers which broadcasts the position of the PBCCH channel in the cell (Carrier 2 and Carrier 4)

Note: Carrier 1 and Carrier 2 are for Cell 1, Carrier 3 and Carrier 4 are for Cell 2

Note: Cell Bar Qualify is transmitted on BCCH.CBQ=1,low priority and CBQ=0 is normal priority.

Procedure

a) The SS activates all Carriers.

b) MS is Switched on.

### 20.22.10.5 Test Requirements

1) After Step b) the response from the MS shall be on Carrier 4

Note: Cell 1 BCCH carrier is stronger, but has low priority, So MS should camp on Cell 2

## 20.22.11 Cell Selection/No normal priority cell

### 20.22.11.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

### 20.22.11.2 Conformance requirement

Cells can have two levels of priority,suitable cells which are of low priority are only camped on if there are no other suitable cells of normal priority. (GSM 03.22 Section 3.2.1)

### 20.22.11.3 Test purpose

To verify that the MS camps on a cell of low priority when no suitable cells of normal priority are available. Thus it verifies that PBCCH presence does not degrade the MS functionality.

### 20.22.11.4 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
|---|---|---|---|---|
| RF Signal Level | -80 | -80 | -100 | -100 |
| RXLEV_ACCESS_MI N | -90 | | -90 | |
| GPRS_LEV_ACCESS _MIN | | -90 | | -90 |
| CELL_BAR_QUALIF Y | 1 | | 0 | |
| C1 | 10 | 10 | -10 | -10 |

Note 1:Carrier 1 and Carrier 3 are the BCCH Carriers which broadcasts the position of the PBCCH channels in the cell (Carrier 2 and Carrier 4)

Note: Carrier 1 and Carrier 2 are for Cell 1, Carrier 3 and Carrier 4 are for Cell 2

Note: Cell Bar Qualify is transmitted on BCCH.CBQ=1,low priority and CBQ=0 is normal priority

Procedure

a) The SS activates all the Carriers.

b) MS is switched on.

### 20.22.11.5 Test Requirements

1) After Step b) the first response from the MS shall be on Carrier 2 within 33 seconds.

Note: Cell 1 BCCH carrier is stronger, but has low priority, So MS should camp on Carrier 2 (PBCCH carrier on Cell1).

## 20.22.12 Cell Selection on “LA Not Allowed”

### 20.22.12.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

### 20.22.12.2 Conformance requirement

If the MS has received the cause “LA Not Allowed” it shall ignore this fact when selecting a cell to camp on (GSM 03.22, 3.2.1)

### 20.22.12.3 Test purpose

To verify that the MS does not reject a cell because the cell is a part of the LA for which it has received the cause “LA Not Allowed”.

Note: During GPRS Attach, the MS receives an ATTACH REJECT message with cause ‘LA not allowed”. The MS shall then camp on any acceptable cell and shall be able to make emergency calls.

### 20.22.12.4 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
|---|---|---|---|---|
| RF Signal Level | -60 | -60 | -75 | -75 |
| RXLEV_ACCESS_MI N | -90 | | -90 | |
| GPRS_LEV_ACCESS _MIN | | -90 | | -90 |
| CELL_BAR_ACCESS | 0 | | 1 | |
| LAC | Default | | Default | |
| C1 | 30 | 30 | 15 | 15 |

Note 1: Carrier 1 and Carrier 3 are the BCCH Carriers which broadcasts the position of the PBCCH channel in the cell (Carrier 2 and Carrier 4)

Note: Carrier 1 and Carrier 2 are for Cell 1, Carrier 3 and Carrier 4 are for Cell 2

#### 20.22.12.4.2 Procedure

a) The SS activates all the Carriers.

b) MS is Switched on.

c) The SS sends an Attach Reject Message on Cell 1 with cause as “LA not allowed”.

d) MS is switched off and then switched on

e) The MS is manually commanded to set up an emergency call.

### 20.22.12.5 Test Requirements

1) After Step b) the response shall be on Carrier 2.

2) In step e), the MS shall access on carrier 2 with a channel request message, within 15 seconds of being commanded to set up the emergency call.

Note 2: Cell 2 is barred and hence it is not suitable for Camping.

## 20.22.13 Cell Reselection based on C32 quality

### 20.22.13.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

### 20.22.13.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest,the MS shall update RLA_P and calculate the value of C1,C31 and C32 for the serving cell and the non-serving cells; (GSM 05.08,10.1.2.)The MS shall make a cell re-selection if:

a. The path loss criterion parameter (C1) for the serving cell falls below zero.

b. A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell.The best cell is the cell with highest value of C32 among

   - Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion C31 >=0,or
   - All cells, if no cells fulfill the criterion C31>=0.
   - If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area:0
- in ready state, if the new cell is in the same routing area:

  GPRS_CELL_RESELECT_HYSTERE SIS.If the parameter C31_HYST is set,GPRS_CELL_RESELECT_HYSTE RESIS shall also be subtracted from the C31 value for the neighbour cells.

- in standby or ready state, if the new cell is in a different routing area:

  RA_RESELECT_HYSTERESIS.

- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERE SIS,C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.(GSM 05.08 10.1, GSM 05.08 10.1.2, GSM 05.08 10.1.3)

### 20.22.13.3 Test purpose

To verify that if C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied for the neighbour cells with the highest RLA value of those cells for which C32 is compared, Otherwise positive GRO shall be applied for all the neighbour cells.

20.22.13.4 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 | Carrier4 | Carrier5 | Carrier6 |
|---|---|---|---|---|---|---|
| RF Signal Level | -50 to -75 | -50 to -75 | -60 | -60 | -65 | -65 |
| RXLEV_ACCESS_MIN | -90 | | -90 | | -90 | |
| GPRS_RXLEV_ACCESS_ MIN | | -90 | | -90 | | -90 |
| GPRS_PRIORITY_CLAS S | | 1 | | 1 | | 1 |
| GPRS_RESELECT_OFFS ET | | | | 2 | | 10 |
| GPRS_HCS_THR | | -90 | | -80 | | -80 |
| C1 | 40 to 15 | 40 to 15 | 30 | 30 | 25 | 25 |
| C31 | | 30 to 5 | | 20 | | 10 |
| C32 | | 40 to 15 | | 32 | | 25 |

Note 1: All cells shall be in the same routing area

Note 2:Carrier 1, Carrier 3 and Carrier 5 are the BCCH Carriers which broadcasts the position of the PBCCH channels in the cell (Carrier 2, Carrier 4 and Carrier 6)

Note 3: Carrier 1 and Carrier 2 are for Cell1, Carrier 3 and Carrier 4 are for Cell2, Carrier 5 and Carrier 6 are for Cell3

20.22.13.4.2 Procedure

a) The SS activates all carriers.

b) MS is switched on.

c) GPRS attach procedure is completed by SS.

d) The RF level of Carrier 1 and 2 is decreased to –75 so that C32 (Cell 1) is lesser than that of the other cells

e) the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 4

20.22.13.5 Test Requirements

1) The MS shall camp on Cell 1 within 33 seconds after step b).

2) The MS is GPRS Attached after step c).

3) After step d), the MS camps on Carrier 4.

4) In step e), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

Note 1: C32(n) = C1(n)+GRO {n is the neighboring cells}

Note 2: If C32_QUAL is set on PBCCH then this positive GRO is added to only highest RLA_P, i.e. to Carrier4. So Cell 2 is selected. If C32_QUAL was not set, then GRO is added to all the carriers. So Carrier 6 would have been more suitable.

## 20.22.14 Cell Reselection in case Cell reselection occurred in the previous 15 seconds

20.22.14.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

### 20.22.14.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest,the MS shall update RLA_P and calculate the value of C1,C31 and C32 for the serving cell and the non-serving cells; (GSM 05.08,10.1.2.)The MS shall make a cell re-selection if:

a. The path loss criterion parameter (C1) for the serving cell falls below zero.

b. A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell.The best cell is the cell with highest value of C32 among

   - Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion C31 >=0,or
   - All cells, if no cells fulfill the criterion C31>=0.
   - If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area:0
- in ready state, if the new cell is in the same routing area:

  GPRS_CELL_RESELECT_HYSTERE SIS.If the parameter C31_HYST is set,GPRS_CELL_RESELECT_HYSTE RESIS shall also be subtracted from the C31 value for the neighbour cells.

- in standby or ready state, if the new cell is in a different routing area:

  RA_RESELECT_HYSTERESIS.

- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERE SIS,C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.(GSM 05.08 10.1, GSM 05.08 10.1.2, GSM 05.08 10.1.3)

### 20.22.14.3 Test purpose

To verify that while reselecting a cell, in case cell reselection occurred within the previous 15 seconds, the Hysteresis value subtracted from the C32 value of the neighbour cells is 5dB.

### 20.22.14.4 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 | Carrier4 | Carrier5 | Carrier6 |
|---|---|---|---|---|---|---|
| RF Signal Level | -70 | -70 | -70 | -70 | -66 | -66 |
| RXLEV_ACCESS_MI N | -90 | | -90 | | -90 | |
| GPRS_RXLEV_ACCE SS_MIN | | - 90 | | -90 | | -90 |
| GPRS_CRH | | | | +2 dB | | |
| Network Control Order | | NC2 | | NC0 | | NC0 |
| C1 | 20 | 20 | 20 | 20 | 24 | 24 |
| C2 | 20 | 20 | | | | |
| C32 | | | | 20 | | 24 |

Note 1: MS is GRPS attached on Cell 1 (Carrier 1 & 2) and in ready state. Ready timer set to default value

Note 2: Carrier 1, Carrier 3 & Carrier5 are the BCCH Carriers which broadcasts the position of the PBCCH channel in the cell (Carrier 2,Carrier 4 & Carrier 6)

Note 3: Cell 1 (Carriers 1 & 2), Cell 2 (Carriers 3 & 4), Cell 3 (Carriers 5 & 6)

Note 4: MS_TXPWR_MAX_CCH may be set to a value such that B is negative and C1 =A=RF Signal level - GPRS_RXLEV_ACCESS_MIN.

Note 5: Carriers should have a relative accuracy of +/- 2 db.

#### 20.22.14.4.2 Procedure

a) The SS activates Carrier 3 & 4.

b) Send PCCO message on PCCCH to Order the MS to change to Cell 2.

c) The SS waits for 5 secs and switches off Carriers 1 and 2.

d) The SS waits for 5 secs before activating Carrier 5 and Carrier 6 such that

C32 (Cell 2) > C32 (Cell 3) - 5dB

(to check that the MS does not reselect based on CRH in ready state when cell reselection has taken place in the previous 15 seconds).

e) The SS waits for 5 seconds

f) the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 4

### 20.22.14.5 Test Requirements

1) MS shall reselect to Cell 2 after step b).

2) The MS shall remain camped on Cell 2 after step d).

3) In step f), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

## 20.22.15 Cell Reselection/ ready state / no reselection

### 20.22.15.1 Definition and applicability

This test is applicable for all classes of GPRS Mobiles.

### 20.22.15.2 Conformance requirement

At least every 5 secs, the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non-serving cells (if necessary). GSM 05.08 Section 6.6.2.

The MS shall then check whether

i) the path loss criterion (C1) for the current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high.

ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds except:

a) in the case of a new cell being in a different Location Area or, for a GPRS MS, in a different routing area or always for a GPRS MS in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at-least CELL_RESELECT_HYSERISIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds;

### 20.22.15.3 Test purpose

To verify that the MS does not reselect because of a C2 criteria when GMM is in ready state (MS GPRS attached) and when the C2 value for adjacent cell exceeds the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB for a period of less than 5 seconds.

Note 1: The serving cell C2 decreases before mobile is out of ready state with the following conditions

a) C2 (Serving) + CELL_RESELECT_HYSTERESIS > C2 (Adjacent)

b) C2 (Serving) + CELL_RESELECT_HYSTERESIS < C2(Adjacent) for < 5 seconds

### 20.22.15.4 Method of Test

#### Initial Conditions

Parameters changed from the default values in Table 20.22.1

| Parameter | Carrier1 | Carrier2 |
|---|---|---|
| RF Signal Level | -55 to –75 | -60 |
| RXLEV_ACCESS_MIN | -90 | -90 |
| CRH | 10 | |
| C2 | 35 to 15 | 30 |

Note 1: MS must be configured to Initiate GPRS Attach on Power On.

Note 2: Cell reselection criteria from the above parameters

[C2(s) = 15 ] < [C2(n) = 30]

[C2(s)+CRH = 25] > [C2(n) = 30]

for a period of less than 5 seconds, where ‘s’ denotes the serving cell and ‘n’ denotes the non-serving cell. After 5 seconds, C2 of serving cell goes back to the original higher value.

#### 20.22.15.4.2 Procedure

a) The SS activates both carriers.

b) MS is switched on.

c) The SS completes the GPRS Attach procedure (Ready Timer set to default value).

d) The C2 value for carrier 1 is decreased by 10 dB for < 5 seconds.

e) the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1

### 20.22.15.5 Test requirements

1) The MS shall camp on carrier 1 within 33 seconds after step b), and Initiate the GPRS Attach procedure.

2) The MS is in GMM Ready State after step b)

3) The MS continues to be in ready state and does not initiate cell-reselection after step d).

4) In step d), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

# 20.22.16 Cell Reselection/ ready state/ Reselection and Cell update procedure

## 20.22.16.1 Definition and applicability

This test is applicable to all classes of GPRS Mobiles.

## 20.22.16.2 Conformance requirement

The MS is required to perform the following measurements to ensure that the path loss criterion to the serving cell is acceptable.(GSM 05.08 6.6.2).

At least every 5s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

1) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high.

2) The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds, except:

   a) in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERSIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds; or

   b) in case of a cell reselection occurring within the previous 15 seconds in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5dB for a period of 5 seconds.

   This indicates that it is a better cell.

A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state. If the RA has changed, a routeing area update is executed instead of a cell update.(GSM 03.60 6.9.11)

## 20.22.16.3 Test purpose

1. To verify that the MS reselects an adjacent cell because of a C2 criteria when GMM is in ready state (MS GPRS attached) and when the C2 value for adjacent cell exceeds the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB for a period of 5 seconds.

2. To verify that the MS performs the cell update procedure (when the cell is in the same Routing Area) and

   C2(Serving) + CELL_RESELECT_HYSTERESIS < C2(Adjacent) for at least 5 seconds.

## 20.22.16.4 Method of Test

### Initial Conditions

Parameters changed from the default values in Table 20.22.1.

| Parameter | Carrier1 | Carrier2 |
|---|---|---|
| RF Signal Level | -60 to -75 to –60 | -65 |
| RXLEV_ACCESS_MIN | -90 | -90 |
| CRH | 6 | |
| C2 | 30 to 15 to 30 | 25 |

Note 1: Cell reselection criteria from the above parameters

[C2(s) = 15 ] < [C2(n) = 25] for a period > 5 seconds

[C2(s)+CRH = 21] < [C2(n) = 25] for a period > 5 seconds

Procedure

a) The SS activates both carriers.

b) MS is switched on.

c) The SS completes the GPRS Attach procedure (Ready Timer set to default value).

d) The C2 value for carrier 1 is decreased by 15 dB for 10 seconds.

#### 20.22.16.5 Test requirements

1) The MS shall camp on carrier 1 within 33 seconds after step b) and initiate a GPRS Attach procedure

2) The MS is in GMM ready state after step c)

3) Verify that the MS reselects carrier 2 and initiates the Cell Update procedure after step d).

## 20.22.17 C2 reselection in another RA - no cell reselection

#### 20.22.17.1 Definition and applicability

This test is applicable for all classes of GPRS Mobiles.

#### 20.22.17.2 Conformance requirement

The MS is required to perform the following measurements to ensure that the path loss criterion to the serving cell is acceptable.(GSM 05.08 6.6.2)

At least every 5s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells(if necessary).The MS shall then check whether :

1) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high.

2) The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds, except;

   a) in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERSIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds; or

   b) in case of a cell reselection occurring within the previous 15 seconds in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5dB for a period of 5 seconds.

   This indicates that it is a better cell.

A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state. If the RA has changed, a routeing area update is executed instead of a cell update.(GSM 03.60 6.9.11)

#### 20.22.17.3 Test purpose

To verify that the MS does not reselecting an adjacent cell when the cell is in a routing area different from the serving cell's one and when the C2 value for the adjacent cell does not exceed the C2 value of the serving cell for a period of 5 seconds by at least CRH dB.

20.22.17.4 Method of Test

Initial Conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
|---|---|---|---|---|
| RF Signal | -60 to -80 | -65 | -75 | -75 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MI N | -100 | -100 | -100 | -100 |
| CRH | +10 | | | |
| C1 | 40 to 20 | 35 | 25 | 25 |
| C2 | 40 to 20 | 35 | 25 | 25 |
| GPRS Supported | Yes | Yes | Yes | Yes |

Note: Carrier 1 and Carrier 3 are in same routing area, Carrier 2 and Carrier 4 are in different routing area from Carrier 1 and 3.

20.22.17.4.2 Procedure

a) The SS activates all carriers.

b) MS is switched ON.

c) The SS shall complete the GPRS attach procedure (Ready timer set to default).

d) Decrease the RF level of Carrier 1 such that the following conditions are met for a period of less than 5 seconds.

- C2(adjacent) > C2(Serving)

C2+CRH(serving cell) < C2(adjacent cell)

e) the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1

20.22.17.5 Test requirements

1) MS shall camp on Carrier 1 after step b) and initiate a GPRS attach procedure.

2) The MS is in GMM ready state after step c)

3) After completion of step d) the MS shall not initiate reselection.

4) In step e), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

## 20.22.18 C2 reselection in another Routing Area - Routing Area Update

20.22.18.1 Definition and applicability

This test is applicable for all classes of GPRS Mobiles.

20.22.18.2 Conformance requirement

The MS is required to perform the following measurements to ensure that the path loss criterion to the serving cell is acceptable.(GSM 05.08 6.6.2)

At least every 5s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells(if necessary).The MS shall then check whether :

1) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high.

2) The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds, except;

a) in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERSIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds; or

b) in case of a cell reselection occurring within the previous 15 seconds in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5dB for a period of 5 seconds.

This indicates that it is a better cell.

A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state. If the RA has changed, a routeing area update is executed instead of a cell update (GSM 03.60 6.9.11).

### 20.22.18.3 Test purpose

1. To Verify that when the MS is in ready state, the MS reselects an adjacent cell when the cell is in a routing area different from the serving cell's one and when the C2 value for the adjacent cell exceed the C2 value of the serving cell for a period of 5 seconds by at least CRH dB.

2. To verify that the MS performs the Normal Routing Area Update procedure.

### 20.22.18.4 Method of Test

Initial Conditions:

| Parameter | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
|---|---|---|---|---|
| RF Signal | -60 to –80 | -65 | -75 | -75 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MI N | -100 | -100 | -100 | -100 |
| CRH | +10 | | | |
| C1 | 40 to 20 | 35 | 25 | 25 |
| C2 | 40 to 20 | 35 | 25 | 25 |

Note: Carrier 1 and Carrier 3 are in same routing area.

Carrier 2 and Carrier 4 are in different routing area from Carrier 1 and Carrier 3.

#### 20.22.18.4.2 Procedure

a) The SS activates all carriers.

b) MS is switched ON.

c) SS Completes the GPRS attach procedure (Ready timer set to default).

d) The RF level of Carrier 1 is decreased to –80 dBm such that the following conditions are met:

C2(serving) +CRH< C2(adjacent cell)

### 20.22.18.5 Test requirements

1) MS shall camp on Carrier 1 after step b) and initiate a GPRS attach procedure.

2) The MS is in GMM ready state after step c).

3) After step e) the MS shall reselect to Carrier 2. The MS shall initiate the Routing Area Update procedure.

# 20.22.19 Borders between routing areas - reselection of a GPRS cell in a homogenous network

## 20.22.19.1 Definition and applicability

This test is applicable for all classes of GPRS Mobiles.

## 20.22.19.2 Conformance requirement

The MS is required to perform the following measurements to ensure that the path loss criterion to the serving cell is acceptable.(GSM 05.08 6.6.2, GSM 03.22 3.4). A cell in a different registration area is only selected if it is better in terms of path loss criterion than all the cells in the current registration area by at least the value of CELL_RESELECT_HYSTERSIS (CRH). A GPRS MS uses a GPRS_CELL_RESELECT_HYSTERSIS (GCRH) if provided.

At least every 5s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells(if necessary).The MS shall then check whether :

1) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high.

2) The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds, except;

   a) in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERSIS (CRH) dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds; or

   b) in case of a cell reselection occurring within the previous 15 seconds in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5dB for a period of 5 seconds.

   This indicates that it is a better cell.

   A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state the RA has changed, a routing area update is executed instead of a cell update.(GSM 03.60 6.9.11)

## 20.22.19.3 Test purpose

To Verify that the MS does not reselect a cell in a different routing area when another one is suitable in the same routing area even if C2 is lower. The MS performs Cell Update procedure.

## 20.22.19.4 Method of Test

### Initial Conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
|---|---|---|---|---|
| RF Signal | -60 to –105 | -65 | -70 | -75 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MI N | -100 | -100 | -100 | -100 |
| CRH | +10 | | +10 | |
| C1 | 40 to -5 | 35 | 30 | 25 |
| C2 | 40 to -5 | 35 | 30 | 25 |

Note: Carrier 1 and Carrier 3 are in same routing area.

Carrier 2 and Carrier 4 are in different routing area then Carrier 1 and Carrier 3.

### 20.22.19.4.2 Procedure

a) The SS activates all carriers.

b) MS is switched ON.

c) The SS completes the GPRS attach procedure.

d) The RF level of Carrier 1 is decreased such that C1 is < 0 for 5 secs.

#### 20.22.19.5 Test requirements

1) The MS shall camp on carrier 1 after step b) and initiate the GPRS attach procedure.

2) The MS is in Ready State after Step c)

3) After step d) the MS shall reselect to carrier 3 as

C2(Carrier 2) > C2 (Carrier 3)

C2(Carrier 3) +CRH(Carrier 1) >C2(Carrier 2)

After reselection, cell update procedure shall be initiated.

## 20.22.20 Cell Reselection based on C32 - Cell Reselection on CCCH - PBCCH not present

#### 20.22. 20.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

#### 20.22.20.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest,the MS shall update RLA_P and calculate the value of C1,C31 and C32 for the serving cell and the non-serving cells; GSM 05.08,10.1.2.The MS shall make a cell re-selection if:

a. The path loss criterion parameter (C1) for the serving cell falls below zero.

b. A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among

- Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion C31 >=0,or
- All cells, if no cells fulfill the criterion C31>=0.
- If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area:0
- in ready state, if the new cell is in the same routing area:

  GPRS_CELL_RESELECT_HYSTERESIS.If the parameter C31_HYST is set,GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.

- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS,C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in sub-clauses 10.1.1 to 10.1.3 (of GSM 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6.(of GSM 05.08)

### 20.22.20.3 Test purpose

1. To verify that the MS reselects the correct cell based on the C32 parameter when GPRS_RESELECT_OFFSET,TEMPORARY_OFFSET and PENALTY_TIME parameters are transmitted in the Packet Measurment Order Message on PACCH.

2. To verify MS does not reselect on the basis of C31 as there are no HCS threshold values transmitted in the System Information Messages.

Note1: No PBCCH exists in any of the cells.

Note2 : GPRS reselection parameters are transmitted on the Packet Measurement Order Message on PACCH.

### 20.22.20.4 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 |
|---|---|---|
| RF Signal Level | -60 | -50 |
| RXLEV_ACCESS_MIN | -100 | -100 |
| GPRS_RXLEV_ACCESS _MIN | -100 | -100 |
| GPRS_RESELECT_OFFS ET | | 10 |
| GPRS_PENALTY_TIME | | 40sec |
| GPRS_TEMPORARY_OF FSET | | 30dB |
| C1 | 40 | 50 |
| C32 | 40 | 30 (within the duration of penalty time)<br>to 60 (after expiry of penalty time) |

Note 1: This test needs two GPRS cells with default settings specified in section 40 (channel combination without PBCCH)

#### 20.22.20.4.2 Procedure

a) The SS activates Carrier1

b) MS is switched on.

c) GPRS attach procedure is completed by SS.

d) SS activates Carrier2

e) Send GPRS reselection parameters through Packet Measurement Order message

f) The RF level of Carrier 1 is decreased such that

-C32 (Carrier2) < C32 (Carrier1) {with in the duration of penalty time sec}

-C32 (Carrier2) > C32 (Carrier1) {after expiry of penalty time sec}

g) the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 2

Note: GPRS_TEMPORARY_OFFSET applies a negative offset to C32 for the duration of GPRS_PENALTY_TIME.

#### 20.22.20.5 Test Requirements

1) The MS shall camp on carrier 1 within 33 seconds after step b) and initiates the attach procedure.

2) After step e), the MS shall not initiate reselection until penalty time expires and MS reselects to Carrier 2 after expiry of penalty time.

3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

## 20.22.21 Cell Reselection based on C32/GCRH value - Cell Reselection on CCCH - PBCCH not present

#### 20.22.21.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

#### 20.22.21.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest,the MS shall update RLA_P and calculate the value of C1,C31 and C32 for the serving cell and the non-serving cells; GSM 05.08,10.1.2.The MS shall make a cell re-selection if:

a. The path loss criterion parameter (C1) for the serving cell falls below zero.

b. A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell.The best cell is the cell with highest value of C32 among

   - Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion C31 >=0, or
   - All cells, if no cells fulfill the criterion C31 >= 0.
   - If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area:0
- in ready state, if the new cell is in the same routing area:

  GPRS_CELL_RESELECT_HYSTERESIS.If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.

- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS,C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in sub-clauses 10.1.1 to 10.1.3 (of GSM 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message.

Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 (of GSM 05.08).

### 20.22.21.3 Test purpose

To verify that the MS reselects the correct cell based on the C32 parameter when GPRS_CELL_RESELECT_HYSTERESIS value is available.

This GPRS_CELL_RESELECT_HYSTERESIS value shall be deducted from C31 also for neighbour cells if C31_HYST is set. GPRS Reselection Parameters are transmitted on the Packet Measurement Order message on PACCH.

Note: No PBCCH exists in any of the cells.

### 20.22.21.4 Method of test

#### Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 |
|---|---|---|---|
| RF SIGNAL LEVEL | -60 to -85 | -75 | -70 |
| RXLEV_ACCESS_MIN | -100 | -100 | -100 |
| GPRS_PRIORITY_CLAS S | 1 | 1 | 1 |
| GPRS_HCS_THR | -80 | -84 | -90 |
| GPRS_RESELECT_OFFS ET | | 16 | 4 |
| CELL_RESELECT_HYST ERISIS | 12 | 0 | 0 |
| NETWORK_CONTROL_ ORDER | NC2 | NC2 | NC2 |
| C1 | 40 to 15 | 25 | 30 |
| C31 | 20 to-5 | 9 | 20 |
| C32 | 40 to 15 | 29 | 22 |

Note 1: All cells shall be in the same routing area.

Note 2: As PBCCH is not supported, GCRH value maps onto CRH value as per Table4 of 05.08.

Note 3: CELL_RESELECT_HYSTERISIS is broadcast in System Information messages on BCCH.

Note 4: This test needs three GPRS cells with default settings specified in section 40 (channel combination without PBCCH).

#### Procedure

a) The SS activates all carriers.

b) MS is switched on.

c) GPRS attach procedure is completed by SS.

d) Send GPRS reselection parameters through Packet Measurement Order message.

e) The RF level of Carrier 1 is decreased such that C32 (Carrier1) is less than that of the other carriers.

f) the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 2.

### 20.22.21.5 Test Requirements

1) The MS shall camp on carrier 1 within 33 seconds after step b) and initiates the attach procedure.

2) After step e), the MS reselects to carrier2.

3) In step f), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

Note1: C32(n)= C1(n) + GRO -GCRH {If MS is in ready state, n is for neighbor cells}

Note2: IF C31_HYST is set, GCRH value shall also to be subtracted from C31 value for the neighbor cells.

Note 3: IF C31_HYST is set, then C31 of Carrier 2 becomes negative. Then among Carrier 2 and Carrier 3 (having same priority), the MS neglects Carrier 2 because C31 value is negative for Carrier 2 though possessing higher C32 value . So, the MS selects Carrier 3 as it meets the criteria C31>=0 among highest PRIORITY_CLASS.

C31(n)= RLA_P- HCS_THR - GCRH <as C31_HYST is set >

C31(n)=RLA_P_HCS_THR { if C31_HYST is ZERO }

## 20.22.22 Cell Reselection with cells in different Routing area - Cell Reselection on CCCH - PBCCH not present

### 20.22.22.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

### 20.22.22.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08,10.1.2. The MS shall make a cell re-selection if:

a. The path loss criterion parameter (C1) for the serving cell falls below zero.

b. A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among

   - Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion C31 >=0, or
   - All cells, if no cells fulfill the criterion C31>=0.
   - If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbor cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area:0
- in ready state, if the new cell is in the same routing area:

  GPRS_CELL_RESELECT_HYSTERESIS.If the parameter C31_HYST is set,GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.

- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS,C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in sub-clauses 10.1.1 to 10.1.3 (of GSM 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 (of GSM 05.08).

### 20.22.22.3 Test purpose

To verify that the MS reselects to the correct cell by calculating C32 correctly when one of the cells is in a different routing area. When the MS is in the Standby or ready state, on triggering of a reselection, when it considers a suitable cell which happens to be in a different Routing Area, the C32 value of the new cell must be reduced by RARH for comparison.

### 20.22.22.4 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 |
|---|---|---|---|
| RF Signal | -60 to -80 | -65 | -70 |
| GPRS_RXLEV_ACCESS_MIN | -90 | -90 | -90 |
| RA COLOUR | 001 | 010 | 001 |
| RARH | 10 | | |
| C1 | 30 to 10 | 25 | 20 |
| C32 | 30 to 10 | 15 | 20 |

Note 1: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet System Information messages.

Note 2: The value of RXLEV_ACCESS_MIN is obtained from the SI messages for reselection. If required the GPRS cell-reselection parameters are sent to the MS, so that it updates the cell-reselection parameters.

Note 3: When a neighbouring cell belongs to a different RA, RARH value is deduced from its C32 value during reselection, if the MS is in Standby or Ready state. In absence of PBCCH, when RARH is not available, CRH (from SI messages on BCCH) is used instead (GSM 05.08 10.1.1).

Note 4: This test needs three GPRS cells with default settings specified in section 40 (channel combination without PBCCH).

#### 20.22.22.4.2 Procedure

a) All the carriers are activated and MS is powered-ON.

b) SS completes the GPRS Attach procedure after (1).Ready Timer value = 30 seconds.

c) Send GPRS reselection parameters through Packet Measurement Order message.

d) SS waits for 30 seconds. The RF level of Carrier 1 is reduced to -80, hence Reselection is triggered.

e) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 2

### 20.22.22.5 Test Requirements

1) After step a) the MS camps on Carrier 1 and initiates the GPRS Attach procedure.

2) MS reselects to carrier 3 after step c).

3) In step e), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

# 20.22.23 Cell Reselection based on C32 - Cell Reselection on CCCH - PBCCH not supported

## 20.22.23.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

## 20.22.23.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest,the MS shall update RLA_P and calculate the value of C1,C31 and C32 for the serving cell and the non-serving cells; GSM 05.08,10.1.2.The MS shall make a cell re-selection if:

a. The path loss criterion parameter (C1) for the serving cell falls below zero.

b. A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell.The best cell is the cell with highest value of C32 among

   - Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion C31 >=0, or
   - All cells, if no cells fulfill the criterion C31>=0.
   - If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area:0
- in ready state, if the new cell is in the same routing area:

  GPRS_CELL_RESELECT_HYSTERESIS.If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS,C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in sub-clauses 10.1.1 to 10.1.3 (of GSM 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 (of GSM 05.08).

## 20.22.23.3 Test purpose

To verify that when all cells fulfill the criteria C31>=0, the MS selects the cell with the highest value of C32 among the cells with the highest PRIORITY_CLASS.

Note: GPRS reselection parameters are transmitted on the Packet Measurement Order Message on CCCH.

20.22.23.4 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 |
|---|---|---|---|
| RF Signal Level | -60 to -85 | -65 | -60 |
| RXLEV_ACCESS_MIN | -100 | -100 | -100 |
| CELL_RESELECT_OFFSET | 0 | 10 | 0 |
| GPRS_RESELECT_OFFSET | 0 | 10 | 10 |
| GPRS_PRIORITY_CLAS S | 0 | 3 | 0 |
| GPRS_HCS_THR | -90 | -90 | -90 |
| C1 | 40 to 15 | 35 | 40 |
| C31 | 30 to 5 | 25 | 30 |
| C32 | 40 to 15 | 45 | 50 |

Note 1: All cells shall be in the same routing area.

Note 2: This test needs three GPRS cells with default settings specified in section 40 (channel combination without PBCCH).

Procedure

a) The SS activates Carrier1.

b) MS is switched on.

c) GPRS attach procedure is completed by SS.

d) Send GPRS reselection parameters through Packet Measurement Order message.

e) SS activates Carrier2 and Carrier3.

f) The RF level of Carrier 1 is decreased such that C32(Carrier1) is less than that of the other Carriers.

g) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 2

20.22.23.5 Test Requirements

1) The MS shall camp on carrier 1 within 33 seconds after step b) and initiate the attach procedure.

2) After step f), the MS reselects to Carrier 2.

3) In step e), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

Note: All cells fulfil the criteria C31>=0. After checking C31 condition, MS Checks for highest PRIORITY_CLASS.

Though C32 value of Carrier 3 is greater than that of Carrier 2, Carrier 2 has higher PRIORITY_CLASS. So MS reselects to Carrier2.

## 20.22.24 Cell Reselection based on C32/cell of same priority/ Cell Reselection on CCCH - PBCCH not supported

20.22.24.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.24.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest,the MS shall update RLA_P and calculate the value of C1,C31 and C32 for the serving cell and the non-serving cells; GSM 05.08,10.1.2.The MS shall make a cell re-selection if:

a. The path loss criterion parameter (C1) for the serving cell falls below zero.

b. A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell.The best cell is the cell with highest value of C32 among

   - Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion C31 >=0, or
   - All cells, if no cells fulfill the criterion C31>=0.
   - If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area: 0
- in ready state, if the new cell is in the same routing area:

  GPRS_CELL_RESELECT_HYSTERESIS.If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.

- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS,C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in sub-clauses 10.1.1 to 10.1.3 (of GSM 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 (of GSM 05.08).

### 20.22.24.3 Test purpose

To verify that the MS selects the cell with the highest value of C32 when no cells fulfilling the criteria C31>=0 and all cells are of same priority.

Note: GPRS reselection parameters are transmitted on the Packet Measurement Order Message on CCCH.

20.22.24.4 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 |
|---|---|---|---|
| RF Signal Level | -60 to -85 | -70 | -64 |
| RXLEV_ACCESS_MIN | -100 | -100 | -90 |
| GPRS_RXLEV_ACCESS _MIN | -100 | -100 | -90 |
| GPRS_PRIORITY_CLAS S | 1 | 1 | 1 |
| GPRS_HCS_THR | -80 | -60 | -60 |
| C1 | 40 to 15 | 30 | 26 |
| C31 | 20 to -5 | -10 | -4 |
| C32 | 40 to 15 | 30 | 26 |

Note 1: All cells shall be in the same routing area

Note 2: This test needs three GPRS cells with default settings specified in section 40 (channel combination without PBCCH)

Procedure

a) The SS activates Carrier1.

b) MS is switched on.

c) GPRS attach procedure is completed by SS.

d) Send GPRS reselection parameters through Packet Measurement Order message.

e) SS activates Carrier2 and Carrier3.

e) The RF level of Carrier 1 is decreased such that C32 (Carrier1) is less than that of the other Carriers.

f) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 2.

20.22.24.5 Test Requirements

1) The MS shall camp on carrier 1 within 33 seconds after step b).

2) After step e), the MS reselects Carrier 2.

3) In step e), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

Note1: As C31 value of all other Carriers is less than zero, MS checks for highest C32 value only. Here all cells are of same priority.

Note2: RF signal level of Carrier3 is greater than that of Carrier2, because C32 value is less than that of Carrier2, MS reselects Carrier2, as C31 value is less than zero for all carriers.

## 20.22.25 Cell Reselection based on C32/C31<0/ Cell Reselection on CCCH - PBCCH not supported

20.22.25.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

20.22.25.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest,the MS shall update RLA_P and calculate the value of C1,C31 and C32 for the serving cell and the non-serving cells; GSM 05.08,10.1.2.The MS shall make a cell re-selection if:

a. The path loss criterion parameter (C1) for the serving cell falls below zero.

b. A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell.The best cell is the cell with highest value of C32 among

   - Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion C31 >=0, or
   - All cells, if no cells fulfill the criterion C31>=0.
   - If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area:0
- in ready state, if the new cell is in the same routing area:

  GPRS_CELL_RESELECT_HYSTERESIS.If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS,C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in sub-clauses 10.1.1 to 10.1.3 (of GSM 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6.(of GSM 05.08)

### 20.22.25.3 Test purpose

To verify that the MS selects the cell with the highest value of C32 when no cells fulfil the criteria C31>=0 and cells are of different priority.

Note: GPRS reselection parameters are transmitted on the Packet Measurement Order Message on CCCH.

### 20.22.25.4 Method of test

Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 |
|---|---|---|---|
| RF Signal Level | -60 to –85 | -65 | -70 |
| RXLEV_ACCESS_MIN | -100 | -90 | -100 |
| GPRS_PRIORITY_CLAS S | 1 | 3 | 1 |
| GPRS_HCS_THR | -60 | -60 | -60 |
| C1 | 40 to 15 | 25 | 30 |
| C31 | 0 to –25 | -5 | -10 |
| C32 | 40 to 15 | 25 | 30 |

Note 1: All cells shall be in the same routing area

Note 2: This test needs three GPRS cells with default settings specified in section 40 (channel combination without PBCCH)

Procedure

a) The SS activate first Carrier1.

b) MS is switched on.

c) GPRS attach procedure is completed by SS.

d) Send GPRS reselection parameters through Packet Measurement Order message.

e) SS activates Carrier2 and Carrier3.

f) The RF level of Carrier 1 is decreased such that C32(Carrier1) is lesser than that of the other Carriers.

g) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 2.

#### 20.22.25.5 Test Requirements

1) The MS shall camp on carrier 1 within 33 seconds after step b).

2) After step e), the MS camps on Carrier 3

3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST

Note1: As C31 value of all other Carriers is less than zero, it simply checks for highest C32 value. Here non-serving cells are not of same priority.

Note2: Though the PRORITY_CLASS of Carrier3 is lesser than that of Carrier2, as Carrier 3 has highest C32 value, MS reselects Carrier 3 only as all Carriers ‘s C31 value is negative.

## 20.22.26 Cell Reselection based on C32 quality / Cell Reselection on CCCH - PBCCH not supported

#### 20.22.26.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

#### 20.22.26.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest,the MS shall update RLA_P and calculate the value of C1,C31 and C32 for the serving cell and the non-serving cells; GSM 05.08,10.1.2.The MS shall make a cell re-selection if:

a. The path loss criterion parameter (C1) for the serving cell falls below zero.

b. A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell.The best cell is the cell with highest value of C32 among

   - Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion C31 >=0,or
   - All cells, if no cells fulfill the criterion C31>=0.
   - If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area:0
- in ready state, if the new cell is in the same routing area:

  GPRS_CELL_RESELECT_HYSTERESIS.If the parameter C31_HYST is set,GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.

- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS,C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in sub-clauses 10.1.1 to 10.1.3 (of GSM 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 (of GSM 05.08).

### 20.22.26.3 Test purpose

To verify that if C32_QUAL is set, positive GPRS_RESELECT_OFFSETvalues shall only be applied for the neighbour cells with the highest RLA value of those cells for which C32 is compared, Otherwise positive GRO shall be applied for all the neighbour cells.

Note: GPRS reselection parameters are transmitted on the Packet Measurement Order Message on PACCH.

### 20.22.26.4 Method of test

#### Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 |
|---|---|---|---|
| RF Signal Level | -60 to -90 | -60 | -70 |
| RXLEV_ACCESS_MIN | -100 | -90 | -100 |
| GPRS_PRIORITY_CLAS S | 1 | 1 | 1 |
| GPRS_RESELECT_OFFS ET | | 4 | 10 |
| GPRS_HCS_THR | -90 | -80 | -80 |
| C1 | 40 to 10 | 30 | 30 |
| C31 | 30 to 0 | 20 | 10 |
| C32 | 40 to 10 | 34 | 40 |

Note1: All cells shall be in the same routing area.

Note2: As PBCCH is not supported, C32_QUAL value is always ZERO, as per Table 4 of 05.08 . Table 4 gives info regarding Conversion from idle mode to GPRS cell re-selection parameters.

Note3: Since C32_QUALis ZERO, GPRS_RESELECT_OFFSET is added to all cells, irrespective of the values of RLA_P.

Note 4: This test needs three GPRS cells with default settings specified in section 40 (channel combination without PBCCH).

#### Procedure

a) The SS activates carrier1.

b) MS is switched on.

c) GPRS attach procedure is completed by SS.

d) Send GPRS reselection parameters through Packet Measurement Order message.

e) SS activates later carrier2 and carrier3.

f) The RF level of Carrier 1 is decreased such that C32(Carrier1) is lesser than that of the other Carriers.

g) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 3.

#### 20.22.26.5 Test Requirements

1) The MS shall camp on carrier 1 within 33 seconds after step b) and initiates the attach procedure.

2) After step d), the MS reselects to Carrier 3.

3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

Note1: While calculating C32 value positive GPRS_RESECT_OFFSET is added to C1 value. C32(n)=C1(n)+GPRS_RESELECT_OFFSET {n is for neighbouring cell}

Note2: GRO is added to all neighbouring cells as C32_QUAL value is ZERO.

Note 3: If C32_QUAL is set {if PBCCH exists}, then this positive GRO is added to only highest RLA_P, i.e to Carrier2 and then MS reselects Carrier2 (C32 value 34) instead of Carrier3 (C32 value 30) as highest C32 value is of Carrier2.

## 20.22.27 Cell Reselection in standby state - new cell in same routing area/ Cell Reselection on CCCH - PBCCH not supported

#### 20.22.27.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

#### 20.22.27.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest,the MS shall update RLA_P and calculate the value of C1,C31 and C32 for the serving cell and the non-serving cells; GSM 05.08,10.1.2.The MS shall make a cell re-selection if:

a. The path loss criterion parameter (C1) for the serving cell falls below zero.

b. A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell.The best cell is the cell with highest value of C32 among:

   - Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion C31 >=0, or
   - All cells, if no cells fulfill the criterion C31>=0.
   - If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area:0
- in ready state, if the new cell is in the same routing area:

GPRS_CELL_RESELECT_HYSTERESIS.If the parameter C31_HYST is set,GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.

- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS,C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in sub-clauses 10.1.1 to 10.1.3 (of GSM 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 (of GSM 05.08).

### 20.22.27.3 Test purpose

To verify that while reselecting a cell (where the new cell is in same RA),if the MS is in Ready state, the GCRH value is subtracted from its C32 during comparison. However, when in standby state,the Hysteresis value subtracted from the C32 value of the neighbour cells is 0 - during the comparison of C32 values of neighbour cells as a part of the Cell Reselection algorithm.

Note: As GCRH value can not be sent through either PMO or PCCO, we are considiering here CRH and C2 instead of GCRH and C32.

### 20.22.27.4 Method of test

#### Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 |
|---|---|---|---|
| RF Signal | -60 to -85 | -65 | -100 |
| CBA | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN | -90 | -90 | -90 |
| CRH | +6 | | |
| C1 | 30 to 5 | 25 | -10 |
| C2 | 30 to 5 | 19 (till ready timer expires) /25 | -16/-10 |

Note 1: All cells shall be in the same routing area.

Note 2: The CRH replaces the required GCRH (GSM 05.08, 10.1.1)and is broadcast in SI messages on BCCH.

Note 3: When a neighbouring cell belongs to same RA, GCRH value is deduced from its C32 value during reselection, if the MS is in Ready state. In case the Reselection is triggered when the MS is in Standby state the GCRH value used in calculation for C32 is equal to zero. In absence of PBCCH, when GCRH is not available, CRH (from SI messages on BCCH) is used instead.

Note 4: This test needs three GPRS cells with default settings specified in section 40 (channel combination without PBCCH).

#### Procedure

a) The SS activates all carriers.

b) MS is switched ON.

c) GPRS attach procedure is completed by SS.

d) Send GPRS reselection parameters through Packet Measurement Order message.

e) The RF level of Carrier 1 is decreased during the Ready State of the MS such that, its C2 value of carrier 1 becomes less than C2 value of carrier 2. However, since the CRH value is subtracted from the C2 of the neighbor cells and resulting C2 is not greater than serving cell C2, no reselection takes place. C1 value is less than for Carrier3. So it will not consider carrier3 at all.

f) SS waits for the ready timer to expire.

g) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 2.

#### 20.22.27.5 Test Requirements

1) MS shall camp on Carrier 1.after step b), with attach procedure initiated.

2) The Ready timer starts for the MS after step c).

3) The MS shall not reselect on carrier 2 after step e).

4) The MS reselects Carrier 2 after step f) as the MS is in the Standby state.

5) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

## 20.22.28 Cell Reselection/no suitable cell found/cell selection

#### 20.22.28.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

#### 20.22.28.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest,the MS shall update RLA_P and calculate the value of C1,C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2. The MS shall make a cell re-selection if:

a. The path loss criterion parameter (C1) for the serving cell falls below zero.

b. A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among:

   - Those cells that have the highest PRIORITY_CLASS among those that fulfill the criterion C31 >=0, or
   - All cells, if no cells fulfill the criterion C31>=0.
   - If the parameter C32_QUAL is set, positive GRPS_RESELECT_OFFSET values shall be only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area:0
- in ready state, if the new cell is in the same routing area:

  GPRS_CELL_RESELECT_HYSTERESIS.If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.

- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.

- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS,C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

Cell re-selection for any other reason (see GSM 03.22) shall take place immediately, but the cell that the MS was camped on shall not be returned to within 5 seconds if another suitable cell can be found. If valid RLA_P values are not available, the MS shall wait until these values are available and then perform the cell re-selection if it is still required. The MS may accelerate the measurement procedure within the requirements in subclause 10.1.1 to minimise the cell re-selection delay.

If no suitable cell is found within 10 seconds, the cell selection algorithm of GSM 03.22 shall be performed. Since information concerning a number of channels is already known to the MS, it may assign high priority to measurements on the strongest carriers from which it has not previously made attempts to obtain BCCH information, and omit repeated measurements on the known ones (05.08, 10.1.3).

The cell re-selection procedures defined in sub-clauses 10.1.1 to 10.1.3 (of GSM 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 (of GSM 05.08).

### 20.22.28.3 Test purpose

To verify that if cell re-selection is triggered and no suitable cell is found within 10 seconds, the cell selection procedures of GSM 03.22 are performed.

Note: If cell reselection occurs due to reasons other than Path loss criteria or more suitable neighbour cell, and no suitable cell is found within 10 seconds, the MS performs the cell selection procedures of GSM 03.22.

### 20.22.28.4 Method of test

#### Initial conditions

| Parameter | Carrier1 | Carrier2 | Carrier3 |
|---|---|---|---|
| RF Signal Level | -70 | -60 | -65 |
| RXLEV_ACCESS_MI N | -100 | -100 | -100 |
| Cell_Bar_Access | 01 | 1 | 0 |
| C1 | 30 | 40 | 35 |
| C2 | 30 | 40 | 35 |

Note 1: PBCCH is not supported in any of the cells

Note 2: All cells support GPRS

Note 3: MS is GRPS attached and in ready state. Ready timer value should be set to a large enough value to allow the test to be carried out (say 32 seconds)

Note 4: This test needs three GPRS cells with default settings specified in section 40 (channel combination without PBCCH)

#### Procedure

a) The SS activates Carrier 1.

b) MS is switched ON.

c) The SS shall complete the GPRS attach procedure.

d) Send GPRS reselection parameters through Packet Measurement Order message.

f) The SS activates Carrier 2 and Carrier 3.

g) The SS then bars Carrier 1.

h) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 3,

#### 20.22.28.5 Test Requirements

1) MS shall camp on Carrier 1 after step b) and initiate the attach procedure.

2) The MS shall camp on Carrier 3 after step g).

3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

(Since Carrier 2 is a better cell in terms of RF signal level, the MS should reselect to Carrier 2. However, Carrier 2 is not suitable as it is barred. Hence the Mobile initiates the Cell selection algorithm of GSM 03.22 and camps on Carrier 3 though it does not belong to the neighbour list.)

## 20.23 COMPACT Cell Selection and Reselection

The absolute accuracy of the MS signal level measurements is assumed to be +/-6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1, C31,C32 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be +/-3 dB for the signal levels used in the tests of this section. A difference of at least 5 dB is allowed for cases of discrimination between C1 and C31 and C32 values on different carriers.

NOTE 1: The accuracy of MS signal level measurements is specified in GSM 05.08. For all of the tests in this section, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in GSM 05.08 is +/-10 % except for PENALTY_TIME where it is +/-2 seconds. In the tests of this section, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is +/-2 % and the SS tolerance on power level +/-1 dB.

The cell re-selection tests defined in the following sections applies to the MSs attached to EGPRS if a CPBCCH exists in the serving cell. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 or clause 10 of GSM 05.08 and therefore tests defined in section 20 or 20.22 of GSM 11.10 apply respectively.

Unless otherwise stated in the method of test, in all of the tests of this section:

- The SIM is in the idle updated state in the default registration area with a PTMSI assigned at the beginning of each test.
- All carriers support COMPACT
- The Scheduling of Packet System information should be such that a complete set of consistent PSI messages can be decoded within 8 multiframes
- The mobile station supports COMPACT
- The mobile station is either packet data only capable or it does not support GSM CS services
- Time Group 0 is used to send CPBCCH / CPCCCH blocks for all ARFCN values (one active timegroup/carrier)
- 1 CPBCCH block and 3 CPPCH blocks are allocated in all timegroups (N_CCCH_NH = 4)
- All cells must be timeslot and frame synchronized to each other

**Table 20.23.1: Default values of the system information fields**

| Parameter | GSM 04.60 reference | Abbr. | Normal Setting |
|---|---|---|---|
| PRIORITY_CLASS | 11.2.20 | PC | 1 |
| C31_HYST | 11.2.20 | C31H | 0 |

## 20.23.1 Cell selection

### 20.23.1.1 Definition and applicability

Cell selection is a process in which an MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

### 20.23.1.2 Conformance requirement

1. The MS shall be able to select the strongest COMPACT cell within 120 seconds of switch on. This assumes a valid SIM, with PIN disabled and ideal radio conditions.

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

   2.1 (i) It should be a cell of the selected PLMN

   2.2 (ii) It should not be "barred" (see GSM 03.22 section 3.5.1)

   2.3 (iii) It should not be in an LA which is in the list of "forbidden LAs for roaming";

   2.4 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in section 3.6. (GSM 03.22, 3.2.1)

NOTE: Criteria 2.3 (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it, GSM 03.22, 3.2.1.

4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection, GSM 05.08, 12.3.4.

### 20.23.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1. when all cells support COMPACT.

2. To verify that:

   2.1 The MS does not select a cell of a PLMN, which is not the selected PLMN.

   2.2 The MS does not select a cell which is "barred".

   2.4 The MS does not select a cell with C1<0.

3. To verify that the MS selects suitable cells in descending order of received signal strength.

4. To verify that the MS does not select a cell with C1<0.

#### 20.23.1.4 Method of test

Initial conditions

Parameters changed from the default values in table 20.23.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBm) | -75 | -80 | -70 | -60 | -70 | -80 |
| CBA2 | 0 | 0 | 0 | 1 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | | | | | | -90 |
| GPRS_RXLEV_ACCESS_MIN | -90 | -90 | -90 | -90 | -60 | |
| MNC | | | 01 | | | |
| MCC | | | 002 | | | |
| C1 | 15 | 10 | 20 | 30 | -10 | 10 |

NOTE 1: For an E-GSM MS carrier 1 and carrier 5 ARFCNs are chosen in the E-GSM band, carrier 3 and carrier 4 ARFCNs in the P-GSM band.

NOTE 2: Carrier 6 is GSM BCCH and do not support GPRS/EGPRS.

Procedure

a) The SS activates and pages on the MS on all carriers. All Carriers are monitored for RA requests from the MS.

b) The MS is switched on.

#### 20.23.1.5 Test requirements

1) After step b), the first response from the MS shall be on carrier 1 within 123 seconds. There shall be no response from the MS on any other carrier

### 20.23.2 Cell reselection in Packet Idle mode

#### 20.23.2.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

#### 20.23.2.2 Conformance requirement

2. At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2 The MS shall make a cell re-selection if:

(i) The path loss criterion parameter (C1) for the serving cell falls below zero.

(ii) A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among

- those cells that have the highest PRIORITY_CLASS among those that fulfil the criterion C31 ≥ 0, or

all cells, if no cells fulfil the criterion C31 ≥ 0.

If the parameter C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on CPBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area: GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on CPBCCH of the serving cell.

### 20.23.2.3 Test purpose

To verify that the MS reselects the correct cell based on the C32 parameter when GPRS_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are transmitted in the System information messages.

1. To verify MS does not reselect on the basis of C31 as there are no HCS threshold values transmitted in the System information messages.

### 20.23.2.4 Method of test

#### Initial conditions

Parameters changed from the default values in table 20.23.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBm) | -70 | -70 | -65 | -60 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -90 | -100 | -85 | -90 |
| GPT | | | 40 s | |
| GRO | | -20 dB | 20 dB | |
| GTO | | | 20 dB | |
| C1 | 20 | 30 | 20 | 30 |
| C32 | 20 | 10 | 20-40 | 30 |

NOTE 1: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test.

NOTE 2: The HCS structure is omitted from the packet system information messages .

#### Procedure

a) The SS activates carriers 1 and 4. The MS is paged on Carriers 1 and 4. The SS starts monitoring carriers 1 and 4 for RA requests from the MS.

b) The MS is switched on.

c) The SS activates carriers 2 and 3. The MS is paged on both carriers. The SS monitors carriers 2 and 3 for RA requests from the MS.

#### 20.23.2.5 Test Requirements

1) After step b) there should be a response on carrier 4 within 123 seconds.

NOTE: The SS should ensure that the MS final state is in Packet Idle mode on carrier 4.

2) After step c) there should be no response on carrier 3 within 38 seconds of activating the carrier but MS should respond on carrier 3 within 50 seconds of activating the carrier.

NOTE: Minimum time of 38 seconds set by penalty timer on carrier 4 less 2 second tolerance. Maximum time includes 42 seconds (40 seconds + 2 second tolerance) for expiry of penalty timer on carrier 4, 2 seconds to decode CPBCCH, 1 second for reselection, since the MS will already have running averages on carrier 4, when the penalty timers expire, allow 50 seconds.

## 20.23.3 Priority of cells

#### 20.23.3.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

#### 20.23.3.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2 The MS shall make a cell re-selection if:

(i) The path loss criterion parameter (C1) for the serving cell falls below zero.

(ii) A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among

- those cells that have the highest PRIORITY_CLASS among those that fulfil the criterion C31 ≥ 0, or
- all cells, if no cells fulfil the criterion C31 ≥ 0.

If the parameter C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on CPBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area: GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on CPBCCH of the serving cell.

#### 20.23.3.3 Test purpose

1. To verify that the MS reselects to the correct cell by calculating C31 correctly when C31_HYST is set on the network.

#### 20.23.3.4 Method of Test

##### Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|---|---|---|---|---|---|
| RF Signal Level (dBm) | -60 | -80 | -65 | -70 | -70 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -95 | -100 | -102 |
| C31_HYST = 1 | | | | | |
| Priority Class | 1 | 1 | 1 | 1 | 3 |
| GRO | | 10 | 4 | 10 | 14 |
| HCS_THR | -90 | -70 | -76 | -80 | -80 |
| GCRH | 10 | | | | |
| C1 | 40 to 15 | 20 | 30 | 30 | 32 |
| C31 | 20 to 5 | -10 | 11 | 10 | 10 |
| C32 | 40 to 15 | 20 | 24 | 30 | 36 |

NOTE 1: GRO = GPRS_RESELECT_OFFSET, GCRH = GPRS_CELL_RESELECT_HYSTERESIS, RARH = RA_RESELECT_HYSTERESIS.

NOTE 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

##### Procedure

a) The MS is switched on and a downlink TBF is set-up on carrier 1

b) The SS waits 10 seconds.

c) The RF level of Carrier 1 is reduced to -85 dBm (C1=decreases to 15)

#### 20.23.3.5 Test Requirements

After step c) the MS should respond on carrier 4 within 10 seconds. (Carrier 2 should be rejected as C31 <0, Carrier 5 has a lower priority class than Carrier 3 and Carrier 4 so is rejected, even though C32= 36, out of carrier 3 and 4, Carrier 4 has highest C32 value.

Note: Time allowed includes 5 sec for MS to determine C32 on neighbour cell is higher, 2 seconds to decode CPBCCH and 1 sec for re-selection.

## 20.23.4 Cell re-selection with cells in different routing area

#### 20.23.4.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

#### 20.23.4.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2 The MS shall make a cell re-selection if:

(i) The path loss criterion parameter (C1) for the serving cell falls below zero.

(ii) A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among

- those cells that have the highest PRIORITY_CLASS among those that fulfil the criterion C31 ≥ 0, or
- all cells, if no cells fulfil the criterion C31 ≥ 0.

If the parameter C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on CPBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area: GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on CPBCCH of the serving cell.

### 20.23.4.3 Test purpose

To verify that the MS reselects to the correct cell by calculating C32 correctly when one of the cells is in a different routing area.

### 20.23.4.4 Method of Test

#### Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|---|---|---|---|---|---|
| RF Signal Level (dBm) | -60 | -70 | -70 | -70 | -70 |
| RAI | | | | Different | |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100 | -80 | -100 | -100 | -80 |
| GRO | | 4 | 4 | 6 | 4 |
| GCRH | 4 | | | | |
| RARH | 14 | | | | |
| C1 | 40 to 15 | 10 | 30 | 30 | 10 |
| C32 | 40 to 15 | 14 | 34 | 22 | 14 |

Note 1: GRO = GPRS_RESELECT_OFFSET, GCRH = GPRS_CELL_RESELECT_HYSTERESIS, RARH = RA_RESELECT_HYSTERESIS.

Note 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

Procedure

a) The MS is switched on and a downlink TBF is set-up on carrier 1

b) The SS waits 10 seconds.

c) The RF level of Carrier 1 is reduced to -85 dBm (C1=decreases to 15)

#### 20.23.4.5 Test Requirements

After step c) the MS should respond on carrier 3 within 10 seconds. (Carrier 4 C32=22 if RA_RESELECT_HYSTERESIS is used correctly by MS otherwise it will be 36 and MS will select carrier 4 incorrectly)

Note: Time allowed includes 5 sec for MS to determine C32 on neighbour cell is higher, 2 seconds to decode CPBCCH and 1 sec for re-selection.

### 20.23.5 Network controlled Cell re-selection in Transfer Mode

#### 20.23.5.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

#### 20.23.5.2 Conformance requirement

1. A cell re-selection command may be sent from the network to an MS. When the MS receives the command, it shall immediately re-select the cell according to the included cell description and change the network control mode according to the command (GSM 04. 60, GSM05.08: 10.1.4).

#### 20.23.5.3 Test purpose

To verify the MS can correctly interpret the network control commands and reselect to the correct cell.

#### 20.23.5.4 Method of Test

Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 |
|---|---|---|---|
| RF Signal Level (dBm) | -60 | -80 | -70 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -100 |
| NEWORK_CONTROL_ORDER | NC2 | NC0 | NC2 |
| NC_REPORTING PERIOD_T (s) | 0.96 | | 0.96 |
| C1 | 40-20 | 20-40 | 30 |
| C32 | 40-20 | 20-40 | 30 |

Note 1: The HCS structure is omitted from the packet system information messages on all the cells. Therefore C31 is not used.

20Procedure

a) The MS is switched on and a downlink TBF is set up on carrier 1.

b) The RF level of carrier 1 is reduced to –80dBm. (C32 becomes 20).

c) The SS waits 15 seconds after the RF level of carrier 1 is reduced before sending a reselect command to the MS to select carrier 3.

d) The RF level of carrier 2 is increased to –60dBm. (C32 becomes 40).

e) The SS waits 15 seconds after increasing the RF level of carrier 2 before the Network Control Order is changed to NC0 on carrier 3. The SS sends a RESET command to the MS.

#### 20.23.5.5 Test Requirements

1) After step b) there should be no response on carriers 2 or 3.

2) After step c) there should be a response on carrier 3 within 5 seconds of the re-select command. (The 3s = 2s for CPBCCH decoding + 1s fo re-selection + tolerance)

3) After step d) there should be no response on carriers 1 or 2.

4) After step e) there should be a response on carrier 2 within 3 seconds of the SS sending the RESET command. (The 3s = 2s for CPBCCH decoding + 1s for re-selection + tolerance).

## 20.23.6 Cell reselection timings

#### 20.23.6.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

#### 20.23.6.2 Conformance requirement

At least for every sample or every second, whichever is greatest, the MS shall calculate the value of C1, C31 and C32 for the serving cell and recalculate C1, C31 and C32 values for non serving cells (if necessary). The MS shall make a cell re-selection if:

i) The path loss criterion parameter (C1) for the serving cells falls below zero.

#### 20.23.6.3 Test purpose

1. To verify that the MS meets conformance requirement 6.2 (i) within time allowed.

#### 20.23.6.4 Method of Test

##### Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter | Carrier 1 | Carrier 2 |
|---|---|---|
| RF Signal Level (dBm) | -60 | -70 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -90 | -100 |
| GRO | | -28 |
| SPLIT_PG_CYCLE | 4 | 4 |
| C1 | 30 | 30 |
| C32 | 30 | 2 |

Note 1: The HCS structure is omitted from the system information messages on all the cells. Therefore C31 is not used.

Note 2: The RLA_P should be updated every 3.84 seconds with SPLIT_PG_CYCLE=4

##### Procedure

a) The SS activates both carriers and pages the MS on carrier 2. The SS starts to monitor carrier 2 for responses from the MS.

b) The MS is switched on.

c) The SS waits 120s before the RF level of carrier 1 is reduced to –100 dBm for 8 seconds. (During this period C1 becomes –10). Then the SS raises the level back to –60 dBm.The SS waits 20 seconds.

d) The SS reduces the RF level on carrier 1 to –100dBm.

#### 20.23.6.5 Test Requirements

1) After step c) there shall be no access on carrier 2.

2) After step d) there shall be access on carrier 2 within 23 seconds (allow 20s for c1 average to reach –10 + 2s to decode CPBCCH)

## 20.23.7 Downlink signalling failure

#### 20.23.7.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

#### 20.23.7.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. If DRX period split is supported, DSC shall be initialised to a value equal to the nearest integer to max(10,90/64*SPLIT_PG_CYCLE) where SPLIT_PG_CYCLE is an parameter defined at GPRS attach (see 05.02)

2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1, however never beyond the max value defined in 1.

3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.

4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, GSM 03.22, 4.5 (ii) and GSM 05.08, 6.5

NOTE: The network sends the paging subchannel for a given MS every 64/SPLIT_PG_CYCLE multiframes . The requirement for network transmission on the paging subchannel is specified in GSM 04.08. The MS is required to attempt to decode a message every time its paging subchannel is sent.

#### 20.23.7.3 Test purpose

1. To verify that the MS initialises the DSC counter in accordance with the conformance requirement. This is verified indirectly.

2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to max defined in 16.2.1). This is verified indirectly.

3 To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.

4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

#### 20.23.7.4 Method of Test

##### Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter | Carrier 1 | Carrier 2 |
|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | -65 | -60 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -95 | -100 |
| SPLIT_PG_CYCLE | 4 | 4 |
| C1 | 30 | 40 |
| C32 | 30 | 40 |

Note 1: The HCS structure is omitted from the system information messages on all the cells. Therefore C31 is not used.

Note 2: With SPLIT_PG_CYCLE=4 DSC should be set to 10, Paging blocks occur every 832 frames or 3.84 seconds.

Procedure

a) The MS is switched on. On carrier 2 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS. On carrier 1 the MS is paged continuously in all paging blocks.

b) After 40s the SS sends corrupted data (using random data, wrong parity bits see GSM 05.03, 4.3 & 4.1.2 or other lower layer error) in 2 successive paging blocks on carrier 2 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on 2 successive paging blocks should decrease the DSC to 2.

c) The SS monitors all accesses on both carriers for 40 s. (Allows the DSC counter to go back to maximum of 10, paging block every 3.84 secs)

d) The SS sends corrupted data in 3 successive paging blocks on carrier 2 and then reverts to sending normal data..

NOTE 2: Sending corrupted, data on 3 successive paging blocks should decrease the DSC to < 0 (-2) and cause a cell reselection.

e) The SS monitors all accesses on both carriers for 30s

### 20.23.7.5 Test requirements

1) There shall be no access on carrier 1 after step b).

2) The MS shall access on carrier 1 at test step e) within 3 seconds. (The time should be measured from the transmission of the complete 3rd successive paging block with errors and allows 2 secs for decoding CPBCCH).

## 20.23.8 COMPACT Cell re-selection when target cell is BCCH supporting EGPRS and different routing area

### 20.23.8.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

### 20.23.8.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2 The MS shall make a cell re-selection if:

(i) The path loss criterion parameter (C1) for the serving cell falls below zero.

(ii) A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among

- those cells that have the highest PRIORITY_CLASS among those that fulfil the criterion C31 ≥ 0, or

- all cells, if no cells fulfil the criterion C31 ≥ 0.

If the parameter C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on CPBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.

- in ready state, if the new cell is in the same routing area: GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.

- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.

- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on CPBCCH of the serving cell.

### 20.23.8.3 Test purpose

To verify that the MS is able to reselect a correct cell when target cell is non COMPACT cell supporting EGPRS,

### 20.23.8.4 Method of Test

#### Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|---|---|---|---|---|---|
| RF Signal Level (dBm) | -60 | -70 | -70 | -65 | -70 |
| RAI | | | | Different | |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100 | -80 | -100 | -100 | -80 |
| GRO | | 4 | 4 | 6 | 4 |
| GCRH | 4 | | | | |
| RARH | 6 | | | | |
| C1 | 40 to 15 | 10 | 30 | 35 | 10 |
| C32 | 40 to 15 | 10 | 30 | 35 | 10 |

Note1: GRO = GPRS_RESELECT_OFFSET, GCRH = GPRS_CELL_RESELECT_HYSTERESIS, RARH = RA_RESELECT_HYSTERESIS.

Note 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

Note 3: Carrier 4 is continuous GSM BCCH supporting EGPRS.

#### Procedure

a) The MS is switched on and a downlink TBF is set-up on carrier 1

b) The SS waits 10 seconds.

c) The RF level of Carrier 1 is reduced to -85 dBm (C1=decreases to 15)

#### 20.23.8.5 Test Requirements

1. After step c) the MS should respond on carrier 4 within 10 seconds. (Carrier 4 C32=35 if RA_RESELECT_HYSTERESIS is used correctly by MS)

Note : Time allowed includes 5 sec for MS to determine C32 on neighbour cell is higher, 2 seconds to decode CPBCCH and 1 sec for re-selection.

### 20.23.9 Cell re-selection when target cell is COMPACT CPBCCH in different routing area

#### 20.23.9.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

#### 20.23.9.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2 The MS shall make a cell re-selection if:

(i) The path loss criterion parameter (C1) for the serving cell falls below zero.

(ii) A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among

- those cells that have the highest PRIORITY_CLASS among those that fulfil the criterion C31 ≥ 0, or
- all cells, if no cells fulfil the criterion C31 ≥ 0.

If the parameter C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area: GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

#### 20.23.9.3 Test purpose

To verify that the MS reselects to the correct cell by calculating C32 correctly when the target cells are supporting COMPACT.

20.23.9.4 Method of Test

Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|---|---|---|---|---|---|
| RF Signal Level (dBm) | -60 | -60 | -70 | -70 | -65 | -70 |
| RAI | | | | | Different | |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -80 | -100 | -100 | -80 |
| GRO | | | 4 | 4 | 6 | 4 |
| GCRH | 4 | | | | | |
| RARH | 6 | | | | | |
| C1 | 40 to 15 | | 10 | 30 | 35 | 10 |
| C32 | 40 to 15 | | 10 | 30 | 35 | 10 |

Note1: GRO = GPRS_RESELECT_OFFSET, GCRH = GPRS_CELL_RESELECT_HYSTERESIS, RARH = RA_RESELECT_HYSTERESIS.

Note 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

Note 3: Carrier 1 is the BCCH carrier which broadcasts the position of the PBCCH channel supporting EGPRS in the cell (Carrier 2.)

Note 4: Carriers 3, 4 and 6 are continuous GSM BCCH's supporting EGPRS.

Procedure

a) The MS is switched on and a downlink TBF is set-up on carrier 2

b) The SS waits 10 seconds.

c) The RF level of Carriers 1 & 2 are reduced to -85 dBm (C1=decreases to 15)

20.23.9.5 Test Requirements

After step c) the MS should respond on carrier 5 within 10 seconds. (Carrier 5 C32=35 if RA_RESELECT_HYSTERESIS is used correctly by MS)

Note : Time allowed includes 5 sec for MS to determine C32 on neighbour cell is higher, 2 seconds to decode CPBCCH and 1 sec for re-selection.

# 20.24 SoLSA Cell Selection and Reselection

All GSM test cases presented in GSM 11.10 chapter 20 are applicable for SoLSA ME with or without LSA SIM. Nevertheless, if LSA SIM are used, it must be checked that no LSA subscription matches the information broadcast by the cell. Otherwise, test cases dealing with cell reselection would fail.

The cell re-selection tests defined in the following sections apply to the SoLSA MS if an LSA support exists in the serving cell. Otherwise the SoLSA MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of GSM 05.08.

The SS transmits one BCCH carrier per cell as indicated in the initial conditions for each test. These are referred to as carrier 1, carrier 2, etc. Each of these cell control channels are non-combined with SDCCHs. It is assumed that the SS can simultaneously transmit seven BCCH carriers and monitor three random access channels. In some cases, a test is performed in multiple stages in order that the requirements can be tested within the above constraints.

For any SoLSA MS all the carriers are in its supported band(s) of operation. For an E-GSM mobile station at least one of the carriers is in the extension band and one of the carriers is in the primary band.

Unless otherwise stated in the method of test, in all of the tests of this section:

- The SS is continuously paging the SoLSA MS on all carriers at the start of the test and does not respond to RACH requests from the SoLSA MS. Where a test specifies that the SoLSA MS is not paged on a particular carrier, only idle paging is transmitted according to GSM 04.18, 3.2.2.2.
- The default values of the system information data fields given in Table 20.24.1 are used.
- The SIM is in the idle updated state in the default location area with a TMSI assigned at the beginning of each test.
- The ARFCNs used for the carriers in each test are chosen from those in Table 20.24.1 with adjacent carriers separated by a minimum of three channels.

The absolute accuracy of the SoLSA MS signal level measurements is assumed to be +/-6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1, C2 or C4 values and 0.

The relative accuracy of the SoLSA MS signal level measurements is assumed to be +/-3 dB for the signal levels used in the tests of this section. A difference of at least 5 dB is allowed for cases of discrimination between C1, C2 or C4 values on different carriers.

NOTE 1: The accuracy of SoLSA MS signal level measurements is specified in GSM 05.08. For all of the tests in this section, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in GSM 05.08 is +/-10 % except for PENALTY_TIME where it is +/-2 seconds. In the tests of this section, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is +/-2 % and the SS tolerance on power level +/-1 dB.

NOTE 3: Additional to the abbreviations and definitions in 3G TR 21.905 the following definitions are used within this section:

Definitions:

| | |
|---|---|
| LSA cell | A cell in which SoLSA features are possible |
| LSA only SIM | A SIM with LSA only access |
| LSA SIM | A SIM with SoLSA files |
| Normal LSA cell | An LSA cell which is not an LSA exclusive access cell |
| Normal LSA SIM | An LSA SIM which is not an LSA only SIM |
| SoLSA ME | An ME supporting SoLSA |
| SoLSA MS | A SoLSA ME with LSA SIM |

**Table 20.24.1: Default values of the system information fields**

| Parameter | Reference | Abbr. | Normal Setting |
|---|---|---|---|
| Cell channel description | GSM 04.18, 10.5.2.1b | - | Any values |
| MAX retrans | GSM 04.18, 10.5.2.29 | - | 1 |

| | | | |
|---|---|---|---|
| | | | INFORMATION TYPE 2 (GSM 850 cell) and SYSTEM INFORMATION TYPE 2ter (other band cell). |
| LSA Identifier | GSM 24.008, 10.5.3.11 | LSA ID | Any value |
| LSA Offset | GSM 4.18,10.5.2.35; GSM 5.08, 9. Table 1 | LSA_OFFSET | 0 |
| Priority Threshold | GSM 4.18, 10.5.2.35 GSM 5.08, 9. Table 1 | PRIO_THR | 0 |

Default values of the SIM card:

The "LSA only access indicator" byte of file $EF_{SAI}$ on the SIM card shall be disabled unless otherwise stated. (see chap. 20.24. General remark 3.)

General initial conditions:

1. Following LSA shall be defined in the fields of the $EF_{SLL}$ (GSM 11.11, 10.4.1.2) and in the LSA descriptor files (GSM 11.11, 10.4.1.3) on the SIM card used for testing:

| | **LSA ID** | **CI** | **LAC** | **LAC + CI** | **PLMN code** (see NOTE) | **LSA Priority** | **Idle mode support** | **LSA indication for idle mode** |
|---|---|---|---|---|---|---|---|---|
| **LSA1** | 54<br>66.001 | | | | HPLMN | 0 | On | Off |
| **LSA2** | 66.000 | | | | HPLMN | 0 | Off | On |
| **LSA3** | 9.000.000 | | | 2 + [250..254] | HPLMN | 8 | On | On |
| **LSA4** | 9.000.001 | | | | HPLMN | 8 | Off | Off |
| **LSA5** | 30.000 | [256..260] | | | HPLMN | 15 | On | On |
| **LSA6** | 5 | | 1 | | HPLMN | 7 | On | On |
| **LSA7** | 100 | | 10 | 3 + 500 | HPLMN | 0 | On | On |
| **LSA8** | 9.000.001 | | | | VPLMN | 15 | On | On |
| **LSA9** | 54 | | | | VPLMN | 8 | On | On |

NOTE: VPLMN is a set of values for MCC and MNC for the LSA which shall not be in the list of the forbidden PLMNs on the SIM card.

2. List of values, that shall not be found in the SIM card, in order to be sure that the SoLSA MS is not subscribed to the LSA defined by the current carrier:

| | **LSA ID** | **CI** | **LAC** | **LAC + CI** |
|---|---|---|---|---|
| **LSA value** | [250..255] | [5000..5005] | 5 | 5 + [5000..5005] |

3. The initial condition "escape PLMN" is set to "Yes" in the following tables of this section, in case of testing with an LSA exclusive access cell.

General Remark

1) Elementary File $EF_{SLL}$ (GSM 11.11, 10.4.1.2)

The information regarding 'idle mode support' and 'LSA indication for idle mode' is contained on the SIM card, in the Elementary File $EF_{SLL}$ SoLSA LSA List (identifier '4F31') and, more precisely, in the 'Configuration Parameters' byte.

File $EF_{SLL}$ is represented in the table below, from GSM 11.11, 10.4.1.2.

Each LSA is described by one record that is linked to an LSA Descriptor file. Each record contains information of the PLMN, priority of the LSA, information about the subscription and may also contain a text string and/or an icon that identifies the LSA to the user. The text string can be edited by the user.

| Identifier: '4F31' | Structure: linear fixed | Optional |
|---|---|---|
| Record length: X + 10 bytes | Update activity: low | |

Access Conditions:

| | |
|---|---|
| READ | CHV1 |
| UPDATE | CHV1 |
| INVALIDATE | ADM |
| REHABILITATE | ADM |

| Bytes | Description | M/O | Length |
|---|---|---|---|
| 1 to X | LSA name | O | X bytes |
| X+1 | Configuration parameters | M | 1 byte |
| X+2 | RFU | M | 1 byte |
| X+3 | Icon Identifier | M | 1 byte |
| X+4 | Priority | M | 1 byte |
| X+5 to X+7 | PLMN code | M | 3 bytes |
| X+8 to X+9 | LSA Descriptor File Identifier | M | 2 byte |
| X+10 | LSA Descriptor Record Identifier | M | 1 byte |

- Configuration parameters

  Contents: Icon qualifier, control of idle mode support and control of LSA indication for idle mode.

  Coding:

  Idle mode support:

  Contents: The idle mode support is used to indicate whether the ME shall favour camping on the LSA cells in idle mode.

  b3 = 0:Idle mode support disabled
  b3 = 1:Idle mode support enabled

  LSA indication for idle mode:

  Contents: The LSA indication for idle mode is used to indicate whether or not the ME shall display the LSA name when the ME is camped on a cell within the LSA.

  b4 = 0:LSA indication for idle mode disabled
  b4 = 1:LSA indication for idle mode enabled

- Priority

  Contents: Priority of the LSA which gives the ME the preference of this LSA relative to the other LSAs.

  Coding:

  '0' is lowest priority, 'F' is highest.

- PLMN code

  Contents: MCC + MNC for the LSA.

  Coding: according to GSM 04.08 [15] and $EF_{LOCI}$.

- LSA Descriptor File Identifier:

  Contents: these bytes identify the EF which contains the LSA Descriptors forming the LSA.

  Coding: byte X+8: high byte of the LSA Descriptor file;
  byte X+9: low byte of the LSA Descriptor file.

- LSA Descriptor Record Identifier:

  Contents: this byte identifies the number of the first record in the LSA Descriptor file forming the LSA.

  Coding: binary.

2) Elementary Files „LSA Descriptor File“ (GSM 11.11, 10.4.1.3)

The information regarding the LSA identification is contained on the SIM card in the LSA descriptor files, more precisely in the byte ‘LSA descriptor type and number’ (see table below, from GSM 11.11, 10.4.1.3).

Residing under $DF_{SoLSA}$, there may be several LSA Descriptor files. These EFs contains one or more records again containing LSA Descriptors forming the LSAs. LSAs can be described in four different ways. As a list of LSA IDs, as a list of LAC + CIs, as a list of CIs or as a list of LACs. As the basic elements (LSA ID, LAC + CI, CI and LAC) of the four types of lists are of different length, they can not be mixed within one record.

Different records may contain different kinds of lists within the EFs.

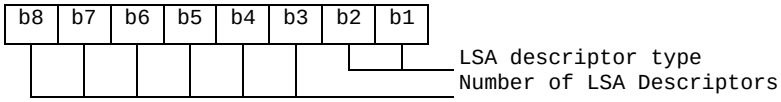
| Identifier: '4FXX' | Structure: linear fixed | Optional |
|---|---|---|
| Record length: n*X+2 bytes | Update activity: low | |
| Access Conditions:<br>READ CHV1<br>UPDATE ADM<br>INVALIDATE ADM<br>REHABILITATE ADM | | |

| Bytes | Description | M/O | Length |
|---|---|---|---|
| 1 | LSA descriptor type and number | M | 1 byte |
| 2 to X+1 | 1st LSA Descriptor | M | X bytes |
| X+2 to 2X+1 | 2nd LSA Descriptor | M | X bytes |
| | | | |
| (n-1)*X+2 to n*X+1 | nth LSA Descriptor | M | X bytes |
| n*X+2 | Record Identifier | M | 1 byte |

- LSA descriptor type and number:

  Contents: The LSA descriptor type gives the format of the LSA descriptor and the number of valid LSA Descriptors within the record.

Coding:



The bit 1 and bit 2 of the first byte of the LSA descriptor file identify the LSA descriptor type.

LSA descriptor type:

Contents: Gives the format of the LSA Descriptors.

b2, b1: 00: LSA ID. identification of the LSA is done by means of the LSA ID
01: LAC + CI identification of the LSA is done by means of the LAC + CI
10: CI identification of the LSA is done by means of the CI
11: LAC identification of the LSA is done by means of the LAC

3) Elementary File $EF_{SAI}$ (GSM 11.11, 10.4.1.1)

This EF contains the 'LSA only access indicator'.This EF shall always be allocated if $DF_{SoLSA}$ is present.

If the indicator is set, the network will prevent terminated and/or originated calls when the MS is camped in cells that are not included in the list of allowed LSAs in $EF_{SLL}$. Emergency calls are, however, always allowed.

The EF also contains a text string which may be displayed when the MS is out of the served area(s).

| Identifier: '4F30' | Structure: transparent | Optional |
|---|---|---|
| File size: X + 1 bytes | Update activity: low | |

Access Conditions:

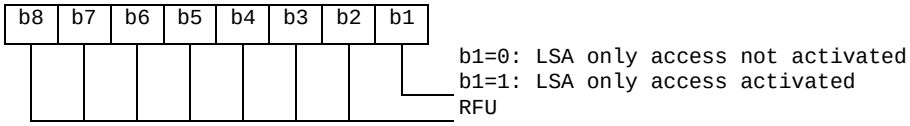
| | |
|---|---|
| READ | CHV1 |
| UPDATE | ADM |
| INVALIDATE | ADM |
| REHABILITATE | ADM |

| Bytes | Description | M/O | Length |
|---|---|---|---|
| 1 | LSA only access indicator | M | 1 byte |
| 2 to X+1 | LSA only access indication text | M | X bytes |

- LSA only access indicator

  Contents: indicates whether the MS is restricted to use LSA cells only or not.

  Coding:



- LSA only access indication text
  Contents: text to be displayed by the ME when it's out of LSA area.

## 20.24.1 SoLSA Cell Selection suitable cell

### 20.24.1.1 Definition and applicability

SoLSA Cell selection is a process in which a SoLSA MS, whenever a new PLMN is selected, attempts to find a "suitable cell" of that PLMN to camp on. Two methods of searching for a "suitable cell" are possible, normal cell selection and stored list cell selection. The process ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the SoLSA MS is camped on a cell, access to the network is allowed.

This test is applicable for all types of SoLSA MS.

### 20.24.1.2 Conformance requirement

1. The SoLSA MS shall be able to select the strongest "suitable cell" and be able to respond to paging on that cell within 30 seconds of switch on. This requires a valid normal LSA SIM with PIN disabled and ideal radio conditions; GSM 05.08, 6.1. And it requires a list of LSAs for the subscriber stored on the SIM; GSM 11.11, 10.4.1.2.

   NOTE: For camping on an LSA cell the LSA subscription is not necessary except for camping on an LSA exclusive access cell; GSM 03.73, 11.4.2.

   NOTE: There should be no extra delay in cell selection procedure; GSM 02.43, 4.2.2.

2. There are various requirements that a cell must satisfy before a SoLSA MS can perform normal camping on it:

   2.1 (i) It should be a cell of the selected PLMN.

   2.2 (ii) It should not be "barred".

   2.3 (iv) The radio path loss between SoLSA MS and BTS must be below a threshold set by the PLMN operator.

   2.4 (v) It should not be an LSA exclusive access cell to which the SoLSA MS does not subscribe.

   GSM 03.22, 3.2.1.

   NOTE: Criteria (iii) is not applicable for Cell Selection.

3. Initially the SoLSA MS looks for a cell which satisfies these 5 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a "suitable cell" is found, the SoLSA MS camps on it; GSM 03.22, 3.2.1.

4. The SoLSA MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; GSM 05.08, 6.4.

5. The LSA identification shall be stored on the SIM card in the LSA descriptor files.
   LSAs can be described in four different ways; GSM 11.11, 10.4.1.3:

   - as a list of LSA IDs (3 bytes)

   - as a list of LAC + CIs (4 bytes)

   - as a list of CIs (2 bytes)

   - as a list of LACs (2 bytes)

   - or as a combination of the lists above

### 20.24.1.3 Test purpose

The SoLSA MS shall be able to select a "suitable cell" according to the normal cell selection criteria. The identification of the LSA is done by using the LSA ID, the CI, the LAC or the LAC + CI.

20.23.1.4 Method of tests

20.24.1.4.1 SoLSA Cell Selection suitable cell / LSA identified by LSA ID

20.24.1.4.1.1 Initial conditions

a) Identification of the LSA by means of LSA ID (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1.; further initial conditions

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | 63/-50 |
| CBA | 0 | 0 | 1 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| MNC | | | | 1 |
| MCC | | | | 002 |
| C1 | 20 | -10 | 30 | 40 |
| LSA ID | 66.001 | 66.001 | 66.001 | 66.001 |
| LAC | 5 | 5 | 5 | 5 |
| CI | 5.000 | 5.001 | 5.002 | 5.003 |
| Matching LSA on SIM | LSA1 | LSA1 | LSA1 | - |
| Escape PLMN | No | No | No | No |

c) Parameters changed from the default values in Table 20.24.1;
further initial conditions (for test procedure step g)

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | OFF |
| CBA | 0 | 0 | 1 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | -10 | 30 | |
| LSA ID | 250 | 66.001 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5.000 | 5.001 | 5.002 | |
| Matching LSA on SIM | - | LSA1 | - | |
| Escape PLMN | Yes | Yes | No | |

20.24.1.4.1.2 Test Procedure

a) The SS activates all carriers according to Table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.

b) The SoLSA MS is switched on.

c) The SoLSA MS is switched off.

d) The SS monitors carrier 3 for RA requests from the SoLSA MS.

e) The SoLSA MS is switched on.

f) The SoLSA MS is switched off.

g) The SS is reconfigured according to Table c). The SS monitors carriers 1, 2, and 3 for RA requests from the SoLSA MS.

h) The SoLSA MS is switched on.

i) The SoLSA MS is switched off.

j) The SS is reconfigured and the level of carrier 2 increases to 33 dBµV / - 80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.

k) The SoLSA MS is switched on.

#### 20.24.1.4.1.3 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.1.4.1.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 seconds. There shall be no response from the SoLSA MS on the other monitored carriers.
NOTE: 33 seconds for cell selection, 10 seconds for communicating the data between SIM and ME, 5 seconds for search of a matching LSA on SIM: allow 50 seconds.

2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 seconds.
NOTE: Any potential access is likely to occur within 50 seconds.

3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 seconds (carrier 1 is not fulfilling conformance requirement 2.4).

4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 seconds. There shall be no response from the SoLSA MS on the other monitored carriers .

20.24.1.4.2 SoLSA Cell Selection suitable cell / LSA identified by LAC + CI

20.24.1.4.2.1 Initial conditions

a) Identification of the LSA by means of LAC + CI (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1; further initial conditions

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | 63/-50 |
| CBA | 0 | 0 | 1 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| MNC | | | | 1 |
| MCC | | | | 002 |
| C1 | 20 | -10 | 30 | 40 |
| LSA ID | 250 | 250 | 250 | 250 |
| LAC | 2 | 2 | 2 | 2 |
| CI | 250 | 251 | 252 | 253 |
| Matching LSA on SIM | LSA3 | LSA3 | LSA3 | - |
| Escape PLMN | No | No | No | No |

c) Parameters changed from the default values in Table 20.24.1;
further initial conditions (for test procedure step g)

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | OFF |
| CBA | 0 | 0 | 1 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | -10 | 30 | |
| LSA ID | 250 | 250 | 250 | |
| LAC | 2 | 2 | 5 | |
| CI | 5000 | 250 | 251 | |
| Matching LSA on SIM | - | LSA3 | - | |
| Escape PLMN | Yes | Yes | No | |

20.24.1.4.2.2 Test Procedure

a) The SS activates all carriers according to Table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.

b) The SoLSA MS is switched on.

c) The SoLSA MS is switched off.

d) The SS monitors carrier 3 for RA requests from the SoLSA MS.

e) The SoLSA MS is switched on.

f) The SoLSA MS is switched off.

g) The SS is reconfigured according to Table c). The SS monitors carriers 1, 2, and 3 for RA requests from the SoLSA MS.

h) The SoLSA MS is switched on.

i) The SoLSA MS is switched off.

j) The SS is reconfigured and the level of carrier 2 increases to 33 dBµV / - 80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.

k) The SoLSA MS is switched on.

#### 20.24.1.4.2.3 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.1.4.2.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 seconds. There shall be no response from the SoLSA MS on the other monitored carriers.

2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 seconds.
NOTE: Any potential access is likely to occur within 50 seconds.

3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 seconds.

4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 seconds. There shall be no response from the SoLSA MS on the other monitored carriers .

### 20.24.1.4.3 SoLSA Cell Selection suitable cell / LSA identified by CI

#### 20.24.1.4.3.1 Initial conditions

a) Identification of the LSA by means of CI (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1; further initial conditions

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | 63/-50 |
| CBA | 0 | 0 | 1 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| MNC | | | | 1 |
| MCC | | | | 002 |
| C1 | 20 | -10 | 30 | 40 |
| LSA ID | 250 | 250 | 250 | 250 |
| LAC | 5 | 5 | 5 | 5 |
| CI | 257 | 258 | 259 | 260 |
| Matching LSA on SIM | LSA5 | LSA5 | LSA5 | - |
| Escape PLMN | No | No | No | No |

c) Parameters changed from the default values in Table 20.24.1;
further initial conditions (for test procedure step g)

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | OFF |
| CBA | 0 | 0 | 1 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | -10 | 30 | |
| LSA ID | 250 | 250 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5.000 | 258 | 5.001 | |
| Matching LSA on SIM | - | LSA5 | - | |
| Escape PLMN | Yes | Yes | No | |

#### 20.24.1.4.3.2 Test Procedure

a) The SS activates all carriers according to Table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.

b) The SoLSA MS is switched on.

c) The SoLSA MS is switched off.

d) The SS monitors carrier 3 for RA requests from the SoLSA MS.

e) The SoLSA MS is switched on.

f) The SoLSA MS is switched off.

g) The SS is reconfigured according to Table c). The SS monitors carriers 1, 2, and 3 for RA requests from the SoLSA MS.

h) The SoLSA MS is switched on.

i) The SoLSA MS is switched off.

j) The SS is reconfigured and the level of carrier 2 increases to 33 dBµV / - 80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.

k) The SoLSA MS is switched on.

#### 20.24.1.4.3.3 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.1.4.3.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 seconds. There shall be no response from the SoLSA MS on the other monitored carriers.

2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 seconds.
NOTE: Any potential access is likely to occur within 50 seconds.

3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 seconds.

4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 seconds. There shall be no response from the SoLSA MS on the other monitored carriers .

20.24.1.4.4 SoLSA Cell Selection suitable cell / LSA identified by LAC

20.24.1.4.4.1 Initial conditions

a) Identification of the LSA by means of LAC (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1; further initial conditions

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | 63/-50 |
| CBA | 0 | 0 | 1 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| MNC | | | | 1 |
| MCC | | | | 002 |
| C1 | 20 | -10 | 30 | 40 |
| LSA ID | 250 | 250 | 250 | 250 |
| LAC | 1 | 1 | 1 | 1 |
| CI | 5.000 | 5.001 | 5.002 | 5.003 |
| Matching LSA on SIM | LSA6 | LSA6 | LSA6 | - |
| Escape PLMN | No | No | No | No |

c) Parameters changed from the default values in Table 20.24.1;
further initial conditions (for test procedure step g)

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/-70 | 13/-100 | 53/-60 | OFF |
| CBA | 0 | 0 | 1 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | -10 | 30 | |
| LSA ID | 250 | 250 | 250 | |
| LAC | 5 | 1 | 5 | |
| CI | 5.000 | 5.001 | 5.002 | |
| Matching LSA on SIM | - | LSA6 | - | |
| Escape PLMN | Yes | Yes | No | |

20.24.1.4.4.2 Test Procedure

a) The SS activates all carriers according to Table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.

b) The SoLSA MS is switched on.

c) The SoLSA MS is switched off.

d) The SS monitors carrier 3 for RA requests from the SoLSA MS.

e) The SoLSA MS is switched on.

f) The SoLSA MS is switched off.

g) The SS is reconfigured according to Table c). The SS monitors carriers 1, 2, and 3 for RA requests from the SoLSA MS.

h) The SoLSA MS is switched on.

i) The SoLSA MS is switched off.

j) The SS is reconfigured and the level of carrier 2 increases to 33 dBµV / - 80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.

k) The SoLSA MS is switched on.

#### 20.24.1.4.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.1.4.4.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 seconds. There shall be no response from the SoLSA MS on the other monitored carriers.

2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 seconds.
NOTE: Any potential access is likely to occur within 50 seconds.

3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 seconds.

4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 seconds. There shall be no response from the SoLSA MS on the other monitored carriers .

## 20.24.2 SoLSA Cell (Re)Selection Emergency Call

### 20.24.2.1 Definition and applicability

This test is applicable for all types of SoLSA MS.

### 20.24.2.2 Conformance requirement

1. The SoLSA MS shall be able to initiate emergency calls when no “suitable cells” of the selected PLMN are available, but at least one acceptable cell is available. The SoLSA MS is in limited service state.
An LSA exclusive access cell is “suitable” only if the LSA of the cell is one of the allowed LSA according to the SIM. Emergency calls are always allowed if no cells are found suitable; GSM 03.73, 11.4.2

2. When in a limited service state and if not camped on a cell, the MS shall monitor the received signal level of all RF channels within its band of operation, and search for a BCCH carrier which has C1>0 and which is not barred. When such a carrier is found, the MS shall camp on that cell, irrespective of the PLMN identity; GSM 05.08, 6.8.

3. The MS shall perform cell reselection at least among the cells of the PLMN of the cell on which the MS has camped, according to the algorithm of GSM 03.22, except that a zero value of CELL_RESELECT_HYSTERESIS shall be used.

### 20.24.2.3 Test purpose

1. To verify that the SoLSA MS shall be able to initiate emergency calls when no “suitable cells” of selected PLMN are available, but at least one acceptable cell is available. The available cells are

   a) LSA exclusive access cells of the selected PLMN with no LSA subscription

   b) Normal LSA cell of forbidden PLMN

2. To verify that the MS selects a cell with C1>0 and CBA = 0 when no suitable cells of the selected PLMN are available.

3. To verify that the MS, when performing cell reselection in the limited service state, uses CELL_RESELECT_HYSTERESIS = 0, GSM 05.08, 6.8.

20.24.2.4 Method of test

20.24.2.4.1 Initial conditions

a) Parameters changed from the default values in Table 20.24.1; further initial conditions for LSA exclusive access cell

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dbµV emf() / dBm) | 38/ -75 | 23 / -90 | 33 / -80 | OFF |
| RXLEV_ACCESS_MIN (dBm) | -90 | -80 | -90 | |
| CBA | 1 (barred) | 0 | 0 | |
| MCC, MNC | Home PLMN | Home PLMN | Home PLMN | |
| CRH (dB) | 0 | 0 | 14 | |
| C1 | 15 | -10 | 10 | |
| LSA_ID | 250 | 251 | 252 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | - | - | |
| Escape PLMN | Yes | Yes | Yes | |

b) Parameters changed from the default values in Table 20.24.1; further initial conditions for normal LSA cell

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 38/ -75 | 23 / -90 | 33 / -80 | OFF |
| RXLEV_ACCESS_MIN (dBm) | -90 | -80 | -90 | |
| CBA | 1 (barred) | 0 | 0 | |
| MCC, MNC | forbidden | forbidden | forbidden | |
| CRH (dB) | 0 | 0 | 14 | |
| C1 | 15 | -10 | 10 | |
| LSA_ID | 250 | 251 | 252 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | - | - | |
| Escape PLMN | No | No | No | |

NOTE: All the BCCH carriers belong to the same PLMN, which is not the MS's home PLMN and which is in the SIM's forbidden PLMN list.

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a).

- using initial conditions b).

20.24.2.4.2 Test Procedure

a) The SS activates the carriers. The SS monitors carriers 1, 2 and 3 for RA requests for the duration of the test.

b) The SoLSA MS is switched on.

c) 60 seconds after switch on, an emergency call is initiated on the SoLSA MS.

d) The SS changes the CBA of carrier 1 to 0.

NOTE: The MS should reselect carrier 1 because it should not take into account the CRH value of 14 but use 0 instead.

e) After 350 s an emergency call is initiated on the SoLSA MS.

NOTE: 330 seconds to detect change of BCCH data on neighbour cell, 15 seconds to perform reselection of carrier 1 since the SoLSA MS already has a running average on carrier 1, 5 seconds for search of a matching LSA on SIM.

#### 20.24.2.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.2.4.4 Test requirements

1) In step c), the first access of the SoLSA MS shall be on carrier 3.

2) In step e), the first access of the SoLSA MS shall be on carrier 1.

## 20.24.3 SoLSA Cell Reselection / idle mode support enabled

General Remark

The identification of the LSA is done by means of the LSA ID, see General Remark 2) in chapter 20.24.

### 20.24.3.1 General conformance requirement

1. There are various requirements that a cell must satisfy before a SoLSA MS can perform normal camping on it:

   i) It should be a cell of the selected PLMN.

   ii) It should not be “barred”.

   iii) It should not be in an LA which is in the list of “forbidden LA for roaming”.

   iv) The radio path loss between SoLSA MS and BTS must be below a threshold set by the PLMN operator.

   v) It should not be an LSA exclusive access cell to which the SoLSA MS does not subscribe.

   GSM 03.22, 3.2.1.

2. While camped on a cell of the selected PLMN (“camped normally”), the SoLSA MS may need to select a different cell (“normal cell reselection” state). The following events trigger a cell reselection:

   - The cell camped on (current serving cell) has become barred.

   - There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

   The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

   GSM 03.22, 4.5.

3. At least for every new sample or every second, whichever is the greatest, the SoLSA MS calculates the value of C1, C2 and C4 for the serving cell and the non-serving cells. The SoLSA MS shall make a cell reselection if:

   i) The path loss criterion parameter (C1) for the serving cell falls below zero for a period of 5 seconds.

   ii) A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell for a period of 5 seconds. The best cell is:

   - the cell with the highest value of C2 + LSA_OFFSET among those cells that have highest LSA priority among those that fulfil the criteria $C4 \geq 0$, or

   - the cell with the highest value of C2 among all cells, if no cell fulfil the criterion $C4 \geq 0$.

LSA_OFFSET and LSA ID(s) are broadcast on BCCH. LSA priority is defined by the list of LSAs for the subscriber stored on the SIM. Cells with no LSA priority, e.g. non-LSA cells, are given LSA priority lower than 0. If no LSA_OFFSET parameter is broadcast, LSA_OFFSET shall be set to 0.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C2 value for the neighbour cells:

- if the new cell is in the same location area: 0.
- if the new cell is in a different location area:
  CELL_RESELECT_HYSTERESIS, which is broadcast on BCCH of the serving cell.
- in case of a cell reselection occurred within the previous 15 seconds: 5 dB.

GSM 05.08, 6.6.3.

4. Cell reselection for any other reason shall take place immediately, but the cell that the SoLSA MS was camped on shall not be returned to within 5 seconds if another suitable cell can be found. If valid receive level averages are not available, the SoLSA MS shall wait until these values are available and then perform the cell reselection if it is still required. The SoLSA MS may accelerate the measurement procedure within the requirements in 05.08, subclause 6.6.1 to minimise the cell reselection delay. GSM 05.08, 6.6.3.

5. If no suitable cell is found within 10 seconds, the cell selection algorithm of GSM 03.22 shall be performed. Since information concerning a number of channels is already known to the SoLSA MS, it may assign high priority to measurements on the strongest carriers from which it has not previously made attempts to obtain BCCH information, and omit repeated measurements on the known ones. GSM 05.08, 6.6.3.

6. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

   i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high.

   ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds, except;

      a) in the case of the new cell being in a different location area or, for a GPRS MS, in a different routing area or always for a GPRS MS in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds;

      or

      b) in case of a cell reselection occurring within the previous 15 seconds in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5 dB for a period of 5 seconds.

   This indicates that it is a better cell.

   GSM 05.08, 6.6.2.

7. The SoLSA MS shall attempt to decode the full BCCH data of the serving cell at least every 30 seconds; GSM 05.08, 6.6.1.

8. The signal strength threshold criterion parameter C4 is used to determine whether prioritised LSA cell reselection shall apply and is defined by:

   C4 = A – PRIO_THR

   where

   A = RLA_C – RXLEV_ACCESS_MIN

   and PRIO_THR is the signal threshold for applying LSA reselection. PRIO_THR is broadcast on the BCCH. If the idle mode support is disabled for the LSA (GSM 11.11, 10.4.1.2) or if the cell does not belong to any LSA to which the MS is subscribed or if no PRIO_THR parameter is broadcast, PRIO_THR shall be set to ∞.

GSM 05.08, 6.4.

9. The LSA identification is stored on the SIM card within the descriptor file for the LSA. GSM 11.11, 10.4.1.3.

## 20.24.3.2 SoLSA Cell Reselection / idle mode support enabled / LSA Priority

### 20.24.3.2.1 Definition and applicability

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled. (See General Remark 1. in chapter 20.24).

This test is applicable for all types of SoLSA MS.

### 20.24.3.2.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

   - The cell camped on (current serving cell) has become barred.

   - There is a better cell (in terms of the path loss criterion C2) in the same LA.

   The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

   GSM 03.22, 4.5.

2. A SoLSA MS with SIM indicating LSA subscription shall always try to reselect the cell with highest LSA priority according to the information stored on the SIM. GSM 03.73, 11.4.2.

### 20.24.3.2.3 Test purpose

To verify that the SoLSA MS when idle mode support for SoLSA on the SIM card is enabled shall favour camping on those LSA cells with the highest LSA priority the SoLSA MS is subscribed to.

### 20.24.3.2.4 Method of test

#### 20.24.3.2.4.1 Initial conditions

a) Identification of the LSA by means of LSA ID (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 63/ -50 | 53/ -60 | 33 / -80 | OFF |
| CBA | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| LAC | | | | |
| C1 | 40 | 30 | 10 | |
| C2 | 40 | 30 | 10 | |
| C4 | 40 | 30 | 10 | |
| LSA IDs | 66.001<br>250<br>251<br>252 | 9.000.000<br>66.001<br>250<br>251 | 30.000<br>66.001<br>9.000.000<br>250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |

c) Further initial conditions (Carrier 1-3 are normal LSA cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM | LSA1 | LSA1, LSA3 | LSA1, LSA3, LSA5 | |
| Escape PLMN | No | No | No | |

d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM | LSA1 | LSA1, LSA3 | LSA1, LSA3, LSA5 | |
| Escape PLMN | Yes | Yes | Yes | |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c)
- using initial conditions a), b) and d)

#### 20.24.3.2.4.2 Test Procedure

a) The SS activates carriers 1, 2, and 3 and monitors these carriers for RA requests from the SoLSA MS.

b) The SoLSA MS is switched on.

c) After approx. 60s the SS is reconfigured and carrier 3 becomes barred (CBA = 1) in order to give the MS the time to perform cell reselection on carrier 3

d) The SS is reconfigured and the level of carrier 2 is decreased to 13 dBµVemf() / -100 dBm. (C2 decreases to –10 dB).

#### 20.24.3.2.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.3.2.4.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 (highest C1) within 50 seconds (Cell Selection).

   NOTE: 33 seconds for the MS to read the BCCH of carrier 3 (30 seconds + 10 %), 10 seconds for communicating the data between SIM and ME, 5 seconds for search of a matching LSA on SIM. Total 48 seconds, allow 50 seconds.

2) The following response from the SoLSA MS shall be received on carrier 3 within 25 seconds after the first response on carrier 1 (Reselection, highest LSA Priority (15)).

   NOTE: 5 seconds for the running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 1, 1 second to perform RA, 5 seconds for search of a matching LSA on SIM. Total 23,4 seconds, allow 25 seconds.

3) After step c), there shall be response from the SoLSA MS on carrier 2 within 55 seconds after carrier 3 has been barred (Highest LSA Priority on the SIM (8)).

   NOTE: 30 seconds for the MS to read the BCCH of carrier 3, 20 seconds to reselect carrier 2, 5 seconds for search of a matching LSA on SIM: total 55 seconds.

4) After step d), there shall be response from the SoLSA MS on carrier 1 within 25 seconds after carrier 2 has been reconfigured.

NOTE: 5 seconds for the running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 1, 1 second to perform RA, 5 seconds for search of a matching LSA on SIM. Total 23,4 seconds, allow 25 seconds.

## 20.24.3.3 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / different location area

### 20.23.3.3.1 Definition and applicability

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled (See General Remark 1. of chapter 20.24).

This test is applicable for all types of SoLSA MS.

### 20.24.3.3.2 Conformance requirement

1. While camped on a cell of the selected PLMN (“camped normally”), the SoLSA MS may need to select a different cell (“normal cell reselection” state). The following events trigger a cell reselection:

   - The cell camped on (current serving cell) has become barred.
   - There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

   The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

   GSM 03.22, 4.5.

2. A SoLSA MS with SIM indicating LSA subscription shall always try to reselect the cell with highest LSA priority according to the information stored on the SIM. GSM 03.73, 11.4.2.

3. The LSA identification shall be stored on the SIM card in the LSA descriptor files (EF).
   LSAs can be described in four different ways (see GSM 11.11, 10.4.1.3):

   - as a list of LSA IDs (3 bytes)
   - as a list of LAC + CIs (4 bytes)
   - as a list of CIs (2 bytes)
   - as a list of LACs (2 bytes)
   - or as a combination of the lists above

### 20.24.3.3.3 Test purpose

To verify that the SoLSA MS when idle mode support for SoLSA on the SIM card is enabled shall favour camping on those LSA cells with the highest C2 among those cells with the highest LSA priority the SoLSA MS is subscribed to even if the cell belongs to a different location area.

### 20.24.3.3.4 Method of test

#### 20.24.3.3.4.1 Initial conditions

a) Identification of the LSA by means of LSA ID (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/ -70 | 33/ -80 | 33 / -80 | 13 / -100 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| CRH (dB) | 10 | | 10 | |
| C1 | 20 | 10 | 10 | -10 |
| C2 | 20 | 10 | 10 | -10 |
| C4 | 20 | 10 | 10 | -10 |
| LSA ID | 54 | 54 | 54 | 30.000 |
| LAC | 5 | 5 | 3 | 3 |
| CI | 5000 | 5001 | 5002 | 5003 |

c) Further initial conditions (Carrier 1-3 are normal LSA cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM | LSA1 | LSA1 | LSA1 | LSA5 |
| Escape PLMN | No | No | No | No |

d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM | LSA1 | LSA1 | LSA1 | LSA5 |
| Escape PLMN | Yes | Yes | Yes | Yes |

e) Identification of the LSA by means of:
- LSA ID on Carrier 1
- LAC + CI on Carrier 2
- LAC on Carrier 3
- CI on carrier 4

(see chap. 20.24. General remark 2.)

f) Parameters changed from the default values in Table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/ -70 | 33/ -80 | 33 / -80 | 13 / -100 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| CRH (dB) | 10 | | 10 | |
| C1 | 20 | 10 | 10 | -10 |
| C2 | 20 | 10 | 10 | -10 |
| C4 | 20 | 10 | 10 | -10 |
| LSA ID | 100 | 250 | 250 | 250 |
| LAC | 3 | 3 | 10 | 5 |
| CI | 5000 | 500 | 5002 | 256 |

g) Further initial conditions (Carrier 1-4 are normal LSA cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM | LSA7 | LSA7 | LSA7 | LSA5 |
| Escape PLMN | No | No | No | No |

h) Further initial conditions (Carrier 1-4 are LSA exclusive access cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM | LSA7 | LSA7 | LSA7 | LSA5 |
| Escape PLMN | Yes | Yes | Yes | Yes |

Run the following test procedure twice by using four different sets of initial conditions:

- using initial conditions a), b) and c)
- using initial conditions a), b) and d)
- using initial conditions e), f) and g)
- using initial conditions e), f) and h)

#### 20.24.3.3.4.2 Test Procedure

a) The SS activates carriers 1, 2, and 3 and monitors these carriers for RA requests from the SoLSA MS. Carrier 4 is switched off.

b) The SoLSA MS is switched on.

c) The SS is reconfigured and the level of carrier 3 is increased to 63 dBµV emf() / -50 dBm (C2 increases to 40 dB).

d) The SS is reconfigured and the level of carrier 2 is increased to 63 dBµV emf() / -50 dBm (C2 increases to 40 dB).

e) The SS is reconfigured and carrier 3 becomes barred (CBA = 1).

f) The SS activates carrier 4 and monitors carriers 1, 2, and 4. Carrier 3 is switched off.

g) The SS is reconfigured and the level of carrier 4 is increased to 33 dBµV emf () / -80 dBm (C2 increases to 10 dB).

#### 20.24.3.3.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.3.3.4.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 seconds. (Cell Selection, highest C1). There shall be no response from the SoLSA MS on any other carrier within 35 seconds after first response on carrier 1.
   NOTE: Any potential access is likely to occur within 25s.

2) After step c), there shall be response from the SoLSA MS on carrier 3 within 25 seconds after increasing the level of carrier 3 (now highest C2 (C2-CRH), for cells with C4>0)

3) After step d), there shall be no response from the SoLSA MS on carrier 2 within 35 seconds after increasing the level of carrier 2 (still highest C2/C2-CRH for carrier 3).
   NOTE: Any potential access is likely to occur within 25s.

4) After step e), there shall be response from the SoLSA MS on carrier 2 within 55 seconds after carrier 3 becomes barred.

5) After step f), there shall be no response from the SoLSA MS on carrier 4 within 60 seconds after carrier 4 is switched on (Highest LSA Priority (15), but C2 <0).

6) After step g), there shall be response from the SoLSA MS on carrier 4 within 25 seconds after increasing level of carrier 4. (not highest C2, but C4>0 and highest LSA Priority (15) on the SIM)

### 20.24.3.4 SoLSA Cell Reselection / idle mode support enabled / Priority Threshold

#### 20.24.3.4.1 Definition and applicability

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled (See General Remark 1 in chapter 20.24).

This test is applicable for all types of SoLSA MS.

#### 20.24.3.4.2 Conformance requirement

The SoLSA MS shall be able to calculate correctly the signal strength threshold criterion parameter C4 which is to determine whether prioritised LSA cell reselection shall apply.

The signal strength threshold criterion parameter C4 is used to determine whether prioritised LSA cell reselection shall apply and is defined by:

C4 = A - PRIO_THR

where

A is defined as above and PRIO_THR is the signal threshold for applying LSA reselection. PRIO_THR is broadcast on the BCCH. If the idle mode support is disabled for the LSA (see GSM 11.11) or if the cell does not belong to any LSA to which the MS is subscribed or if no PRIO_THR parameter is broadcast, PRIO_THR shall be set to ∞.

GSM 05.08, 6.4.

20.24.3.4.3 SoLSA Cell Reselection / idle mode support enabled / Priority Threshold any value

20.24.3.4.3.1 Test purpose

To verify that the SoLSA MS is able to reselect cells correctly according to parameter PRIO_THR. (parameter C4 criterion).

20.24.3.4.3.2 Method of test

20.24.3.4.3.2.1 Initial conditions

a) Identification of the LSA by means of LSA ID (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 47 / - 66 | 55 / -58 | 63 / -50 | OFF |
| CBA | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 15 | 25 | 40 | |
| C2 | 15 | 25 | 40 | |
| PRIO_THR (level / dB) | 1 / 6 | 6 / 36 | 2 / 12 | |
| C4 | 9 | -11 | 28 | |
| LSA ID | 66.001 | 9.000.000 | 30.000 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |

NOTE: The level of PRIO_THR is evaluated according to GSM 05.08, 9. Table 1.

c) Further initial conditions (Carrier 1-3 are normal LSA cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM<br>Escape PLMN | LSA1<br>No | LSA3<br>No | LSA5<br>No | |

d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM<br>Escape PLMN | LSA1<br>Yes | LSA3<br>Yes | LSA5<br>Yes | |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c)
- using initial conditions a), b) and d)

20.24.3.4.3.2.2 Test Procedure

a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS.

b) The SoLSA MS is switched on.

c) Carrier 3 is barred (CBA = 1).

d) The PRIO_THR value of carrier 2 is set to 0 dB (level 0).

e) The PRIO_THR value of carrier 2 is set to 36 dB (level 6).

#### 20.24.3.4.3.2.3 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.3.4.3.2.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 3 within 50 seconds after switch on.

2) After step c), the SoLSA MS shall respond on carrier 1 within 55 seconds after barring of carrier 3 (Highest Priority + C4>0).

3) After step d), the SoLSA MS shall respond on carrier 2 within 55 seconds after changing the PRIO_THR value of carrier 2 (C4>0 + Highest C2+LSA_OFFSET).

4) After step e), the SoLSA MS shall respond on carrier 1 within 55 seconds after changing the PRIO_THR value of carrier 2 (C4>0, Highest priority).

20.24.3.4.4 SoLSA Cell Reselection / idle mode support enabled / Priority Threshold infinite

20.24.3.4.4.1 Test purpose

To verify that the SoLSA MS is able to reselect cells correctly according to parameter C2 among those cell not fulfilling C4 ≥ 0.

20.24.3.4.4.2 Method of test

20.24.3.4.4.2.1 Initial conditions

a) Identification of the LSA by means of LSA ID (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 63 / -50 | 53 / -60 | 58 / -55 | 31 / -82 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| CRH (dB) | 10 | | | |
| PRIO_THR (level / dB) | 7 / 'infinite' | 7 / 'infinite' | 7 / 'infinite' | |
| C1 | 40 | 30 | 35 | 8 |
| C2 | 40 | 30 | 35 | 8 |
| C4 | <0 | <0 | <0 | 8 |
| LSA_OFFSET (level / dB) | | ***5 / 32*** | | |
| LSA ID | 66.001 | 66.001 | 9.000.000 | 30.000 |
| LAC | 5 | 5 | 3 | 3 |
| CI | 5000 | 5001 | 5002 | 5003 |

c) Further initial conditions (Carrier 1-4 are normal LSA cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM | LSA1 | LSA1 | LSA3 | LSA5 |
| Escape PLMN | No | No | No | No |

d) Further initial conditions (Carrier 1-4 are LSA exclusive access cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM | LSA1 | LSA1 | LSA3 | LSA5 |
| Escape PLMN | Yes | Yes | Yes | Yes |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c)

- using initial conditions a), b) and d)

20.24.3.4.4.2.2 Test Procedure

a) The SS activates carriers 1, 2, and 3 and monitors these carriers for RA requests from the SoLSA MS. Carrier 4 is switched off.

b) The SoLSA MS is switched on.

c) The SS is reconfigured and the level of carrier 1 is decreased to 33 dBµV emf() / -80 dBm (C2 of carrier 1 becomes 10).

d) The SS is reconfigured and the level of carrier 3 is increased to 63 dBµV emf() / -50 dBm (C2 of carrier 3 becomes 40).

e) Carrier 1 is switched off. Carrier 4 is switched on. The SS monitors carriers 2, 3, and 4.

#### 20.24.3.4.4.2.3 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.3.4.4.2.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 seconds. There shall be no response from the SoLSA MS on any other carrier within 35 seconds after the first response on carrier 1.
NOTE: Any potential access is likely to occur within 25s.

2) After step c), there shall be response from the SoLSA MS on carrier 2 within 25 seconds after carrier 1 has been reconfigured (Highest C2/C2-CRH).

3) After step d), there shall be response on carrier 3 within 25 seconds after carrier 2 has been reconfigured (Highest C2/C2-CRH).

4) After step e), there shall be response on carrier 4 within 60 seconds after the system has been reconfigured (idle mode support enabled for carrier 4).
NOTE: 5,5 seconds to notice new strongest carriers on top 6 (because the updating time for the 6 strongest is 5 seconds (+/- 10%)), 33 seconds to read BCCH, 15 seconds for reselection, 5 seconds for search of a matching LSA on SIM. Allow 60s.

### 20.24.3.5 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / LSA_OFFSET

#### 20.24.3.5.1 Definition and applicability

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This test is applicable for all types of SoLSA MS.

#### 20.24.3.5.2 Conformance requirement

While performing cell reselection, the SoLSA MS shall be able to calculate correctly the signal strength threshold criterion parameter consisting of C2 + LSA_OFFSET to determine which LSA cell shall be selected among those having the same LSA priority; GSM 05.08, 6.6.3.

#### 20.24.3.5.3 Test Purpose

To verify that the SoLSA MS shall be able to reselect the cell with the highest value of C2 + LSA_OFFSET among those cells that have highest LSA priority and fulfil the criteria $C4 \geq 0$.

20.24.3.5.4 Method of test

20.24.3.5.4.1 Initial conditions

a) Identification of the LSA by means of LSA ID (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 63 / -50 | 43 / -70 | 33 / -80 | OFF |
| CBA | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 40 | 20 | 10 | |
| C2 | 40 | 20 | 10 | |
| C4 | 40 | 20 | 10 | |
| LSA_OFFSET (level / dB) | 0 / 0 | 1 / 4 | 4 / 24 | |
| LSA ID | 30.000 | 66.001 | 66.001 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |

NOTE: The level of LSA_OFFSET is evaluated according to GSM 05.08, 9 Table 1.

c) Further initial conditions (Carrier 1-3 are normal LSA cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM<br>Escape PLMN | LSA5<br>No | LSA1<br>No | LSA1<br>No | |

d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM<br>Escape PLMN | LSA5<br>Yes | LSA1<br>Yes | LSA1<br>Yes | |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c)
- using initial conditions a), b) and d)

20.24.3.5.4.2 Test Procedure

a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS.

b) The SoLSA MS is switched on.

c) Carrier 1 is barred (CBA = 1).

d) Carrier 3 is barred (CBA = 1)

#### 20.24.3.5.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.3.5.4.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 after 50 seconds. (highest value of C1). There shall be no response from the SoLSA MS on other carriers within 35s after the first response sent on carrier 1.
   NOTE: Any potential access is likely to occur within 25 seconds.

2) After step c), the SoLSA MS shall respond on carrier 3 within 55 seconds after carrier 1 becomes barred. (same priority as for LSA on carrier 2 but highest value of C2+LSA_OFFSET).

3) After step d), the SoLSA MS shall respond on carrier 2 within 55 seconds after carrier 3 becomes barred.

### 20.24.3.6 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / cell combinations

#### 20.24.3.6.1 Definition and applicability

This test is applicable for all types of SoLSA MS.

#### 20.24.3.6.2 Conformance requirement

1. While camped on a cell of the selected PLMN (“camped normally”), the SoLSA MS may need to select a different cell (“normal cell reselection” state). The following events trigger a cell reselection:

   - The cell camped on (current serving cell) has become barred.

   - There is a better cell (in terms of the path loss criterion C2) in the same LA.

   The MS will then reselect a new cell in order to fulfil the process goal.

   GSM 03.22, 4.5.

2. The SoLSA MS shall reselect the correct cell when subscription for normal LSA cells and LSA exclusive access cells varies; GSM 03.73, 4.3.1, 4.3.3.
   The setting of the LSA only bit on the SIM shall not influence the behaviour of the cell reselection: for subscribers with LSA only access call unrelated service requests are accepted even outside of the allowed LSAs. GSM 03.73, 4.5.4.

3. When MS is out of the allowed LSA it shall be registered in PLMN but indicate subscriber/service specific "out of LSA area" notification. It shall be a network controlled function to prevent terminated or/and originated calls. Emergency calls are however always allowed. GSM 02.11, 5.3.

#### 20.24.3.6.3 Test purpose

To verify that the SoLSA MS shall reselect the correct cell when subscription for normal LSA cells and LSA exclusive access cells varies. The setting of LSA only bit on the SIM shall not influence the behaviour of the cell reselection.

20.24.3.6.4 Method of tests

20.24.3.6.4.1 Initial conditions

a) Parameters changed from the default values in Table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 53/ -60 | 43/ -70 | 63 / -50 | OFF |
| CBA | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 30 | 20 | 40 | |
| C2 | 30 | 20 | 40 | |
| C4 | 30 | 20 | <0 | |

b) Further parameters changed from the default values in Table 20.24.1; further initial conditions

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| LSA ID | 9.000.000 | 30.000 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | LSA3 | LSA5 | - | |
| Escape PLMN | Yes | No | No | |

c) Further parameters changed from the default values in Table 20.24.1; further initial conditions

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| LSA ID | 250 | 9.000.000 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | LSA3 | - | |
| Escape PLMN | No | Yes | No | |

d) Further parameters changed from the default values in Table 20.24.1; further initial conditions

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| LSA ID | 250 | 30.000 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | LSA5 | - | |
| Escape PLMN | No | No | Yes | |

e) Further parameters changed from the default values in Table 20.24.1; further initial conditions

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| LSA ID | 250 | 250 | 250 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | - | - | |
| Escape PLMN | Yes | No | No | |

f) Identification of the LSA by means of LSA ID (see chap. 20.24. General remark 2.)

Run the following test procedures twice using two different sets of initial conditions:

- with an LSA only SIM
- with a normal LSA SIM

#### 20.24.3.6.4.2.1 Test Procedure

Using conditions from Table a),b) and f).

a) The SS activates the carriers 1,2,3 and monitors these carriers for RA requests from the SoLSA MS.

b) The SoLSA MS is switched on.

c) The SS is reconfigured and carrier 3 becomes barred (CBA = 1)

d) The SS is reconfigured and carrier 2 becomes barred (CBA = 1) and carrier 3 becomes not barred (CBA = 0).

#### 20.24.3.6.4.2.2 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.3.6.4.2.3 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 3 within 50 seconds. There shall be no response from the SoLSA MS on any other carrier within 35 seconds after the first response on carrier 3.

   NOTE: Any potential access is likely to occur within 35s.

2) After step c), there shall be response from the SoLSA MS on carrier 2 within 60 seconds after activating of carriers 2 and 3. (Highest LSA Priority on the SIM (15) for C4>=0 in the present subscription).

   NOTE: 5,5 seconds to notice new strongest carriers on top 6 (because the updating time for the 6 strongest is 5 seconds (+/- 10%)), 33 seconds to read BCCH, 15 seconds for reselection, 5 seconds for search of a matching LSA on SIM. Allow 60s.

3) After step d), there shall be response from SoLSA MS on carrier 1 within 55 seconds after carrier 2 has become barred. (highest priority (8) with C4>= 0)

#### 20.24.3.6.4.3.1 Test Procedure

Using conditions from Table a), c) and f).

a) The SS activates carrier 1 and monitors that carrier for RA requests from the SoLSA MS. Carrier 2 and 3 are switched off.

b) The SoLSA MS is switched on.

c) The SS activates the carriers 2 and 3 (carrier 1 is still switched on) and monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.

d) The SS is reconfigured and the carrier 2 becomes barred (CBA = 1).

#### 20.24.3.6.4.3.2 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.3.6.4.3.3 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 seconds.

2) After step c), there shall be response from the SoLSA MS on carrier 2 after 60 seconds. (highest LSA Priority on the SIM (8) with C4>=0).

3) After step d), there shall be response from SoLSA MS on carrier 3 within 55 seconds after carrier 2 becomes barred (no subscription, Highest C2).

#### 20.24.3.6.4.4.1 Test Procedure

Using conditions from Table a), d) and f).

a) The SS activates the carrier 1 and monitors that carrier for RA requests from the SoLSA MS. Carrier 2 and 3 are switched off.

b) The SoLSA MS is switched on.

c) The SS activates the carriers 2 and 3 (carrier 1 is still switched on) and monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.

d) The SS is reconfigured and carrier 2 becomes barred (CBA = 1).

#### 20.24.3.6.4.4.2 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.3.6.4.4.3 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 seconds.

2) After step c), there shall be response from the SoLSA MS on carrier 2 after 60 seconds after carrier 2 and 3 were switched on. (LSA with highest Priority (15))

3) After step d), there shall be response from SoLSA MS on carrier 1 within 55 seconds after carrier 2 has become barred (Carrier 3 is an LSA exclusive access cell with no matching subscription).

#### 20.24.3.6.4.5.1 Test Procedure

Using conditions from Table a),e) and f).

a) The SS activates carriers 1 and 3 and monitors these for RA requests from the SoLSA MS.

b) The SoLSA MS is switched on.

c) The SS activates carrier 2 and carrier 3 becomes barred. (CBA = 1).

d) The SS is reconfigured and carrier 2 becomes barred. (CBA = 1).

#### 20.24.3.6.4.5.2 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.3.6.4.5.3 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 3 within 50 seconds (Carrier 1 is an LSA exclusive access cell with no matching subscription).

2) After step c), there shall be response from the SoLSA MS on carrier 2 within 55 seconds.

3) After step d), there shall be no paging response from SoLSA MS on any carrier (Carrier 2 and 3 are barred, carrier 1 is an exclusive access cell, the SoLSA MS is in the limited state) within 65s.

NOTE: Any potential access is likely to occur quicker.

## 20.24.3.7 SoLSA Cell Reselection / roaming

### 20.24.3.7.1 Definition and applicability

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled. (See General Remark 1. in chapter 20.24)

This test is applicable for all types of SoLSA MS.

### 20.23.3.7.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
   - There is a better cell (in terms of the path loss criterion C2) in the same LA.

   The SoLSA MS will then reselect a new cell in order to fulfil the process goal.
   GSM 03.22, 4.5.

2. A SoLSA MS with SIM indicating LSA subscription shall always try to reselect the cell with highest LSA priority according to the information stored on the SIM. GSM 03.73, 11.4.2.

### 20.24.3.7.3 Test Purpose

To verify that the SoLSA MS when idle mode support for SoLSA on the SIM card is enabled shall favour camping on those LSA cells with the highest LSA priority the SoLSA MS is subscribed to even if subscriber is outside of his HPLMN.

### 20.24.3.7.4. Method of test

#### 20.24.3.7.4.1 Initial conditions

a) Identification of the LSA by means of LSA ID (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/-70 | 53/-60 | 33/-80 | 63/-50 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| MCC, MNC | VPLMN | VPLMN | VPLMN | VPLMN |
| C1 | 20 | 30 | 10 | 40 |
| C2 | 20 | 30 | 10 | 40 |
| C4 | 20 | <0 | 10 | 40 |
| LSA ID | 9.000.000 | - | 9.000.001 | 54 |
| LAC | 5 | 5 | 5 | 5 |
| CI | 5000 | 5001 | 5002 | 5003 |

c) Further initial conditions (Carrier 1-3 are normal LSA cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM<br>Escape PLMN | -<br>No | -<br>No | LSA8<br>No | LSA9<br>No |

d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Matching LSA on SIM<br>Escape PLMN | -<br>Yes | -<br>Yes | LSA8<br>Yes | LSA9<br>Yes |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c)
- using initial conditions a), b) and d)

#### 20.24.3.7.4.2 Test Procedure

a) The SS activates carrier 1 and carrier 2, pages the MS on these carriers and monitors these for RA requests from the SoLSA MS. Carrier 3 and 4 are switched off.

b) The SoLSA MS is switched on.

c) After approx. 60s the SS is reconfigured and level of carrier 2 decreases to 33 dBµV/-80dBm (C2 decreases to 10). The SS monitors carriers 1 and 2 for RA requests from the SoLSA MS.

d) The SS activates carriers 3 and 4. The SS pages the MS on carriers 3 and 4, and monitors these carriers for RA requests from the SoLSA MS.

e) The SS is reconfigured and carrier 3 becomes barred (CBA = 1). The SS pages the MS on carrier 4, and monitors this carrier for RA requests from the SoLSA MS.

#### 20.24.3.7.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA

#### 20.24.3.7.4.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 2 within 50 seconds.

2) After step c), there shall be response from the SoLSA MS on carrier 1 within 25 seconds after decreasing the level of carrier 2 (highest C2).

3) After step d), there shall be response from the SoLSA MS on carrier 3 within 55 seconds (highest priority on the SIM card for matching LSA subscription).

4) After step e), there shall be response from the SoLSA MS on carrier 4 within 55 seconds.

## 20.24.4 SoLSA Cell Reselection / idle mode support / any value

### General Remark

Definition of “idle mode support” is given in chapter 20.24 General Remark 1.

“Idle mode support” is only controlling if ‘favouring’ shall be done at cell reselection. It does not disable the LSA subscription.

### 20.24.4.1 Definition and applicability

While camped on a cell of the selected PLMN a SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This test is applicable for all types of SoLSA MS.

### 20.24.4.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

   - The cell camped on (current serving cell) has become barred.

   - There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

   The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

   GSM 03.22, 4.5.

### 20.24.4.3 Test purpose

To verify that the SoLSA MS shall not favour camping on the LSA for which support in idle mode is disabled.

### 20.24.4.4 Method of test

### 20.24.4.5 Initial conditions

a) Identification of the LSA by means of LSA ID (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 63/ -50 | 53/-60 | 58/-55 | 31 / -82 |
| CBA | 0 | 0 | 0 | 0 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 |
| CRH (dB) | 10 | | | |
| C1 | 40 | 30 | 35 | 8 |
| C2 | 40 | 30 | 35 | 8 |
| C4 | 40 | 30 | 35 | 8 |
| LSA ID | 66.000 | 66.000 | 9.000.001 | 5 |
| LAC | 5 | 5 | 3 | 3 |
| CI | 5000 | 5001 | 5002 | 5003 |

c) Further initial conditions (Carrier 1-4 are normal LSA cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Idle mode support enabled | No | No | No | Yes |
| Matching LSA on SIM | LSA2 | LSA2 | LSA4 | LSA6 |
| Escape PLMN | No | No | No | No |

d) Further initial conditions (Carrier 1-4 are LSA exclusive access cells):

| | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| Idle mode support enabled | No | No | No | Yes |
| Matching LSA on SIM | LSA2 | LSA2 | LSA4 | LSA6 |
| Escape PLMN | Yes | Yes | Yes | Yes |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c)
- using initial conditions a), b) and d)

### 20.24.4.6 Test Procedure

a) The SS activates carriers 1, 2, and 3 and monitors these carriers for RA requests from the SoLSA MS. Carrier 4 is switched off.

b) The SoLSA MS is switched on.

c) The SS is reconfigured and the level of carrier 1 is decreased to 33 dBµV emf() / -80 dBm (C2 of carrier 1 becomes 10).

d) The SS is reconfigured and the level of carrier 3 is increased to 63 dBµV emf() / -50 dBm (C2 of carrier 3 becomes 40).

e) Carrier 1 is switched off. Carrier 4 is switched on. The SS monitors carriers 2, 3, and 4.

### 20.24.4.7 Related PICS/PIXIT statement(s)

- Support of SoLSA

### 20.24.4.8 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 seconds. There shall be no response from the SoLSA MS on any other carrier within 35 seconds after the first response on carrier 1.
NOTE: Any potential access is likely to occur within 25s.

2) After step c), there shall be response from the SoLSA MS on carrier 2 within 25 seconds after carrier 1 has been reconfigured (Highest C2/C2-CRH).

3) After step d), there shall be response on carrier 3 within 25 seconds after carrier 3 has been reconfigured (Highest C2/C2-CRH).

4) After step e), there shall be response on carrier 4 within 60 seconds after the system has been reconfigured (idle mode support enabled for carrier 4).
NOTE: 5,5 seconds to notice new strongest carriers on top 6 (because the updating time for the 6 strongest is 5 seconds (+/- 10%)), 33 seconds to read BCCH, 15 seconds for reselection, 5 seconds for search of a matching LSA on SIM. Allow 60s.

## 20.24.5 SoLSA Cell Reselection / LSA indication for idle mode

General Remark

Definition of “LSA indication for idle mode” is given in chapter 20.24 General Remark 1.

“LSA indication for idle mode” is only controlling if indication of the LSA name shall be done. It has no influence on the LSA subscription.

### 20.24.5.1 General definition and applicability

The SoLSA MS in idle mode may inform the user whether or not the serving cell belongs to the subscribed LSA.

- The indication is dependent on the setting of the idle mode indication bit on the SIM card for that LSA.
- The indication is independent from the setting of the LSA idle mode support bit on the SIM card for that LSA. (see chap. 20.24 General Remark 1.)

### 20.24.5.2 General conformance requirement

1. The service subscriber can define a name (alphanumeric name, icon, etc) for each of her allowed LSAs. The MS will, in idle mode and if required by the user, indicate to the user the current LSA. The indication may be the name of the current LSA, as set by the user. The form of display and indication are left to manufacturer's choice. GSM 03.73, 4.3.2.
2. In addition to indicate the registered PLMN, an MS with subscription for an LSA in the registered PLMN shall indicate this LSA when it is available. The indication towards the user is optional and may be done by displaying the stored LSA name that corresponds to the ID of the current LSA. An MS with LSA only access subscription may also give an indication towards the user, when the no subscribed LSAs are available to the user. The indication is optional and may be done by displaying the LSA only access text stored in the SIM. GSM 03.73, 11.8.1.

### 20.24.5.3 SoLSA Cell Reselection / LSA indication for idle mode / idle mode support enabled

#### 20.24.5.3.1 Definition and applicability

See general definition and applicability of this section.

This test is applicable for all types of SoLSA MS.

#### 20.24.5.3.2 Conformance requirement

1. When both idle mode support and idle mode indication are enabled on the SIM card, the SoLSA MS shall display the name (which was defined by the service subscriber) of the current LSA to the user.
2. When idle mode support is enabled and idle mode indication is disabled on the SIM card, it is expected that the SoLSA MS does not display the LSA name (which was defined by the service subscriber) of the current LSA to the user.

GSM 03.73, 4.3.2; GSM 03.73, 11.8.1; GSM 11.11, 10.4.1.2.

#### 20.24.5.3.3 Test Purpose

1. To verify that if idle mode indication bit on the SIM card is enabled for the LSA, the SoLSA MS supports the LSA indication. The LSA name (text/icon) shall be displayed on the SoLSA MS.
2. To verify that if idle mode indication bit on the SIM card is disabled for the LSA the SoLSA MS does not support the LSA indication.

20.24.5.3.4 Method of test

20.24.5.3.4.1 Initial conditions

a) Identification of the LSA by means of LSA ID (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1; further initial conditions

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/-70 | 53/-60 | 33/-80 | OFF |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | 30 | 10 | |
| C2 | 20 | 30 | 10 | |
| LSA ID | - | 66.001 | 9.000.000 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | LSA1 | LSA3 | |
| Escape PLMN | No | No | No | |

20.24.5.3.4.2 Test Procedure

a) The SS activates carrier 1, pages the MS on this carrier and monitors it for RA requests from the SoLSA MS. Carrier 2 and 3 are switched off.

b) The SoLSA MS is switched on.

c) Carrier 2 and Carrier 3 are switched on. The SS pages the MS on carriers 1, 2, and 3, and monitors these carriers for RA requests from the SoLSA MS.

d) The SS is reconfigured and carrier 3 becomes barred (CBA=1). The SS pages the MS on carriers 1, 2 and 3, and monitors these carriers for RA requests from the SoLSA MS.

e) The SS is reconfigured and sets CBA=0 on carrier 3. The SS pages the MS on carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS.

20.24.5.3.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA
- Interface to the human user (p1=Y/N)
- Way to indicate the identity of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user)
- Way to indicate the change of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user)

#### 20.24.5.3.4.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 seconds. There shall be no LSA indication on the SoLSA MS. (No LSA)

2) After step c), there shall be response from the SoLSA MS on carrier 3 within 25 seconds (highest LSA Priority (8) on the SIM card). An LSA indication is expected on the SoLSA MS.

3) After step d), there shall be response from the SoLSA MS on carrier 2 within 55 seconds. There shall be no indication on the SoLSA MS. (highest LSA Priority on the SIM card, no indication on the SIM card)

4) After step e), there shall be response from the SoLSA MS on carrier 3 within 55 seconds (LSA carrier on the SIM card). An LSA indication is expected on the SoLSA MS. (idle mode indication for that LSA is enabled)

### 20.24.5.4 SoLSA Cell Reselection / LSA indication for idle mode / idle mode support disabled

#### 20.24.5.4.1 Definition and applicability

See general definition and applicability of this section.

This test is applicable for all types of SoLSA MS.

#### 20.24.5.4.2 Conformance requirement

1. When idle mode support is disabled and idle mode indication is enabled on the SIM card, it is expected that the SoLSA MS displays the LSA name (which was defined by the service subscriber) of the current LSA to the user.

2. When idle mode support is disabled and idle mode indication is disabled on the SIM card, the SoLSA MS shall not display the LSA name (which was defined by the service subscriber) of the current LSA to the user.

GSM 03.73, 4.3.2; GSM 03.73, 11.8.1; GSM 11.11, 10.4.1.2.

#### 20.24.5.4.3 Test Purpose

To verify that when idle mode support is disabled, the SoLSA MS shall display the LSA name in dependence from the idle mode indication bit.

20.24.5.4.4 Method of test

20.24.5.4.4.1 Initial conditions

a) Identification of the LSA by means of LSA ID (see chap. 20.24. General remark 2.)

b) Parameters changed from the default values in Table 20.24.1; further initial conditions

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---|---|---|---|---|
| RF Signal Level (dBµV emf() / dBm) | 43/-70 | 53/-60 | 33/-80 | OFF |
| CBA | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | |
| C1 | 20 | 30 | 10 | |
| C2 | 20 | 30 | 10 | |
| LSA ID | 250 | 66.000 | 9.000.001 | |
| LAC | 5 | 5 | 5 | |
| CI | 5000 | 5001 | 5002 | |
| Matching LSA on SIM | - | LSA2 | LSA4 | |
| Escape PLMN | No | No | No | |

20.24.5.4.4.2 Test Procedure

a) The SS activates carrier 1, pages this carrier and monitors it for RA requests from the SoLSA MS. Carriers 2 and 3 are switched off.

b) The SoLSA MS is switched on.

c) Carrier 2 and carrier 3 are switched on. The SS pages the MS on carriers 1, 2, and 3, and monitors these carriers for RA requests from the SoLSA MS.

d) The SS is reconfigured and the level of carrier 3 increases to 63 dBµVemf / -50dBm (C2 increases to 40 dB).

e) The SS is reconfigured and the level of carrier 3 decreases to 33 dBµVemf0,1,0 /- 80dBm (C2 decreases to 10dB).

20.24.5.4.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA
- Interface to the human user (p1=Y/N)
- Way to indicate the identity of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user)
- Way to indicate the change of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user)

#### 20.24.5.4.4.4 Test Requirements

1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 seconds. There shall be no LSA indication on the SoLSA MS.

2) After step c), there shall be response from the SoLSA MS on carrier 2 within 25 seconds (highest C2). An LSA indication is expected on the SoLSA MS.

3) After step d), there shall be response from the SoLSA MS on carrier 3 within 25 seconds (highest C2). There shall be no LSA indication on the SoLSA MS.

4) After step e), there shall be response from the SoLSA MS on carrier 2 within 25 seconds (highest C2). An LSA indication is expected on the SoLSA MS

# 21 Received signal measurements

For evaluating the reception quality (the basis for handover and power control) the following two criteria are used:

- signal strength (RXLEV)
- signal quality (RXQUAL).

## 21.1 Signal strength

### 21.1.1 Definition and applicability

The MS reports RXLEV values related to the apparent received RF signal strength. It is necessary for these levels to attain sufficient accuracy for the correct functioning of the system.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800, PCS 1900 and any multiband MSs.

### 21.1.2 Conformance requirement

1. The RMS received signal level at the receiver input shall be measured by the MS over the full range of -110 dBm to -48 dBm with a relative accuracy between signals with levels up to 20 dB difference according to table 21-1

   1.1 under normal conditions, GSM 05.08, 8.1.2 and GSM 05.05, 6.2.

   1.2 under extreme conditions, GSM 05.08, 8.1.2, GSM 05.05, annex D.1, D.2.

**Table 21-1: Tolerance for relative accuracy of receive signal measurement**

| Absolute level of lower level signal dBm | | | | | | Tolerance dB | | | |
|---|---|---|---|---|---|---|---|---|---|
| GSM Small MS | GSM Other MS | DCS 1800 Class 1&2 | DCS 1800 Class 3 | PCS 1900 Class 1&2 | PCS 1900 Other MS | Lower limit Single | Lower limit Multi | Upper limit Single | Upper limit Multi |
| >= -88 | >= -90 | >= -86 | >= -88 | >=-88 | >= -90 | 2 | 4 | 2 | 4 |
| >=-101 | >=-103 | >= -99 | >=-101 | >=-101 | >=-103 | 3 | 5 | 2 | 5 |
| < -101 | < -103 | < -99 | < -101 | < -101 | < -103 | 4 | 6 | 2 | 6 |

   Single means that the measurements are on the same or different RF channel within the same frequency band.

   Multi means that the measurements are on different RF channel on different frequency bands.

   For measurements between ARFCN in different bands the 'Absolute level of lower level signal' column for the band including the lower level signal shall be used to determine which tolerance applies.

   At extreme temperature conditions an extra 2 dB shall be added to the Multi limits in above table.

2. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of +/-4 dB from -110 dBm to -70 dBm under normal conditions; GSM 05.08, 8.1.2.

3. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of +/-6 dB over the full range of -110 dBm to -48 dBm under both normal and extreme conditions; GSM 05.08, 8.1.2.

4. If the received signal level falls below the reference sensitivity level for the type of MS then the MS shall report a level between the reference sensitivity level and the actual received level, but with the tolerances given in conformance requirements 2. and 3. above.

5. The measured signal level shall be mapped to an RXLEV value between 0 and 63 as specified in GSM 05.08; GSM 05.08, 8.1.4.

### 21.1.3 Test purpose

1. To verify that the RXLEV reported by the MS does not exceed conformance requirement 1.

   1.1 under normal conditions;

   1.2 under extreme conditions.

2. To verify that the RXLEV reported by the MS does not exceed conformance requirement 2 under normal conditions.

3. To verify that the RXLEV reported by the MS does not exceed conformance requirement 3 under extreme conditions and under normal conditions from -48 dBm to -70 dBm.

4. To verify that the RXLEV reported by the MS does not exceed conformance requirement 4.

NOTE: Conformance requirement 5 is inherently tested in each of the test purposes 1. to 4.

### 21.1.4 Method of test

#### 21.1.4.1 Initial conditions

The SS is set to produce the BCCH of the serving cell at 63 dBμVemf( ) and the BCCHs of 6 surrounding cells at 28 dBμVemf( ). The BCCH of the serving cell indicates these BCCHs, but not the BCCH of the serving cell. The ARFCN of the serving cell BCCH is chosen so as not to interfere with the other channels as shown in table 21-2. The fading profile for the BCCHs of the serving and surrounding cells will be set to static.

After 30 s, a call is set up according to the generic call set up procedure to an ARFCN, within the supported band of operation. The SACCH indicates the same surrounding cell BCCHs as the BCCH of the serving cell.

NOTE: The 30 s is to allow the MS to scan and find all BCCHs.

#### 21.1.4.2 Procedure

a) The levels of the TCH and BCCHs are set according to table 21-2 step 1. The SS waits 20 s before continuing.

**Table 21-2: Signal levels at receiver input in dBµVemf( )**

| Step | ARFCN | TCH | BCCH1 | BCCH2 | BCCH3 | BCCH4 | BCCH5 | BCCH6 |
|---|---|---|---|---|---|---|---|---|
| | GSM450 | 259 | 276 | 293 | 264 | 269 | 281 | 288 |
| | GSM480 | 306 | 323 | 340 | 311 | 316 | 328 | 335 |
| | GSM900: | 1 | 62 | 124 | 20 | 40 | 80 | 100 |
| | DCS1800 | 512 | 700 | 885 | 585 | 660 | 790 | 835 |
| | PCS1900 | 512 | 700 | 805 | 585 | 660 | 790 | 550 |
| | 450/900 | 259 | 124 | 276 | 293 | 269 | 288 | 1 |
| | 480/900 | 306 | 124 | 323 | 340 | 316 | 335 | 1 |
| | 450/1800 | 259 | 885 | 276 | 293 | 269 | 288 | 512 |
| | 480/1800 | 306 | 885 | 323 | 340 | 316 | 335 | 512 |
| | 900/1800 | 1 | 885 | 62 | 124 | 40 | 100 | 512 |
| | 450/900/1800 | 259 | 124 | 276 | 885 | 293 | 1 | 512 |
| | 480/900/1800 | 306 | 124 | 323 | 885 | 340 | 1 | 512 |
| | GSM850 | 128 | 189 | 251 | 150 | 170 | 210 | 230 |
| | GSM 750 | 438 | 475 | 511 | 440 | 455 | 485 | 500 |
| | 750/850 | 438 | 251 | 475 | 511 | 455 | 485 | 128 |
| 1+m*21 | | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 |
| 2+m*21 | | 54,5-m*10 | 63,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 |
| 3+m*21 | | 54,5-m*10 | 62,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 |
| . | | . | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 17+m*21 | | 54,5-m*10 | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 18+m*21 | | 44,5-m*10 | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| . | | . | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 21+m*21 | | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 |

m = 0, 1, 2, 3, 4.

b) The measurement is done in 105 steps. The initial signal levels of the TCH of the serving cell and the BCCHs of the surrounding cells are adjusted according to table 21-2. At each step the SS keeps the signal levels stable for one reporting period, except at steps 21+m*21 where the level is held stable for 1,75 reporting periods. The RXLEV value for the period in which the change occurs (reported in the following period) is discarded. The SS records the RXLEV values reported for the surrounding cell BCCHs in steps 1 + m * 21 and 21 + m * 21. The RXLEV values for BCCH 1 are recorded by the SS for all 105 steps.

NOTE: This extension at steps 21+m*21 is to allow an extra quarter reporting period for the MS to stabilize for steps 1+m*21.

At steps 1 to 30 the SS simulates a base station with DTX off and at steps 31 to 105 the SS simulates a base station with DTX on.

At steps 1 to 30 the SS checks the accuracy of the measured signal strength of TCH by checking the values of the parameters RXLEV_FULL and RXLEV_SUB. At steps 31 to 105 the SS shall check only the value of the parameter RXLEV_SUB.

At step 64, within every 480 ms reporting period, out of the 4 SACCH and 8 SID timeslots the SS transmits the first six active timeslots of the TCH with signal level 39,5 dBµVemf( ) and the last six active timeslots of the TCH with signal level 29,5 dBµVemf( ).

c) Step b) is repeated under extreme conditions (annex 1, TC2,2 and TC3).

### 21.1.5 Test requirements

#### 21.1.5.1 Relative accuracy of measurements on different ARFCN

For normal and each of the 4 extreme conditions tested the following applies;

a) For each of the steps 1, 21, 22, 42, 43, and 64, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 4 if the measurements are on the same or on different RF channel within the same frequency band and no more than 8 (12 for extreme temperature conditions) if the measurements are on different frequency bands.

b) For each of the steps 63 and 85, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 for small MS, DCS 1 800 and PCS 1 900 (Class 1&2) MS or 4 for other MS if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 for small MS, DCS 1 800 and PCS 1 900 (Class

1&2) MS or 8 for other MS and other PCS 1 900 MS (13 and 12 for extreme temperature conditions) if the measurements are on different frequency bands.

c) For step 84, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 (13 for extreme temperature conditions) if the measurements are on different frequency bands.

d) For step 105, of the reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 6 if the measurements are on the same or on different RF channel within the same frequency band and no more than 10 (14 for extreme temperature conditions) if the measurements are on different frequency bands.

NOTE: It is not mandatory for the MS to report any of the BCCHs in step 105.

#### 21.1.5.2 Relative accuracy at a single frequency (BCCH1)

For normal and each of the 4 extreme conditions tested the following applies;

For n <= 21 and $RXLEV_1 = 63$

$RXLEV_n$ - (63 - n + r) shall be between:

-2 and +2

NOTE: This formula allows for an MS with an absolute accuracy worse than +0,5 dB and therefore reporting an RXLEV of 63 for more than one step. The formula checks the relative accuracy from the lowest input level for which the MS last reports RXLEV of 63.

Otherwise

$RXLEV_{(m*21+1)}$ - $RXLEV_{(m*21+n)}$ - n + 1 shall be between:

-2 and +2

for steps 2 to 62 and 65 to 71 for DCS 1 800 class 1/2 MS; or steps 2 to 62 and 65 to 73 for DCS 1 800 class 3, PCS 1 900 (Class 1&2) and Small GSM MS; or 2 to 75 for other MS and other PCS 1 900 MS.

-3 and +2

for steps 63 and 72 to 96 for DCS 1 800 class 1/2 MS; or steps 63 and 74 to 98 for DCS 1 800 class 3, PCS 1 900 (Class 1&2) and Small GSM MS; or 76 to 100 for other MS and other PCS 1 900 MS.

-4 and +2

for steps 97 to 105 for DCS 1 800 class 1/2 MS; or steps 99 to 105 for DCS 1 800 class 3, PCS 1 900 (Class 1&2) and Small GSM MS; or 101 to 105 for other MS and other PCS 1 900 MS.

where: 1 < n <= 21 and 0 <= m <= 4 as identified in table 21-2, and r is the number of the last step where RXLEV of 63 was reported.

NOTE: It is not mandatory for the MS to report BCCH1 for steps greater than 99 for GSM 400, GSM 700, GSM 850 or GSM 900 Small MS or 101 for other GSM and other PCS 1 900 MS or 97 for a DCS 1 800 Class 1 or Class 2 MS and 99 for DCS 1 800 Class 3 and PCS 1 900 (Class 1&2) MS. If the MS reports a level and the upper limit for this step in the above formula implies a level below the reference sensitivity level for the type of MS, then the upper limit shall be considered as equal to a value corresponding to the reference sensitivity level.

#### 21.1.5.3 Absolute accuracy

For each BCCH reported, $|RXLEV_{MS} + m * 10 - 62|$ shall be no more than:

4 for steps 64 and 85 under normal conditions.

6 for steps 64 and 85 under extreme conditions.

6 for steps 1, 22 and 43 under normal and extreme conditions.

where: 0 <= m <= 4 as identified in table 21-2.

# 21.2 Signal strength selectivity

## 21.2.1 Definition and applicability

The signal strength selectivity is a measure of the ability of the signal strength measuring part of the MS to discriminate against RF power from adjacent ARFCN. The RXLEV selectivity figure corresponds to the amount by which the adjacent channel power shall be attenuated.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

## 21.2.2 Conformance requirement

The selectivity of the received signal measurement shall be as follows:

- for adjacent (200 kHz) channel; >= 16 dB
- for adjacent (400 kHz) channel; >= 48 dB
- for adjacent (600 kHz) channel; >= 56 dB

GSM 05.08, 8.1.2.

## 21.2.3 Test purpose

To verify that the MS meets the conformance requirement at the 200 kHz adjacent channel above and below the wanted.

## 21.2.4 Method of test

### 21.2.4.1 Initial conditions

For GSM 450:

A call is set up according to the generic call set up procedure on ARFCN 269 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 281.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 270 and 280 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 480:

A call is set up according to the generic call set up procedure on ARFCN 316 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 328.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 317 and 327 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 750:

A call is set up according to the generic call set up procedure on ARFCN 450 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 485.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 451 and 484 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 850:

A call is set up according to the generic call set up procedure on ARFCN 170 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 210.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 171 and 209 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 900:

A call is set up according to the generic call set up procedure on ARFCN 40 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 80.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 41 and 79 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For DCS 1 800 and PCS 1 900:

A call is set up according to the generic call set up procedure on ARFCN 690 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 790.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 691 and 789 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

#### 21.2.4.2 Procedure

a) The SS records the RXLEV values reported for the TCH and BCCH3.

b) BCCH1 and 2 are set to 9 dB above the signal level of the TCH and BCCH3.

NOTE: The first adjacent channel interference requirement limits the level of BCCHs 1 and 2 to 9 dB. This ensures that the MS can maintain the call, and read BCCH3.

c) These conditions are kept for 30 s.

d) The SS records the RXLEV values reported for the TCH and BCCH3.

### 21.2.5 Test requirements

The values of RXLEV recorded in step d) shall be no more than 1 above the values recorded in step a).

NOTE: This one change in the reported value of RXLEV is calculated as follows: The level of the first adjacent interfering signal is such that C/I is -9 dB. With an RXLEV selectivity for the first adjacent channel of 16 dB, the power from the adjacent channel is equal to -7 dB with respect to the power level of the useful signal. The increase in power therefore is equal to $10\log(1 + 10^{-0,7}) = 0,71$ dB. Thus, the value of RXLEV could increase by 1.

# 21.3 Signal quality under static conditions

## 21.3.1 Signal quality under static conditions - TCH/FS

### 21.3.1.1 Definition and applicability

The MS must be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in section 8.4 of GSM 05.08. The MS has to map this BER into RXQUAL values using the coding scheme defined in section 8.2.4 of GSM 05.08. For the full rate channel without downlink DTX, the error assessment is based on 104 TDMA frames: RXQUAL_FULL. In case downlink DTX is used, the assessment is based on 12 TDMA frames: RXQUAL_SUB.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS supporting speech on a full rate channel.

### 21.3.1.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set and sub-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in GSM 05.08, 8.2.4; GSM 05.08, 8.2.2 & 8.2.4.

2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; GSM 05.08, 8.2.3.

### 21.3.1.3 Test purpose

1. To verify, under static propagation conditions, that the received signal quality is measured and mapped to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. The probability that the correct RXQUAL band is reported shall meet the values given in as per the table in GSM 05.08, 8.2.4.

2. To verify that the reported parameters (RXQUAL) are the received signal quality, averaged over the reporting period of length one SACCH multiframe.

3. To verify that, for downlink DTX, the reported parameter RXQUAL_SUB is the received signal quality, averaged over the correct frames ( SID ).

### 21.3.1.4 Method of test

#### 21.3.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a full rate speech channel in the mid ARFCN range. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.2.1.1.3.

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The wanted signal is the standard test signal C1. It is at the nominal frequency of the receiver and its level is 28 dBμVemf( ). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

21.3.1.4.2 Procedure

a) The SS sets the level of the unwanted signal at a value for which the BER of the looped back bursts, averaged over the reporting period as defined in GSM 05.08, clause 8.4, is in the "Range of actual BER" for "Quality band" RXQUAL_i, given in the table of GSM 05.08, subclause 8.2.4, with i equal to 0.

b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases an event counter for each incorrect MS reported RXQUAL level and continues the test for Max-samples, as given in subclause 21.3.1.5 for every i. For i = 7, the test is performed in steps using 60 SACCH blocks. In between steps, at least 35 SACCH blocks, are transmitted with a level of the unwanted signal that allows the radio link counter in the MS to reach the maximum value.

NOTE 1: This special procedure for i = 7 is due to the high error rates involved with testing RXQUAL_7, that could lead to the MS experiencing a radio link time-out.

c) The SS repeats steps a) to b) for i equals 1, 2, ...,7.

d) The SS removes the unwanted signal and sets downlink DTX on.

e) The SS verifies that the MS reports RXQUAL_SUB = 0 and RXQUAL_FULL = 7.

NOTE 2: When testing RXQUAL_SUB , on a full rate speech channel, the MS has approximately twice as many bits as the SS to assess BER. The MS has both SID and SACCH bits, whereas the SS only has the looped back SID bits. Therefore it is only tested that the MS uses the correct frames for RXQUAL_SUB reporting by checking both RXQUAL_SUB and RXQUAL_FULL reports. No quantitative assessment is done.

f) The SS releases the call.

21.3.1.5 Test requirements

The number of errors in reporting the RXQUAL bands recorded in each of the considered cases shall not exceed the corresponding value of max-events shown in the following tables, when the number of samples relevant to the case under test is equal to max-samples.

**Table 21.3: Maximum number of incorrectly reported RXQUAL_FULL for TCH/FS**

| CASE | Expected RXQUAL_FULL | Specified reporting error rate | Max-events | Max-samples |
|---|---|---|---|---|
| 0 | RXQUAL_0 | 10% | 200 | 1640 |
| 1 | RXQUAL_1 | 25% | 200 | 666 |
| 2 | RXQUAL_2 | 15% | 200 | 1093 |
| 3 | RXQUAL_3 | 10% | 200 | 1640 |
| 4 | RXQUAL_4 | 10% | 200 | 1640 |
| 5 | RXQUAL_5 | 5% | 200 | 3279 |
| 6 | RXQUAL_6 | 5% | 200 | 3279 |
| 7 | RXQUAL_7 | 5% | 201 | 3300 |

NOTE: In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate, and the minimum number for Max-events, need to be increased. The following figures are used for static propagation conditions:

| specified error rate | multiplication factor | min. Max-events |
|---|---|---|
| ≤ 25 % | 1,22 | 200 |

## 21.3.2 Signal quality under static conditions - TCH/HS

### 21.3.2.1 Definition and applicability

The MS shall be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in section 8.4 of GSM 05.08. The MS shall map this BER into RXQUAL values using the coding scheme defined in section 8.2.4 of GSM 05.08. For the half rate channel without downlink DTX, the error assessment is based on 52 TDMA frames: RXQUAL_FULL. In case downlink DTX is used, the assessment is based on 12 TDMA frames: RXQUAL_SUB.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS supporting speech on a half rate channel.

### 21.3.2.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set and sub-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in GSM 05.08, 8.2.4; GSM 05.08, 8.2.2 & 8.2.4.

2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; GSM 05.08, 8.2.3.

### 21.3.2.3 Test purpose

1. To verify, under static propagation conditions, that the received signal quality is measured and mapped to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. The probability that the correct RXQUAL band is reported shall meet the values given as per the table in GSM 05.08, 8.2.4.

2. To verify that the reported parameters (RXQUAL) are the received signal quality, averaged over the reporting period of length one SACCH multiframe.

3. To verify that, for downlink DTX, the reported parameter RXQUAL_SUB is the received signal quality, averaged over the correct frames ( SID ).

### 21.3.2.4 Method of test

#### 21.3.2.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a half rate speech channel in the mid ARFCN range. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.2.1.1.3.

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The wanted signal is the standard test signal C1. It is at the nominal frequency of the receiver and its level is 28 dBµVemf( ). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

#### 21.3.2.4.2 Procedure

a) The SS sets the level of the unwanted signal at a value for which the BER of the looped back bursts, averaged over the reporting period as defined in GSM 05.08, clause 8.4, is in the "Range of actual BER" for "Quality band" RXQUAL_i, given in the table of GSM 05.08, subclause 8.2.4, with i equal to 0.

b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases an event counter for each incorrect MS reported RXQUAL level and continues the test for Max-samples, as given in subclause 21.3.2.5 for every i. For i = 7, the test is performed in steps using 60 SACCH blocks. In between steps, at least 35 SACCH

blocks, are transmitted with a level of the unwanted signal that allows the radio link counter in the MS to reach the maximum value.

NOTE 1: This special procedure for i = 7 is due to the high error rates involved with testing RXQUAL_7, that could lead to the MS experiencing a radio link time-out.

c) The SS repeats steps a) to b) for i equals 1, 2, ...,7.

d) The SS removes the unwanted signal and sets downlink DTX on.

e) The SS verifies that the MS reports RXQUAL_SUB = 0 and RXQUAL_FULL = 7.

NOTE 2: When testing RXQUAL_SUB , on a half rate speech channel, the MS has approximately twice as many bits as the SS to assess BER. The MS has both SID and SACCH bits, whereas the SS only has the looped back SID bits. Therefore it is only tested that the MS uses the correct frames for RXQUAL_SUB reporting reporting by checking both RXQUAL_SUB and RXQUAL_FULL reports. No quantitative assessment is done.

f) The SS releases the call.

### 21.3.2.5 Test requirements

The number of errors in reporting the RXQUAL bands recorded in each of the considered cases shall not exceed the corresponding value of max-events shown in the following tables, when the number of samples relevant to the case under test is equal to max-samples.

**Table 21.6: Maximum number of incorrectly reported RXQUAL_FULL for TCH/HS**

| CASE | Expected RXQUAL_FULL | Specified reporting error rate | Max-events | Max-samples |
|---|---|---|---|---|
| 0 | RXQUAL_0 | 10% | 200 | 1640 |
| 1 | RXQUAL_1 | 40% | 300 | 660 |
| 2 | RXQUAL_2 | 30% | 300 | 870 |
| 3 | RXQUAL_3 | 15% | 200 | 1093 |
| 4 | RXQUAL_4 | 15% | 200 | 1093 |
| 5 | RXQUAL_5 | 5% | 200 | 3279 |
| 6 | RXQUAL_6 | 5% | 200 | 3279 |
| 7 | RXQUAL_7 | 5% | 201 | 3300 |

NOTE: In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate, and the minimum number for Max-events, need to be increased. The following figures are used for static propagation conditions:

| specified error rate | multiplication factor | min. Max-events |
|---|---|---|
| ≤ 25 % | 1,22 | 200 |
| 30 - 40 % | 1,15 | 300 |
| > 40 % | 1,1 | 400 |

## 21.4 Signal quality under TUhigh propagation conditions

### 21.4.1 Definition and applicability

The MS must be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in section 8.4 of GSM 05.08. The MS has to map this BER into RXQUAL values using the coding scheme defined in section 8.2.4 of GSM 05.08. For the full rate channel without downlink DTX, the error assessment is based on 104 TDMA frames: RXQUAL_FULL.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1800 and PCS 1 900 MS supporting speech on a full rate channel.

### 21.4.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of 1 SACCH multiframe. The assessed equivalent BER before channel decoding shall be mapped to the eight levels of RXQUAL using the coding scheme defined in section 8.2.4 of GSM 05.08; GSM 05.08 8.2.2, 8.2.4.

2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe.

   GSM 05.08, 8.2.3.

### 21.4.3 Test purpose

1. To verify, under TUhigh conditions, that the received signal quality is measured and reported to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of length one SACCH multiframe for the TCH/FS. The probability that the correct RXQUAL band is reported shall meet the values given as per the Table in GSM 05.08 8.2.

2. To verify that the reported parameters (RXQUAL) is the received signal quality, averaged over the reporting period of length one SACCH multiframe.

### 21.4.4 Method of test

#### 21.4.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a full rate speech channel in the mid ARFCN range. The RADIO_LINK_TIMEOUT parameter is set to maximum.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.2.1.1.3.

The SS produces the standard test signal C1, with TUhigh propagation profile. It shall be at the nominal frequency of the receiver at a level of 28 dBµVemf( ).

#### 21.4.4.2 Procedure

a) The SS counts the number of bit errors occurring in 50 SACCH multiframes and the relevant BER is computed. If this BER does correspond to one out of the 8 different cases shown in Table 21.7, the procedure is continued from step c).

**Table 21.7**

| CASE | Average BER (%) |
|---|---|
| 0 | < 0,10 |
| 1 | 0,26 to 0,30 |
| 2 | 0,51 to 0,64 |
| 3 | 1,0 to 1,3 |
| 4 | 1,9 to 2,7 |
| 5 | 3,8 to 5,4 |
| 6 | 7,6 to 11 |
| 7 | > 15 |

b) The SS generates an independent, uncorrelated interfering (unwanted) signal with TUhigh propagation profile. The unwanted signal is on the same channel as the wanted signal but has no fixed relationship with the bit transitions of the wanted signal, and is modulated with random data. The SS sets the level of this signal such that the BER computed on the basis of the number of bit errors occuring in 50 SACCH multiframes corresponds to one of the cases: case_i in Table 21.7.

c) The SS verifies that the MS reports RXQUAL. The SS also computes the RXQUAL level for the multiframe based on the looped back bits. The SS compares the RXQUAL level it computed based on the looped back bits of the multiframe with the RXQUAL level reported by the MS for that multiframe. The reported level is considered correct if RXQUAL reported by the MS is equal to RXQUAL_i (with i = 0, 1, ... 7), or to one of the adjacent bands RXQUAL_(i-1) (with i = 1, 2, ..., 7) and RXQUAL_(i+1) (with i = 0, 1, ..., 6). For each failure (to be in the correct or one of the adjacent bands) that is found, if any, a counter Max-events_i is increased by one. This step is continued for Max_samples_i RXQUAL_i based on the looped back bits.

   If the MS reports RXQUAL = 7 during the test period, then at least 35 SACCH multiframes, are transmitted with a level of the unwanted signal that allows the radio link counter in the MS to reach the maximum value.

NOTE: This special procedure for RXQUAL = 7 is due to the high error, that could lead to the MS experiencing a radio link time-out.

d) The SS repeats steps b) and c) for all of the eight case_i.

#### 21.4.5 Test requirements

The number of errors in reporting the RXQUAL bands recorded in each of the considered cases shall not exceed the corresponding value of Max-events shown in Table 21.8, when the number of samples relevant for the case is equal to Max_samples.

**Table 21.8: Maximum number of incorrectly reported RXQUAL_FULL for TCH/FS**

| CASE | Expected RXQUAL_FULL | Specified reporting error rate | Max-events | Max_samples |
|---|---|---|---|---|
| 0 | RXQUAL_0/1 | 15% | 200 | 1093 |
| 1 | RXQUAL_1/0/2 | 15% | 200 | 1093 |
| 2 | RXQUAL_2/1/3 | 15% | 200 | 1093 |
| 3 | RXQUAL_3/2/4 | 10% | 200 | 1640 |
| 4 | RXQUAL_4/3/5 | 10% | 200 | 1640 |
| 5 | RXQUAL_5/4/6 | 10% | 200 | 1640 |
| 6 | RXQUAL_6/5/7 | 10% | 200 | 1640 |
| 7 | RXQUAL_7/6 | 10% | 200 | 1640 |

## 21.5 Received signal measurements in HSCSD multislot configuration

### 21.5.1 Signal strength

#### 21.5.1.1 Definition and applicability

The MS reports RXLEV values related to the apparent received RF signal strength. It is necessary for these levels to attain sufficient accuracy for the correct functioning of the system.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800, PCS 1 900 and any multiband MSs which are capable of HSCSD multislot operation.

#### 21.5.1.2 Conformance requirement

1. The RMS received signal level at the receiver input shall be measured by the MS over the full range of -110 dBm to -48 dBm with a relative accuracy between signals with levels up to 20 dB difference according to table 21.5-1

   1.1 under normal conditions, GSM 05.08, 8.1.2 and GSM 05.05, 6.2.

   1.2 under extreme conditions, GSM 05.08, 8.1.2, GSM 05.05, annex D.1, D.2.

**Table 21.5-1: Tolerance for relative accuracy of receive signal measurement**

| Absolute level of lower level signal dBm | | | | | | Tolerance dB | | | |
|---|---|---|---|---|---|---|---|---|---|
| GSM Small MS | GSM Other MS | DCS1800 Class 1&2 | DCS1800 Class 3 | PCS1900 Class 1&2 | PCS1900 Other MS | Lower limit Single | Lower limit Multi | Upper limit Single | Upper limit Multi |
| >= -88 | >= -90 | >= -86 | >= -88 | >= -88 | >= -90 | 2 | 4 | 2 | 4 |
| >= -101 | >= -103 | >= -99 | >= -101 | >=-101 | >= -103 | 3 | 5 | 2 | 5 |
| < -101 | < -103 | < -99 | < -101 | < -101 | < -103 | 4 | 6 | 2 | 6 |

Single means that the measurements are on the same or different RF channel within the same frequency band.

Multi means that the measurements are on different RF channel on different frequency bands.

For measurements between ARFCN in different bands the 'Absolute level of lower level signal' column for the band including the lower level signal shall be used to determine which tolerance applies.

At extreme temperature conditions an extra 2 dB shall be added to the Multi limits in above table.

2. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of +/-4 dB from -110 dBm to -70 dBm under normal conditions; GSM 05.08, 8.1.2.

3. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of +/-6 dB over the full range of -110 dBm to -48 dBm under both normal and extreme conditions; GSM 05.08, 8.1.2.

4. If the received signal level falls below the reference sensitivity level for the type of MS then the MS shall report a level between the reference sensitivity level and the actual received level, but with the tolerances given in conformance requirements 2. and 3. above.

5. The measured signal level shall be mapped to an RXLEV value between 0 and 63 as specified in GSM 05.08; GSM 05.08, 8.1.4.

### 21.5.1.3 Test purpose

1. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 1.

   1.1 under normal conditions;

   1.2 under extreme conditions.

2. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 2 under normal conditions.

3. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 3 under extreme conditions and under normal conditions from -48 dBm to -70 dBm.

4. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 4.

NOTE: Conformance requirement 5 is inherently tested in each of the test purposes 1. to 4.

### 21.5.1.4 Method of test

#### 21.5.1.4.1 Initial conditions

The SS is set to produce the BCCH of the serving cell at 63 dBµVemf( ) and the BCCHs of 6 surrounding cells at 28 dBµVemf( ). The BCCH of the serving cell indicates these BCCHs, but not the BCCH of the serving cell. The ARFCN of the serving cell BCCH is chosen so as not to interfere with the other channels as shown in table 21.5-2. The fading profile for the BCCHs of the serving and surrounding cells will be set to static.

After 30 s, a call is set up according to the generic call set up procedure for multislot HSCSD to an ARFCN, within the supported band of operation. The SACCH indicates the same surrounding cell BCCHs as the BCCH of the serving cell.

SS commands the MS to operate in the multislot class with maximum number of bidirectional channels.

NOTE: The 30 s is to allow the MS to scan and find all BCCHs.

#### 21.5.1.4.2 Procedure

a) The levels of the TCH and BCCHs are set according to table 21.5-2 step 1. The SS waits 20 s before continuing. Same TCH levels are set to all multislot subchannels.

**Table 21.5-2: Signal levels at receiver input in dBµVemf( )**

| Step | ARFCN | TCH | BCCH1 | BCCH2 | BCCH3 | BCCH4 | BCCH5 | BCCH6 |
|---|---|---|---|---|---|---|---|---|
| | GSM450 | 259 | 276 | 293 | 264 | 269 | 281 | 288 |
| | GSM480 | 306 | 323 | 340 | 311 | 316 | 328 | 335 |
| | GSM900: | 1 | 62 | 124 | 20 | 40 | 80 | 100 |
| | DCS1800 | 512 | 700 | 885 | 585 | 660 | 790 | 835 |
| | PCS1900 | 512 | 700 | 805 | 585 | 660 | 790 | 550 |
| | 450/900 | 259 | 124 | 276 | 293 | 269 | 288 | 1 |
| | 480/900 | 306 | 124 | 323 | 340 | 316 | 335 | 1 |
| | 450/1800 | 259 | 885 | 276 | 293 | 269 | 288 | 512 |
| | 480/1800 | 306 | 885 | 323 | 340 | 316 | 335 | 512 |
| | 900/1800 | 1 | 885 | 62 | 124 | 40 | 100 | 512 |
| | 450/900/1800 | 259 | 124 | 276 | 885 | 293 | 1 | 512 |
| | 480/900/1800 | 306 | 124 | 323 | 885 | 340 | 1 | 512 |
| | GSM850 | 128 | 189 | 251 | 150 | 170 | 210 | 230 |
| | GSM 750 | 438 | 475 | 511 | 440 | 455 | 485 | 500 |
| | 750/850 | 438 | 251 | 475 | 511 | 455 | 485 | 128 |
| 1+m*21 | | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 |
| 2+m*21 | | 54,5-m*10 | 63,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 |
| 3+m*21 | | 54,5-m*10 | 62,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 |
| . | | . | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 17+m*21 | | 54,5-m*10 | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 18+m*21 | | 44,5-m*10 | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| . | | . | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 21+m*21 | | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 |

m = 0, 1, 2, 3, 4.

b) The measurement is done in 105 steps. The initial signal levels of each multislot TCH of the serving cell and the BCCHs of the surrounding cells are adjusted according to table 21.5-2. At each step the SS keeps the signal levels stable for one reporting period, except at steps 21+m*21 where the level is held stable for 1,75 reporting periods. The RXLEV value for the period in which the change occurs (reported in the following period) is discarded. The SS records the RXLEV values reported for the surrounding cell BCCHs in steps 1 + m * 21 and 21 + m * 21. The RXLEV values for BCCH 1 are recorded by the SS for all 105 steps.

NOTE: This extension at steps 21+m*21 is to allow an extra quarter reporting period for the MS to stabilize for steps 1+m*21.

At steps 1 to 30 the SS simulates a base station with DTX off and at steps 31 to 105 the SS simulates a base station with DTX on.

At steps 1 to 30 the SS checks the accuracy of the measured signal strength of TCH by checking the values of the parameters RXLEV_FULL and RXLEV_SUB. At steps 31 to 105 the SS shall check only the value of the parameter RXLEV_SUB.

At step 64, within every 480 ms reporting period, out of the 4 SACCH and 8 SID timeslots the SS transmits the first six active timeslots of the TCH with signal level 39,5 dBµVemf( ) and the last six active timeslots of the TCH with signal level 29,5 dBµVemf( ).

c) The SS sets signal levels for all multislot subchannels and BCCH as in step 50 of the table 21.5-2. The SS lowers the signal level on one of the subchannels in 6 steps of 1 dB. This is repeated on all subchannels. The SS simulates a base station with DTX off.

d) Steps b) and c) are repeated under extreme conditions (annex 1, TC2,2 and TC3).

### 21.5.1.5 Test requirements

#### 21.5.1.5.1 Relative accuracy of measurements on different ARFCN

For normal and each of the 4 extreme conditions for all multislot subchannels tested the following applies;

a) For each of the steps 1, 21, 22, 42, 43, and 64, of the at least 7 (depending on the multislot class the MS is capable) reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 4 if the measurements are on the same or on different RF channel within the same frequency band and no more than 8 (12 for extreme temperature conditions) if the measurements are on different frequency bands.

b) For each of the steps 63 and 85, of the at least 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 for small MS, DCS 1 800 and PCS 1 900 (Class 1&2) MS or 4 for other MS if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 for small MS, DCS 1 800 and PCS 1 900 (Class 1&2) MS or 8 for other MS and other PCS 1 900 MS (13 and 12 for extreme temperature conditions) if the measurements are on different frequency bands.

c) For step 84, of the at least 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 (13 for extreme temperature conditions) if the measurements are on different frequency bands.

d) For step 105, of the reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 6 if the measurements are on the same or on different RF channel within the same frequency band and no more than 10 (14 for extreme temperature conditions) if the measurements are on different frequency bands.

NOTE: It is not mandatory for the MS to report any of the BCCHs in step 105.

#### 21.5.1.5.2 Relative accuracy at a single frequency (BCCH1)

For normal and each of the 4 extreme conditions tested the following applies;

For n <= 21 and $RXLEV_1 = 63$

$RXLEV_n$ - (63 - n + r) shall be between:

-2 and +2

NOTE: This formula allows for an MS with an absolute accuracy worse than +0,5 dB and therefore reporting an RXLEV of 63 for more than one step. The formula checks the relative accuracy from the lowest input level for which the MS last reports RXLEV of 63.

Otherwise

$RXLEV_{(m*21+1)}$ - $RXLEV_{(m*21+n)}$ - n + 1 shall be between:

-2 and +2

for steps 2 to 62 and 65 to 71 for DCS 1 800 class 1/2 MS; or steps 2 to 62 and 65 to 73 for DCS 1 800 class 3, PCS 1 900 (Class 1&2) and Small GSM MS; or 2 to 75 for other MS and other PCS 1 900 MS.

-3 and +2

for steps 63 and 72 to 96 for DCS 1 800 class 1/2 MS; or steps 63 and 74 to 98 for DCS 1 800 class 3, PCS 1 900 (Class 1&2) and Small GSM MS; or 76 to 100 for other MS and other PCS 1 900 MS.

-4 and +2

for steps 97 to 105 for DCS 1 800 class 1/2 MS; or steps 99 to 105 for DCS 1 800 class 3, PCS 1 900 (Class 1&2) and Small GSM MS; or 101 to 105 for other MS and other PCS 1 900 MS.

where: 1 < n <= 21 and 0 <= m <= 4 as identified in table 21-2, and r is the number of the last step where RXLEV of 63 was reported.

NOTE: It is not mandatory for the MS to report BCCH1 for steps greater than 99 for GSM 400, GSM 700, GSM 850 or GSM 900 Small MS or 101 for other GSM and other PCS 1 900 MS or 97 for a DCS 1 800 Class 1 or Class 2 MS and 99 for DCS 1 800 Class 3 and PCS 1 900 (Class 1&2) MS. If the MS reports a level and the upper limit for this step in the above formulae implies a level below the reference sensitivity level for the type of MS, then the upper limit shall be considered as equal to a value corresponding to the reference sensitivity level.

#### 21.5.1.5.3 Absolute accuracy

For each BCCH reported, $|RXLEV_{MS} + m * 10 - 62|$ shall be no more than:

4 for steps 64 and 85 under normal conditions.

6 for steps 64 and 85 under extreme conditions.

6 for steps 1, 22 and 43 under normal and extreme conditions.

where: 0 <= m <= 4 as identified in table 21.5-2.

#### 21.5.1.5.4 Relative accuracy of measurements of different subchannel

In step c) the RXLEV values reported for all subchannels are checked, allowing +/- 2 dB relative accuracy. Reporting shall be independent on all bidirectional subchannels.

## 21.6 COMPACT Signal strength

### 21.6.1 Definition and applicability

The MS reports RXLEV values related to the apparent received RF signal strength. It is necessary for these levels to attain sufficient accuracy for the correct functioning of the system.

The requirements and this test apply to all types of MSs supporting COMPACT.

### 21.6.2 Conformance requirement

1. The RMS received signal level at the receiver input shall be measured by the MS over the full range of -110 dBm to -48 dBm with a relative accuracy between signals with levels up to 20 dB difference according to table 21-6

   1.1 under normal conditions, GSM 05.08, 8.1.2 and GSM 05.05, 6.2.

   1.2 under extreme conditions, GSM 05.08, 8.1.2, GSM 05.05, annex D.1, D.2.

**Table 21-6: Tolerance for relative accuracy of receive signal measurement**

| Absolute level of lower level signal dBm | Tolerance dB |
|---|---|

| GSM 400, 700, 850 and 900 | GSM 400, 700, 850 and 900 | DCS1800, PCS1900 | DCS1800, PCS1900 | | | | |
|---|---|---|---|---|---|---|---|
| Small MS | Other MS | Class 1 & 2 | Class 3 | Lower limit Single | Multi | Upper limit Single | Multi |
| >= -88 | >= -90 | >= -86 | >= -88 | 2 | 4 | 2 | 4 |
| >= -101 | >= -103 | >= -99 | >= -101 | 3 | 5 | 2 | 5 |
| < -101 | < -103 | < -99 | < -101 | 4 | 6 | 2 | 6 |

Single means that the measurements are on the same or different RF channel within the same frequency band.

Multi means that the measurements are on different RF channel on different frequency bands.

For measurements between ARFCN in different bands the 'Absolute level of lower level signal' column for the band including the lower level signal shall be used to determine which tolerance applies.

At extreme temperature conditions an extra 2 dB shall be added to the Multi limits in above table.

2. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of +/-4 dB from -110 dBm to -70 dBm under normal conditions; GSM 05.08, 8.1.2.

3. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of +/-6 dB over the full range of -110 dBm to -48 dBm under both normal and extreme conditions; GSM 05.08, 8.1.2.

4. If the received signal level falls below the reference sensitivity level for the type of MS then the MS shall report a level between the reference sensitivity level and the actual received level, but with the tolerances given in conformance requirements 2. and 3. above.

5. The measured signal level shall be mapped to an RXLEV value between 0 and 63 as specified in GSM 05.08; GSM 05.08, 8.1.4.

### 21.6.3 Test purpose

1. To verify that the RXLEV reported by the MS does not exceed conformance requirement 1.

   1.1 under normal conditions;

   1.2 under extreme conditions.

2. To verify that the RXLEV reported by the MS does not exceed conformance requirement 2 under normal conditions.

3. To verify that the RXLEV reported by the MS does not exceed conformance requirement 3 under extreme conditions and under normal conditions from -48 dBm to -70 dBm.

4. To verify that the RXLEV reported by the MS does not exceed conformance requirement 4.

5. To Verify that the MS is able to adjust meausurement timing.

6. To verify that the MS is able to decode BSIC from the neighbors.

NOTE: Conformance requirement 5 is inherently tested in each of the test purposes 1. to 4.

### 21.6.4 Method of test

#### Initial conditions

The SS is set to produce the CPBCCH of the serving cell at 63 dBμVemf( ) and the CPBCCHs of 6 surrounding cells at 28 dBμVemf( ). The CPBCCH of the serving cell indicates these CPBCCHs, but not the CPBCCH of the serving cell. The ARFCN of the serving cell CPBCCH is chosen so as not to interfere with the other channels as shown in table 21-6. The fading profile for the CPBCCHs of the serving and surrounding cells will be set to static.

After 120 s, a downlink TBF is set up according to the generic TBF set up procedure to an ARFCN, within the supported band of operation. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see GSM 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. MCS-1 coding is used.

NOTE: The 120 s is to allow the MS to scan and find all CPBCCHs.

The SS must broadcast to MS a parameter NETWORK_CONTROL_ORDER set to value NC2. The MS shall send measurement reports to the network and the MS shall not perform autonomous cell re-selection. Parameter NC_REPORTINGPERIOD_T (time period for cell reselection meaurement reporting for packet transfer mode) is set to 1.92 s (corresponding 8*52multiframes). The MS is able to take at least 18 samples / timegroup in every 4*52 multiframe. The average number of samples / carrier should be (4 *18) * 2 /6 = 24. . In every TDMA frame possible, a received signal level measurement sample shall be taken on at least one of the CPBCCH carriers, as evenly distributed as possible among the neighbours.

### Procedure

a) The TimeGroups are set according to table 21-6-1.

**Table 21-6-1: CPBCCH Timegroups**

| CPBCCH | TG |
|---|---|
| 1 , 5 | 0 |
| 2, 6 | 1 |
| 3 | 2 |
| 4 | 3 |

b) The levels of the PDTCH and CPBCCHs are set according to table 21-6-2 step 1. The SS waits 20 s before continuing.

**Table 21-6-2: Signal levels at receiver input in dBµVemf( )**

| Step | ARFCN | PDTCH | CPBCCH1 | CPBCCH2 | CPBCCH3 | CPBCCH4 | CPBCCH5 | CPBCCH6 |
|---|---|---|---|---|---|---|---|---|
| | GSM450 | 259 | 276 | 293 | 264 | 269 | 281 | 288 |
| | GSM480 | 306 | 323 | 340 | 311 | 316 | 328 | 335 |
| | GSM900: | 1 | 62 | 124 | 20 | 40 | 80 | 100 |
| | DCS1800 | 512 | 700 | 885 | 585 | 660 | 790 | 835 |
| | 450/900 | 259 | 124 | 276 | 293 | 269 | 288 | 1 |
| | 480/900 | 306 | 124 | 323 | 340 | 316 | 335 | 1 |
| | 450/1800 | 259 | 885 | 276 | 293 | 269 | 288 | 512 |
| | 480/1800 | 306 | 885 | 323 | 340 | 316 | 335 | 512 |
| | 900/1800 | 1 | 885 | 62 | 124 | 40 | 100 | 512 |
| | 450/900/1800 | 259 | 124 | 276 | 885 | 293 | 1 | 512 |
| | 480/900/1800 | 306 | 124 | 323 | 885 | 340 | 1 | 512 |
| | GSM850 | 128 | 189 | 251 | 150 | 170 | 210 | 230 |
| | PCS1900 | 512 | 661 | 810 | 560 | 610 | 710 | 760 |
| | 850/1900 | 128 | 810 | 189 | 251 | 170 | 230 | 512 |
| | GSM 750 | 438 | 475 | 511 | 440 | 455 | 485 | 500 |
| | 750/850 | 438 | 251 | 475 | 511 | 455 | 485 | 128 |
| | 750/1900 | 438 | 810 | 475 | 511 | 455 | 485 | 512 |
| | 750/850/1900 | 438 | 251 | 475 | 810 | 511 | 128 | 512 |
| 1+m*21 | | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 |
| 2+m*21 | | 54,5-m*10 | 63,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 |
| 3+m*21 | | 54,5-m*10 | 62,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 |
| . | | . | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 17+m*21 | | 54,5-m*10 | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 18+m*21 | | 44,5-m*10 | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| . | | . | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 21+m*21 | | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 |

m = 0, 1, 2, 3, 4.

b) The first measurement is done in 105 steps. The initial signal levels of the PDTCH of the serving cell and the CPBCCHs of the surrounding cells are adjusted according to table 21-6-2. At each step the SS keeps the signal

levels stable for one reporting period, except at steps 21+m*21 where the level is held stable for 1,75 reporting periods. The RXLEV value for the period in which the change occurs (reported in the following period) is discarded. The SS records the RXLEV values reported for the surrounding cell CPBCCHs in steps 1 + m * 21 and 21 + m * 21. The RXLEV values for CPBCCH 1 are recorded by the SS for all 105 steps.

NOTE: This extension at steps 21+m*21 is to allow an extra quarter reporting period for the MS to stabilize for steps 1+m*21.

At steps 1 to 105 the SS checks the accuracy of the measured signal strength of PDTCH by checking the values of the parameter RXLEV.

The second part of test (105 steps) is done by following the rules defined above with the inclusion that the SS shall delay the transmission (CBCCH's) from surronding cells by n*3 bits (n=1,2,3…,21), where n is incremented by 1 after every 5 performed measurement steps (5,10,15,20…,100).

c) Step b) is repeated under extreme conditions (annex 1, TC2,2 and TC3).

### 21.6.5 Test requirements

#### 21.6.5.1 Relative accuracy of measurements on different ARFCN

For normal and each of the 4 extreme conditions (both with and without the delay) tested the following applies;

a) For each of the steps 1, 21, 22, 42, 43, and 64, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 4 if the measurements are on the same or on different RF channel within the same frequency band and no more than 8 (12 for extreme temperature conditions) if the measurements are on different frequency bands.

b) For each of the steps 63 and 85, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 for small MS and DCS 1 800/PCS 1900 MS or 4 for other MS if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 for small MS and DCS 1 800/PCS 1900 MS or 8 for other MS (13 and 12 for extreme temperature conditions) if the measurements are on different frequency bands.

c) For step 84, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 (13 for extreme temperature conditions) if the measurements are on different frequency bands.

d) For step 105, of the reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 6 if the measurements are on the same or on different RF channel within the same frequency band and no more than 10 (14 for extreme temperature conditions) if the measurements are on different frequency bands.

d) For Step 1, check that the MS reports correclty the BSIC from all the neighbors and the reported BSIC value is unchanged during the whole tests

NOTE: It is not mandatory for the MS to report any of the CPBCCHs in step 105.

#### 21.6.5.2 Relative accuracy at a single frequency (CPBCCH1)

For normal and each of the 4 extreme conditions tested the following applies;

For n <= 21 and $RXLEV_1 = 63$

$RXLEV_n$ - (63 - n + r) shall be between:

-2 and +2

NOTE: This formula allows for an MS with an absolute accuracy worse than +0,5 dB and therefore reporting an RXLEV of 63 for more than one step. The formula checks the relative accuracy from the lowest input level for which the MS last reports RXLEV of 63.

Otherwise

$RXLEV_{(m*21+1)}$ - $RXLEV_{(m*21+n)}$ - n + 1 shall be between:

-2 and +2

for steps 2 to 62 and 65 to 71 for DCS 1 800/ PCS 1900 class 1/2 MS; or steps 2 to 62 and 65 to 73 for DCS 1 800/PCS 1900 class 3 and Small GSM MS; or 2 to 75 for other MS.

-3 and +2

for steps 63 and 72 to 96 for DCS 1 800/PCS1900 class 1/2 MS; or steps 63 and 74 to 98 for DCS 1 800/PCS 1900 class 3 and Small GSM MS; or 76 to 100 for other MS.

-4 and +2

for steps 97 to 105 for DCS 1 800/PCS 1900 class 1/2 MS; or steps 99 to 105 for DCS 1 800/ PCS 1900 class 3 and Small GSM MS; or 101 to 105 for other MS.

where: 1 < n <= 21 and 0 <= m <= 4 as identified in table 21-6, and r is the number of the last step where RXLEV of 63 was reported.

NOTE: It is not mandatory for the MS to report CPBCCH1 for steps greater than 99 for GSM 400, GSM 700, GSM 850 OR GSM 900 Small MS or 101 for other GSM MS or 97 for a DCS 1 800/PCS1900 Class 1 or Class 2 MS and 99 for DCS 1 800/PCS1900 Class 3 MS. If the MS reports a level and the upper limit for this step in the above formulae implies a level below the reference sensitivity level for the type of MS, then the upper limit shall be considered as equal to a value corresponding to the reference sensitivity level.

#### 21.6.5.3 Absolute accuracy

For each BCCH reported, $|RXLEV_{MS} + m * 10 - 62|$ shall be no more than:

4 for steps 64 and 85 under normal conditions.

6 for steps 64 and 85 under extreme conditions.

6 for steps 1, 22 and 43 under normal and extreme conditions.

where: 0 <= m <= 4 as identified in table 21-2.

## 21.7 COMPACT Signal strength selectivity

### 21.7.1 Definition and applicability

The signal strength selectivity is a measure of the ability of the signal strength measuring part of the MS to discriminate against RF power from adjacent ARFCN. The RXLEV selectivity figure corresponds to the amount by which the adjacent channel power shall be attenuated.

The requirements and this test apply to all types of MS supporting COMPACT.

### 21.7.2 Conformance requirement

The selectivity of the received signal measurement shall be as follows:

- for adjacent (200 kHz) channel; >= 16 dB
- for adjacent (400 kHz) channel; >= 48 dB
- for adjacent (600 kHz) channel; >= 56 dB

GSM 05.08, 8.1.2.

### 21.7.3 Test purpose

To verify that the MS meets the conformance requirement at the 200 kHz adjacent channel above and below the wanted.

### 21.7.4 Method of test

All CPBCCH's are using time group 0.

The SS must broadcast to MS a parameter NETWORK_CONTROL_ORDER set to value NC2. The MS shall send measurement reports to the network and the MS shall not perform autonomous cell re-selection. Parameter NC_REPORTINGPERIOD_T (time period for cell reselection meaurement reporting for packet transfer mode) is set to 0.96 s (corresponding 4*52multiframes).

Initial conditions

For GSM 450:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 269 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 281. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see GSM 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 270 and 280 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCH.

For GSM 480:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 316 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 328. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see GSM 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 317 and 327 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCH.

For GSM 750:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 450 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 485. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see GSM 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 451 and 484 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCH.

For GSM 850:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 170 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 210. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see GSM 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 171 and 209 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCH.

For GSM 900:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 40 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 80. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see GSM 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 41 and 79 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCH.

For DCS 1 800:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 690 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 790. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see GSM 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 691 and 789 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCH.

For PCS 1 900:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 650 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 710. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see GSM 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 651 and 709 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCH.

Procedure

a) The SS records the RXLEV values reported for the PDTCH and CPBCCH3.

b) CPBCCH1 and 2 are set to 9 dB above the signal level of the PDTCH and CPBCCH3.

NOTE: The first adjacent channel interference requirement limits the level of CPBCCHs 1 and 2 to 9 dB. This ensures that the MS can maintain the call, and read CPBCCH3.

c) These conditions are kept for 30 s.

d) The SS records the RXLEV values reported for the PDTCH and CPBCCH3.

### 21.7.5 Test requirements

The values of RXLEV recorded in step d) shall be no more than 1 above the values recorded in step a).

NOTE: This one change in the reported value of RXLEV is calculated as follows: The level of the first adjacent interfering signal is such that C/I is -9 dB. With an RXLEV selectivity for the first adjacent channel of 16 dB, the power from the adjacent channel is equal to -7 dB with respect to the power level of the useful signal. The increase in power therefore is equal to $10\log(1 + 10^{-0,7}) = 0,71$ dB. Thus, the value of RXLEV could increase by 1.

# 22 Transmit power control timing and confirmation

## 22.1 Transmit power control timing and confirmation, single slot

### 22.1.1 Definition and applicability

The RF power level to be employed by the MS is indicated by means of the 5 bit TXPWR field sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block.

When a power change is signalled the MS must change its power control level to the new level at a certain rate of change.

The MS shall confirm the power level that it is currently employing by setting the MS_TXPWR_CONF field in the uplink SACCH L1 header.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MS.

### 22.1.2 Conformance requirement

1. The RF power control level to be employed by the MS is indicated by means of the power control information sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block; GSM 05.08, 4.2.

2. The MS shall confirm the power level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the MS for the last burst of the previous SACCH period; GSM 05.08, 4.2.

3. Upon receipt of a command on the SACCH to change its RF power level, the MS shall change to the new level at a rate of one nominal 2 dB power control step every 60 ms; GSM 05.08, 4.7.

4. The change (in conformance requirement 3) shall commence at the first TDMA frame belonging to the next reporting period; GSM 05.08, 4.7.

5. In case of channel change the commanded power level shall be applied on the new channel immediately; GSM 05.08, 4.7.

### 22.1.3 Test purpose

1. To verify that the MS will set its transmitter output power in accordance with conformance requirement 1.

2. To verify that the MS will confirm the power level it is currently employing according to conformance requirement 2.

3. To verify that the MS, upon receipt of a command from the SACCH to change its RF power level, will change according to conformance requirement 3.

4. To verify that the MS will commence the change of power level at least by the sixth TDMA frame belonging to the next reporting period.

5. To verify that in case of new channel assignment the commanded power level is applied on the new channel according to conformance requirement 5.

### 22.1.4 Method of test

NOTE: The method of measuring the MS transmitter output power is given in section 13.3.

#### 22.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range (ref. table 3.3), power control level set to maximum power.

#### 22.1.4.2 Procedure

a) The SS signals minimum power control level to the MS in the SACCH.

b) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.

c) The SS now sets TXPWR in the SACCH to the maximum peak power appropriate to the class of the MS.

d) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.

e) The SS now sets the SACCH TXPWR to 8.

f) After 3 s the SS sets the SACCH TXPWR to 9.

g) The SS measures the MS transmitter output power on TDMA frame 6.

h) The SS sets the SACCH TXPWR to 8.

i) The SS measures the MS transmitter output power on TDMA frame 6.

j) The channel assignment is changed and the demanded power within the channel assignment is set to the minimum power control level of the MS.

k) When the MS has changed channel its output power is measured on the first burst on the new channel.

### 22.1.5 Test requirements

NOTE: Refer to tables 13-2 , 13-3 and 13-4 for relationship between the power class, power control level, transmitter output power and the relevant tolerances.

a) In steps b) and d), the transmitter output power shall change by one power step towards the new level signalled for each measured burst until the MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level.

b) In steps b) and d), the value of the MS_TXPWR_CONF field in the uplink SACCH L1 header shall correspond to the actual power control level used for the last transmitted burst of the previous SACCH multiframe. The first one shall indicate the initial transmitted power control level, the subsequent ones shall change by 8 each time until the final power control level has been reached in which case that value shall be indicated.

c) In steps g) and i) the transmitter output power of TDMA frame 6 shall correspond to the new commanded power control level.

d) In step k) the MS output power, measured on the new channel shall correspond to the power control level in the channel assignment.

# 22.2 Transmit power control timing and confirmation in HSCSD multislot configurations

## 22.2.1 Definition and applicability

The RF power level to be employed by the MS is indicated by means of the 5 bit TXPWR field sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block.

When a power change is signalled the MS must change its power control level to the new level at a certain rate of change.

The MS shall confirm the power level that it is currently employing by setting the MS_TXPWR_CONF field in the uplink SACCH L1 header.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MS and any multiband MS which are capable of HSCSD multislot operation.

## 22.2.2 Conformance requirement

1. The RF power control level to be employed by the MS is indicated by means of the power control information sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block; GSM 05.08, 4.2.

2. The MS shall confirm the power level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the MS for the last burst of the previous SACCH period; GSM 05.08, 4.2.

3. Upon receipt of a command on the SACCH to change its RF power level, the MS shall change to the new level at a rate of one nominal 2 dB power control step every 60 ms; GSM 05.08, 4.7.

4. The change (in conformance requirement 3) shall commence at the first TDMA frame belonging to the next reporting period; GSM 05.08, 4.7.

5. In case of channel change the commanded power level shall be applied on the new channel immediately; GSM 05.08, 4.7.

## 22.2.3 Test purpose

1. To verify that the MS will set its transmitter output power in accordance with conformance requirement 1.

2. To verify that the MS will confirm the power level it is currently employing according to conformance requirement 2.

3. To verify that the MS, upon receipt of a command from the SACCH to change its RF power level, will change according to conformance requirement 3.

4. To verify that the MS will commence the change of power level at least by the sixth TDMA frame belonging to the next reporting period.

5. To verify that in case of new channel assignment the commanded power level is applied on the new channel according to conformance requirement 5.

## 22.2.4 Method of test

NOTE: The method of measuring the MS transmitter output power is given in section 13.3.

### 22.2.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for multislot configuration on a channel with ARFCN in the Mid ARFCN range (ref. table 3.3), power control level set to maximum power.

The SS commands the MS to operate in multislot configuration where it has highest possible number of Tx slots.

#### 22.2.4.2 Procedure

a) The SS signals minimum power control level to the MS in the SACCH for one of the subchannels.

b) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.

c) The SS now sets TXPWR in the SACCH to the maximum peak power appropriate to the class of the MS.

d) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.

e) The SS now sets the SACCH TXPWR to 8.

f) After 3 s the SS sets the SACCH TXPWR to 9.

g) The SS measures the MS transmitter output power on TDMA frame 6.

h) The SS sets the SACCH TXPWR to 8.

i) The SS measures the MS transmitter output power on TDMA frame 6.

j) The channel assignment is changed and the demanded power within the channel assignment is set to the minimum power control level of the MS.

k) When the MS has changed channel its output power is measured on the first burst on the new channel.

l) Steps a) to k) are repeated on the next subchannel untill each is is tested.

### 22.2.5 Test requirements

NOTE: Refer to tables 13-2, 13-3 and 13-4 for relationship between the power class, power control level, transmitter output power and the relevant tolerances.

a) In steps b) and d), the transmitter output power shall change by one power step towards the new level signalled for each measured burst until the MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level.

b) In steps b) and d), the value of the MS_TXPWR_CONF field in the uplink SACCH L1 header shall correspond to the actual power control level used for the last transmitted burst of the previous SACCH multiframe. The first one shall indicate the initial transmitted power control level, the subsequent ones shall change by 8 each time until the final power control level has been reached in which case that value shall be indicated.

c) In steps g) and i) the transmitter output power of TDMA frame 6 shall correspond to the new commanded power control level.

d) In step k) the MS output power, measured on the new channel shall correspond to the power control level in the channel assignment.

## 22.3 GPRS Uplink Power Control – Use of α and $\Gamma_{CH}$ parameters

### 22.3.1 Definition and applicability

Power control is important for spectrum efficiency as well as for power consumption in a cellular system. Power control for a packet oriented connection is more complicated than for a circuit switched connection, since there is no continuos two-way connection.

The RF output power, $P_{CH}$ , to be employed by the MS on each individual uplink PDCH shall be:

$$P_{CH} = \min(\Gamma_0 - \Gamma_{CH} - \alpha * (C + 48), PMAX),$$

Where

$\Gamma_{CH}$ is an MS and channel specific power control parameter, sent to the MS in an RLC control message (see GSM 04.60).

$\Gamma_0$ = 39 dBm for GSM 400, GSM 700, GSM 850 and GSM900
= 36 dBm for DCS1800 and PCS 1900

$\alpha$ is a system parameter, broadcast on PBCCH or optionally sent to MS in an RLC control message (see GSM 04.08 and 04.60).

C is the normalised received signal level at the MS as defined in GSM 05.08, 10.2.3.1.

PMAX is the maximum allowed output power in the cell =
GPRS_MS_TXPWR_MAX_CCH if PBCCH exists
MS_TXPWR_MAX_CCH otherwise

All power values are expressed in dBm. (Note that the constants $\Gamma_0$ and 48 are included only for optimising the coding of $\Gamma_{CH}$ and C-value).

This is a flexible tool that can be used for different power control algorithms.

A pure open loop is achieved by setting $\alpha = 1$ and keeping $\Gamma_{CH}$ constant. With this method the output power is based on the received signal level assuming the same path loss in uplink and downlink. This is useful in the beginning of a packet transmission.

A pure closed loop is achieved by setting $\alpha = 0$. With this method the output power is commanded by the network based on received signal level measurements made in the BTS in a similar way as for a circuit switched connection.

This test applies to all GSM 400, GSM 700, GSM 850, GSM900, DCS1800 and PCS 1900 which support GPRS.

### 22.3.2 Conformance requirement

The MS shall use the same output power on all four bursts within one radio block. GSM 05.08, 10.2.1.

If a calculated output power is not supported by the MS, the MS shall use the supported output power which is closest to the calculated output power. GSM 05.08, 10.2.1.

When the MS receives new $\Gamma_{CH}$ or $\alpha$ values, the MS shall use the new value to update $P_{CH}$ 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value. GSM 05.08, 10.2.1.

The transmitted power shall be a monotonic function of the calculated output power and any change of 2 dB in the calculated value shall correspond to a change of of $2 \pm 1.5$ dB in the transmitted value. The MS may round the calculated output power to the nearest nominal output power value. GSM 05.08, 10.2.1.

### 22.3.3. Test purpose

To verify the MS uses that the same output power on all four bursts of a radio block under normal conditions.

To verify that the highest power supported by the MS is used if the calculated power is greater.

To verify that the MS applies new $\Gamma_{CH}$ or $\alpha$ values 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value.

To verify that any change of 2dB in the calculated power corresponds to a change of $2 \pm 1.5$ dB in the transmitted value under normal conditions.

NOTE: For changes in calculated power which are less than the tolerances specified for absolute power accuracy in a MS, the transmitted power as a function of calculated power cannot be tested for monotonicity. Monotonicity between power control steps is implicitly tested in section 13.16.

### 22.3.4 Method of test

#### 22.3.4.1 Initial conditions

The SS establishes a BCCH and a PBCCH on the same carrier in the mid ARFCN range. GPRS_MS_TXPWR_MAX_CCH is set to the maximum level (39dBm for GSM and 36dBm for DCS and PCS). The $\Gamma_{CH}$ value is set such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the maximum power control level supported by the Power Class of the MS under test. The $\alpha$ value is set to 0.

The SS establishes a downlink TBF on the same ARFCN as the BCCH and PBCCH. The MS shall transmit on the uplink. This is achieved using the GPRS test mode by transmitting a GPRS_TEST_MODE_CMD (see GSM 04.14, section5.4). The downlink power level is adjusted until a stable C-value of –52dBm is reported by the MS in the channel quality report (see GSM 05.08, 10.2.3).

#### 22.3.4.2 Procedure

a) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block.

   The method of power measurement is described in section 13.16.

b) The SS shall modify the $\Gamma_{CH}$ value such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the minimum power control level supported by the MS under test (5dBm for GSM 400, GSM 700, GSM 850 and GSM900 and 0dBm for DCS1800 and PCS 1 900). If the transmission of the RLC control message containing the new $\Gamma_{CH}$ value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.

c) The SS shall modify the $\Gamma_{CH}$ value such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the maximum power control level supported by the power class of the MS under test. If the transmission of the RLC control message containing the new $\Gamma_{CH}$ value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.

d) The SS shall modify the $\Gamma_{CH}$ value such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the value 4dB below the maximum power control level supported by the power class of the MS under test. The $\alpha$ value is set to 1.

e) The SS shall decrement the $\alpha$ value with a step size of 0.1 until $\alpha$ equals 0. For each step change in $\alpha$ value, if the transmission of the RLC control message containing the new $\alpha$ value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.

f) For each value of $\alpha$, the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step e). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of $\alpha$ values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of $\alpha$ from the maximum power measured for the larger value of $\alpha$. The minimum step change is calculated by subtracting the maximum power measured from the smaller value of $\alpha$ from the minimum power measured for the larger value of $\alpha$.

NOTE

If the power values measured for the four bursts of the radio block with $\alpha$ equal to 1.0 are:

$P_{m0}$ ,$P_{m1,}$ $P_{m2,}$ $P_{m3}$

And, the power values measured for the four bursts of the radio block with $\alpha$ equal to 0.5 are:

$P_{n0}$ ,$P_{n1,}$ $P_{n2,}$ $P_{n3}$

Then,

$P_{m(max)}$ = MAX($P_{m0}$ ,$P_{m1,}$ $P_{m2,}$ $P_{m3}$)

$P_{m(min)}$ = MIN($P_{m0}$ ,$P_{m1,}$ $P_{m2,}$ $P_{m3}$)

$P_{n(max)}$ = MAX($P_{n0}$ ,$P_{n1,}$ $P_{n2,}$ $P_{n3}$)

$P_{n(min)} = MIN(P_{n0}, P_{n1}, P_{n2}, P_{n3})$

The maximum and minimum step sizes are:

$STEP(MAX) = P_{m(max)} - P_{n(min)}$

$STEP(MIN) = P_{m(min)} - P_{n(max)}$

g) The SS shall modify the $\Gamma_{CH}$ value such that ($\Gamma_0 - \Gamma_{CH}$) equals the midrange power control level supported by the MS under test. The $\alpha$ value is set to 0.

h) The SS shall increment the $\alpha$ value with a step size of 0.1 until $\alpha$ equals 1. For each step change in $\alpha$ value, if the transmission of the RLC control message containing the new $\alpha$ value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.

i) For each value of $\alpha$, the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step h). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of $\alpha$ values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of $\alpha$ from the maximum power measured for the larger value of $\alpha$. The minimum step change is calculated by subtracting the maximum power measured from the smaller value of $\alpha$ from the minimum power measured for the larger value of $\alpha$.

j) The SS shall modify the $\Gamma_{CH}$ value such that ($\Gamma_0 - \Gamma_{CH}$) equals the minimum power control level supported by the MS under test (5dBm for GSM 400, GSM 700, GSM 850 and GSM900 and 0dBm for DCS1800 and PCS 1900). The $\alpha$ value is set to 0.

k) The SS shall increment the $\alpha$ value with a step size of 0.1 until $\alpha$ equals 1. For each step change in $\alpha$ value, if the transmission of the RLC control message containing the new $\alpha$ value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.

l) For each value of $\alpha$, the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step k). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of $\alpha$ values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of $\alpha$ from the maximum power measured for the larger value of $\alpha$. The minimum step change is calculated by subtracting the maximum power measured from the smaller value of $\alpha$ from the minimum power measured for the larger value of $\alpha$.

### 22.3.5 Test requirements

1. The power of all four bursts within the radio block measured in step a) and c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table:

| Power class | GSM 400, GSM 700, GSM 850 & GSM 900 Nominal Maximum output power | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum output power | Tolerance (dB) for normal conditions |
|---|---|---|---|---|
| 1 | - - - - - - | 1 W (30 dBm) | 1 W (30dBm) | ±2 |
| 2 | 8 W (39 dBm) | 0.25 W (24 dBm) | 0.25 W (24 dBm) | ±2 |
| 3 | 5 W (37 dBm) | 4 W (36 dBm) | 2 W (33 dBm) | ±2 |
| 4 | 2 W (33 dBm) | | | ±2 |
| 5 | 0.8 W (29 dBm) | | | ±2 |

2. The power of all four bursts within the radio block measured in step b) shall be 5dBm for a GSM 400, GSM 700, GSM 850 or GSM900 MS and 0dBm for a DCS1800 and PCS 1900 MS with an accuracy of ± 5dB in both cases.

3. In steps f), i) and l), the maximum change in transmitted power between each identified pair of $\alpha$ values shall be 3.5dB.

4. In steps f), i) and l), the minimum change in transmitted power between each identified pair of $\alpha$ values shall be 0.5dB.

# 22.4 GPRS Uplink Power Control – Independence of TS Power Control

## 22.4.1 Definition and applicability

This test applies to all GSM 400, GSM 700, GSM 850, GSM900, DCS1800 and PCS 1900 MS which support multislot GPRS on the uplink.

## 22.4.2 Conformance requirement

For a GPRS multislot MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH. GSM 05.08, 10.2.1.

## 22.4.3 Test purpose

To verify that for a GPRS multislot MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH.

## 22.4.4 Method of test

### 22.4.4.1 Initial conditions

The MS shall transmit on the uplink with the maximum number of TS for the multislot class of the MS.. This is achieved using the GPRS test mode by first establishing a downlink TBF and transmitting a GPRS_TESST_MODE_CMD (see GSM 04.14, section 5,4). Each TS is transmitting on its maximum power. The $\alpha$-value is set to 0.

### 22.4.4.2. Procedure

The SS shall modify the $\Gamma_{CH}$ value of one TS such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the minimum power control level supported by the MS under test (5dBm for GSM 400, GSM 700, GSM 850 and GSM900 and 0dBm for DCS1800 and PCS 1900).

a) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block of the TS under test.

b) The SS shall trigger a transmittter output power measurement on each of the four bursts of any radio block of the other active TS.

c) The SS shall modify the $\Gamma_{CH}$ value for the TS under test such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the maximum power control level supported by the MS under test.

d) Steps a) to d) shall be repeated for each TS of the multislot configuration.

## 22.4.5. Test requirements

1. The power of all four bursts within the radio block measured in step b) shall be 5dBm for a GSM 400, GSM 700, GSM 850 or GSM900 MS and 0dBm for a DCS1800 and PCS 1900 MS with an accuracy of $\pm$ 5dB in both cases.

2. For all TS, the power of all four bursts within the radio block measured in step c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table:

| Power class | GSM 400, GSM 700, GSM 850 & GSM 900 Nominal Maximum output power | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum output power | Tolerance (dB) for normal conditions |
|---|---|---|---|---|
| 1 | - - - - - - | 1 W (30 dBm) | 1 W (30dBm) | ±2 |
| 2 | 8 W (39 dBm) | 0.25 W (24 dBm) | 0.25 W (24 dBm) | ±2 |
| 3 | 5 W (37 dBm) | 4 W (36 dBm) | 2 W (33 dBm) | ±2 |
| 4 | 2 W (33 dBm) | | | ±2 |
| 5 | 0.8 W (29 dBm) | | | ±2 |

# 22.5 [Reserved for future GPRS test]

# 22.6 Normal transmit power control timing and confirmation in ECSD

## 22.6.1 Definition and applicability

The RF power level to be employed by the MS is indicated by means of the 5 bit TXPWR field sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block.

When a power change is signalled the MS must change its power control level to the new level at a certain rate of change.

The MS shall confirm the power level that it is currently employing by setting the MS_TXPWR_CONF field in the uplink SACCH L1 header.

The requirements and this test apply to all types of MSs which are capable of ECSD operation.

## 22.6.2 Test conformance

1. The RF power control level to be employed by the MS is indicated by means of the power control information sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block; GSM 05.08, 4.2.

2. The MS shall confirm the power level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the MS for the last burst of the previous SACCH period; GSM 05.08, 4.2.

3. Upon receipt of a command on the SACCH to change its RF power level, the MS shall change to the new level at a rate of one nominal 2 dB power control step every 60 ms; GSM 05.08, 4.7.

4. The change (in conformance requirement 3) shall commence at the first TDMA frame belonging to the next reporting period; GSM 05.08, 4.7.

5. In case of channel change the commanded power level shall be applied on the new channel immediately; GSM 05.08, 4.7.

## 22.6.3 Test purpose

1. To verify that the MS will set its transmitter output power in accordance with conformance requirement 1.

2. To verify that the MS will confirm the power level it is currently employing according to conformance requirement 2.

3. To verify that the MS, upon receipt of a command from the SACCH to change its RF power level, will change according to conformance requirement 3.

4. To verify that the MS will commence the change of power level at least by the sixth TDMA frame belonging to the next reporting period.

5. To verify that in case of new channel assignment the commanded power level is applied on the new channel according to conformance requirement 5.

### 22.6.4 Test method

NOTE: The method of measuring the MS transmitter output power is given in section 13.3. For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See section 13.17.3.

#### 22.6.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for multislot configuration on a channel with ARFCN in the Mid ARFCN range (ref. table 3.3), power control level set to maximum power.

The SS commands the MS to operate in multislot configuration where it has highest possible number of Tx slots.

#### 22.6.4.2 Procedure

If the MS supports both GMSK and 8PSK modulation on the uplink, the test is repeated with each modulation format.

a) The SS signals minimum power control level to the MS in the SACCH for one of the subchannels.

b) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.

c) The SS now sets TXPWR in the SACCH to the maximum peak power appropriate to the class of the MS.

d) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.

e) The SS now sets the SACCH TXPWR to 8.

f) After 3 s the SS sets the SACCH TXPWR to 9.

g) The SS measures the MS transmitter output power on TDMA frame 6.

h) The SS sets the SACCH TXPWR to 8.

i) The SS measures the MS transmitter output power on TDMA frame 6.

j) The channel assignment is changed and the demanded power within the channel assignment is set to the minimum power control level of the MS.

k) When the MS has changed channel its output power is measured on the first burst on the new channel.

l) Steps a) to k) are repeated on the next subchannel until each is tested.

### 22.6.5 Test requirement

NOTE: Refer to tables 13.17.3-1, 13.17.3-2, 13.17.3-3 and 13.17.3-4 for relationship between the power class, power control level, transmitter output power and the relevant tolerances.

a) In steps b) and d), the transmitter output power shall change by one power step towards the new level signalled for each measured burst until the MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level.

b) In steps b) and d), the value of the MS_TXPWR_CONF field in the uplink SACCH L1 header shall correspond to the actual power control level used for the last transmitted burst of the previous SACCH multiframe. The first one shall indicate the initial transmitted power control level, the subsequent ones shall change by 8 each time until the final power control level has been reached in which case that value shall be indicated.

c) In steps g) and i) the transmitter output power of TDMA frame 6 shall correspond to the new commanded power control level.

d) In step k) the MS output power, measured on the new channel shall correspond to the power control level in the channel assignment.

# 22.7 ECSD Fast Power Control (FPC) timing and interworking with normal power control

## 22.7.1 Definition and applicability

Using the SACCH L1 header, normal uplink power control modifies the MS transmit power at a maximum rate of one power control level change per SACCH period (480ms). Under Fast Power Control the output power of an MS, in E-TCH mode, is updated each fast power reporting period. There are 24 fast power reporting periods in a 104 frame SACCH period.

The requirements and this test apply to all types of MSs which are capable of class B ECSD operation.

## 22.7.2 Test conformance

1. In the E-TCH mode, the MS shall, if so indicated by the BSS in the SACCH L1 header or Assignment command, use FPC (fast power control); GSM 05.08, 4.2

2. Switching between the normal power control mechanism and FPC shall be done if FPC is enabled or disabled via signalling in the SACCH L1 header. The respective power control mechanism to be used shall then be active as from the first TDMA frame belonging to the next reporting period; GSM 05.08, 4.7

3. The initial power control level to be used by the MS immediately after switching between normal and fast power control mechanisms shall, in both cases, be the level last commanded by the normal power control mechanism; GSM 05.08, 4.7

4. The fast power control mechanism shall use the differential power control mechanism defined in the table of GSM 05.08, 4.3

5. The MS shall employ the most recently commanded fast power control level on each uplink E-TCH channel; GSM 05.08, 4.2

6. If a power control command is received but the requested output power is not supported by the MS, the MS shall use the supported output power which is closest to the requested output power; GSM 05.08, 4.3

7. If FPC is in use, the MS shall report, in the SACCH L1 header, the power control level used at the end of the normal power control reporting period; GSM 05.08, 4.2

8. In case of a multislot configuration, each bi-directional channel shall be power controlled individually by the corresponding SACCH or fast inband signalling link, whichever is applicable; GSM 05.08, 4.2

## 22.7.3 Test purpose

1. To verify that the MS switches between normal power control and fast power control mechanisms in accordance with conformance requirements 1 and 2.

2. To verify that the initial power control level used by the MS after switching between normal and fast power control mechanisms is in accordance with conformance requirement 3.

3. To verify that power level changes using the fast power control are implemented by the MS in accordance with conformance requirements 4 and 5.

4. To verify that power control commands requesting levels not supported by the MS are treated in accordance with conformance requirement 6.

5. To verify that the power reported by the MS at the end of the normal power control reporting period is in accordance with conformance requirement 7.

6. To verify that in a multislot configuration the MS implements fast power control independently on each bi-directional E-TCH in accordance with conformance requirement 8.

### 22.7.4 Test method

#### 22.7.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for multislot configuration on a channel with ARFCN in the Mid ARFCN range (ref. table 3.3).

The SS commands the MS to operate in multislot configuration where it has the highest possible number of bi-directional E-TCHs. Using normal power control, the level of each TX slot is set to maximum power.

#### 22.7.4.2 Procedure

For the purpose of this test the SS shall randomly select one bi-directional E-TCH to exercise. All other E-TCHs shall maintain the state defined under the initial conditions. In this procedure these other E-TCHs are referred to as the active but unselected channels.

a) Using the normal power control mechanism, the SS shall command the MS to transmit at power level 15 in the case of GSM400, GSM 700, GSM 850 and GSM900 or power level 8 in the case of DCS1800 and PCS1900 on the selected E-TCH. After 1s, a power measurement shall be made on each TX slot of the multislot configuration.

NOTE: The method of measuring the MS transmitter output power is given in section 13.3. For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See section 13.17.3.

b) The SS shall command the MS to switch between the normal power control and the fast power control mechanism by means of the SACCH L1 header (see GSM 04.04). Each power control mechanism shall be maintained for a single SACCH period. This cycle shall be repeated until all power measurements specified in steps c) to h) have been completed.

During the SACCH periods when normal power control is active, the SS shall command the MS to maintain the power levels set in step a). During the SACCH period when Fast Power Control is active, the SS shall command the MS to follow the schedule of fast power control detailed in the table below.

| FPC Reporting Period Number | Fast Power Control Command | Nominal Output Power during FPC Reporting period GSM400, GSM 700, GSM 850 & GSM900 | Nominal Output Power during FPC Reporting Period DCS1800 & PCS1900 | Pn |
|---|---|---|---|---|
| 0 | 2 Step Decrease | 13dBm | 14dBm | P0 |
| 1 | 2 Step Decrease | 11dBm | 12dBm | |
| 2 | 2 Step Decrease | 9dBm | 10dBm | |
| 3 | 2 Step Decrease | 7dBm | 8dBm | |
| 4 | 2 Step Decrease | 5dBm | 6dBm | |
| 5 | 2 Step Decrease | 5dBm | 4dBm | |
| 6 | 2 Step Decrease | 5dBm | 2dBm | |
| 7 | 2 Step Decrease | 5dBm | 0dBm | |
| 8 | 4 Step Increase | 5dBm | 0dBm | P34 |
| 9 | 4 Step Increase | 9dBm | 4dBm | |
| 10 | 4 Step Increase | 13dBm | 8dBm | |
| 11 | 4 Step Increase | 17dBm | 12dBm | |
| 12 | 4 Step Increase | 21dBm | 16dBm | |
| 13 | 4 Step Increase | Max(25dBm,Pmax) | 20dBm | |
| 14 | 4 Step Increase | Max(29dBm,Pmax) | Max(24dBm,Pmax) | |
| 15 | 4 Step Increase | Max(33dBm,Pmax) | Max(28dBm,Pmax) | |
| 16 | 2 Step Decrease | Pmax | Pmax | P69 |
| 17 | 1 Step Increase | Pmax – 4dB | Pmax – 4dB | P73 |
| 18 | 2 Step Decrease | Pmax – 2dB | Pmax – 2dB | P78 |
| 19 | 3 Step Increase | Pmax – 6dB | Pmax – 6dB | P82 |
| 20 | 2 Step Decrease | Pmax | Pmax | P86 |
| 21 | 2 Step Decrease | Pmax – 4dB | Pmax – 4dB | P91 |
| 22 | 4 Step Increase | Pmax – 8dB | Pmax – 8dB | P95 |
| 23 | No Change | Pmax | Pmax | P99 |

Pmax is the maximum power for the mobile class.

Pn values refer to the power measured in the nth frame of the SACCH period.

a) The SS shall make power measurements on each active, but unselected timeslot of the multislot configuration during frames 0 and 103 of the SACCH period when normal power control is active.

b) The SS shall make power measurements on each active, but unselected timeslot of the multislot configuration during frames 0, 34, 69, 73, 78, 82, 86, 91, 95 and 99 of the SACCH period when fast power control is active.

c) The SS shall make power measurements of the selected timeslots during frames 0 and 103 of the SACCH period when normal power control is active.

d) The SS shall make power measurements on the selected timeslot during frames 0, 34, 69, 73, 78, 82, 86, 91, 95 and 99 of the SACCH period when fast power control is active. These power measurements shall be referred to as P0, P34, P69, P73, P78, P82, P86, P91, P95 and P99 respectively.

e) The SS shall note the MS TX power reported by the MS for the selected timeslot in the SACCH reporting period following the change from fast power control to normal power control.

f) The SS shall note the MS TX power reported by the MS for the selected timeslot in the SACCH reporting period following the change from normal power control to fast power control.

### 22.7.5 Test requirement

a) The powers measured for the unselected timeslots in steps a), c) and d) shall conform with the Pmax specification for the MS power class given in the following table.

| Power class | GSM400, GSM 700, GSM 850 & GSM900 Nominal Maximum output power (MS TX Level) | GSM400, GSM 700, GSM 850 & GSM900 Tolerance (dB) for normal conditions | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum Output Power (MS TX Level) | DCS1800 & PCS1900 Tolerance (dB) for normal conditions |
|---|---|---|---|---|---|
| E1 | 33 dBm (5) | ±2 | 30dBm | 30dBm (0) | ±2 |
| E2 | 27dBm (8) | ±3 | 26dBm | 26dBm (2) | -4/+3 |
| E3 | 23dBm (10) | ±3 | 22dBm | 22dBm (4) | ±3 |

b) The power measured for the selected timeslot in steps a) and e) shall be 13dBm in the case of GSM 400, GSM 700, GSM 850 and GSM900, and 14dBm in the case of DCS1800 and PCS1900. In all cases the tolerance shall be +/-3dB.

c) The powers measured in step f) shall conform with the power specifications in the following table.

| Pn | GSM400/GSM700/ GSM850/GSM900 | DCS1800/PCS1900 | Tolerance |
|---|---|---|---|
| P0 | 13dBm | 14dBm | +/-3dB |
| P34 | 5dBm | 0dBm | +/-5dB |
| P69 | Pmax | Pmax | +/-2dB |
| P73 | Pmax – 4dB | Pmax – 4dB | +/-3dB |
| P78 | Pmax – 2dB | Pmax – 2dB | +/-3dB |
| P82 | Pmax – 6dB | Pmax – 6dB | +/-3dB |
| P86 | Pmax | Pmax | +/-2dB |
| P91 | Pmax – 4dB | Pmax – 4dB | +/-3dB |
| P95 | Pmax – 8dB | Pmax – 8dB | +/-3dB |
| P99 | Pmax | Pmax | +/-2dB |

See table in test requirement a) for Pmax value for MS power class.

a) The power level reported by the MS in step g) shall be MS TX level corresponding to Pmax for the MS power class. See the table in test requirement a).

b) The power level reported by the MS in step h) shall be MS TX Level 15 in the case of GSM400, GSM 700, GSM 850 and GSM900 and MS TX Level 8 in the case of DSC1800 and PCS1900.

# 22.8 EGPRS Uplink Power Control – Use of $\alpha$ and $\Gamma_{CH}$ parameters

## 22.8.1 Definition and applicability

Power control is important for spectrum efficiency as well as for power consumption in a cellular system. Power control for a packet oriented connection is more complicated than for a circuit switched connection, since there is no continuos two-way connection.

The RF output power, $P_{CH}$ , to be employed by the MS on each individual uplink PDCH shall be:

$$P_{CH} = \min(\Gamma_0 - \Gamma_{CH} - \alpha * (C + 48), PMAX),$$

Where

$\Gamma_{CH}$ is an MS and channel specific power control parameter, sent to the MS in an RLC control message (see GSM 04.60).

$\Gamma_0$ = 39 dBm for GSM400, GSM 700, GSM 850 and GSM900

= 36 dBm for DCS1800 and PCS1900

| | |
|---|---|
| $\alpha$ | is a system parameter, broadcast on PBCCH or optionally sent to MS in an RLC control message (see GSM 04.08 and 04.60). |
| C | is the normalised received signal level at the MS as defined in GSM 05.08, 10.2.3.1. |
| PMAX | is the maximum allowed output power in the cell = GPRS_MS_TXPWR_MAX_CCH if PBCCH exists MS_TXPWR_MAX_CCH otherwise |

All power values are expressed in dBm. (Note that the constants $\Gamma_0$ and 48 are included only for optimising the coding of $\Gamma_{CH}$ and C-value).

This is a flexible tool that can be used for different power control algorithms.

A pure open loop is achieved by setting $\alpha = 1$ and keeping $\Gamma_{CH}$ constant. With this method the output power is based on the received signal level assuming the same path loss in uplink and downlink. This is useful in the beginning of a packet transmission.

A pure closed loop is achieved by setting $\alpha = 0$. With this method the output power is commanded by the network based on received signal level measurements made in the BTS in a similar way as for a circuit switched connection.

This test applies to all types of MSs which support EGPRS.

### 22.8.2 Conformance requirement

1. The MS shall use the same output power on all four bursts within one radio block. GSM 05.08, 10.2.1.
2. If a calculated output power is not supported by the MS, the MS shall use the supported output power which is closest to the calculated output power. GSM 05.08, 10.2.1.
3. When the MS receives new $\Gamma_{CH}$ or $\alpha$ values, the MS shall use the new value to update $P_{CH}$ 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value. GSM 05.08, 10.2.1.
4. The transmitted power shall be a monotonic function of the calculated output power and any change of 2 dB in the calculated value shall correspond to a change of of $2 \pm 1.5$ dB in the transmitted value. The MS may round the calculated output power to the nearest nominal output power value. GSM 05.08, 10.2.1.

### 22.8.3 Test purpose

1. To verify the MS uses that the same output power on all four bursts of a radio block under normal conditions.
2. To verify that the highest power supported by the MS is used if the calculated power is greater.
3. To verify that the MS applies new $\Gamma_{CH}$ or $\alpha$ values 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value.
4. To verify that any change of 2dB in the calculated power corresponds to a change of $2 \pm 1.5$ dB in the transmitted value under normal conditions.

NOTE: For changes in calculated power which are less than the tolerances specified for absolute power accuracy in a MS, the transmitted power as a function of calculated power cannot be tested for monotonicity. Monotonicity between power control steps is implicitly tested in section 13.16.

### 22.8.4 Test method

#### 22.8.4.1 Initial conditions

The SS establishes a BCCH and a PBCCH on the same carrier in the mid ARFCN range. GPRS_MS_TXPWR_MAX_CCH is set to the maximum level (39dBm for GSM400, GSM 700, GSM 850 and GSM900 and 36dBm for DCS1800 and PCS1900). The $\Gamma_{CH}$ value is set such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the maximum power control level supported by the Power Class of the MS under test. The $\alpha$ value is set to 0.

The SS establishes a downlink TBF on the same ARFCN as the BCCH and PBCCH. The SS orders the MS to transmit on the uplink. This is achieved using the EGPRS test mode by transmitting a EGPRS_TEST_MODE_CMD (see GSM 04.14, section TBD).

The downlink power level is adjusted until a stable C-value of –52dBm is reported by the MS in the channel quality report (see GSM 05.08, 10.2.3).

#### 22.8.4.2 Procedure

If the MS supports both GMSK and 8PSK modulation on the uplink, the test is repeated with each modulation format.

a) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block.

b) The method of power measurement is described in section 13.17.3.

c) NOTE: For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See section 13.17.3.

d) The SS shall modify the $\Gamma_{CH}$ value such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the minimum power control level supported by the MS under test (5dBm for GSM400, GSM 700, GSM 850 and GSM900 and 0dBm for DCS1800 and PCS1900). If the transmission of the RLC control message containing the new $\Gamma_{CH}$ value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.

e) The SS shall modify the $\Gamma_{CH}$ value such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the maximum power control level supported by the power class of the MS under test. If the transmission of the RLC control message containing the new $\Gamma_{CH}$ value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.

f) The SS shall modify the $\Gamma_{CH}$ value such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the value 4dB below the maximum power control level supported by the power class of the MS under test. The $\alpha$ value is set to 1.

g) The SS shall decrement the $\alpha$ value with a step size of 0.1 until $\alpha$ equals 0. For each step change in $\alpha$ value, if the transmission of the RLC control message containing the new $\alpha$ value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.

h) For each value of $\alpha$, the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step e). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of $\alpha$ values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of $\alpha$ from the maximum power measured for the larger value of $\alpha$. The minimum step change is calculated by subtracting the maximum power measured from the smaller value of $\alpha$ from the minimum power measured for the larger value of $\alpha$.

NOTE:

If the power values measured for the four bursts of the radio block with $\alpha$ equal to 1.0 are:

$P_{m0}, P_{m1}, P_{m2}, P_{m3}$

And, the power values measured for the four bursts of the radio block with $\alpha$ equal to 0.5 are:

$P_{n0}, P_{n1}, P_{n2}, P_{n3}$

Then,

$P_{m(max)} = MAX(P_{m0}, P_{m1}, P_{m2}, P_{m3})$

$P_{m(min)} = MIN(P_{m0}, P_{m1}, P_{m2}, P_{m3})$

$P_{n(max)} = MAX(P_{n0}, P_{n1}, P_{n2}, P_{n3})$

$P_{n(min)} = MIN(P_{n0}, P_{n1}, P_{n2}, P_{n3})$

The maximum and minimum step sizes are:

$STEP(MAX) = P_{m(max)} - P_{n(min)}$

$STEP(MIN) = P_{m(min)} - P_{n(max)}$

g) The SS shall modify the $\Gamma_{CH}$ value such that ($\Gamma_0 - \Gamma_{CH}$) equals the midrange power control level supported by the MS under test. The $\alpha$ value is set to 0.

h) The SS shall increment the $\alpha$ value with a step size of 0.1 until $\alpha$ equals 1. For each step change in $\alpha$ value, if the transmission of the RLC control message containing the new $\alpha$ value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.

i) For each value of $\alpha$, the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step h). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of $\alpha$ values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of $\alpha$ from the maximum power measured for the larger value of $\alpha$. The minimum step change is calculated by subtracting the maximum power measured from the smaller value of $\alpha$ from the minimum power measured for the larger value of $\alpha$.

j) The SS shall modify the $\Gamma_{CH}$ value such that ($\Gamma_0 - \Gamma_{CH}$) equals the minimum power control level supported by the MS under test (5dBm for GSM400, GSM 700, GSM 850 and GSM900 and 0dBm for DCS1800 and PCS1900). The $\alpha$ value is set to 0.

k) The SS shall increment the $\alpha$ value with a step size of 0.1 until $\alpha$ equals 1. For each step change in $\alpha$ value, if the transmission of the RLC control message containing the new $\alpha$ value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.

l) For each value of $\alpha$, the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step k). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of $\alpha$ values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of $\alpha$ from the maximum power measured for the larger value of $\alpha$. The minimum step change is calculated by subtracting the maximum power measured from the smaller value of $\alpha$ from the minimum power measured for the larger value of $\alpha$.

### 22.8.5 Test requirement

1. The power of all four bursts within the radio block measured in step a) and c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table:

| Power class | GSM400, GSM 700, GSM 850 & GSM 900 Nominal Maximum output power | GSM400, GSM 700, GSM 850 & GSM 900 Tolerance (dB) for normal conditions | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum Output power | DCS1800 & PCS1900 Tolerance (dB) for normal conditions |
|---|---|---|---|---|---|
| 1 | - - - - - - | | 30 dBm | 30dBm | ±2 |
| 2 | 39 dBm | | 24 dBm | 24dBm | ±2 |
| 3 | 37 dBm | | 36 dBm | 33dBm | ±2 |
| 4 | 33 dBm | | | | ±2 |
| 5 | 29 dBm | | | | ±2 |
| E1 | 33 dBm | ±2 | 30dBm | 30dBm | ±2 |
| E2 | 27dBm | ±3 | 26dBm | 26dBm | -4/+3 |
| E3 | 23dBm | ±3 | 22dBm | 22dBm | ±3 |

2. The power of all four bursts within the radio block measured in step b) shall be 5dBm for a GSM400, GSM 700, GSM 850 and GSM900 MS and 0dBm for a DCS1800 or PCS1900 MS with an accuracy of ± 5dB in all cases.

3. In steps f), i) and l), the maximum change in transmitted power between each identified pair of $\alpha$ values shall be 3.5dB.

4. In steps f), i) and l), the minimum change in transmitted power between each identified pair of $\alpha$ values shall be 0.5dB.

# 22.9 EGPRS Uplink Power Control – Independence of TS Power Control

## 22.9.1 Definition and applicability

This test applies to all types of MS and all multiband MSs which support multislot EGPRS.

## 22.9.2 Test conformance

For an EGPRS multislot MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH. GSM 05.08, 10.2.1.

## 22.9.3 Test purpose

To verify that EGPRS power control is applied to each PDCH in a multislot configuration independently.

## 22.9.4 Test method

### 22.9.4.1 Initial conditions

The SS establishes a downlink TBF. The SS orders the MS to transmit on the maximum number of timeslots for the multislot class of the MS on the uplink. This is achieved using the EGPRS test mode by transmitting a EGPRS_TEST_MODE_CMD (see GSM 04.14, section TBD).

Each timeslot is transmitting on its maximum power. The $\alpha$-value is set to 0.

### 22.9.4.2 Procedure

If the MS supports both GMSK and 8PSK modulation on the uplink, the test is repeated with each modulation format.

a) The SS shall modify the $\Gamma_{CH}$ value of one timeslot such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the minimum power control level supported by the MS under test (5dBm for GSM400, GSM 700, GSM 850 and GSM900 and 0dBm for DCS1800 and PCS1900).

b) The SS shall make a transmitter output power measurement on each of the four bursts of any radio block of the timeslot under test.

NOTE: For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See section 13.17.3.

c) The SS shall make a transmittter output power measurement on each of the four bursts of any radio block of the other active timeslots.

d) The SS shall modify the $\Gamma_{CH}$ value for the timeslot under test such that ($\Gamma_0$ - $\Gamma_{CH}$) equals the maximum power control level supported by the MS under test.

e) Steps a) to d) shall be repeated for each timeslot of the multislot configuration.

## 22.9.5 Test requirement

1. The power of all four bursts within the radio block measured in step b) shall be 5dBm for a GSM400, GSM 700, GSM 850 and GSM900 MS and 0dBm for a DCS1800 or PCS1900 MS with an accuracy of $\pm$ 5dB in all cases.

2. For all TS, the power of all four bursts within the radio block measured in step c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table:

| Power class | GSM400, GSM 700, GSM 850 & GSM 900 Nominal Maximum output power | GSM400, GSM 700, GSM 850 & GSM 900 Tolerance (dB) for normal conditions | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum Output power | DCS1800 & PCS1900 Tolerance (dB) for normal conditions |
|---|---|---|---|---|---|
| 1 | - - - - - - | | 30 dBm | 30dBm | ±2 |
| 2 | 39 dBm | | 24 dBm | 24dBm | ±2 |

## 22.10 [Reserved for future EGPRS test]

# 23 Single frequency reference

### 23.1 Definition and applicability

The MS is required to use one single frequency reference for both RF generation/reception and baseband signals. A test method to verify this is not available.

The requirement applies to all types of MSs.

### 23.2 Conformance requirement

The MS shall use the same frequency source for both RF frequency generation and clocking the timebase; GSM 05.10, 6.1.

### 23.3 Test purpose

There is no test specified.

# 24 Tests of the layer 1 signalling functions

Testing of Layer 1 signalling functions is included in the tests in sections 15, 16, 17, 18, 19, 20, 21, 22, 23. Other Layer 1 functions are tested in sections 12, 13 and 14. Some testing of Layer 1 functions is integrated with Layer 3 signalling testing (26).

# 25 Tests of the layer 2 signalling functions

## 25.1 Introduction, objective and scope

### 25.1.1 General

The objective of section 25 is to provide detail of how Layer 2 of the MS is tested to verify conformance to the testable parameters given in GSM 04.06. The tests cover SAPI = 0, and they will be carried out on SDCCH and FACCH/F and on FACCH/H if the MS supports half-rate. Testing of unnumbered information transfer on SACCHs is covered implicitly by the test in section 26.6.3.

The testing is performed using the test configuration described in section 25.1.1.2. This configuration does not provide for testing of conformance of any maintenance functions.

The MS under test shall conform to the test configuration, and the Remote Single layer (RS) test method (CCITT X.290, section 8.1.4) will be used.

### 25.1.2 Test configurations

The Layer 2 test configuration defines the Layer 2 functional blocks of a MS being tested and the access arrangement between MS and tester.

NOTE: These functional blocks provide the Layer 2 basic capabilities which have to be implemented in accordance with the specification given in GSM 04.06. However, the definition of Layer 2 in the form of a number of functional blocks places no requirements on the Layer 2 implementation in a MS.

An example of a functional composition of the MS Layer 2 is given in GSM 04.05. These function blocks provide basic capabilities which have to be implemented in accordance with GSM 04.05 and GSM 04.06.

Also there are alternatives or options included in GSM 04.05 and GSM 04.06, these are provided as complementary capabilities.

### 25.1.3 Pre-conditions

Before carrying out any Layer 2 tests the tests specified in section 12, 13, 14 and 15 to 23 (Layer 1 tests) shall be performed.

Apart from powering up the MS to be tested and being able to establish a call the only access to the MS needed and used for Layer 2 testing is the radio interface. It therefore is necessary that the MS is able to synchronize to the System Simulator and to decode its BCCH and CCCH. Furthermore, the MS must be able to perform the following elementary Layer 3 procedures:

- Paging
- Immediate Assignment
- Dedicated Channel Assignment
- Handover
- Channel Release.

It is necessary that the tests are performed in the order specified, except where the starting point is set (25.1.5).

The data link is maintained by the MS and the SS sending fill frames (c.f. GSM 04.06, sect. 5.4.2.3) on the SDCCH when no other frames are to be transmitted. Fill frames are also sent on the FACCH while the channel mode is set to signalling. The default mode is signalling. The tests will normally be performed with the MS sending fill frames on the main DCCH (i.e. FACCH or SDCCH). Consequently throughout the tests fill frames will be sent and received even while waiting for other Layer 2 frames. The scheduling of the fill frame sending cannot be specified as this sending is closely linked to the processing times in the MS. Therefore, the instants of transmission of fill frames cannot be tested nor the number of these transmissions however, in certain circumstances, the fact that a fill frame is sent can be used as proof that the MS requirement has been fulfilled.

## 25.1.4 Layer 2 test frames

The Layer 2 conformance test is accomplished by sequences of those frames which are contained in GSM 04.06 (Layer 2 frame repertoire etc.).

These frame sequences are under control of the System Simulator and are related to the state that the System Simulator perceives the MS to be in as a result of frames transferred across the MS-BS interface.

These frame sequences shall comply with the following rules:

1) The test sequences exchanged between the System Simulator and MS are assumed to be free from transmission errors.

2) The tester may introduce errors in the direction tester to MS by inserting wrong parameters in the address, control and length indication field.

3) The tester may simulate errors in the direction MS to tester by ignoring the receipt of frames from the MS.

4) The tester may violate the protocol rules related to the control of state variables to provoke sequence gaps.

5) There is no contention on the Dm channel at Layer 1 (Layer 1 point-to-point).

6) With respect to contention on the Dm channel at Layer 2, two distinct situations are defined:

   i) Test of the protocol procedure supported by a single entity. In this case there is no contention on the Dm channel (one peer-to-peer information transfer invoked at a time). This test applies to all MSs and is performed for SAPI = 0.

   ii) Test of Layer 2 multiplexing and MS processing capacity in terms of the number of SAPs and links which a MS is able to support simultaneously. In this case there is contention on the Dm channel at Layer 2 and this contention is resolved within Layer 2 based on the SAPI. This test applies to MSs which are designed for supporting SAPI in addition to SAPI = 0.

Examples of special GSM Layer 2 functions to be tested:

- Correct L2 functions on specific GSM control channels;
- Length indication;
- Fill bits;
- Segmentation, more data bit;
- SABM/UA containing information for contention resolution;
- Abnormal release.

### 25.1.5 Establishment of the dedicated physical resource

The System Simulator shall simulate a BS with BCCH/CCCH on one carrier. The MS shall be listening to this CCCH and able to respond to paging messages. The system simulator sends Paging Request to the MS on the paging channel. The MS shall respond with Channel Request on the random access channel. The system simulator sends Immediate Assign to the MS, thereby ordering the MS either to a SDCCH or to a TCH, that is FACCH. Each test is performed once on SDCCH, once on FACCH/F and once on FACCH/H if the MS supports half-rate. However tests that explicitly check SDCCH and FACCH are performed once if the MS does not support half-rate and twice (once with FACCH/F and once with FACCH/H) if the MS supports half-rate.

### 25.1.6 Release of the dedicated physical resource

After a test has been performed the System Simulator shall initiate the release of the SDCCH or FACCH, as laid out in GSM 04.08, section 7.1.6. This shall return the MS to the idle mode, i.e. the MS shall again be listening to the CCCH of the System Simulator.

## 25.2 Test sequences

Timing requirement:

The MS shall respond to a command within T200 as defined in GSM 04.06.

The MS shall repeat a command after time-out of T200 if the command has not been acknowledged as defined in GSM 04.06.

Constant bit values:

In each frame from the MS:

- bits 6 through 8 of the address field shall be set to zero as defined in GSM 04.06.
- except for test 25.2.7, the address extension bit (EA bit) shall be set to 1 as defined in GSM 04.06.
- except for test 25.2.7, the length indicator field extension bit (EL bit) shall be set to 1 as defined in GSM 04.06.

This shall be checked each time a frame from the MS is received.

Fill bits:

The fill bits transmitted with each frame from the MS whose length indicator L is less than N201 as defined in GSM 04.06 shall be set as defined in GSM 04.06.

Frame format description

The frames are described by the following parameter sets:

SABM (C, P, M = 0, L = 0) (* SABM without an information field*)

SABM (C, P, M = 0, L > 0) (* SABM with an information field*)

DISC (C, P, M = 0, L = 0)

UA, (F, M = 0, L = 0) (* UA without an information field*)

UA, (F, M = 0, L > 0) (* UA with an information field*)

DM (R, F, M = 0, L = 0)

RR (C, P, M = 0, L = 0, N(R))

RR (R, F, M = 0, L = 0, N(R))

REJ (C, P, M = 0, L = 0, N(R))

REJ (R, F, M = 0, L = 0, N(R))

I (C, P, M = 0, L < N201, N(S), N(R))

I (C, P, M = 1, L = N201, N(S), N(R))

UI (C, P = 0, M = 0, L = 0)

UI (C, P = 0, M = 0, L < N201)

where:

C = command

R = response

P = poll

F = final

M = M bit

L = length indicator

N(S) = send sequence number

N(R) = receive sequence number.

## 25.2.1 Initialization

### 25.2.1.1 Initialization when contention resolution required

#### 25.2.1.1.1 Normal initialization

##### 25.2.1.1.1.1 Test purpose

To test the normal establishment of multiple frame operation between the SS and the MS when contention resolution is required.

##### 25.2.1.1.1.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

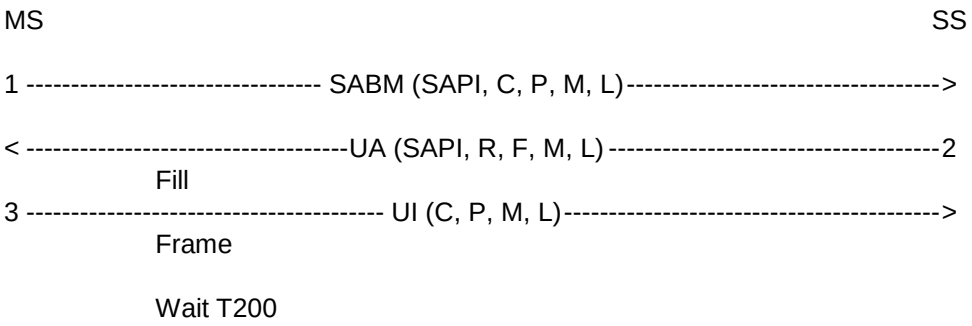
The SS responds with a UA frame.

The MS shall send a UI fill frame.

The SS waits for at least T200 after the UA to ensure the SABM frame is not repeated. This confirms that the UA has been received.

The MS is returned to the idle state as described in 25.1.1.6.

Expected sequence



The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM

information field = information field of SABM

#### 25.2.1.1.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 <= L <= N201

information field = Page Response

3: One UI frame containing:

C = 0, P = 0, M = 0, L = 0

### 25.2.1.1.2 Initialization failure

#### 25.2.1.1.2.1 Loss of UA frame

##### 25.2.1.1.2.1.1 Test purpose

To test the MS response to the loss of a Layer 2 UA frame during initialization.

##### 25.2.1.1.2.1.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending an SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

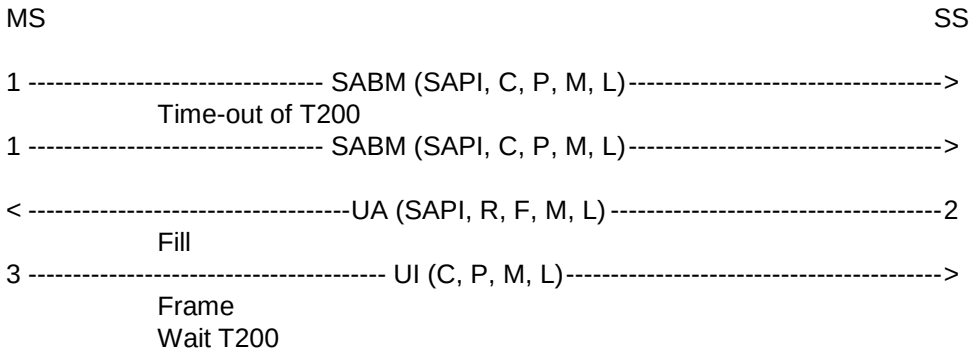
The SS responds with a UA frame.

The MS shall send a UI fill frame.

The SS waits for at least T200 to ensure the SABM frame is not repeated

The MS is returned to the initial condition by clearing of the call (not part of this test).

Expected sequence



The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM

information field = information field of SABM

#### 25.2.1.1.2.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 <= L <= N201

information field = Page Response

The second SABM frame shall follow the first SABM frame after

time-out of timer T200.

3: One UI frame containing:

C = 0, P = 0, M = 0, L = 0

### 25.2.1.1.2.2 UA frame with different information field

#### 25.2.1.1.2.2.1 Test purpose

To test that the MS will leave the channel and return to the idle state when multiple frame establishment fails because a UA frame with a different information field is received in response to the SABM frame.

To test that the MS will thereafter repeat the immediate assignment procedure returning to the idle state when multiple frame establishment fails because a UA frame with a different information field is received in response to the SABM frame.

To test that MS will not attempt to perform the immediate assignment procedure after the first repetition.

25.2.1.1.2.2.2 Method of test

The MS is paged as described in the general section for Layer 2 testing in section 25.1.5. The MS is now in a condition to test the Layer 2 aspects of multiple frame establishment with contention resolution and a UA frame with an information field different from the one in its SABM frame.

The MS shall send an SABM frame.

The SS shall respond with an UA frame whose information field is different from the one in the SABM frame.

The MS shall send an SABM frame.

The SS shall respond with an UA frame whose information field is different from the one in the SABM frame.

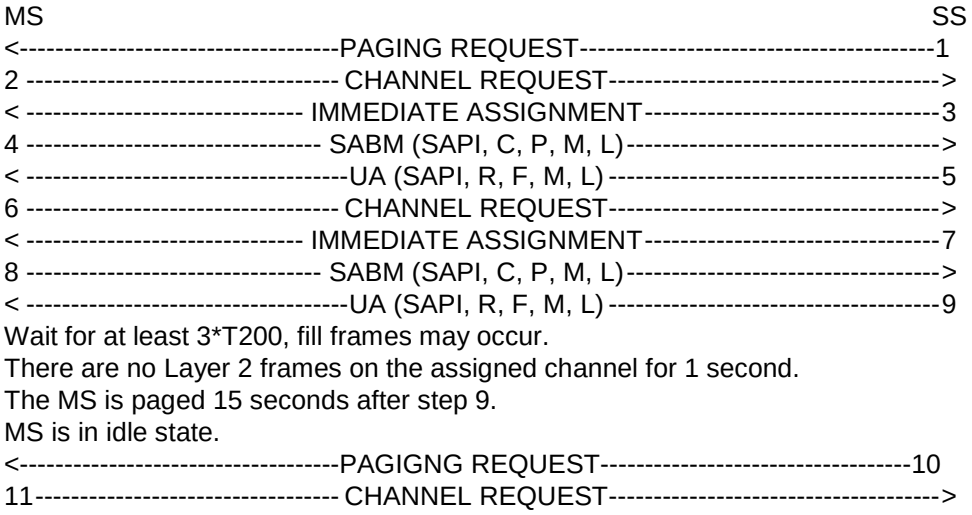
The SS shall wait for 3*T200 to check that the MS does not send any L2 frames other than L2 fill frames on the assigned channel.

After a time equal to 3*T200 the SS checks that there are no more Layer 2 frames on the assigned channel, for a period of 1 second.

NOTE 1: Possible fill frames are allowed in order to take into account processing time inside the MS.

NOTE 2: There are no further attempts of immediate assiignment procedure after the repetition.

15 seconds after sending the UA frame in response to the repetition of the immediate assignment procedure the SS pages the MS according to 25.2.1.1.1, to make sure that the MS has returned to the idle state.



5,9: Two UA frames containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

25.2.1.1.2.2.3 Test requirements

The frames from the MS shall be:

4,8: Two SABM frames containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 < L <= N201

information field = Page Response

#### 25.2.1.1.2.3 Information frame and supervisory frames in response to an SABM frame

##### 25.2.1.1.2.3.1 Test purpose

To test that the MS will ignore receipt of frames other than a UA when received in response to the SABM frame.

##### 25.2.1.1.2.3.2 Method of test

As in 25.2.1.1.2.2, but instead of returning a UA frame the SS will respond with an I frame, RR frame, REJ frame. (So this test will actually be performed 3 times.). The MS shall ignore receipt of the frames sent by the SS and therefore resend its SABM frame after time-out of T200.

Expected Sequence

| MS | | SS |
|---|---|---|
| 1 | SABM (SAPI, C, P, M, L) | > |
| < | I, RR, REJ (SAPI, C, P, M, L, N(R), N(S)) | 2 |
| | Time-out of T200 | |
| 1 | SABM (SAPI, C, P, M, L) | > |

The frames from the SS will be:

2: One I frame containing:

SAPI = 0, C = 1, P = 1, M = 0, 0 <= L <= N201 (arbitrary), N(R), N(S) arbitrary

information field arbitrary

or One RR frame containing:

SAPI = 0, C = 1, P = 1, N(R) arbitrary

or One REJ frame containing:

SAPI = 0, C = 1, P = 1, N(R) arbitrary

##### 25.2.1.1.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 <= L <= N201

information field = Page Response

The second SABM frame shall follow the first SABM frame after time-out of timer T200.

### 25.2.1.1.3 Initialization denial

#### 25.2.1.1.3.1 Test purpose

To test that the MS takes appropriate action if the network side indicates that it can not enter the multiple frame established state.

#### 25.2.1.1.3.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

The SS responds with a DM frame.

The SS then waits at least T200 for the MS to transmit.

The MS shall not repeat the SABM frame.

Expected Sequence

| MS | | SS |
|---|---|---|
| 1 | SABM (SAPI, C, P, M, L) | > |
| < | DM (SAPI, R, F, M, L) | 2 |
| | Wait for at least T200. | |

The frames from the SS will be:

2: One DM frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

#### 25.2.1.1.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 <= L <= N201

information field = Page Response

### 25.2.1.1.4 Total initialization failure

#### 25.2.1.1.4.1 Test purpose

To test the MS response to the lack of the system to respond to requests to initialize the data link.

#### 25.2.1.1.4.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

This is repeated until the MS has sent the SABM frame six times. The MS shall not send the SABM any more than six times.

The SS continues to send paging messages on the BCCH/CCCH and the test continues as in test 25.2.1.1.1.

Expected Sequence

| MS | | SS |
|---|---|---|
| 1 | SABM (SAPI, C, P, M, L) | > |
| | Time-out of T200 | |
| 1 | SABM (SAPI, C, P, M, L) | > |
| | Time-out of T200 | |
| 1 | SABM (SAPI, C, P, M, L) | > |
| | Time-out of T200 | |
| 1 | SABM (SAPI, C, P, M, L) | > |
| | Time-out of T200 | |
| 1 | SABM (SAPI, C, P, M, L) | > |
| | Time-out of T200 | |
| 1 | SABM (SAPI, C, P, M, L) | > |

#### 25.2.1.1.4.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs six times) containing:

SAPI = 0, C = 0, P = 1, M = 0, <= L <= N201

information field = Page Response

The subsequent SABM frames shall follow the previous SABM frame after time-out of timer T200.

### 25.2.1.2 Initialization, contention resolution not required

This procedure is used after a data link has been established with contention resolution and a new data link is established on a new channel e.g. handover, dedicated channel assignment.

#### 25.2.1.2.1 Normal initialization without contention resolution

##### 25.2.1.2.1.1 Test purpose

To test the normal initialization of multiple-frame operation when contention resolution is not required.

##### 25.2.1.2.1.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign an SDCCH.

The MS shall then continue the setup by sending a SABM frame without contention resolution.

The SS responds with a UA frame.

The MS shall then send an I frame containing the assignment complete message.

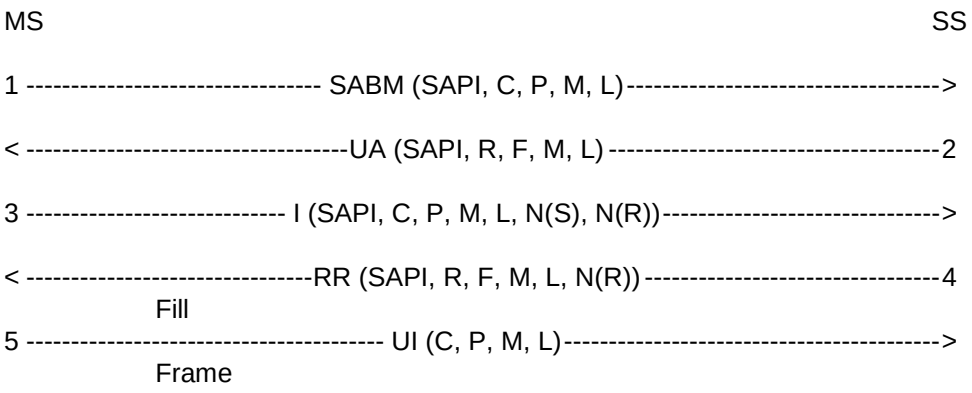
The SS shall acknowledge the I frame with an RR frame.

The SS then waits for the MS to send a UI fill frame.

The SS then initiates the dedicated channel assignment procedure to assign an FACCH.

The expected sequence is then repeated. The SS waits for at least T200 to ensure that the SABM is not repeated.

Expected Sequence



The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

4: One RR frame containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1

#### 25.2.1.2.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, 0 <= L <= N201, N(S) = 0, N(R) = 0

Information field = Assignment Complete

5 One UI frame containing:

C = 0, P = 0, M = 0, L = 0

### 25.2.1.2.2 Initialization failure

#### 25.2.1.2.2.1 Test purpose

To test the MS response to the loss of a Layer 2 UA frame during initialization.

#### 25.2.1.2.2.2 Method of test

The SS initiates the dedicated channel assignment procedure to assign an SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

The SS responds with a UA frame.

The MS shall then send an I frame containing the assignment complete message.

The SS shall acknowledge the I frame with an RR frame.

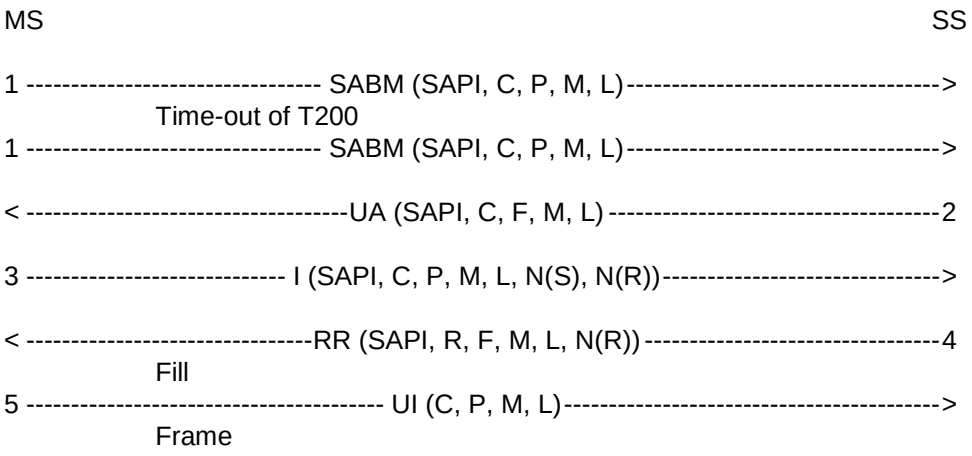
The SS then waits for the MS to send a UI fill frame.

The SS then initiates the dedicated channel assignment procedure to assign a FACCH.

The expected sequence is then repeated. The SS waits for at least T200 to ensure that the SABM is not repeated.

The MS is returned to the idle state as described in 25.1.1.6.

Expected Sequence



The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

4: One RR frame containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1

#### 25.2.1.2.2.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

The second SABM frame shall follow the first SABM frame after time-out of timer T200.

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, 0 <= L <= N201, N(S) = 0, N(R) = 0

Information field = Assignment Complete

5: One UI frame containing:

C = 0, P = 0, M = 0, L = 0

### 25.2.1.2.3 Initialization denial

#### 25.2.1.2.3.1 Test purpose

To test that the MS takes appropriate action if the data link can not be initialized if the network side indicates the Layer 3 process is busy.

#### 25.2.1.2.3.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign a SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS responds with a DM frame.

The SS then waits at least T200.

The MS shall not repeat the SABM frame. However the MS will attempt to re-establish the link on the previous channel.

The test is repeated, but a FACCH is assigned in place of the SDCCH.

Expected Sequence

| MS | | SS |
|---|---|---|
| 1 | SABM (SAPI, C, P, M, L) | > |
| < | DM (SAPI, C, P, M, L) | 2 |

The frames from the SS will be:

2: One DM frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

#### 25.2.1.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

### 25.2.1.2.4 Total initialization failure

#### 25.2.1.2.4.1 Test purpose

To test the MS response to the lack of the system to respond to requests to initialize the data link.

#### 25.2.1.2.4.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign a SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

This is repeated until the MS has sent the SABM frame six times.

The MS shall not send the SABM any more than six times.

The test is repeated, but a FACCH is assigned in place of the SDCCH.

Expected Sequence

| MS | | SS |
|---|---|---|
| 1 | SABM (SAPI, C, P, M, L) | > |
| | Time-out of T200 | |
| 1 | SABM (SAPI, C, P, M, L) | > |
| | Time-out of T200 | |
| 1 | SABM (SAPI, C, P, M, L) | > |
| | Time-out of T200 | |
| 1 | SABM (SAPI, C, P, M, L) | > |
| | Time-out of T200 | |
| 1 | SABM (SAPI, C, P, M, L) | > |
| | Time-out of T200 | |
| 1 | SABM (SAPI, C, P, M, L) | > |

#### 25.2.1.2.4.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs six times) containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

The subsequent SABM frames shall follow the previous SABM frame after time-out of timer T200.

## 25.2.2 Normal information transfer

### 25.2.2.1 Sequence counting and I frame acknowledgements

#### 25.2.2.1.1 Test purpose

To test the operation of Layer 2 sequence numbering. Since there are 8 sequence numbers the test cycles through 9 information frame transfers.

#### 25.2.2.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an Identity Request message asking for IMEI to the MS.

The MS shall acknowledge this I frame with an Identity Response I frame or a RR frame.

This is repeated a further 8 times as rapidly as possible assuming a window size 1.

The MS Layer 3 response time should be less than 4*T200 and therefore the MS responses to at least the 5th, 6th, 7th, 8th and 9th I frames must be an I frame on the SDCCH. On the FACCH it is possible that all MS responses at Layer 2 will be RR frames.

The frames from the SS will be:

1,3,5,7,9,11,13,15,17: One I frame (occurs nine times) containing:

SAPI = 0, C = 1, P = 0, M = 0, 0 <= L <= N201

N(S) = 0, 1, 2, 3 .... 7, 0

N(R) = (number of I frames received in the test sequence hitherto) mod 8

information field = Identity Request (IMEI)

19, 21, and so on, until the SS has received 9 I frames from the MS: One RR frame containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0

N(R) = (number of I frames received in the test sequence hitherto) mod 8

#### 25.2.2.1.3 Test requirements

There shall be an integer k >= 0 such that for i = 1, 2, ...., k + 9 the following conditions (a) and (b) both hold:

(a) The MS sends 9 I frames and k RR frames during the test.

(b) The frames sent by the MS in step 2*i are:

(b1) If the frame is an RR frame (occurs k times): one RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0

N(R) = ((Value of N(S) in the last received I frame from the SS) + 1) mod 8

(b2) If the frame is an I frame (occurs 9 times): one I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, 0 <= L <= N201

N(R) = ((Value of N(S) in the last received I frame from the SS) + 1) mod 8

N(S) = (number of I frame sent hitherto by the MS to SS excluding the actual I frame) mod 8

information field = Identity Response (IMEI)

Example of expected sequence (assuming 3xT200 < L3 reaction time < 4xT200):

MS SS

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------1

2 ----------RR (SAPI, R, M, L, N(R), F)----------->

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------3

4 ----------RR (SAPI, R, M, L, N(R), F)----------->

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------5

6 ----------RR (SAPI, R, M, L, N(R), F)----------->

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------7

8 ----------RR (SAPI, R, M, L, N(R), F)----------->

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------9

10---------- I (SAPI, C, P, M, L, N(S), N(R))----------->

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------11

12---------- I (SAPI, C, P, M, L, N(S), N(R))----------->

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------13

14---------- I (SAPI, C, P, M, L, N(S), N(R))----------->

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------15

16---------- I (SAPI, C, P, M, L, N(S), N(R))----------->

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------17

18---------- I (SAPI, C, P, M, L, N(S), N(R))----------->

< ----------RR (SAPI, R, M, L, N(R), F)----------19

20---------- I (SAPI, C, P, M, L, N(S), N(R))----------->

< ----------RR (SAPI, R, M, L, N(R), F)----------21

22---------- I (SAPI, C, P, M, L, N(S), N(R))----------->

< ----------RR (SAPI, R, M, L, N(R), F)----------23

24---------- I (SAPI, C, P, M, L, N(S), N(R))----------->

< ----------RR (SAPI, R, M, L, N(R), F)----------25

26---------- I (SAPI, C, P, M, L, N(S), N(R))----------->

< ----------RR (SAPI, R, M, L, N(R), F)----------27

The frames from the SS will be:

1, 3, 5, 7, 9, 11, 13, 15, 17:, One I frame (occurs nine times) containing:

SAPI = 0, C = 1, P = 0, M = 0, 0 <= L <= N201

N(S) = 0, 1, 2, 3....7, 0

N(R) = 0, 0, 0, 0, 0, 1, 2, 3, 4

information field = Identity Request (IMEI)

19, 21, 23, 25, 27: One RR frame (occurs five times) containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0

N(R) = 5, 6, 7, 0, 1

The frames from the MS shall be:

2, 4, 6, 8: One RR frame (occurs four times) containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0

N(R) = 1, 2, 3, 4

10, 12, 14, 16, 18, 20, 22, 24, 26: One I frame (occurs nine times) containing:

SAPI = 0, C = 0, P = 0, M = 0, 0 <= L <= N201

N(R) = 5, 6, 7, 0, 1, 1, 1, 1, 1

N(S) = 0, 1, 2, 3, 4, 5, 6, 7, 0

information field = Identity Response (IMEI)

### 25.2.2.2 Receipt of an I frame in the timer recovery state

#### 25.2.2.2.1 Test purpose

To test that the MS is able to respond to I frames whilst in the timer recovery state.

#### 25.2.2.2.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an Identity Request message asking for IMEI to the MS.

The MS shall respond with a RR frame though this may be incorporated with the Identity Response I frame.

The SS does not respond to the I frame.

The MS shall wait for expiry of timer T200 and then repeat the I frame but with the P bit set to 1.

The SS then sends a valid Identity Request I frame asking for IMEI which does not acknowledge receipt of the I frame from the MS.

On the FACCH the MS may send an RR frame acknowledging the I frame.

The MS shall repeat the I frame, this frame will acknowledge receipt of the second I frame from the SS.

The SS then acknowledges receipt of the MS I frame by sending a RR frame.

The MS shall send the next I frame. The SS acknowledges this I frame.

Expected Sequence

MS SS

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------1

2 ----------RR (SAPI, R, M, L, N(R), F)----------> May be incorporated

3 ---------- I (SAPI, C, P, M, L, N(S), N(R))----------> Time-out of T200

4 ---------- I (SAPI, C, P, M, L, N(S), N(R))----------> 

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------5

5 bis----------RR(SAPI, R, M, L, N(R), F) ----------> 

6 ---------- I (SAPI, C, P, M, L, N(S), N(R))----------> 

< ----------RR (SAPI, R, M, L, N(R), F)----------7 Time-out of T200

8 ---------- I (SAPI, C, P, M, L, N(S), N(R))----------> 

< ----------RR (SAPI, R, M, L, N(R), F)----------9

The frames from the SS will be:

1, 5: One I frame (occurs twice) containing:

SAPI = 0, C = 1, P = 0, M = 0, 0 <= L <= N201, N(S) = 0, 1, N(R) = 0

information field = Identity Request

7, 9: One RR frame (occurs twice) containing:

SAPI = 0, R = 0, F = 1, 0, M = 0, L = 0, N(R) = 1, 2

### 25.2.2.2.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1

3, 8: One I frame (occurs twice) containing:

SAPI = 0, C = 0, P = 0, M = 0, 0 <= L <= N201, N(R) = 1, 2, N(S) = 0, 1

information field = Identity Response

4, 6: One I frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 <= L <= N201, N(R) = 1, 2, N(S) = 0

information field = Identity Response

5 bis: (possible only on the FACCH) One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 2

## 25.2.2.3 Segmentation and concatenation

### 25.2.2.3.1 Test purpose

To test the proper use of segmentation and concatenation, suspend and resume.

### 25.2.2.3.2 Method of test

If the MS supports the UnStructuredSSData operation, then the MS is made to activate an unknown supplementary service as defined in GSM 02.30 with the following sequence *NN*si#: NN is chosen to be undefined in GSM 02.30 annex 2 and is an IA5. Total length of *NN*si# shall be 20 characters.

If the MS does not support the UnStructuredSSData operation, then the MS is made to initiate a call.

The SS responds with the Immediate Assign procedure firstly allocating a SDCCH and on the second repeat of the test a TCH.

The MS is brought into the multiple frame established state by continuing as described in test 25.2.1.1.1. The layer three message element in the SABM will be CM Serv Request.

The SS sends the UA and waits for 10 s. The SS then sends an I frame with CM Serv Accept.

The MS sends either:

- a REGISTER message which is segmented between two I frames;

or

- a SETUP message.

The SS shall acknowledge only the I frame with more bit set to 1 (if any) but it shall not acknowledge the I frame with more bit set to 0.

The SS then performs a handover (in the case of SDCCH this shall be finely synchronized) while still on the assigned channel and without acknowledging the last I frame of the MS layer 3 message, making sure to fill the handover command to more than 21 octets (for example by using the cell channel description element).

On the SDCCH the MS will go into timer recovery and resend the last I frame of the layer 3 message with the P bit set to 1 when it acknowledges the two I frames of the handover command. On the FACCH the MS may simply acknowledge both I frames.

The MS does not attempt to resend the last I frame of the REGISTER or SETUP message on the old channel but instead goes to the new channel where it performs a random access using the Handover Access message and then multiple frame establishment without contention resolution as described in test 25.2.1.2.1.

The MS shall then send an I frame with the Handover complete message. Assuming this is a finely synchronized handover.

The SS acknowledges this I frame.

The MS shall then resend the previous REGISTER or SETUP message, that is all frames which are acknowledged in the usual way.

The test has to be repeated on the FACCH.

Expected Sequence

MS SS

1 ---------- SABM (SAPI, C, P, M, L)---------->

Frame

NOTE 1: The MS may send RR frames on the FACCH in addition to the I frames in 9 and 11.

NOTE 2: The I frame in 11 is optional.

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM

information field = information field of SABM

3: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, 0 < L <N201, N(S) = 0, N(R) = 0

information field = CM Service Accept

6: One RR frame containing: (This frame is sent only if frame 5 was received)

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1

8, 10: Two I frames containing:

SAPI = 0, C = 1, P = 0, M = 1, 0, L = N201, <= N201, N(S) = 1, 2, N(R) = 1 or 0

information field = Handover

13: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

15, 17, 19: Two or three RR frames containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1, 2 or 1, 2, 3

#### 25.2.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 <= L <= N201

information field = CM Service Request

4: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1

5, 7: Two I frames containing: (The first I frame may be missing)

SAPI = 0, C = 0, P = 0, M = 1, 0, L = N201, <= N201, N(S) = 0, 1 or 0, N(R) = 1

information field = Register or Setup

9, 11: Two I frames containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 < L <= N201, N(S) = 1 or 0, N(R) = 2, 3

information field = Register or Setup

NOTE: The I frame in 11 is optional.

12: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

14: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, 0 < L < N201, N(S) = 0, N(R) = 0

information field = Handover Complete

16, 18: Two I frames containing: (The first I frame may be missing)

SAPI = 0, C = 0, P = 0, M = 1, 0, L = N201, 0 < L <= N201, N(S) = 1, 2 or 1, N(R) = 0

information field = Register or Setup

20: UI frame containing:

C = 0, P = 0, M = 0, L = 0

## 25.2.3 Normal layer 2 disconnection

### 25.2.3.1 Test purpose

To test the normal data link disconnection sequences.

### 25.2.3.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

The SS sends a Layer 2 Disconnect message to the MS.

The MS shall respond with a UA frame and return to the idle state; no more Layer 2 (I, S or U) frames, except possibly one or more "Fill" frames, shall be sent. The SS may receive "Fill" frames after the sending of the DISC frame. If this occurs this may only happen for up to T200 after the sending of the DISC frame. The checking for Layer 2 frames, and the recording of any "Fill" frames, is done for a time defined as 4 * T200.

The SS confirms that the MS has returned to the idle state by performing test 25.2.1.1.1.

Expected Sequence

MS SS

< ---------- DISC (SAPI, C, P, M, L) ----------1

2 ----------UA (SAPI, R, M, L, F) ---------->

The frames from the SS will be:

1: One DISC frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0

### 25.2.3.3 Test requirements

The frames from the MS shall be:

2: One UA frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0

No other Layer 2 (I, S or U) frames shall occur. If "Fill" frames are sent this may only be done for up to T200 after the sending of the DISC frame.

## 25.2.4 Test of link failure

### 25.2.4.1 I frame loss (MS to SS)

#### 25.2.4.1.1 Test purpose

To test that the MS repeats an I frame N200 times with T200 between two I frames and that the MS releases the layer 2 link after N200 repetitions of the I frame in the case when no answer to the I frame is received.

25.2.4.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an Identity Request message asking for IMEI to the MS.

The MS shall respond with a RR frame though this may be incorporated with the Identity Response I frame.

The SS does not respond to the I frame.

The MS shall wait for expiry of timer T200 and then repeat the I frame but with the P bit set to 1.

This is repeated until the MS has sent the I frame N200+1 times. The MS shall not send any layer 2 frame. This is checked for a time of 4 * T200. The MS shall return to the idle state. This is checked by performing test 25.2.1.1.1.

Expected Sequence

| MS | | SS |
|---|---|---|
| < | I (SAPI, C, P, M, L, N(S), N(R)) | 1 |
| 2 | RR (SAPI, R, M, L, N(R), F) | > |
| | May be incorporated | |
| 3 | I (SAPI, C, P, M, L, N(S), N(R)) | > |
| | Time-out of T200 | |
| 4 | I (SAPI, C, P, M, L, N(S), N(R)) | > |
| | Time-out of T200 | |
| 4 | I (SAPI, C, P, M, L, N(S), N(R)) | > |
| | Time-out of T200 | |
| | . | . |
| | . | . |
| | . | . |
| 4 | I (SAPI, C, P, M, L, N(S), N(R)) | > |
| | Time-out of T200 | |
| 4 | I (SAPI, C, P, M, L, N(S), N(R)) | > |

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, 0 <= L <= N201, N(S) = 0, N(R) = 0

information field = Identity Request

25.2.4.1.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, 0 <= L <= N201, N(R) = 1, N(S) = 0

information field = Identity Response

4: One I frame (occurs N200 times) containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 <= L <= N201, N(R) = 1, N(S) = 0

information field = Identity Response

## 25.2.4.2 RR response frame loss (SS to MS)

Covered in test 25.2.2.2.

## 25.2.4.3 RR response frame loss (MS to SS)

### 25.2.4.3.1 Test purpose

To test the Layer 2 recovery mechanism in the event of RR frame loss.

### 25.2.4.3.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends a I frame containing a Layer 3 message using PD=1111 (e.g. 0FH) to the MS. The L3 message is TEST INTERFACE with tested device equal to 0.

The MS shall respond with a RR frame.

The SS ignores the RR frame from the MS but after T200 from the I frame sent by the SS the SS repeats the I frame but with the P bit set to 1. This simulates loss of the RR from the MS.

The MS shall respond with either an RR or REJ frame.

NOTE: This requirement is less restrictive than GSM 04.06.

Expected Sequence

| MS | | SS |
|---|---|---|
| < | I (SAPI, C, P, M, L, N(S), N(R)) | 1 |
| 2 | RR (SAPI, R, M, L, N(R), F) | > |
| | Time-out of T200 | |
| < | I (SAPI, C, P, M, L, N(S), N(R)) | 3 |
| 4 | RR (SAPI, R, M, L, N(R), F) | > |
| OR | | |
| 4 | REJ (SAPI, R, M, L, N(R), F) | > |

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, L = 3, N(S) = 0, N(R) = 0

3: One I frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 3, N(S) = 0, N(R) = 0

### 25.2.4.3.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1

4: One RR frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1

OR

4: One REJ frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1

## 25.2.5 Test of frame transmission with incorrect C/R values

### Purpose of tests

To test that the MS will react correctly upon the reception of a frame with incorrect C/R value.

### Initial Conditions

Perform the establishment of the dedicated physical resource according to 25.1.5 and initialize the link as in 25.2.1.1.1. Then proceed as stated below.

### 25.2.5.1 I frame with C bit set to zero

#### 25.2.5.1.1 Test purpose

To test that the MS will take no action when it receives an I frame with the C bit set to zero (R).

#### 25.2.5.1.2 Method of test

The data link is set up between the MS and the SS as in test 25.2.1.1.1.

The SS shall send an I frame with the C bit set to zero to the MS.

The SS shall then wait for at least 4 times T200 to make sure that the MS does not respond to that I frame but that the MS keeps sending fill frames.

The SS shall after 4 times T200 send a RR command, P bit set to 1.

The MS shall respond with a RR response, F bit set to 1.

### Expected Sequence

| MS | | SS |
|---|---|---|
| < | I (SAPI, C, P, M, L, N(S), N(R)) | 1 |
| | Fill | |
| 2 | UI (C, P, M, L) | > |
| | Frame | |
| < | RR (SAPI, C, M, L, N(R), P) | 3 |
| 4 | RR (SAPI, R, M, L, N(R), F) | > |

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 <= L <= N201, N(R) = 0, N(S) = 0

Information field = Identity Request

3: One RR frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0

#### 25.2.5.1.3 Test requirements

The frames from the MS shall be:

2: UI frames containing:

C = 0, P = 0, M = 0, L = 0

4: One RR frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 0

### 25.2.5.2 SABM frame with C bit set to zero

#### 25.2.5.2.1 Test purpose

To test that the MS will take no action when it receives an SABM frame with the C bit set to zero (R).

#### 25.2.5.2.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an I frame containing a Layer 3 message using PD=1111 (e.g. 0FH) in order to raise V(R) in the MS to 1. The L3 message is TEST INTERFACE with tested device equal to 0.

The MS shall acknowledge this by the appropriate RR frame.

The SS sends SABM with the C bit set to zero.

The SS shall after 4 times T200 send a RR command, P bit set to 1.

The MS shall respond with a RR response, F bit set to 1.

The MS is returned to the idle state as described in 25.2.1.1.6.

Expected Sequence

| MS | | SS |
|---|---|---|
| < | I (SAPI, C, P, M, L, N(S), N(R)) | 1 |
| 2 | RR (SAPI, R, M, L, N(R), F) | > |
| < | SABM (SAPI, C, P, M, L) | 3 |
| 4 | Fill UI (C, P, M, L) Frame | > |
| < | RR (SAPI, C, M, L, N(R), P) | 5 |
| 6 | RR (SAPI, R, M, L, N(R), F) | > |

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, L = 3, N(S) = 0, N(R) = 0

3: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

5: One RR frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0

#### 25.2.5.2.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1

4: One UI frame containing:

C = 0, P = 0, M = 0, L = 0

6: One RR frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1

## 25.2.6 Test of errors in the control field

Purpose of tests

To test that the MS will react in the proper way to errors in the Control Field.

### 25.2.6.1 N(S) sequence error

#### 25.2.6.1.1 Test purpose

To test that the MS will ignore the contents of the I field of an out-of-sequence I frame from the SS.

#### 25.2.6.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS shall send a correct I frame containing Identity Request.

The MS shall acknowledge this in a RR frame or piggy back the acknowledgement onto the I frame carrying Identity Response.

The SS shall then send an I frame containing Identity Request with incorrect N(S) but correctly acknowledging the MS's I frame; P bit set to zero.

The MS shall send a REJ frame.

The SS shall, after T200, send another I frame with incorrect N(S), P bit set to 1 this time.

The MS shall respond with a REJ, F bit set to 1.

The MS shall resume the transmission of fill frames.

Expected Sequence

MS SS

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------1

2 ----------RR (SAPI, R, M, L, N(R), F)----------> May be incorporated

3 ---------- I (SAPI, C, P, M, L, N(S), N(R))----------> 

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------4

5 ----------REJ (SAPI, R, P, M, L, N(R))----------> Time out of T200.

< ---------- I (SAPI, C, P, M, L, N(S), N(R))----------6

7 ----------REJ (SAPI, R, F, M, L, N(R))----------> Fill

8 ---------- UI (C, P, M, L)----------> Frame

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, 0 <= L <= N201, N(S) = 0, N(R) = 0

information field = Identity Request

4: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, 0 <= L <= N201, N(S) = 0, N(R) = 1

information field = Identity Request

6: One I frame containing:

SAPI = 0, C = 1, P = 1, M = 0, 0 <= L <= N201, N(S) = 0, N(R) = 1

information field = Identity Request

#### 25.2.6.1.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, 0 <= L <= N201, N(R) = 1, N(S) = 0

information field = Identity Response

5: One REJ frame containing:

SAPI = 0, R = 1, P = 0, M = 0, L = 0, N(R) = 1

7: One REJ frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1

8: One UI frame containing:

C = 0, P = 0, M = 0, L = 0

### 25.2.6.2 N(R) sequence error

#### 25.2.6.2.1 Test purpose

To test that the MS will detect a N(R) sequence error and react in the proper way to it.

#### 25.2.6.2.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS shall send an I frame containing an information field of length N201 and an incorrect receive sequence number.

The MS may

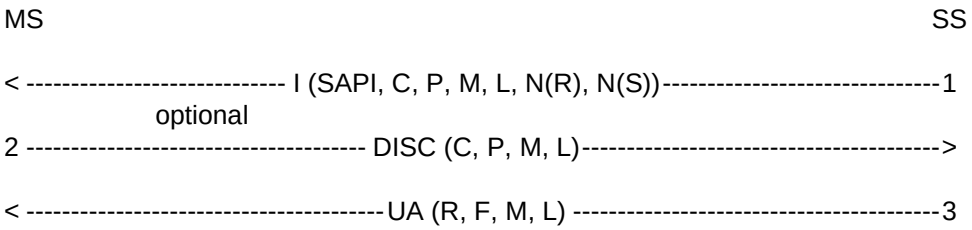
a) send a DISC frame within N200*T200 or

b) perform a "local end release".

In case a) the SS shall respond with a UA frame. In case b) it detects a lower layer failure.

NOTE: The delay N200*T200 is specified for test purpose only. It is assumed that the L3 reaction time within the MS to command a release is less than this delay, which is less than the delay before the SS would detect a L2 failure.

Expected Sequence



The frames from the SS are:

1: One I frame:

SAPI 0, C = 1, P = 0, M = 1, L = N201, N(R) = 1, N(S) = 0

In case a):

3: One UA frame:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

#### 25.2.6.2.3 Test requirements

The frame from the MS in case a) shall be:

2: One DISC frame:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

### 25.2.6.3 Improper F bit

#### 25.2.6.3.1 Test purpose

To test that the MS, being in the timer recovery state, will return to the multiple frame established state only after having received an RR response with the F bit set to 1. This test is covered in test 25.2.2.2.

## 25.2.7 Test on receipt of invalid frames

### 25.2.7.1 Test purpose

To test that the MS will ignore all invalid frames.

### 25.2.7.2 Method of test

The data link is set up between the MS and the SS as in test 25.2.1.1.1.

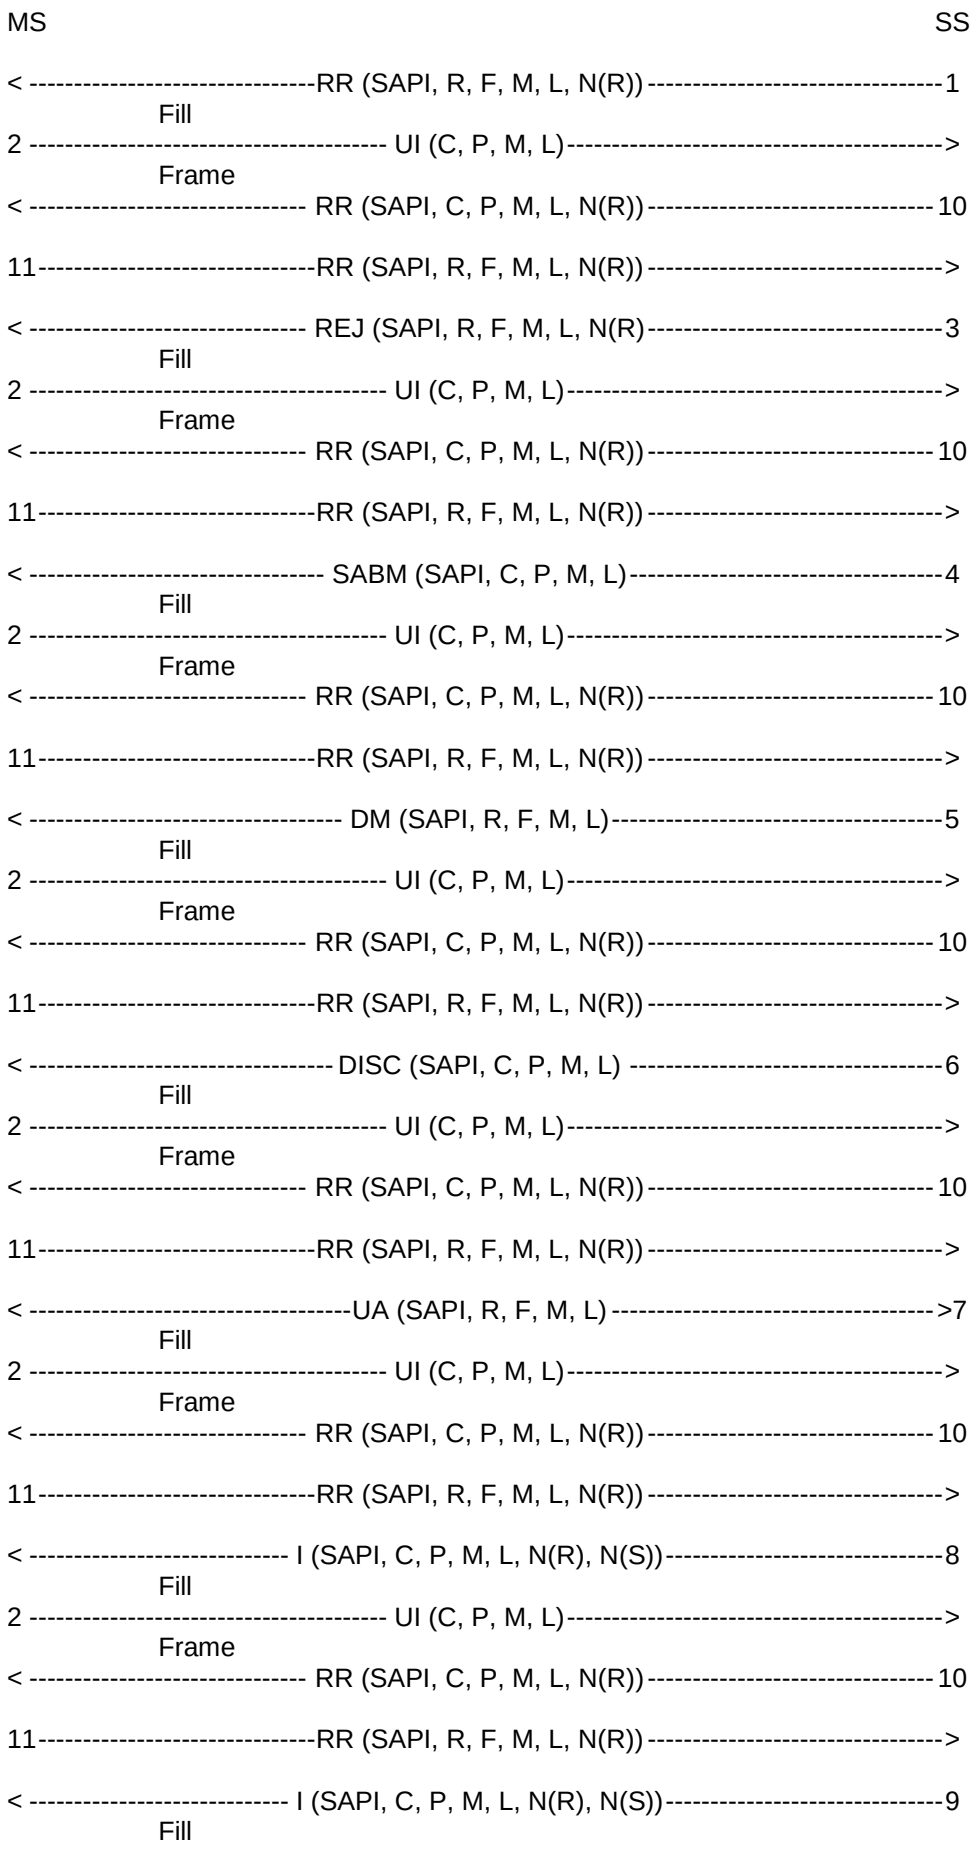
The SS shall then transmit an:

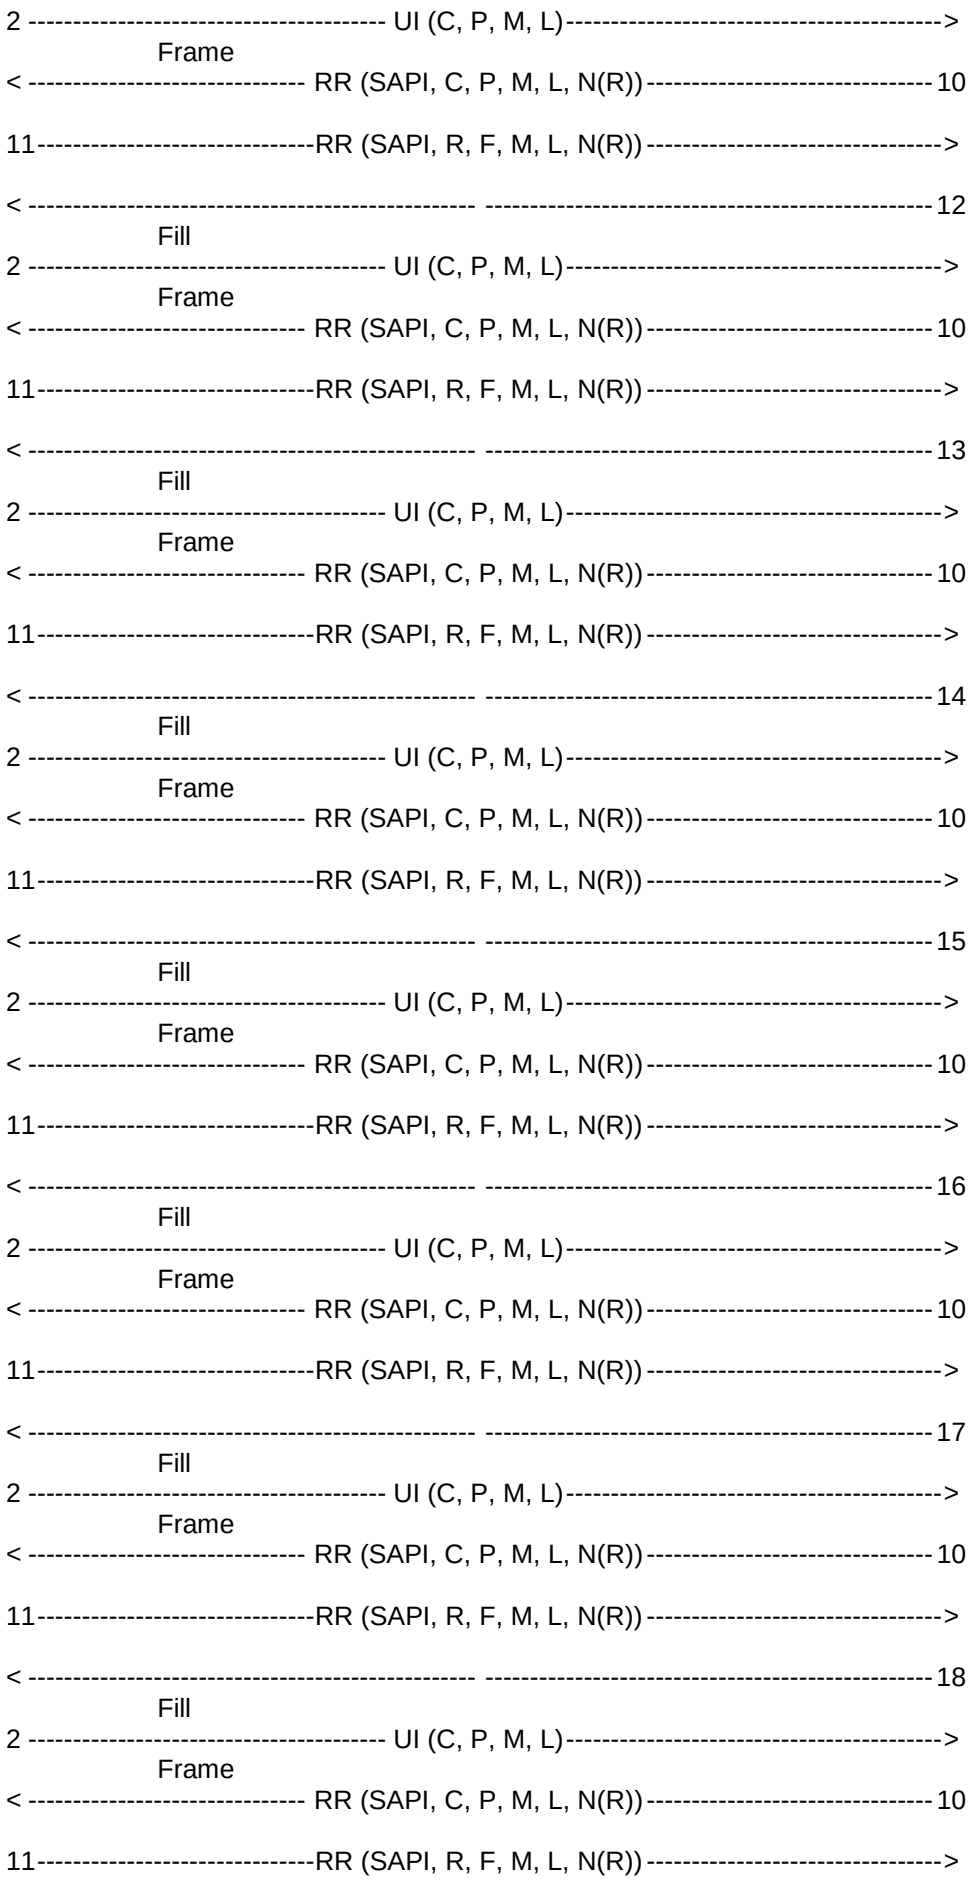
- RR frame with the Length indicator greater than zero and a faulty N(R)
- REJ frame with the EA bit set to zero and a faulty N(R)
- SABM frame with the EL bit set to zero
- DM frame with the Length indicator greater than zero
- DISC frame with the M bit set to 1
- UA frame with the EA bit set to zero
- I frame with the Length indicator greater than N201
- I frame with the M bit set to 1 and the Length indicator less than N201.
- command frames with correct Address and Length indicator field and a non-implemented control field.

After T200 the SS shall in every case transmit an RR command, P bit set to 1.

The MS shall respond with an RR response, F bit set to 1.

Expected Sequence





2 UI (C, P, M, L)
Frame
RR (SAPI, C, P, M, L, N(R)) 10
11 RR (SAPI, R, F, M, L, N(R))
12

Fill
2 UI (C, P, M, L)
Frame
RR (SAPI, C, P, M, L, N(R)) 10
11 RR (SAPI, R, F, M, L, N(R))

The frames from the SS are:

1: One RR frame:

SAPI = 0, R = 0, F = 0, M = 0, L > 0, N(R) = 1

3: One REJ frame:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1, EA = 0

4: One SABM frame:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, EL = 0

5: One DM frame:

SAPI = 0, R = 0, F = 1, M = 0, L > 0

6: One DISC frame:

SAPI = 0, C = 1, P = 1, M = 1, L = 0,

7: One UA frame:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, EA = 0

8: One I frame:

SAPI = 0, C = 1, P = 0, M = 0, L > N201, N(R) = 0, N(S) = 6

9: One I frame:

SAPI = 0, C = 1, P = 0, M = 1, L < N201, N(R) = 0, N(S) = 7

10: One RR frame:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0

12: One command frame with

Control Field = xxx1 1101

13: One command frame with

Control field = xxx1 1011

14: One command frame with

Control field = xxx1 0111

15: One command frame with

Control field = 01x1 1111

16: One command frame with

Control field = 1xx1 1111

17: One command frame with

Control field = 0011 0011

18: One command frame with

Control field = 1xx1 0011

NOTE: An "x" stands for an arbitrary bit value.

#### 25.2.7.3 Test requirements

The frames from the MS shall be:

2: One UI frame (occurs fifteen times):

C = 0, P = 0, M = 0, L = 0

11: One RR frame (occurs fifteen times):

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 0

# 26 Testing of layer 3 functions

**Ref.: GSM 04.08**

NOTE: The tests on functioning of the elementary procedures in the MS are grouped as the description of those procedures in GSM 04.08. However, the test procedures are carried out in an order which is more logic for the purpose of testing.

## 26.1 Default conditions and structured sequence of tests

### 26.1.1 Default test conditions during layer 3 tests

During tests in section 26 the following default test conditions shall apply if not otherwise stated within the test description. In the table below, decimal values are normally used. Sometimes a hexadecimal value, indicated with a "H", or a binary value, indicated with a "B" is given.

| | **GSM 900** | **DCS 1 800** |

These informations are provided by system information 1, 2, 3 and 4 messages.

The system information elements which are broadcast on the SACCH during the dedicated mode should be consistent with those sent on the BCCH when the MS was in idle mode prior to the channel request.

In addition, all fill paging messages sent on the paging sub-channels will have by default, their page mode set to NORMAL PAGING.

## 26.1.2 Structured sequence of the tests

The tests shall be performed in the order as indicated in the following table.

The validity of the tests depends upon the results of the tests performed before.

| | | |
|---|---|---|
| Channel request (basic test) | RR | 26.2.1 |
| Immediate assignment | RR | 26.6.1 |
| IMSI attach/detach (basic) | RR | 26.2.2 |

| Additional assignment | RR | 26.6.9 |
| Partial release | RR | 26.6.10 |
| Re-establishment | CC | 26.8.2 |
| Dedicated channel assignment (during calls) | RR | 26.6.4 |
| Transmission mode change | RR | 26.6.7 |
| Mobility management connection establishment | MM | 26.7.5 |
| Test of Layer 3 error handling | | 26.5 |
| User to user signalling | CC | 26.8.3 |
| Testing of structured procedures | | 26.9 |
| E-GSM or R-GSM signalling | | 26.10 |
| Multiband signalling | | 26.11 |

## 26.1.3 General rules for message parameters

The following rules concerning message parameters apply to section 26:

1) Those values of parameters which are a consequence of the context of a test and which are not specific to that test need not be defined.

2) If the value of a parameter of an uplink message (MS to Network) is specified in a test, the implicit meaning is that it has to be checked; if the value is not specified, it is not to be checked unless stated otherwise.

3) An optional field or optional Information Element of a downlink message (Network to MS), the presence of which is not a consequence of a test description, shall be absent in that test.

4) If an optional field or Information Element is not indicated for the uplink (MS to Network) - unless specified otherwise -, it may be included or not.

5) The Protocol Discriminator, Transaction Identifier and Message Type of all uplink messages have to be checked.

## 26.1.4 General rules for layer 3 testing

Unless otherwise specified, before the SS pages the MS, the MS must be given the necessary time to be able to receive paging (see section 20). In addition and unless otherwise specified,the SS must wait at least 1s after the last time slot of the message block containing a CHANNEL RELEASE, before sending a PAGING to the mobile (see 04.13).

In the signalling tests, where the following statement is used:

> 'the RF level of cell x is set sufficiently low to ensure that cell x is not suitable as defined in GSM 05.08 section 6.6.2'

this means that for the cell to be "not suitable" by virtue of its RF level, the RF level is to be lowered until C1 is below 0.

## 26.1.5 Format of layer 3 test descriptions

In sections 26.2, 26.5, 26.6, 26.7, 26.9, 26.10 and 26.11 a rigorous description technique is used which is defined here.

For every test, a subsection titled "method of test" and a subsection titled "expected sequence" define the exact test steps and the verifications to be performed in the test. These sections are normative and give requirements for the MS behaviour. The information of both subsections applies.

For the message contents further normative requirements for the MS behaviour are defined in the following parts which apply in the following order (starting with the highest) on basis of the general rules of 26.1.3:

- specifications in the "method of test" and "expected sequence" subsections;
- specifications in the subsection titled "specific message contents";
- specifications in the subsection "default message contents" at the end of the relevant sections 26.5, 26.6, 26.7, 26.9, 26.10 or 26.11;
- specifications of default conditions in 26.1.

The relevant section may contain the definition of abbreviations of L3 message names that are used in that section.

In many cases, a test description contains an introductory subsection explaining the background of the relevant procedures and explaining why the tests of that description are essential.

For every test, test purposes are given. In general conformance testing methodology, the correspondence between test purposes and test cases can be n to m: To one test purpose more than one test case may correspond (e.g. different test cases checking data variations); also a test case may serve more than one test purpose. In some contexts a structure of conformance test descriptions is advisable which specifies in one part (non-duplicated) test purposes with references to corresponding test suites serving the test purposes, in another part test suites realizing the test purposes; this structuring is especially useful for gaining completeness and avoiding duplications. In this specification, however, it is preferred to group descriptions by test cases. The reasons are:

- The structure is more sought to assist the test execution and evaluation than test development. It must be easy to determine why a wrong behaviour leads to a verdict.
- The structure is to be close to GSM 11.10 phase 1.

For every test purpose of a test, a conformance requirement is given.

For each conformance requirement in a test description, references to core specifications are given.

For every test, the related PICS/PIXIT statements that are necessary for performing the test are given.

For every test, initial conditions for both the System Simulator and the Mobile Station are given. Unless otherwise specified, these initial conditions apply together with the default conditions of 26.1, the initial conditions of the test prevailing over the default conditions of 26.1.

For every test, the foreseen final state of the MS after the test and the maximum duration of the test are specified. These parts are non-normative and do not contain a description of verifications to be performed. The contained information might be used for sequencing different tests and for the decision when a test is to be interrupted.

The expected sequence specifies the actions in numbered steps in a tabular form. In the column "direction", "SS -> MS" denotes a message sent from the SS to the MS, "MS -> SS" denotes a message sent from the MS to the SS, "SS" denotes an action at the SS, "MS" denotes an action at the MS (e.g. interaction with the user or higher layers). The column "message" defines the L3 messages to be sent or expected by the SS. In the "comments" column, further normative information is to be found, e.g. message parameters. In some cases, different alternative behaviours are possible in a test. Then test steps in alternative sequences are numbered as:

"A n", "A n+1",...,"A n+k"

"B n", "B n+1",...,"B n+l"

"C n", "C n+1",...,"C n+m"

etc. (n,m,l,k integers > 0)

and step numbering of a re-unified sequence resumes with the lowest of n+k+1, n+l+1, n+m+1.

In some cases the test steps of a test are to be repeated. Then an execution counter is introduced for the test.

# 26.2 Initial tests

## 26.2.1 Channel request

The random access procedure is used by the MS to ask for resources to the network. If it is not performed correctly, the MS could prevent other MSs from obtaining resources, or the network could be overloaded if the MS does not respect the duration between 2 CHANNEL REQUEST messages.

### 26.2.1.1 Channel request / initial time

#### 26.2.1.1.1 Conformance requirement

1) The MS shall start the initial access procedure at the latest 0,7 second after reception of the paging message.

2) The MS shall spread the initial CHANNEL REQUEST with equal probability on the correct number of time slots.

Reference(s)

GSM 04.08 sections 3.3.1.1.2 and 3.3.2.2.

#### 26.2.1.1.2 Test purpose

1) To verify that the MS answers to a PAGING message by sending a CHANNEL REQUEST message within 0,7 seconds after reception of the PAGING message.

2 To verify that the MS does not always use the same delay between reception of paging message and sending of the CHANNEL REQUEST message. If an MS uses a fixed delay, there is a high probability that different MSs of the same product series use the same delay. There would then be a high risk of collision.

#### 26.2.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, Tx-Integer = 5. The CCCH is either combined or not with SDCCH. This is arbitrarily chosen.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT Statement(s)

None.

Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

Specific test parameters:

K = 200.

The MS is paged. The SS measures and stores the number of CCCH RACH slots between the sending of the PAGING REQUEST message and the reception of the CHANNEL REQUEST from the MS, excluding the slots containing the messages themselves. The SS sends an IMMEDIATE ASSIGNMENT REJECT. The sequence is performed K times.

Maximum Duration of Test

30 min.

Between two consecutive executions (for k and k+1), the SS must wait for an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

Expected Sequence

The sequence is executed for execution counter k = 1, ... , K.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | "Mobile Identity" IE contains the TMSI allocated to the MS. |
| 2 | SS | | The SS measures the number f of CCCH RACH slots between the sending of PAGING REQUEST message and the reception of a CHANNEL REQUEST message from the MS. |
| 3 | SS | | The SS stores f. f(k) shall be lower than 700/4,615+8 if the CCCH is not combined or lower than 81+8 if the CCCH is combined with SDCCH. |
| 4 | MS -> SS | CHANNEL REQUEST | "Establishment Cause" = Answer to paging. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | the first "request reference" corresponds to the CHANNEL REQUEST sent by the MS. |

NOTE: The test limit has been computed to give a confidence of [99,74 %] that a unit which follows the requirements will pass. The number of samples (200) has been chosen to get a good compromise between the test time and the risk of passing a bad unit.

#### 26.2.1.1.4 Test requirements

S(n) = CARD {k | f(k) = n}

The following requirements shall be met:

S(n) <= 41 for all n.

NOTE: CARD {k | f(k) = n} is mathematical notation for the number of times that f(k) equals n.

### 26.2.1.2 Channel request / repetition time

#### 26.2.1.2.1 Conformance requirement

1) The MS shall spread retransmissions of a CHANNEL REQUEST message, with equal probability on Tx-Integer timeslots and with the correct delay after the reception of the PAGING REQUEST.

2) The MS shall not retransmit another CHANNEL REQUEST message when Max-retrans is reached.

Reference(s)

GSM 04.08 section 3.3.1.1.2

26.2.1.2.2 Test purpose

1) To verify that the MS spreads retransmission of a CHANNEL REQUEST message with equal probability on Tx-Integer time slots and correctly applies the fixed delay when the following conditions apply:

   - the CCCH is combined or not combined with SDCCHs;
   - the maximum number of retransmissions is equal to one of the following values: 1, 2, 4, 7;
   - Tx-Integer is put to any of the allowed values among those which are greater or equal to 6.

2) To verify that the MS retransmits exactly Max_Retrans times a CHANNEL REQUEST message if the network never responds to the CHANNEL REQUEST message.

26.2.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell.

Tx-Integer is arbitrarily chosen in the set {6, 7, 8, 9, 10, 11, 12, 14, 16, 20, 25, 32, 50}.

Max_Retrans is arbitrarily chosen in the set {1,2,4,7}.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT Statement(s)

None.

Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

Specific test parameters

K equals the upper rounded value of 230/Max_Retrans.

m equals the upper rounded value of 0,5*Tx-Integer.

Counter M = 0.

Parameter S: according to table 3.1/GSM 04.08 (this parameter depend on the value chosen for Tx-Integer).

N0 = max (8, Tx-Integer)

The MS is paged. The MS sends a CHANNEL REQUEST message. The MS retransmits CHANNEL REQUEST messages Max_Retrans times. The SS measures the number of CCCH RACH slots f(i,k) between the moment where a CHANNEL REQUEST message has been received, and the reception of the following CHANNEL REQUEST message, excluding the slots containing the messages themselves. The SS updates the counter M. The SS does not

answer to the CHANNEL REQUEST messages Max_Retrans times. After the last CHANNEL REQUEST message in every sequence where k is lower than K, the SS sends an IMMEDIATE ASSIGNMENT REJECT . In the last sequence (k = K), the SS does not respond to the MS. The MS shall not send any other CHANNEL REQUEST message.

Maximum Duration of Test

The execution of one sequence (for one value k): 10s.

Between two consecutive executions (for k and k+1), the SS must wait for 35 seconds,which is enough to guarantee that the MS is in service (listening to its paging subchannel).

Expected Sequence

The sequence is executed for execution counter k = 1, ... , K for each of the 2 test cases.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | "Mobile Identity" = TMSI of the MS. |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment Cause" = Answer to paging. |
| | | | Steps 3, 4, 5 are executed for execution counter i = 1,...,Max_Retrans. |
| 3 | MS -> SS | CHANNEL REQUEST | "Establishment Cause" = Answer to paging. |
| 4 | SS | | The SS measures the number f(i,k) of CCCH RACH slots between: - the moment where the last CHANNEL REQUEST message has been received, and - the reception of the new CHANNEL REQUEST message from the MS, excluding the slots containing the messages themselves. f(i,k) shall be in the set {S,S+1,...,S+T-1} |
| 5 | SS | | If f(i,k)-S >= m, M = M+1 |
| A6 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Depending on the value of k, step A6 or B6 is performed: k < K The third "Request Reference" IE corresponds to the last CHANNEL REQUEST message received. The third "Wait Indication" IE specifies 0 second. Other fields do not address the MS under test. |
| B6 | SS | | k = K The SS checks that the MS sends no more CHANNEL REQUEST messages. This is verified during 3 seconds. |
| 7 | SS | | M / (K * Max_Retrans) shall be inside the following interval: [0,8 - m/Tx-Integer ; 1,2 - m/Tx-Integer] |

NOTE: The confidence interval in step 7, and the number of samples are chosen in such a way that the possibility of not accepting a correct MS is less than [0,26 %].

## 26.2.1.3 Channel request / random reference

### 26.2.1.3.1 Conformance requirement

A CHANNEL REQUEST message sent by the MS shall include a random reference randomly drawn from a uniform probability distribution for every new transmission.

Reference(s)

GSM 04.08 section 3.3.1.1.23.3.1.2.

### 26.2.1.3.2 Test purpose

To verify that an MS produces different random references for a CHANNEL REQUEST. If a MS always produces the same random reference, it makes possible that different MSs of the same product series produce the same random reference.

#### 26.2.1.3.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, CCCH not combined with SDCCH.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

##### Related PICS/PIXIT Statement(s)

None.

##### Foreseen Final State of the MS

The MS has a valid TMSI. It is in the MM-state "idle, updated" and in the RR idle-mode.

##### Test Procedure

Specific test parameters:

K = 7.

D = 4.

The SS sends a PAGING REQUEST message. The SS stores the "Random Reference" r(k) contained as a parameter in the CHANNEL REQUEST message sent by the MS. This sequence is performed K times, and it is verified that the MS produces different values r(k).

##### Maximum Duration of Test

6 min

Between two consecutive executions (for k and k+1), the SS must wait for an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

##### Expected Sequence

The sequence is executed for execution counter k = 1, ..., K.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment Cause" = Answer to paging. |
| 3 | SS | | The SS stores the "Random Reference" contained in the CHANNEL REQUEST message. |

#### 26.2.1.3.4 Test requirements

At least D values of r(1),...,r(k) shall be different.

NOTE: D has been computed such that the probability of refusing a correct MS is less than [0,027 %].

## 26.2.2 IMSI detach and IMSI attach

The IMSI detach/attach procedures are used to indicate to the network that the MS is deactivated/activated. Theses procedures are allowed or not by the network (ATT flag set to "MSs in the cell shall apply IMSI attach and detach procedure" or "MSs in the cell are not allowed to apply IMSI attach and detach procedure").

If the IMSI attach procedure does not work correctly then the network would in certain situations not try to establish Mobile Terminating call even if the MS is "idle updated".

If an MS performs an unwanted IMSI detach procedure or does not perform IMSI detach when required, network resources are wasted.

#### 26.2.2.1 Conformance requirement

1) When the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure", the MS shall not perform the IMSI detach procedure upon deactivation.

2) When the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure", the MS shall not perform the IMSI attach procedure upon activation.

3) The MS shall not perform the IMSI detach procedure if the Subscriber Identity Module is removed when the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure".

4) The MS shall not perform the IMSI attach procedure if the Subscriber Identity Module is inserted, when the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure".

5) The MS shall correctly perform the IMSI detach procedure, upon switch off, when it is required by the network to do so.

6) The MS shall correctly perform the IMSI attach procedure upon switch on when the IMSI attach procedure is required by the network. The MS shall correctly acknowledge the implicit TMSI reallocation procedure, which is part of this IMSI attach procedure, this means that the MS shall send a TMSI REALLOCATION COMPLETE message.

7) The MS shall correctly perform the IMSI detach procedure upon SIM removal when it is required by the network to do so.

8) The MS shall correctly perform the IMSI attach procedure, following SIM insertion and switch on when the IMSI attach procedure is required by the network. The MS shall correctly acknowledge the implicit TMSI reallocation procedure which is part of this IMSI attach procedure. This means that the MS shall send a TMSI REALLOCATION COMPLETE message.

Reference(s):

GSM 02.07, normative annex B, section B1.17.

GSM 04.08 sections 4.4.3 and 4.4.4.

#### 26.2.2.2 Test purpose

1) To verify that the MS correctly performs IMSI detach/attach procedures when it is required by the network and upon deactivation/activation or SIM removal/insertion and does not perform these procedures when not required.

2) To verify that the mobile station acknowledges a re-allocated TMSI during IMSI attach.

#### 26.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, default parameters.

For procedures 1 and 2 ATT flag is set to "MSs in the cell are not allowed to apply IMSI attach and detach procedure".

For procedures 3 and 4 ATT flag is set to "MSs in the cell should apply IMSI attach and detach procedure".

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

### Related PICS/PIXIT Statement(s)

| | | |
|---|---|---|
| a: | SIM removal possible without removing power source | Yes / No. |
| b: | On/off switch | Yes / No. |
| c: | IMSI detach after SIM removal | Yes / No. |
| d: | IMSI detach after removing power source | Yes / No. |

### Foreseen Final State of the MS

The MS has a valid TMSI which may be different from the initial one. It is "idle updated".

### Test Procedure

The SS indicates that IMSI detach/attach is not allowed. If possible the MS is switched off, then switched on, otherwise it has its power source removed and then restored (see b in PICS). The SS checks that the MS does not perform IMSI detach/attach procedures. If possible (if a = Yes, see PICS), the SIM is removed, then the SIM is inserted. The SS checks that the MS does not perform IMSI detach/attach procedures.

The SS indicates that IMSI detach/attach is allowed. After a delay of 35s the MS should have detected The SS indicates now, that IMSI detach/attach is allowed. If possible (if b = Yes, see PICS) the MS is switched off, otherwise it has its power source removed (if d = Yes, see PICS). The MS initiates an IMSI detach procedure. Then depending on what has been performed before, the MS is switched on or has its power source restored. It initiates an IMSI attach procedure. The location updating procedure contains an implicit TMSI reallocation. The SIM is removed. If (a = yes and c = yes) or (a = no and d = yes) the MS initiates an IMSI detach procedure. Then the SIM is inserted, it initiates an IMSI attach procedure, the location updating procedure contains an implicit TMSI reallocation.

### Maximum Duration of Test

4 min

### Expected Sequence

#### Procedure 1

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | MS | | If possible the MS is switched off (see b in PICS), otherwise the MS has its power source removed. |
| 2 | MS | | The MS shall not initiate the IMSI detach procedure. This is checked by the SS during 5 seconds. |
| 3 | MS | | Depending on what has been performed in step 1, the MS is brought back to operation. |
| 4 | MS | | The MS shall not initiate an IMSI attach procedure. This is checked by the SS during 30 seconds. |

#### Procedure 2

| | | | |
|---|---|---|---|
| 1 | MS | | If possible (a = Yes, see PICS), the SIM is removed from the MS. |
| 2 | MS | | The MS shall not initiate the IMSI detach procedure. This is checked by the SS during 5 seconds. |
| 3 | MS | | The SIM is inserted in the MS. |
| 4 | MS | | The MS shall not initiate an IMSI attach procedure. This is checked by the SS during 30 seconds. |

Procedure 3

| | | | |
|---|---|---|---|
| 1 | MS | | The MS is switched off, or has its power source removed , depending on value b in the PICS file. If b = Yes or d = Yes the MS initiates an IMSI detach procedure (steps A2, A3, A4, A5), otherwise the SS goes straight to step 6. |
| A2 | MS -> SS | CHANNEL REQUEST | |
| A3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| A4 | MS -> SS | IMSI DETACH INDICATION | |
| A5 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |
| 6 | MS | | Depending on what has been performed in step 1, the MS is brought back to operation. |
| 7 | MS -> SS | CHANNEL REQUEST | The MS initiates an IMSI attach procedure. |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 9 | MS -> SS | LOCATION UPDATING REQUEST | "Location Updating Type" = IMSI attach. |
| 10 | SS -> MS | LOCATION UPDATING ACCEPT | The SS allocates a new TMSI |
| 11 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 12 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |

Specific message contents:

SYSTEM INFORMATION TYPE 3 message:

| Information Element | value/remark |
|---|---|
| Control Channel Description<br>- Attach/Detach allowed | MS shall apply IMSI attach and detach procedures. |

Procedure 4

| | | | |
|---|---|---|---|
| 1 | MS | | The SIM is removed from the MS. If (a = Yes and c= Yes) or (a = no and d = yes) in PICS, the MS initiates an IMSI detach procedure (steps A2, A3, A4, A5), otherwise the SS goes straight to step 6. |
| A2 | MS -> SS | CHANNEL REQUEST | |
| A3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| A4 | MS -> SS | IMSI DETACH INDICATION | |
| A5 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |
| 6 | MS | | The SIM is inserted in the MS. |
| 7 | MS -> SS | CHANNEL REQUEST | The MS initiates a IMSI attach procedure. |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 9 | MS -> SS | LOCATION UPDATING REQUEST | "Location Updating Type" = IMSI attach. |
| 10 | SS -> MS | LOCATION UPDATING ACCEPT | The SS allocates a new TMSI |
| 11 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 12 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |

Specific message contents:

SYSTEM INFORMATION TYPE 3 message:

| Information Element | value/remark |
|---|---|
| Control Channel Description<br>- Attach/Detach allowed | MS shall apply IMSI attach and detach procedures. |

## 26.2.3 Sequenced MM / CM message transfer

The RR sublayer of the MS shall have an associated send state variable V(SD) for sending MM and CM messages. This send state variable has been introduced to avoid the duplication of MM and CM messages. It is useful for the network after a handover or a change of channel to identify duplicated messages.

If the MS started V(SD) with 1 instead of 0 the network would incorrectly diagnose loss of message.

If the MS later on does not handle correctly incrementation of V(SD) the network would not be able to continue the dialogue.

### 26.2.3.1 Conformance requirement

The MS shall implement correctly the "send state variable V(SD)" ("Send duplicated"), included in transmitted MM and CM messages.

#### Reference(s)

GSM 04.08 section 3.1.4.3.

### 26.2.3.2 Test purpose

To verify that V(SD) is correctly set to 0 at the beginning of the establishment of the first RR connection and to verify that the MS handles correctly this variable in the special case of IDENTITY REQUEST messages, which are MM messages.

### 26.2.3.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

#### Related PICS/PIXIT Statement(s)

None.

#### Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

#### Test Procedure

The MS is paged. After reception of the PAGING RESPONSE message from the MS, the SS sends an IDENTITY REQUEST message. The MS sends an IDENTITY RESPONSE message where N(SD) = 0. The SS repeats its IDENTITY REQUEST message 10 times. The MS transmits IDENTITY RESPONSE message with the value 1 and 0 in the N(SD) field alternately.

#### Maximum Duration of Test

1 min

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | IDENTITY REQUEST | |
| 6 | MS -> SS | IDENTITY RESPONSE | N(SD) = 0 |
| 7 | SS -> MS | IDENTITY REQUEST | Steps 7, 8, 9 and 10 are repeated 5 times. |
| 8 | MS -> SS | IDENTITY RESPONSE | N(SD) = 1. |
| 9 | SS -> MS | IDENTITY REQUEST | |
| 10 | MS -> SS | IDENTITY RESPONSE | N(SD) = 0. |
| 11 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |

## 26.2.4 Establishment cause

The establishment cause set by the MS in the CHANNEL REQUEST message shall be consistent with the requested service or function, with the capabilities of the MS and with the indications given by the network.

If the MS uses a wrong establishment cause, the network might assign an inappropriate or incompatible resource.

In the case of Emergency call a wrong priority might be used.

If a reserved value is used, the network may discard the channel request.

### 26.2.4.1 Conformance requirements

In the CHANNEL REQUEST message, the MS shall include an establishment cause which correspond to the establishment cause given by the MM sublayer and the broadcasted NECI value, or which correspond to one of the establishment causes "answer to paging" given by the RR entity in response to a PAGING REQUEST message including the Channel Needed information.

Reference(s)

GSM 04.08 section 3.3.1.1.2

### 26.2.4.2 Test purpose

To verify that the establishment cause sent by the MS in the Max-Retrans+1 CHANNEL REQUEST messages is consistent with the requested service, with the capabilities of the MS and with the indications of the network in the following cases:

1) If the MS supports a service on a traffic channel:

   when the NECI bit is set to 0 and call re-establishment is attempted and the call was established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise.

2) If the MS supports a service on half rate channel:

   when the NECI bit is set to 1 and call re-establishment is attempted and the call was established on TCH/H.

3) If the MS supports speech:

   3.1 when the NECI bit is set to 0 and a speech call is attempted.

   3.2 when the NECI bit is set to 1 and a speech call is attempted.

4) If the MS supports a data service:

4.1 when the NECI bit is set to 0 and a data call is attempted.

4.2 when the NECI bit is set to 1 and a data call is attempted for a service supported on half rate channel (if the MS does not support any data call on half rate channel any data service is used).

5)

5.1 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "any channel".

5.2 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "SDCCH".

5.3 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "TCH/F".

5.4 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "TCH/H or TCH/F".

6)

6.1 when the NECI bit is set to 0 and IMSI attach is attempted.

6.2 when the NECI bit is set to 0 and normal location updating is attempted.

6.3 when the NECI bit is set to 0 and periodic location updating is attempted.

6.4 when the NECI bit is set to 0 and IMSI detach is attempted.

6.5 when the NECI bit is set to 1 and IMSI attach is attempted.

6.6 when the NECI bit is set to 1 and normal location updating is attempted.

6.7 when the NECI bit is set to 1 and periodic location updating is attempted.

6.8 when the NECI bit is set to 1 and IMSI detach is attempted.

7) If the MS supports a non call related supplementary service operation:

when the NECI bit is set to 0 and a supplementary service operation is attempted at the MS.

when the NECI bit is set to 1 and a supplementary service operation is attempted at the MS.

8) If the MS supports SMS/PP MO:

when the NECI bit is set to 0 and a mobile originated short message service transaction is attempted.

when the NECI bit is set to 1 and a mobile originated short message service transaction is attempted.

NOTE: To verify that when the MS supports speech and an emergency call is attempted and the NECI bit is set to 0, then the MS sends a CHANNEL REQUEST message with an establishment cause consistent with the requested service, with the capabilities of the MS and with the indications of the network is done in test 26.9.6.1.1 test purpose 1.

#### 26.2.4.3 Method of test

##### Initial Conditions

System Simulator:

for all procedures: 1 cell, Max-Retrans = 7 slots. The NECI bit is set to 0.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

##### Related PICS/PIXIT Statement(s)

a: MS supports speech on TCH/F Yes / No

b: MS supports speech on TCH/H Yes / No

c: MS supports data on TCH/F Yes / No

d: MS supports data on TCH/H Yes / No

e: MS only supports SDCCH Yes / No

f: MS supports a supplementary service operation Yes / No

g: MS supports SMS/PP MO Yes / No

h: On/Off switch Yes / No

NOTE: In the above PICS, data and speech refer to the Radio Resource Channel Mode.

### Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

### Test Procedures

NOTE: If the procedures are chained, the SS shall ensure that at the beginning of each procedure, the initial conditions are reached and that the MS had enough time to decode the broadcasted parameters.

#### Procedure 1

If the MS supports a service on a traffic channel:

A call is established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise. The SS stops transmission on the SACCH. The MS attempts call reestablishment. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "110".

#### Procedure 2

If the MS supports a service on half rate channel:

The NECI bit is set to 1. A call is established on TCH/H. The SS stops transmission on the SACCH. The MS attempts call reestablishment. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "011010".

#### Procedure 3

If the MS supports speech:

A speech call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111". The NECI bit is set to 1. A speech call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111" if the MS does not support speech on half rate channel or "0100" if the MS supports speech on half rate channel.

#### Procedure 4

If the MS supports a data service:

A data call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks

that all CHANNEL REQUEST messages contain an establishment cause with the value "111". The NECI bit is set to 1. A data call is attempted for a service supported on half rate channel (if the MS does not support any data call on half rate channel any data service is used). The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111"if the MS does not support a data service on half rate channel or "0101" if the MS supports a data service on half rate channel.

Procedure 5

The MS is paged with the paging indication set to "any channel". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100". The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with the paging indication set to "SDCCH". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001". The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with he paging indication set to "TCH/F". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100" if the MS capability is full rate only, "0010" if the MS capability is dual rate and "0001" if the MS capability is SDCCH only. The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with the paging indication set to "TCH/H or TCH/F". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100" if the MS capability is full rate only, "0011" if the MS capability is dual rate and "0001" if the MS capability is SDCCH only.

Procedure 6

This procedure is performed twice. Once for NECI = 0 and once for NECI = 1.

The MS is switched off or powered off. Then system information messages are altered so that IMSI attach/detach is allowed in the cell. The MS is switched on or powered on. The MS performs IMSI attach. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000" when NECI = 1, or “000” when NECI = 0. The IMSI attach procedure is followed. The location area code of the cell is changed, T3212 is set to 1 deci-hour. The MS performs a location updating. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000" when NECI = 1, or “000” when NECI = 0. The location updating procedure is followed. The SS waits for at least 7 minutes. The MS performs a periodic updating. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000". The location updating procedure is followed. The MS is switched off or powered off. If the MS has an On/off switch (see PICS), it attempts IMSI detach. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001" when NECI = 1, or “111” when NECI = 0.

Procedure 7

This procedure is performed twice. Once for NECI = 0 and once for NECI = 1.

If the MS supports a non call related supplementary service operation:

A supplementary service operation is attempted at the MS. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001".

Procedure 8

If the MS supports SMS/PP MO:

A mobile originated short message service transaction is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001" when NECI = 1, or “111” when NECI = 0.

Maximum Duration of Test

For procedures 1, 2, 3, 4 and 5: 5 minutes, including 1 minute for any necessary operator actions.

For procedure 6: 20 minutes, including 2 minutes for any necessary operator actions.

For procedures 7, 8: 10 minutes, including 2 minutes for any necessary operator actions.

Expected Sequence

Procedure 1

This procedure is performed if the MS supports a service on a traffic channel.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | | | a call is established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise. The generic call setup procedure is used. |
| 2 | SS | | the SS stops transmission on the SACCH. |
| 3 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "110" |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 2

This procedure is performed if the MS supports a service on half rate channel.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS | | The NECI bit is set to 1, a call is established on TCH/H. The generic call setup procedure is used. |
| 2 | | | |
| 3 | SS | | the SS stops transmission on the SACCH. |
| 4 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "011010" |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 3

This procedure is performed if the MS supports speech.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | MS | | a speech call is attempted |
| 2 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "111" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 4 | SS | | The NECI bit is set to 1 |
| 5 | SS | | The SS waits for 30 s |
| 6 | MS | | a speech call is attempted |
| 7 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "0100" if the MS supports speech on half rate or set to "111" otherwise |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 4

This procedure is performed if the MS supports a data service.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | MS | | a data call is attempted |
| 2 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "111" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 4 | SS | | The NECI bit is set to 1 |
| 5 | SS | | The SS waits for 30 s |
| 6 | MS | | a data call is attempted for a service supported by the MS on half rate (for any data service if the MS does not support any data service on half rate) |
| 7 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "0101" if the MS supports a data service on half rate or set to "111" otherwise |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 5

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = any channel |
| 2 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "100" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 4 | SS | | The SS waits for 5 seconds |
| 5 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = SDCCH |
| 6 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "0001" |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 8 | SS | | The SS waits for 5 seconds |
| 9 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = TCH/F |
| 10 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "100" if the MS capability is full rate only or "0010" if the MS capability is dual rate or "0001" if the MS capability is SDCCH only |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 12 | SS | | The SS waits for 5 seconds |
| 13 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = TCH/H or TCH/F |
| 14 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "100" if the MS capability is full rate only or "0011" if the MS capability is dual rate or "0001" if the MS capability is SDCCH only |
| 15 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 6

The sequence is executed for execution counter k = 1, 2.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 0 | SS | | When k = 1, NECI set to 0 When k = 2, NECI set to 1 |
| 1 | MS | | The MS is switched off or has its power source removed |
| 2 | SS | | IMSI attach/detach is set to "MSs in the cell shall apply IMSI attach and detach procedure" |
| 3 | MS | | The MS is switched on or powered on |
| 4 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: “000” when k = 1 "0000" when k = 2 |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 6 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = IMSI attach |
| 7 | SS -> MS | LOCATION UPDATING ACCEPT | with no mobile identity |
| 8 | SS -> MS | CHANNEL RELEASE | |
| 9 | SS | | the LAC of the cell is changed and T3212 is set to 6 minutes |
| 10 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: “000” when k = 1 "0000" when k = 2. The MS must send its first Channel Request within 33s after the LAC has been changed. |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 12 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = Normal location updating |
| 13 | SS -> MS | LOCATION UPDATING ACCEPT | with no mobile identity |
| 14 | SS -> MS | CHANNEL RELEASE | |
| 15 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: “000” when k = 1 "0000" when k = 2. The MS must send its first Channel Request within 7 minutes after the preceeding Channel Release |
| 16 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 17 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = Periodic updating |
| 18 | SS -> MS | LOCATION UPDATING ACCEPT | with no mobile identity |
| 19 | SS -> MS | CHANNEL RELEASE | |
| 20 | MS | | If possible (see PICS), the MS is switched off, otherwise it has its power source removed |
| 21 | MS | | If the MS was switched off it attempts IMSI detach |
| 22 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: “111” when k = 1 "0001" when k = 2 |
| 23 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 7

The sequence is executed for execution counter k = 1, 2.

This procedure is performed if the MS supports a non call related supplementary service operation.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | MS | | a non call related supplementary service operation is attempted |
| 2 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: “111” when k = 1 "0001" when k = 2 |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 8

This procedure is performed if the MS supports SMS/PP MO.

The sequence is executed for execution counter k = 1, 2.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 0 | SS | | When k = 1, NECI set to 0 When k = 2, NECI set to 1 |
| 1 | MS | | a mobile originated short message service transaction is attempted |
| 2 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: “111” when k = 1 "0001" when k = 2 |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

# 26.3 Test of MS functions in idle mode

## 26.3.1 Initial conditions

The SIM shall contain a PLMN-Selector that contains only the HPLMN of the MS, and an empty forbidden PLMN list.

### Related PICS/PIXIT statements

Type of mobile station (GSM 400, GSM 700, GSM 850, P-GSM 900, E-GSM 900, R-GSM 900, DCS 1 800 or PCS 1900)

During the tests in 26.3.2 and 26.3.3, the following parameters apply according to the above PICS/PIXIT statement:

| 8 | +53 | 251 |

For testing an E-GSM Mobile station (see PICS/PIXIT), the BCCH ARFCN of cell 7 at GSM 900 column shall be 985 (instead of 97). For testing an R-GSM Mobile station (see PICS/PIXIT), the BCCH ARFCN od cell 7 at GSM 900 column shall be 965 (instead of 97).

NOTE 4: The SIM should contain a PLMN-Selector that contains only the HPLMN of the MS, and an empty forbidden PLMN list.

## 26.3.2 MS indication of available PLMNs

### 26.3.2.1 Test purpose

To verify that a MS can present the available PLMNs to the user when asked to do so in manual mode according to the requirements of GSM 05.08 and GSM 02.11.

### 26.3.2.2 Method of test

a) The MS is switched on, equipped with a SIM containing default values except for those values listed under section 26.3.1 (initial conditions).

b) The MS is put into manual network selection mode (see PIXIT).

### 26.3.2.3 Test requirements

1) On entering manual network selection mode, the MS shall present a list of available PLMNs in all its bands of operation (MCC and MNC values, or any other valid indications, see PIXIT), within 2 minutes. Any PLMN shall only be presented once. The list shall include the MCC and MNC of:

GSM 400, GSM 700, GSM 850 and GSM 900: cells 1 to 7, but not of cell 8.

DCS 1 800: cells 1 to 6, but not of cell 7.

PCS 1900: cells 1 to 6, but not of cell 7.

Multiband: cells 2, 3, 4, 6, 7 and 1 or 5 (cell 1 and 5 have the same MCC and MNC), but not of cell 8.

## 26.3.3 MS will send only if BSS is "on air"

### 26.3.3.1 Test purpose

To verify that the MS will not produce any RF transmission if no BSS is received.

### 26.3.3.2 Method of test

a) The RF-signal for the BCCHs of:

GSM 400, GSM 700, GSM 850 and GSM 900: cell 1 to 8 is switched off.

DCS 1 800: cell 1 to 7 is switched off.

PCS 1900: cell 1 to 7 is switched off.

Any Multiband: cell 1 to 8 is switched off.

b) The SS shall wait 20 s to allow the MS to detect the loss of cells.

c) By MMI, an attempt to originate a call is made.

d) By MMI, an attempt to originate an emergency call is made.

Step d) is only performed if the MS supports speech (see PICS/PIXIT statement).

#### 26.3.3.3 Test requirements

1) The MS must not give "service indication".

2) In steps c) and d) the MS shall not produce any RF output.

## 26.3.4 Manual mode of PLMN selection

#### 26.3.4.1 Conformance requirements

In manual mode, the MS can try to obtain normal service on any available VPLMN and it shall try to obtain normal service on a VPLMN if and only if the user makes a manual selection of this VPLMN.

##### Reference

GSM 03.22 section 3.1.

#### 26.3.4.2 Test purpose

To check that in manual mode the MS is able to obtain normal service on a PLMN which is neither the better nor a preferred PLMN and that it tries to obtain service on VPLMN if and only if the user selects it manually.

#### 26.3.4.3 Method of test

##### Initial conditions

System Simulator:

2 cells, defaults parameter unless otherwise specified.

The SS transmits 2 BCCH carriers in the supported band(s) of the mobile station (for a multiband MS carrier A and B shall be in different bands) with the initial following parameters:

| | | level (dBµVemf) |
|---|---|---|
| carrier A | PLMN 1 | 38 |
| carrier B | PLMN 2 | 33 |

Mobile Station:

The MS is "idle updated" on PLMN1 (HPLMN) and is in manual mode.

The preferred PLMN list does not contain PLMN2, it contains PLMN 3.

##### Related PICS/PIXIT statement(s)

Description of the manual PLMN selector.

Support of multiband functionality

##### Foreseen final state of the MS

The MS is "idle updated".

##### Test procedure

For the different networks and during the whole test, "IMSI attach" flag is set in the BCCH data.

Carrier A is turned off. The MS does not attempt a location updating during 2 minutes.

Carrier A is turned back on with a different MCC-MNC (indicating PLMN 3) and with a higher level (48 dBmVemf) than PLMN 2. The MS does not attempt a location updating during 2 minutes.

PLMN 2 is selected manually. The MS performs a location updating on PLMN 2. Carrier B is turned off. The MS does not attempt a location updating during 2 minutes.

Maximum duration of test

10 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1<br>2 | SS | | carrier A is turned off<br>wait 2 min: the MS shall not send any CHANNEL REQUEST messages during this time |
| 3<br><br>4 | SS | | carrier A is turned on with a different MNC-NCC (PLMN3) and with a high level (48dBmVemf)<br>wait 2 min: the MS shall not send any CHANNEL REQUEST messages during this time |

# 26.4 Lower layer failures in layer 3 testing

## 26.4.1 Introduction

The text in this section is intended to develop a standardized way of creating lower layer failures whilst testing the performance of Layer 3 signalling.

There are two groups of lower layer failures:

1) Detected by analysis of reception at Layer 1 (GSM 05.08, GSM 04.08),

2) Data link layer failures.

References

GSM 04.08, GSM 04.06, GSM 05.08

## 26.4.2 Layer 1 reception failures

The absence of reception of correct frames on the SACCH until the S counter reaches value 0 will be interpreted as a Layer 1 failure.

## 26.4.3 Data link layer failures

Many kinds of error cases can be caused in Layer 2. For example too many "T200 - time-out/retrying" - pairs.

NOTE 1: All types of data link failures are indicated similarly to the RR layer (Release Indication).

NOTE 2: All types of L1 failures are indicated similarly to each layer (Abort Indication, Error Indication).

### 26.4.4 Lower layer failures, used for the tests in clause 25

For L3 testing different lower layer failures are performed:

1) T100 time-out in Layer 1.

2) Too many T200 time-outs consecutively in Layer 2.

## 26.5 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions

### 26.5.1 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown protocol discriminator

An MS ignores messages with unknown protocol discriminator. This allows for the introduction of new messages which will be ignored by MS of earlier phases.

#### 26.5.1.1 Conformance requirements

If the mobile station receives a standard L3 message with a protocol discriminator different from those specified in table 9.2/GSM 04.07, the mobile station shall ignore the message.

References

GSM 04.07, section 11.2.1.

#### 26.5.1.2 Test purpose

To verify that a MS supporting TCH and the call control protocol ignores a message containing an undefined protocol discriminator in the special case of a message coded otherwise like a CC STATUS ENQUIRY message received by the MS having a mobile terminating call in CC-state U10, "active".

#### 26.5.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has been paged and an RR connection has been established.

If the MS supports the call control protocol, the test may alternatively be performed with the MS having a mobile terminating call in the CC-state U10, "active".

Related PICS/PIXIT statements

- At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

Same as in the initial conditions.

Test Procedure

The SS sends a message to the MS which is coded like a CC STATUS ENQUIRY message relating to the active call except for the fact that the protocol discriminator of the message is undefined.

Maximum duration of test

11 seconds.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | UNKNOWN MESSAGE | |
| 2 | SS | | The SS waits between 5 and 10 seconds verifying during this period that the MS does not send a L3 message on the main signalling link. |

Specific message contents

UNKNOWN MESSAGE

| Information element | Value/remark |
|---|---|
| Protocol discriminator | 0000 |
| TI flag | transaction originated by SS |
| TI value | TI value of the active call if the test is performed in state U10 otherwise the value is arbitrary. |
| Message Type | H'34 |

## 26.5.2 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / TI and skip indicator

### 26.5.2.1 TI and skip indicator / RR

The MS ignores RR messages with skip indicator different to 0. This allows for the introduction of new RR messages which will be ignored by MS of earlier phases, especially on the downlink CCCH and BCCH.

#### 26.5.2.1.1 TI and skip indicator / RR / Idle Mode

##### 26.5.2.1.1.1 Conformance requirements

A radio resource message received with skip indicator different from 0000 shall be ignored.

Reference(s):

GSM 04.08, section 10.3.1.

##### 26.5.2.1.1.2 Test purpose

To verify that the MS ignores an RR message with skip indicator different from H'0 in the special case of a PAGING REQUEST TYPE 1 message received in the MM-state "idle, updated" and in RR-idle mode.

##### 26.5.2.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

#### Related PICS/PIXIT statements

None.

#### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

#### Test Procedure

For every binary value x in the range 0001 - 0110 (binary) and for binary value x = 1000, the following procedure is performed: The SS sends a PAGING REQUEST TYPE 1 message to the MS with skip indicator set to x. It is verified that the MS does not answer to the paging request message.

#### Maximum duration of test

5 seconds for each execution.

#### Expected sequence

The sequence is executed for execution counter k = 1,2,3,4,5,6,8.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | The value of the skip indicator IE is the binary encoding of k. |
| 2 | SS | | During 3 seconds the SS verifies that the MS does not send any message on the RACH. |

#### Specific message contents

None.

### 26.5.2.1.2 TI and skip indicator / RR / RR-Connection established

#### 26.5.2.1.2.1 Conformance requirements

A radio resource message received with skip indicator different from H'0 shall be ignored.

#### Reference(s):

GSM 04.08, section 10.3.1.

#### 26.5.2.1.2.2 Test purpose

To verify that the MS ignores RR messages with skip indicator different from H'0 in the case of a message being received during the RR-connection establishment in the MM-state "idle, updated" / "wait for network command" and in RR-connected mode.

#### 26.5.2.1.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters, max retrans = 2.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

### Related PICS/PIXIT statements

None.

### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

### Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message to the MS with skip indicator set to H'0. The first CHANNEL REQUEST message will be answered with an IMMEDIATE ASSIGNMENT addressing the MS but with skip indicator set to H'1. Transmission of the second CHANNEL REQUEST message verifies that the MS has ignored the IMMEDIATE ASSIGNMENT message.

The second CHANNEL REQUEST message is answered by an IMMEDIATE ASSIGNMENT REJECT message addressing the MS but with skip indicator set to H'2 and a reject time set to 255 seconds. Transmission of the third CHANNEL REQUEST message verifies that the MS has ignored the IMMEDIATE ASSIGNMENT REJECT message.

The third CHANNEL REQUEST message from the MS will be answered with a correct IMMEDIATE ASSIGNMENT addressing the MS and having skip indicator set to H'0.

In the RR-Connected mode messages such as CIPHERING MODE COMMAND, HANDOVER COMMAND, ASSIGNMENT COMMAND and CHANNEL RELEASE are sent with the skip indicator <> H'0 and it is checked that the MS does not take any action on these commands.

### Maximum duration of test

40 seconds.

### Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | The value of the skip indicator IE is H'0 |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | skip indicator set to H'1 |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | skip indicator = H'2, reject time = 255 seconds |
| 6 | MS -> SS | CHANNEL REQUEST | Cause, answer to paging |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT | skip indicator = H'0 |
| 8 | MS -> SS | PAGING RESPONSE | RR connection established |
| 9 | SS -> MS | AUTHENTICATION REQUEST | |
| 10 | MS -> SS | AUTHENTICATION RESPONSE | |
| 11 | SS -> MS | CIPHERING MODE COMMAND | skip indicator = H'3 |
| 12 | SS | | the SS neither starts ciphering nor deciphering |
| 13 | SS -> MS | IDENTITY REQUEST | with IMSI requested |
| 14 | MS -> SS | IDENTITY RESPONSE | to check the MS still uses unciphered mode |
| 15 | SS -> MS | ASSIGNMENT COMMAND | skip indicator = H'4 |
| 16 | SS | | SS checks no SABM is sent by the MS on the new channel |
| 17 | SS -> MS | HANDOVER COMMAND | skip indicator = H'5 |
| 18 | SS | | During 3 seconds the SS verifies that the MS does not send a handover failure or RR STATUS message on the old channel |
| 19 | SS -> MS | CHANNEL RELEASE | skip indicator = H'6 |
| 20 | SS -> MS | IDENTITY REQUEST | with IMSI requested |
| 21 | MS -> SS | IDENTITY RESPONSE | to check the RR connection is still established |
| 22 | SS -> MS | CHANNEL RELEASE | skip indicator = H'0 |
| 23 | SS | | The SS checks that the layer 2 connection is released |

Specific message contents

None.

### 26.5.2.2 TI and skip indicator / MM

The MS ignores MM messages with skip indicator different to 0. This allows for the introduction of new MM messages which will be ignored by MS of earlier phases.

#### 26.5.2.2.1 Conformance requirements

A mobility management message received with skip indicator different from 0000 shall be ignored.

References

GSM 04.08, section 10.3.1.

#### 26.5.2.2.2 Test purpose

To verify that the MS ignores an MM message with skip indicator different from H'0 in the special case of an IDENTITY REQUEST message received.

#### 26.5.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active", or alternatively, the MS has been paged and an RR connection has been established.

Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

Foreseen Final State of the MS

Same as in the initial conditions.

Test Procedure

For every binary value x in the range 0001 - 0110 and for the binary value x = 1000, the following procedure is performed: The SS sends an IDENTITY REQUEST message to the MS with skip indicator set to x. It is verified during 5 seconds that the MS does not answer to the IDENTITY REQUEST message.

Maximum duration of test

15 seconds.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'1. |
| 2 | SS | | The SS starts verifying that the MS does not send any L3 message on the main signalling link. This verification continues until step 16 of this test sequence. |
| 3 | SS | | The SS waits 1 second. |
| 4 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'2. |
| 5 | SS | | The SS waits 1 second. |
| 6 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'3. |
| 7 | SS | | The SS waits 1 second. |
| 8 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'4. |
| 9 | SS | | The SS waits 1 second. |
| 10 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'5. |
| 11 | SS | | The SS waits 1 second. |
| 12 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'6. |
| 13 | SS | | The SS waits 1 second. |
| 14 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'8. |
| 15 | SS | | The SS waits 5 seconds. |
| 16 | SS | | The SS stops verifying that the MS does not send any L3 message on the main signalling link. |

Specific message contents

None.

## 26.5.2.3 TI and skip indicator / CC

### 26.5.2.3.1 Conformance requirements

a) Whenever any call control message except SETUP or RELEASE COMPLETE is received specifying a transaction identifier with a value different from 111, which is not recognized as relating to an active call or to a call in progress, the receiving entity shall send a RELEASE COMPLETE message with cause value #81 "invalid transaction identifier value" using the received transaction identifier value and remain in the Null state.

b1) When a RELEASE COMPLETE message is received specifying a transaction identifier with a value different from 111, which is not recognized as relating to an active call or to a call in progress, the MM-connection associated with that transaction identifier shall be released.

b2) When a SETUP message is received with a transaction identifier flag set to "1", this message shall be ignored.

b3) When a SETUP message is received specifying a transaction identifier which is recognized as relating to an active call or to a call in progress, this SETUP message shall be ignored.

c) When a CC message with a TI value = 111 is received, this message shall be ignored.

References

GSM 04.08, section 8.3.

### 26.5.2.3.2 Test purpose

a) To verify that the MS having a mobile terminating call in CC-state U10, "active", on receipt of a DISCONNECT message which includes a transaction identifier with a value different from 111, which is not recognized as relating to an active call or a call in progress, sends a RELEASE COMPLETE message with cause value #81 and referring to the latter TI without changing the state of the active call (this is verified by use of the status enquiry procedure).

b) To verify that the MS having a mobile terminating call in CC-state U10, "active", on receipt of a

b1) RELEASE COMPLETE message which includes a transaction identifier with a value different from 111, which is not recognized as relating to an active call or a call in progress, or a

b2) SETUP message with TI flag referring to a transaction originated by the MS (in the special case where the TI value is equal to the TI value relating to the active call), or a

b3) SETUP message with TI referring to the active call,

ignores that message without changing the state of the active call (this is verified by use of the status enquiry procedure).

c) To verify that the MS ignores a CC message with a TI value of 111.

The test is only applicable to an MS supporting the call control protocol for at least one BC.

#### 26.5.2.3.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active". No other call is active or in progress.

##### Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

##### Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active". No other call is active or in progress.

##### Test Procedure

The SS sends a DISCONNECT message to the MS with a TI not relating to the active call. The MS shall respond with a RELEASE COMPLETE message including cause value #81 and specifying the same transaction. By means of the status enquiry procedure the SS checks that the CC-state of the active call did not change.

Then the SS sends the following call control messages to the MS;

- a RELEASE COMPLETE message, where the TI does not refer to the active call,
- a SETUP message with TI flag set to 1,
- a SETUP message with TI referring to the active call,
- a DISCONNECT message with a TI value of 111.

Each time the SS verifies that the MS does not respond to the message and each time the SS verifies by means of the status enquiry procedure that the CC-state of the active call has not been changed.

##### Maximum duration of test

40 seconds.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | DISCONNECT | TI flag = 0; TI does not refer to the active call. |
| 2 | MS -> SS | RELEASE COMPLETE | TI flag = 1; TI value is equal to TI value received in step 1; Cause IE indicates cause value #81. |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 5 | SS -> MS | RELEASE COMPLETE | TI flag = 0; TI does not refer to the active call. |
| 6 | SS | | The SS verifies during 5 seconds that the MS does not send any L3 message on the main signalling link. |
| 7 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 8 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 9 | SS -> MS | SETUP | TI flag = 1; TI value is equal to TI value of the active call. |
| 10 | SS | | The SS verifies during 5 seconds that the MS does not send any L3 message on the main signalling link. |
| 11 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 12 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 13 | SS -> MS | SETUP | TI flag = 0; TI refers to the active call. |
| 14 | SS | | The SS verifies during 5 seconds that the MS does not send any L3 message on the main signalling link. |
| 15 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 16 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 17 | SS -> MS | DISCONNECT | TI flag = 0; TI value is 111. |
| 18 | SS | | The SS verifies during 5 seconds that the MS does not send any L3 message on the main signalling link. |
| 19 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 20 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

Specific message contents

None.

## 26.5.3 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / undefined or unexpected message type

### 26.5.3.1 Undefined or unexpected message type / undefined message type / CC

#### 26.5.3.1.1 Conformance requirements

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

References

GSM 04.08, section 8.4; GSM 04.07, section 11.2.4.

#### 26.5.3.1.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a mobile terminating call in CC-state U10, "active", on receipt of a message with CC protocol discriminator and an arbitrary undefined message type, returns a STATUS message with cause value #97 to the peer CC entity without changing the state of the active call (this is verified by use of the status enquiry procedure).

#### 26.5.3.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active".

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active".

Test Procedure

The SS sends a message to the MS the PD of which refers to call control, the TI of which refers to the active call, and the message type of which is undefined in the call control protocol (however bit 7 of the message type is "0"). The SS then checks that the MS responds with a STATUS message specifying cause value #97. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause value #30 and call state U10, "active".

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | see comments | PD = "call control; call related SS messages" TI is that of the active call Message type is undefined for call control, bit 7 of the message type is "0" |
| 2 | MS -> SS | STATUS | Cause IE indicates cause value #97. |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

Specific message contents

None.

### 26.5.3.2 Undefined or unexpected message type / undefined message type / MM

#### 26.5.3.2.1 Conformance requirements

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

References

GSM 04.08, section 8.4.

#### 26.5.3.2.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a mobile terminating call in CC-state U10, "active", on receipt of a message with MM protocol discriminator and message type undefined for the mobility management protocol, returns an MM STATUS message with reject cause value #97 without changing the state of the active call (this is verified by use of the status enquiry procedure.) This is tested in the special case where the CC TI has value 0 (so that it has the same encoding as the skip indicator when sent from the SS) and where the message type has the same encoding as DISCONNECT in CC.

#### 26.5.3.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active". The TI of that mobile terminating call has value 0.

##### Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

##### Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active".

##### Test Procedure

The SS sends a message to the MS the PD of which refers to mobility management, the skip indicator of which is "0000", and the message type of which is "0000 0000". The SS then checks that the MS responds with an MM STATUS message specifying reject cause value #97. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause #30 and call state U10, "active".

##### Maximum duration of test

10 s.

##### Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | see comments | PD = "mobility management messages" Skip indicator = "0000" Message type = "0000 0000" rest of the message is H'02 H'E0 H'90 |
| 2 | MS -> SS | MM STATUS | Reject cause IE indicates reject cause value #97. |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

##### Specific message contents

None.

## 26.5.3.3 Undefined or unexpected message type / undefined message type / RR

### 26.5.3.3.1 Conformance requirements

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

#### Reference(s)

GSM 04.08, section 8.4.

### 26.5.3.3.2 Test purpose

To verify that an MS in RR connected mode on receipt of a message with RR protocol discriminator and message type undefined for the RR protocol, returns an RR STATUS message with reject cause value #97 without changing its state (this is checked by observing that the MS does not send L3 messages.)

### 26.5.3.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has been paged and an RR connection has been established.

#### Related PICS/PIXIT statement(s)

- At least one circuit switched basic service supported(p = Y/N)

#### Foreseen Final State of the MS

The MS is in "idle updated" state.

#### Test Procedure

The SS sends a message to the MS the PD of which refers to radio resources management, the skip indicator of which is "0000", and the message type of which is "0010 1010". The SS then checks that the MS responds with an RR STATUS message specifying reject cause value #97. The SS then verifies during 5 seconds that the MS does not send a L3 message on the main signalling link but continues sending L2 fill frames on the main signalling link. Then the SS sends a SETUP message to the MS. This message specifies a BC that is supported by the MS, if there exists any; if the MS does not support any BC, the SETUP message specifies an arbitrary BC. The SS then verifies that the MS responds with a CALL CONFIRMED message if the SETUP had specified a BC supported by the MS, and that the MMS responds with a RELEASE COMPLETE message otherwise. Then the SS sends a CHANNEL RELEASE to the MS and waits for the disconnection of the main signalling link.

#### Maximum duration of test

15 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS->MS | see comments | PD = "radio resources management messages" Skip indicator = "0000" Message type = "0010 0101" rest of the message is H'02 H'E0 H'90 |
| 2 | MS->SS | RR STATUS | RR cause IE indicates RR cause value #97. |
| 3 | SS | | During 5 seconds the SS verifies that the MS does not send a L3 message on the main signalling link but still continues to send L2 fill frames on the main signalling link. |
| 4 | SS->MS | SETUP | If the MS supports at least one BC (p = Y), the SETUP specifies a bearer capability supported by the MS. Otherwise (p = N) the SETUP message specifies any bearer capability. |
| A5 | MS->SS | CALL CONFIRMED | This message shall be sent by the MS if p = Y. |
| B5 | MS->SS | RELEASE COMPLETE | This message shall be sent by the MS if p = N. |
| 6 | SS->MS | CHANNEL RELEASE | The SS waits for disconnection of the main signalling link. |

Specific message contents

None.

## 26.5.3.4 Undefined or unexpected message type / unexpected message type / CC

### 26.5.3.4.1 Conformance requirements

If the Mobile Station receives a message not consistent with the protocol state, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #98 "Message type not compatible with protocol state".

References

GSM 04.08, section 8.4.

### 26.5.3.4.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a call in CC-state U10, "active", on receipt of an inopportune CC message, returns a STATUS message with reject cause value #98 without changing the state of the active call (this is verified by use of the status enquiry procedure.) This is tested in the special case where the inopportune CC message is a CALL PROCEEDING message relating to the active call.

### 26.5.3.4.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call in CC-state U10, "active".

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS has a call in CC-state U10, "active".

Test Procedure

The SS sends a CALL PROCEEDING message to the MS. The SS then checks that the MS responds with a STATUS message specifying reject cause value #98. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause #30 and call state U10, "active".

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | CALL PROCEEDING | |
| 2 | MS -> SS | STATUS | Cause IE indicates cause value #98. |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

Specific message contents

None.

## 26.5.4 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unforeseen information elements in the non-imperative message part

### 26.5.4.1 Unforeseen information elements in the non-imperative message part / duplicated information elements

#### 26.5.4.1.1 Conformance requirements

If an information element with format T, TV, or TLV is repeated in a message in which repetition of the information element is not specified, only the contents of the information element appearing first shall be handled and all subsequent repetitions of the information element shall be ignored.

References

GSM 04.08, section 8.6.3.

#### 26.5.4.1.2 Test purpose

To verify that the MS ignores an unforeseen second occurrence of an information element with format T, TV, or TLV in the special case of the mobile identity IE which has format TLV in the LOCATION UPDATING ACCEPT message.

#### 26.5.4.1.3 Method of test

Initial conditions

System Simulator:

2 cells A and B belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode, listening to the BCCH/CCCH of cell A. It has a valid TMSI.

### Related PICS/PIXIT statements

None.

### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode, listening to the BCCH/CCCH of cell B. It does not have a valid TMSI.

### Test Procedure

The RF level of cell A is lowered until the MS selects cell B (according to the cell-reselection procedures of GSM 05.08). The MS shall establish an RR connection and initiate the normal location updating procedure (using TMSI). The SS responds to the location update request with the LOCATION UPDATING ACCEPT message containing the mobile identity IE specifying the IMSI of the MS followed by an additional mobile identity IE specifying the TMSI that was assigned to the MS in the initial conditions (i.e. duplication of information element).

The SS then pages the MS using the PAGING REQUEST TYPE 1 message including the TMSI which was previously used in the LOCATION UPDATE ACCEPT message. The SS then verifies during 5 seconds that the MS does not answer to paging. The SS then pages the MS with its IMSI. The SS verifies that the MS responds on cell B by initiating the immediate assignment procedure using the CHANNEL REQUEST message.

### Maximum duration of test

20 s.

### Expected sequence

During 3 seconds the SS verifies that the MS does not send any message on the RACH.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS | | The RF level of cell A is lowered until the MS selects cell B. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | Mobile identity IE specifies the TMSI of the MS. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | (see below) |
| 6 | SS -> MS | CHANNEL RELEASE | |
| 7 | SS | | The SS waits at least 5 s to give the MS time to become pageable |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile identity 1 IE specifies the TMSI of the MS. Mobile identity 2 is omitted. |
| 9 | SS | | The SS waits at least 5 seconds During that period the SS verifies that the MS does not send any message on the RACH. |
| 10 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile identity 1 IE specifies the IMSI of the MS. Mobile identity 2 is omitted. |
| 11 | MS -> SS | CHANNEL REQUEST | Establishment cause = answer to paging. |
| 12 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific message contents

LOCATION UPDATING ACCEPT

| Information element | value/remark |
|---|---|
| location area identification | LAI of cell B |
| Mobile identity | coded TLV, specifies the IMSI of the MS |
| Type of identity | IMSI |
| Odd/even indication | corresponding to IMSI |
| Identity digit 1 etc. | corresponding to IMSI |
| Mobile identity (duplication) | coded TLV |
| Type of identity | TMSI of the MS |
| Odd/even indication | corresponding to TMSI |
| Identity digit 1 etc. | corresponding to TMSI |

## 26.5.5 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / non-semantical mandatory IE errors

### 26.5.5.1 Non-semantical mandatory IE errors / RR

#### 26.5.5.1.1 Non-semantical mandatory IE errors / RR / missing mandatory IE error

##### 26.5.5.1.1.1 Non-semantical mandatory IE errors / RR / missing mandatory IE error / special case

The MS shall accept a CHANNEL RELEASE message whether it contains an RR cause or not. This allows for the shortening of the message in the future.

###### 26.5.5.1.1.1.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed the MS shall proceed as follows: If the message is a CHANNEL RELEASE message, the actions taken shall be the same as specified for a normal RR-connection release.

References

GSM 04.08, section 8.5.

###### 26.5.5.1.1.1.2 Test purpose

To verify that the MS in RR connected mode releases the connection upon receipt of a CHANNEL RELEASE message with missing RR cause (which is "mandatory" in that message).

###### 26.5.5.1.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Test Procedure

A mobile terminating RR connection is established. Then the SS sends a CHANNEL RELEASE message in which the RR cause IE is missing. It is verified that the MS releases the main signalling link by sending a L2 DISC frame. The main signalling link release is then completed.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CHANNEL RELEASE | The mandatory RR cause IE is missing (the message consists only of protocol discriminator, skip indicator, and message type). |
| 6 | MS -> SS | | The main signalling link is released (this is observed by a L2 DISC frame sent from the MS to the SS). |

Specific message contents

None.

### 26.5.5.1.1.2 Non-semantical mandatory IE errors / RR / missing mandatory IE error / general case

In the general case, the MS has to report an RR message with missing mandatory IE by the use of an RR STATUS message, but otherwise to ignore it. This is a recovery mechanism for unforeseen states.

#### 26.5.5.1.1.2.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed the MS shall proceed as follows: If the message is not one of the messages listed in sections 8.5.1, 8.5.2, and 8.5.3 of GSM 04.08, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #96 "invalid mandatory information".

References

GSM 04.08, section 8.5.

#### 26.5.5.1.1.2.2 Test purpose

To verify that the MS in RR connected mode ignores a ciphering mode command message in which the ciphering mode setting IE and cipher response IE are missing except for the fact that it returns a RR STATUS message.

#### 26.5.5.1.1.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

##### Related PICS/PIXIT statements

None.

##### Foreseen Final State of the MS

The MS is in RR-connected mode.

##### Test Procedure

A mobile terminating RR connection is established. Then the SS sends a ciphering mode command message in which the ciphering mode setting IE and cipher response IE are messing. The SS verifies that the MS does not start ciphering and returns a RR STATUS message.

##### Maximum duration of test

10 s.

##### Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | The mandatory ciphering mode setting IE and cipher response IE are missing. |
| 6 | MS -> SS | RR STATUS | RR cause IE specifies RR cause value #96. |

##### Specific message contents

None.

### 26.5.5.1.2 Non-semantical mandatory IE errors / RR / comprehension required

#### 26.5.5.1.2.1 Conformance requirements

When an RR message containing an IE unknown in the message, but encoded as "comprehension required" (see subclause 10.5 / GSM 04.08) is received, the MS shall proceed as follows: When the message is not one of the messages listed in GSM 04.08 sections 8.5.1, 8.5.2, and 8.5.3, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a RR STATUS message with cause value #96 "invalid mandatory information".

##### References

GSM 04.08, section 8.5.

#### 26.5.5.1.2.2 Test purpose

To verify that the MS having an RR-connection established ignores a HANDOVER COMMAND message containing in the non-imperative part an IE encoded as comprehension required except for the fact that it returns a RR STATUS message with cause # 96 "invalid mandatory information".

#### 26.5.5.1.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has an MT call in state U10, "active"; or alternatively, the MS has been paged and an RR-connection has been established.

##### Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

##### Foreseen Final State of the MS

As in the initial conditions.

##### Test Procedure

The SS sends a HANDOVER command message containing in the non-imperative part an IE encoded as comprehension required. The SS verifies that the MS returns a RR STATUS message with cause value #96 without changing the dedicated channel.

##### Maximum duration of test

10 s.

##### Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | HANDOVER COMMAND | See below. |
| 2 | MS -> SS | RR STATUS | Sent on the old channel. RR cause IE specifies RR cause value #96. |

##### Specific message contents

HANDOVER COMMAND

| Information element | value/remark |
|---|---|
| cell description | as required |
| channel description | as required |
| handover reference | as required |
| power command | as required |
| comprehension required IEI | 0000 0000 |
| length | 0000 0001 |
| unrecognized IE contents | xxxx xxxx |

## 26.5.5.2 Non-semantical mandatory IE errors / MM

The MS shall ignore MM messages with syntactically incorrect mandatory IE. This allows to use reserved values in later phases.

### 26.5.5.2.1 Non-semantical mandatory IE errors / MM / syntactically incorrect mandatory IE

Test 26.5.5.2.1 is only applicable for an MS supporting at least one BC, whereas test 26.5.5.2.2 is applicable to all types of MS.

#### 26.5.5.2.1.1 Conformance requirements

When an MM message containing a syntactically incorrect mandatory IE is received, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a MM STATUS message with cause value #96 "invalid mandatory information".

##### References

GSM 04.08, section 8.5.

#### 26.5.5.2.1.2 Test purpose

To verify that an MS supporting at least one BC, having a CC entity in state U10, "active", ignores an MM message with syntactically incorrect IE except for the fact that it sends an MM STATUS message with reject cause #96. This is tested in the special case of an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity; that the MS otherwise ignores the message is checked by means of the status enquiry procedure.

#### 26.5.5.2.1.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in the CC-state U10, "active".

##### Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

##### Foreseen Final State of the MS

The MS has a mobile terminating call in the CC-state U10, "active".

##### Test Procedure

The SS sends an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity. The SS verifies that the MS returns an MM STATUS message specifying cause value #96 but does not change its state (this is verified by use of the status enquiry procedure).

##### Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | IDENTITY REQUEST | The identity type IE is encoded as "1111" (so that the type of identity contains the reserved value "111"). |
| 2 | MS -> SS | MM STATUS | Reject cause IE indicates reject cause value #96. |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10. |

Specific message contents

None.

### 26.5.5.2.2 Non-semantical mandatory IE errors / MM / syntactically incorrect mandatory IE

Test 26.5.5.2.1 is only applicable for an MS supporting at least one BC, whereas this test (26.5.5.2.2) is applicable to all types of MS.

#### 26.5.5.2.2.1 Conformance requirement(s)

When an MM message containing a syntactically incorrect mandatory IE is received, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns an MM STATUS message with cause value #96 "invalid mandatory information".

Reference(s)

GSM 04.08, section 8.5.

#### 26.5.5.2.2.2 Test purpose

To verify that an MS having been paged and having an RR connection established ignores an MM message with syntactically incorrect IE except for the fact that it sends an MM STATUS message with reject cause #96. This is tested in the special case of an IDENTITY REQUEST message in which the (mandatory) *identity type* IE specifies a reserved value for the type of identity; the fact that the MS otherwise ignores the message is checked by testing that it answers as usual to an incoming SETUP message.

#### 26.5.5.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has been paged; an RR connection has been established.

The MS has a valid TMSI.

Related PICS/PIXIT statements

At least one circuit switched basic service supported(p=Y/N).

Foreseen final state of the MS

The MS is in the MM-state "idle updated" listening to the BCCH/CCCH of the cell. It has a valid TMSI.

Test Procedure

The SS sends an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity. The SS verifies that the MS returns an MM STATUS message specifying cause value #96 but does not change its state; this is verified as follows:

The SS sends a SETUP message to the MS. This message specifies a BC that is supported by the MS, if there exists any; if the MS does not support any BC, the SETUP message specifies an arbitrary BC. The SS then verifies that the MS responds with a CALL CONFIRMED message if the SETUP had specified a BC supported by the MS, and that the MS responds with a RELEASE COMPLETE message otherwise.

Then the SS sends a CHANNEL RELEASE to the MS and waits for the disconnection of the main signalling link.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | IDENTITY REQUEST | The identity type IE is encoded as "1111" (so that the type of identity contains the reserved value "111"). |
| 2 | MS -> SS | MM STATUS | Reject cause IE indicates reject cause value #96. |
| 3 | SS -> MS | SETUP | If the MS supports at least one BC (p = Y), the SETUP specifies a bearer capability supported by the MS. Otherwise (p = N) the SETUP message specifies any bearer capability. |
| A4 | MS -> SS | CALL CONFIRMED | This message shall be sent by the MS if p = Y. |
| B4 | MS -> SS | RELEASE COMPLETE | This message shall be sent by the MS if p = N. |
| 5 | SS -> MS | CHANNEL RELEASE | The SS waits for disconnection of the main signalling link. |

Specific message contents

None.

### 26.5.5.2.3 Non-semantical mandatory IE errors / MM / comprehension required

The "comprehension required" mechanism allows for the introduction of essential new information elements into messages, such that a message is ignored and a report is sent if the new information element is not understood.

#### 26.5.5.2.3.1 Conformance requirements

When an MM message containing an IE unknown in the message, but encoded as "comprehension required" (see subclause 10.5 / GSM 04.08) is received, the MS shall ignore the message except for the fact that, if an RR-connection exists, it returns an MM STATUS message with cause value #96 "invalid mandatory information".

References

GSM 04.08, section 8.5.

#### 26.5.5.2.3.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message, but encoded as "comprehension required" ignores the message except for the fact that it returns an MM STATUS message with cause value #96 "invalid mandatory information"; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

26.5.5.2.3.3 Method of test

Initial conditions

System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

Test Procedure

The Rf level of cell A is lowered until the MS selects cell B. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element coded as "comprehension required". The SS verifies that the MS returns the MM STATUS message with cause #96 in response to the LOCATION UPDATING ACCEPT. The SS then waits for the MS to abort the RR-connection. The SS verifies that the MS establishes a new RR connection and starts a new location updating procedure.

On receipt of the new LOCATION UPDATING REQUEST, the SS sends a correctly coded LOCATION UPDATING ACCEPT allocating a new TMSI.

The SS verifies that the MS sends a TMSI REALLOCATION COMPLETE message. The SS then initiates the RR connection release.

Maximum duration of test

30 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS | | The RF level of cell A is lowered until the MS selects cell B. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | The mobile identity IE specifies the TMSI of the MS. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | See below. |
| 6 | MS -> SS | MM STATUS | Reject cause IE specifies reject cause value #96. |
| 7 | MS | | The MS aborts the RR connection (it initiates release of L2 on SAPI 0) using the L2 DISC / UA exchange. |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 10 | MS -> SS | LOCATION UPDATING REQUEST | The mobile identity IE specifies the IMSI of the MS. |
| 11 | SS -> MS | LOCATION UPDATING ACCEPT | see below |
| 12 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 13 | SS -> MS | CHANNEL RELEASE | The RR connection is released. |

Specific message contents

LOCATION UPDATING ACCEPT - first occurrence

| Information element | value/remark |
|---|---|
| Location area identification | LAI of cell B |
| Comprehension required IEI | 0000 0000 |
| length | 1 |
| unrecognized IE contents | xxxx xxxx (arbitrary octet) |

LOCATION UPDATING ACCEPT - second occurrence

| Information element | value/remark |
|---|---|
| Location area identification | specifies LAI of cell B |
| Mobile Identity | specifies a TMSI |

## 26.5.5.3 Non-semantical mandatory IE errors / CC

### 26.5.5.3.1 Non-semantical mandatory IE errors / CC / missing mandatory IE

#### 26.5.5.3.1.1 Non-semantical mandatory IE errors / CC / missing mandatory IE / disconnect message

##### 26.5.5.3.1.1.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed, the MS shall proceed as follows: If the message is a DISCONNECT message, a RELEASE message shall be returned with cause value # 96 "invalid mandatory information" and normal call clearing applies.

References

GSM 04.08, section 8.5.

##### 26.5.5.3.1.1.2 Test purpose

To verify that the MS having an MT call in state U10, "active", on receipt of a DISCONNECT message in which the mandatory cause IE is missing shall return a RELEASE message with cause value #96 "invalid mandatory information".

##### 26.5.5.3.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has an MT call in the CC-state U10, "active".

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS sends a DISCONNECT message in which the (mandatory) cause IE is missing. The SS verifies that the MS returns a RELEASE message specifying cause value #96. The SS then sends a RELEASE COMPLETE message and performs the RR connection release.

Maximum duration of test

15 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | DISCONNECT | The mandatory cause IE is missing. |
| 2 | MS -> SS | RELEASE | The cause IE indicates cause value #96 |
| 3 | SS -> MS | RELEASE COMPLETE | |
| 4 | SS -> MS | CHANNEL RELEASE | The RR connection is released. |

Specific message contents

None.

### 26.5.5.3.1.2 Non-semantical mandatory IE errors / CC / missing mandatory IE / general case

#### 26.5.5.3.1.2.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed, the MS shall proceed as follows: If the message is not a SETUP, RELEASE, DISCONNECT, RELEASE COMPLETE, HOLD REJECT or RETRIEVE REJECT message, it shall ignore the message except for the fact that it returns a STATUS message specifying cause value #96.

References

GSM 04.08, section 8.5.

#### 26.5.5.3.1.2.2 Test purpose

To verify that the MS having an MT call in state U10, "active", on receipt of a STATUS message in which the mandatory cause IE and call state IE are missing shall ignore the message except for the fact that it return a STATUS message with cause value #96 "invalid mandatory information" (that the MS does not change state is checked by use of the status enquiry procedure).

#### 26.5.5.3.1.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has an MT call in the CC-state U10, "active".

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS has an MT call in the CC-state U10, "active".

Test Procedure

The SS sends a STATUS message in which the mandatory cause IE and call state IE are missing. The SS verifies that the MS returns a STATUS message with cause value #96 "invalid mandatory information". Then the SS sends a STATUS ENQUIRY message and checks that the MS returns a STATUS message indicating cause value #30 and call state U10, "active".

Maximum duration of test

15 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | STATUS | The mandatory cause IE and call state IE are missing. |
| 2 | MS -> SS | STATUS | The cause IE indicates cause value #96 |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

Specific message contents

None.

### 26.5.5.3.2 Non-semantical mandatory IE errors / CC / comprehension required

This test is applicable to all MS which support at least one MO circuit switched basic service.

#### 26.5.5.3.2.1 Conformance requirements

When a CC message containing an IE unknown in the message, but encoded as "comprehension required" (see GSM 04.08, section 10.5) is received, the MS shall proceed as follows: When the message is not one of the messages listed in GSM 04.08 sections 8.5.1, 8.5.2, and 8.5.3, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a STATUS message with cause value #96 "invalid mandatory information".

References

GSM 04.08, sections 8.5 and 10.5.

#### 26.5.5.3.2.2 Test purpose

To verify that an MS supporting the call control protocol for at least one BC having a call control entity in state U3 ignores a CONNECT message containing in the non-imperative part an IE encoded as comprehension required except for the fact that it returns a STATUS message with cause value #96 "invalid mandatory information".

#### 26.5.5.3.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U3.

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

The MS supports MO calls.

Foreseen Final State of the MS

The MS has a call control entity in CC state U3.

Test Procedure

The SS sends a CONNECT message containing an optional information element coded as "comprehension required". The SS verifies that the MS returns a STATUS message specifying cause value #96 "invalid mandatory information". The SS checks by use of the status enquiry procedure that the MS did not change the state.

Maximum duration of test

5 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | CONNECT | See below. |
| 2 | MS -> SS | STATUS | TI refers to the call in progress; cause IE indicates cause value #96. |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the call in progress. |
| 4 | MS -> SS | STATUS | TI refers to the call in progress; Cause IE indicates cause value #30. Call state IE indicates state U3. |

Specific message contents

CONNECT

| Information element | value/remark |
|---|---|
| Unknown IEI | 0000 0000 |
| length | 1 |
| unknown IE contents | xxxx xxxx (arbitrary octet) |

## 26.5.6 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown IE, comprehension not required

### 26.5.6.1 Unknown information elements in the non-imperative message part / MM

#### 26.5.6.1.1 Unknown IE, comprehension not required / MM / IE unknown in the protocol

##### 26.5.6.1.1.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, sections 8.6.1, 8.6.2 and 10.5.

#### 26.5.6.1.1.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message and unknown in the MM protocol which is not encoded as "comprehension required" ignores that IE; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

#### 26.5.6.1.1.3 Method of test

##### Initial conditions

System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

##### Related PICS/PIXIT statements

None.

##### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

##### Test Procedure

The RF level of cell B is lowered until the MS selects cell A. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element not coded as "comprehension required" the IE of which is unknown in the MM protocol. The LOCATION UPDATING ACCEPT message contains a new TMSI in the mobile identity IE which is placed after the unknown IE. The MS shall send the TMSI REALLOCATION COMPLETE message.

##### Maximum duration of test

20 s.

##### Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS | | The RF level of cell B is lowered until the MS selects cell A. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | The mobile identity IE specifies the TMSI of the MS. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | See below. |
| 6 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 7 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |

Specific message contents

LOCATION UPDATING ACCEPT

| Information element | value/remark |
|---|---|
| Location area identification | LAI of cell A |
| Unknown IEI | 1010 xxx0 (where x is arbitrary) |
| Mobile Identity IEI | |
| length | 5 |
| Type of identity | TMSI |
| Identity | 4 octets of "new" TMSI |

### 26.5.6.1.2 Unknown IE, comprehension not required / MM / IE unknown in the message

#### 26.5.6.1.2.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, sections 8.6.1, 8.6.2 and 10.5.

#### 26.5.6.1.2.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message, but known in the MM protocol, which is not encoded as "comprehension required" ignores that IE; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

#### 26.5.6.1.2.3 Method of test

Initial conditions

System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

Test Procedure

The RF level of cell B is lowered until the MS selects cell A. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message but is used as the location area identification IEI in other messages of the MM protocol. The LOCATION UPDATING ACCEPT message contains a new TMSI in the mobile identity IE which is placed after the unknown IE. The MS shall send the TMSI REALLOCATION COMPLETE message.

Maximum duration of test

20 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS | | The RF level of cell B is lowered until the MS selects cell A. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | The mobile identity IE specifies the TMSI of the MS. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | See below. |
| 6 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 7 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |

Specific message contents

LOCATION UPDATING ACCEPT

| Information element | value/remark |
|---|---|
| Location area identification | LAI of cell A |
| Unknown IEI | 0001 0011 |
| length | 2 |
| unknown IE contents | xxxx xxxx xxxx xxxx (2 arbitrary octets) |
| Mobile Identity IEI | |
| length | 5 |
| Type of identity | TMSI |
| Identity | 4 octets of "new" TMSI |

## 26.5.6.2 Unknown information elements in the non-imperative message part / CC

### 26.5.6.2.1 Unknown information elements in the non-imperative message part / CC / Call establishment

This test is applicable to all MS which support at least one MO circuit switched basic service.

#### 26.5.6.2.1.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, section 8.6.1.

#### 26.5.6.2.1.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of the CC message being a CALL PROCEEDING message received by the MS in state U1.

#### 26.5.6.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U1.

Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

Foreseen Final State of the MS

The MS has a call control entity in CC state U3.

Test Procedure

The SS sends a CALL PROCEEDING message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a called party BCD number IE in other messages of the protocol. The SS verifies by use of the status enquiry procedure that the MS did not change the state.

Maximum duration of test

30 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | CALL PROCEEDING | See below. |
| 2 | SS -> MS | STATUS ENQUIRY | TI refers to the call in progress. |
| 3 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U3. |

Specific message contents

CALL PROCEEDING

| Information element | value/remark |
|---|---|
| Unknown IEI | 0101 1110 |
| length | 1 |
| unknown IE contents | xxxx xxxx (arbitrary octet) |

### 26.5.6.2.2 Unknown information elements in the non-imperative message part / CC / disconnect

#### 26.5.6.2.2.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, section 8.6.1.

#### 26.5.6.2.2.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a DISCONNECT message received by the MS in state U10.

#### 26.5.6.2.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U10.

##### Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

##### Foreseen Final State of the MS

The MS has a call control entity in CC state U19.

##### Test Procedure

The SS sends a DISCONNECT message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a connected number IE in other messages of the protocol. The SS verifies that the MS responds with a RELEASE message; the SS verifies by use of the status enquiry procedure that the MS has entered state U19.

##### Maximum duration of test

5 s.

##### Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | DISCONNECT | See below. |
| 2 | MS -> SS | RELEASE | |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | Cause IE indicates cause value #30. Call state IE indicates state U19. |

##### Specific message contents

DISCONNECT

| Information element | value/remark |
|---|---|
| Unknown IEI | 0100 1100 |
| length | 1 |
| unknown IE contents | xxxx xxxx (arbitrary octet) |

### 26.5.6.2.3 Unknown information elements in the non-imperative message part / CC / release

#### 26.5.6.2.3.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

##### References

GSM 04.08, section 8.6.1.

#### 26.5.6.2.3.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a RELEASE message received by the MS having sent in state U10 a DISCONNECT message.

#### 26.5.6.2.3.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U10.

##### Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

##### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

##### Test Procedure

The MS is made to send a DISCONNECT message. The SS responds with a RELEASE message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a high layer compatibility IE in other messages of the protocol. The SS verifies that the MS responds with a RELEASE COMPLETE message; the SS then releases the RR connection.

##### Maximum duration of test

10 s.

##### Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | MS | | The MS is made to initiate call clearing. |
| 2 | MS -> SS | DISCONNECT | |
| 3 | SS -> MS | RELEASE | See below. |
| 4 | MS -> SS | RELEASE COMPLETE | |
| 5 | SS -> MS | CHANNEL RELEASE | The RR connection is released. |

##### Specific message contents

RELEASE

| Information element | value/remark |
|---|---|
| Unknown IEI | 0111 1101 |
| length | 1 |
| unknown IE contents | 1 arbitrary octet |

### 26.5.6.2.4 Unknown information elements in the non-imperative message part / CC / release complete

#### 26.5.6.2.4.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, section 8.6.1.

#### 26.5.6.2.4.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a RELEASE COMPLETE message received by the MS in state U19.

#### 26.5.6.2.4.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U10.

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS sends a DISCONNECT message. The SS verifies that the MS responds with a RELEASE message. The SS answers with a RELEASE COMPLETE message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for an auxiliary states IE in other messages of the protocol. The SS verifies that the MS releases the link after some time.

Maximum duration of test

20 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | DISCONNECT | |
| 2 | MS -> SS | RELEASE | |
| 3 | SS -> MS | RELEASE COMPLETE | See below. |
| 4 | MS | | The MS aborts the RR connection (it initiates release of L2 on SAPI 0) |

Specific message contents

RELEASE COMPLETE

| Information element | value/remark |
|---|---|
| Unknown IEI<br>length<br>unknown IE contents | 0010 0100<br>1<br>1 arbitrary octet |

## 26.5.6.3 Unknown IE in the non-imperative message part, comprehension not required / RR

### 26.5.6.3.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

#### References

GSM 04.08, sections 8.6.1, 8.6.2 and 10.5.

### 26.5.6.3.2 Test purpose

To verify that the MS ignores an IE which is unknown in a message for Radio Resource Management in the special cases of CIPHERING MODE COMMAND, ASSIGNMENT COMMAND and CHANNEL RELEASE.

### 26.5.6.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in the RR-idle mode. It has a valid TMSI.

#### Related PICS/PIXIT statements

Supported frequency bands, GSM 450 or GSM 480 or GSM 700 or GSM 850 or PGSM or EGSM or DCS 1 800 or PCS 1900.

#### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in the RR-idle mode. It has a valid TMSI.

#### Test Procedure

In the normal call establishment the CIPHERING MODE COMMAND and ASSIGNMENT COMMAND contain additional IEs unknown in the message which are not encoded as "comprehension required", and therefore should be ignored by the MS. After sending an ASSIGNMENT COMPLETE, the subsequent CHANNEL RELEASE received by the MS also contains an IE unknown in a message which is not encoded as "comprehension required". The MS should ignore this IE.

#### Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | See specific message contents |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | |
| 7 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents |
| 8 | MS -> SS | ASSIGNMENT COMPLETE | On the dedicated channel |
| 9 | SS -> MS | CHANNEL RELEASE | See specific message contents |
| 10 | SS | | The SS checks the release of the main signalling link at layer 2 level. |

Specific message contents

None.

Step 5: CIPHERING MODE COMMAND

| | |
|---|---|
| Cipher mode setting | |
| - algorithm identifier | cipher with A5/1 |
| - SC | start ciphering |
| Cipher Response | IMEI shall not be included |
| Unknown IE (type 2) | 1001 0010 |

Step 7: ASSIGNMENT COMMAND

| | |
|---|---|
| Channel Description | |
| Channel Type | TCH/F + ACCHs |
| Timeslot number | arbitrarily selected, but not zero |
| Training sequence code | arbitrarily selected |
| Hopping | RF hopping channel |
| MAIO | 0 |
| HSN | 0 |
| Power Command | arbitrarily selected |
| First Unknown IE (Type 2) | 1101 1010 |
| Cell Channel Description | For GSM 450 mobiles, range 128 encodes ARFCNs 267 and 275. For GSM 480 mobiles, range 128 encodes ARFCNs 315 and 322. For GSM 700 mobiles, range 128 encodes ARFCNs 470 and 490. For GSM 850 mobiles, range 128 encodes ARFCNs 160 and 180. For PGSM and EGSM mobiles, bit map 0 encodes ARFCNs 30 and 50. For DCS 1 800 and PCS 1900 mobiles, the variable bit map format encodes ARFCNs 650 and 750. |
| Second Unknown IE (Type 4) | |
| - IEI | 0110 1001 |
| - length | 2 |
| - contents | xxxx xxxx xxxx xxxx, where x is arbitrarily coded. |
| Mobile Allocation | For GSM450 mobiles, indicates ARFCN 275 only. For GSM 480 mobiles, indicates ARFCN 322 only. For GSM700 mobiles, indicates ARFCN 490 only. For GSM 850 mobiles, indicates ARFCN 180 only. For PGSM and EGSM mobiles, indicates ARFCN 50, only. For DCS 1 800 and PCS 1900 mobiles, indicates ARFCN 750, only. |

Step 9: CHANNEL RELEASE

| | |
|---|---|
| RR Cause | normal event |
| Unknown IE (type 4) | |
| - IEI | 0110 0010 |
| - length | 5 |
| - contents | xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx, where x is arbitrarily coded. |

## 26.5.7 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / spare bits

### 26.5.7.1 Spare bits / RR

#### 26.5.7.1.1 Spare bits / RR / paging channel

##### 26.5.7.1.1.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

GSM 04.08, section 10.5.

##### 26.5.7.1.1.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case of the spare bits occurring in the P1 Rest Octets IE of a PAGING REQUEST TYPE 1 message. That the spare bits are ignored is checked by addressing the MS in that PAGING REQUEST message and verifying that the MS responds to that paging.

##### 26.5.7.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message containing at least one octet in the P1 rest octets IE that is different from 0010 1011.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | See below. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific message contents

PAGING REQUEST TYPE 1

| Information element | Value/remark |
|---|---|
| L2 pseudo length | k+3 where k is the sum of the length of the mobile identity 1 IE |
| Page Mode | Normal paging |
| Channels needed for Mobiles 1 and 2 | |
| Channel (first) | Any channel |
| Channel (second) | (spare) |
| Mobile identity 1 | IMSI or TMSI of MS under test |
| Mobile identity 2 | Omitted |
| P1 rest octets | not all octets are "0010 1011" |

### 26.5.7.1.2 Spare bits / RR / BCCH

#### 26.5.7.1.2.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

GSM 04.08, section 10.5.

#### 26.5.7.1.2.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case where these spare bits are contained in the SI3 and SI4 messages. That the MS ignores the value of the spare bits is checked by changing the LAI in those message and observing the MS initiating a location update though the spare bits do not all have the default value.

#### 26.5.7.1.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS simulates a BCCH where continuously for at least 30 seconds at least one octet of the SI3 Rest Octets IE in all SYSTEM INFORMATION TYPE 3 messages and at least one octet of the SI4 Rest Octets IE in all SYSTEM INFORMATION TYPE 4 messages is different from 0010 1011 and the location area identification IE denotes a location area different from the current location area held by the MS. The SS verifies that the MS sends a CHANNEL REQUEST message on the RACH including the establishment cause "location updating". The SS responds with an IMMEDIATE ASSIGNMENT REJECT message.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | | The SS starts sending modified SYSTEM INFORMATION TYPE 3 and SYSTEM INFORMATION TYPE 4 messages (as defined below) continuously for at least 30 seconds on the BCCH. |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause = "location updating (SDCCH needed). This message may be received during the 30 seconds. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific message contents

SYSTEM INFORMATION TYPE 3

| Information element | value/remark |
|---|---|
| L2 pseudo length | 18 |
| cell identity | as required |
| location area identification | denoting a new location area |
| control channel description | as required, but with the spare bits arbitrarily selected and at least one spare bit set to 1. |
| cell options | as required, but with (spare) bit 8 set to 1 |
| cell selection parameters | as required |
| RACH control parameters | as required |
| SI3 rest octets | at least one octet is different from "0010 1011" |

SYSTEM INFORMATION TYPE 4

| Information element | value/remark |
|---|---|
| L2 pseudo length | 12 |
| location area identification | denoting a new location area |
| cell selection parameters | as required |
| RACH control parameters | as required |
| SI4 rest octets | at least one octet is different from "0010 1011" |

### 26.5.7.1.3 Spare bits / RR / AGCH

#### 26.5.7.1.3.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

GSM 04.08, section 10.5.

#### 26.5.7.1.3.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case of the spare bits occurring in the Page Mode IE, the Spare Half Octet IE, the Channel Description IE, the Timing Advance IE, the IA Rest Octet IE, and in the IAR Rest Octet IE.

#### 26.5.7.1.3.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

##### Related PICS/PIXIT statements

None.

##### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

##### Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT message containing arbitrary spare bits in the Page Mode IE, in the Spare Half Octet IE, in the Channel Description IE, in the Timing Advance IE, and in the IA Rest Octet IE.

It is checked that the MS answers on the dedicated channel with a PAGING RESPONSE message and releases the main signalling link after a CHANNEL RELEASE message.

After a new paging of the MS an IMMEDIATE ASSIGNMENT REJECT is sent to test the spare bits in the IAR Rest Octet IE.

The MS is then paged again to check the idle state.

##### Maximum duration of test

20 s.

##### Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | see below |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CHANNEL RELEASE | |
| 6 | SS | | The SS checks that the MS releases the main signalling link and waits 10 seconds for a cell reselection of the MS |
| 7 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | normal, waiting time = 0, except the IAR Rest Octet IE (see below) |
| 10 | SS | | The SS waits six seconds |
| 11 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 12 | MS -> SS | CHANNEL REQUEST | To check that the MS has reached the idle state after the IMMEDIATE ASSIGNMENT REJECT |

Specific message contents

IMMEDIATE ASSIGNMENT

| Information element | Value/remark |
|---|---|
| L2 pseudo length | sum of the length of all IE except L2 pseudo length and IA Rest Octets |
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | Immediate Assignment |
| Page mode | xx00 (where "xx" is arbitrary, with at least 1 bit set to 1) |
| Dedicated mode or TBF | x000 (where "x" is set to 1) |
| Channel description | normal, no hopping, the two spare bits before ARFCN are chosen arbitrarily with at least one bit set to 1. |
| Request reference | normal (derived from the CHANNEL REQUEST) |
| Timing advance | xx00 0000 (where "xx" is arbitrary, with at least 1 bit set to 1) |
| Mobile allocation | chosen so that, together with the channel description |
| Length | 0 |
| IA rest octets | |
| first octet | 00xx xxxx (where "xx xxxx" is arbitrary but different to 10 1011) |
| other octets | xxxx xxxx (where "xxxx xxxx" is arbitrary but different to 0010 1011) |

IMMEDIATE ASSIGNMENT REJECT

| Information element | Value/remark |
|---|---|
| L2 pseudo length | 19 |
| Page mode | normal |
| Spare half octet | xxxx (where "xxxx" is arbitrary, with at least 1 bit is set to 1) |
| Request reference 1 | addressing the MS under test |
| Wait indication 1 | 0 seconds |
| ... | Other Request References and Wait Indications arbitrary |
| IAR rest octets | |
| Octet 1 to 3 | xxxx xxxx (where "xxxx xxxx" is arbitrary but different to 0010 1011) |

### 26.5.7.1.4 Spare bits / RR / Connected Mode

#### 26.5.7.1.4.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

GSM 04.08, section 10.5.

#### 26.5.7.1.4.2 Test purpose

To verify that the MS in the MM-state "MM-Connection active" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Cell Channel Description IE and in the Power Command IE.

26.5.7.1.4.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters, except:

GSM 450 mobiles are assigned to ARFCN 293 in step 10.

GSM 480 mobiles are assigned to ARFCN 340 in step 10.

GSM 700 mobiles are assigned to ARFCN 511 in step 10.

GSM 850 mobiles are assigned to ARFCN 251 in step 10.

PGSM and EGSM mobiles are assigned to ARFCN 124 in step 10.

DCS 1 800 and PCS 1900 mobiles are assigned to ARFCN 801 in step 10.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Related PICS/PIXIT statements

Mobile's frequency capabilities, GSM 450 or GSM 480 or GSM 700 or GSM 850 or PGSM or EGSM or DCS 1 800 or PCS 1900.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

In the procedure of a normal call establishment the ASSIGNMENT COMMAND will be modified to test the spare bits in the Cell Channel Description IE and in the Power Command IE.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | |
| 7 | SS -> MS | SETUP | |
| 8 | MS -> SS | CALL CONFIRMED | |
| A9 | MS -> SS | ALERTING | |
| B9 | MS ->SS | CONNECT | |
| 10 | SS -> MS | ASSIGNMENT COMMAND | see below |
| 11 | MS -> SS | ASSIGNMENT COMPLETE | on the dedicated channel |
| 12 | SS -> MS | CHANNEL RELEASE | |
| 13 | SS | | The SS checks that the MS release the main signalling link |

Specific message contents

ASSIGNMENT COMMAND

For GSM 450 mobiles

| Information element | Value/remark |
|---|---|
| Channel Description | normal, hopping HSN=63, MAIO=0 |
| Power Command | xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description | |
| octet 2 | 10xx 110? (where "xx" is arbitrary, with at least 1 bit set to 1) Bit 1 of octet 2 and all of octets 3 to 17 (inclusive) indicate ARFCN 293 only (using the Range 128 format). |
| Mobile Allocation | indicates ARFCN 293 only |

For GSM 480 mobiles

| Information element | Value/remark |
|---|---|
| Channel Description | normal, hopping HSN=63, MAIO=0 |
| Power Command | xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description | |
| octet 2 | 10xx 110? (where "xx" is arbitrary, with at least 1 bit set to 1) Bit 1 of octet 2 and all of octets 3 to 17 (inclusive) indicate ARFCN 340 only (using the Range 128 format). |
| Mobile Allocation | indicates ARFCN 340 only |

For GSM 700 mobiles

| Information element | Value/remark |
|---|---|
| Channel Description | normal, hopping HSN=63, MAIO=0 |
| Power Command | xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description | |
| Octet 2 | 10xx 110? (where "xx" is arbitrary, with at least 1 bit set to 1) Bit 1 of octet 2 and all of octets 3 to 17 (inclusive) indicate ARFCN 511 only (using the Range 128 format). |
| Mobile Allocation | indicates ARFCN 511 only |

For GSM 850 mobiles

| Information element | Value/remark |
|---|---|
| Channel Description | normal, hopping HSN=63, MAIO=0 |
| Power Command | xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description | |
| Octet 2 | 10xx 110? (where "xx" is arbitrary, with at least 1 bit set to 1) Bit 1 of octet 2 and all of octets 3 to 17 (inclusive) indicate ARFCN 251 only (using the Range 128 format). |
| Mobile Allocation | Indicates ARFCN 251 only |

For PGSM and EGSM mobiles

| Information element | Value/remark |
|---|---|
| Channel Description | normal, hopping HSN=63, MAIO=0 |
| Power Command | xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description | |
| octet 2 | 00xx 1000 (where "xx" is arbitrary, with at least 1 bit set to 1) |
| octet 3 to 17 (inclusive) | all bits set to zero |
| Mobile Allocation | indicates ARFCN 124 only |

For DCS 1 800 or PCS 1900 mobiles

| Information element | Value/remark |
|---|---|
| Channel Description | normal, hopping, HSN=63, MAIO=0 |
| Power Command | xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description | |
| octet 2 | 10xx 111? (where "xx" is arbitrary, with at least 1 bit set to 1). Bit 1 of octet 2 and all of octets 3 to 17 (inclusive) indicate ARFCN 801 only (using the variable bit map format). |
| Mobile Allocation | indicates ARFCN 801 only |

## 26.5.7.2 Spare bits / MM

### 26.5.7.2.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

GSM 04.08, section 10.5.

#### 26.5.7.2.2 Test purpose

To verify that the MS in the MM-state "wait net cmd" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Cipher Key Seq. Number IE or in the Identity Type IE.

#### 26.5.7.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

##### Related PICS/PIXIT statements

None.

##### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

##### Test Procedure

After the establishment of the RR-connection, in the AUTHENTICATION REQUEST message the spare bits of the Ciphering Key Sequence Number and of the Spare Half Octet IE will be randomly chosen. The spare bits of the Identity Type IE and the Spare Half Octet IE in the IDENTITY REQUEST message will also be chosen arbitrarily.

##### Maximum duration of test

10 s.

##### Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | AUTHENTICATION REQUEST | see below |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | |
| 7 | SS -> MS | IDENTITY REQUEST | see below |
| 8 | MS -> SS | IDENTITY RESPONSE | with the right TMSI |
| 9 | SS -> MS | CHANNEL RELEASE | |
| 10 | SS | | The SS checks that the MS release the main signalling link |

Specific message contents

AUTHENTICATION REQUEST

| Information element | Value/remark |
|---|---|
| Ciphering Key Sequence Number | x000 (where "x" is set to 1) |
| Spare Half Octet | xxxx (where "xxxx" is arbitrary, with at least 1 bit set to 1) |
| Auth. Parameter RAND | standard value |

IDENTITY REQ

| Information element | Value/remark |
|---|---|
| Identity Type | x100 (where "x" is set to 1) |
| Spare Half Octet | xxxx (where "xxxx" is arbitrary, with at least 1 bit set to 1) |

## 26.5.7.3 Spare bits / CC

This test is applicable to all MS supporting at least one MT circuit switched basic service.

### 26.5.7.3.1 Conformance requirements

The MS shall ignore the value of spare bits.

#### References

GSM 04.08, section 10.5.

### 26.5.7.3.2 Test purpose

To verify that the MS in the MM-state "connection established" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Calling Party BCD Number IE, Calling Party Subaddress IE, Called Party Subaddress IE, Cause IE and Progress Indicator IEs.

### 26.5.7.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

#### Related PICS/PIXIT statements

At least one circuit switched basic service supported.

MT calls supported.

#### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

After the establishment of the MM-connection, in the SETUP message the spare bits of the Calling Party BCD Number, Calling Party Subaddress and Called Party Subaddress will be arbitrarily chosen and also in the DISCONNECT message the spare bits of the Progress Indicator IE and of the Cause IE will be arbitrarily chosen.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | |
| 7 | SS -> MS | CIPHERING MODE COMMAND | |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | |
| 9 | SS -> MS | SETUP | see below |
| 10 | MS -> SS | CALL CONFIRMED | |
| A11 | MS -> SS | CONNECT | |
| B11 | MS -> SS | ALERTING | |
| B12 | MS -> SS | CONNECT | |
| 13 | SS -> MS | ASSIGNMENT COMMAND | |
| 14 | MS -> SS | ASSIGNMENT COMPLETE | |
| 15 | SS -> MS | CONNECT ACKNOWLEDGE | |
| 16 | SS -> MS | DISCONNECT | see below |
| 17 | SS -> MS | STATUS ENQUIRY | |
| 18 | MS -> SS | STATUS | with actual call state U12 |
| 19 | SS -> MS | RELEASE | |
| 20 | MS -> SS | RELEASE COMPLETE | |
| 21 | SS -> MS | CHANNEL RELEASE | |

Specific message contents

SETUP

| Information element | Value/remark |
|---|---|
| Calling Party BCD Number | |
| IEI | |
| length | 3 |
| octet 3 | 0000 0000 |
| octet 3a | 100x xx00 (where "x" is chosen arbitrarily, with at least one bit set to 1) |
| octet 4 | 0000 0001 |
| Calling Party Subaddress | |
| IEI | |
| length | 3 |
| octet 3 | 1000 0xxx (where "x" is chosen arbitrarily, with at least one bit set to 1) |
| octet 4 | 0101 0000 (AFI: request IA5 character) |
| octet 5 | 0000 0001 |
| Called Party Subaddress | |
| IEI | |
| length | 3 |
| octet 3 | 1000 0xxx (where "x" is chosen arbitrarily, with at least one bit set to 1) |
| octet 4 | 0101 0000 (AFI: request IA5 character) |
| octet 5 | 0000 0001 |

DISCONNECT

| Information element | Value/remark |
|---|---|
| Cause | |
| Length | 2 |
| octet 3 | 111x 0000 (where "x" is set to 1) |
| octet 4 | 1000 0001 |
| Progress Indicator | |
| IEI | |
| Length | 2 |
| octet 3 | 111x 0000 (where "x" is set to 1) |
| progress description | 8 (in band info now available) |

## 26.5.8 Default contents of messages

Default requirements for messages that are not mentioned in this section are given in section 26.8.4.

CHANNEL RELEASE

| Information element | Value/remark |
|---|---|
| RR cause | Normal event |

CHANNEL REQUEST

DISCONNECT (SS -> MS)

| Information element | Value/remark |
|---|---|
| Cause | |
| Coding standard | Standard defined for the GSM PLMNS |
| Location | user |
| Cause value | #16 |

IDENTITY REQUEST

| Information element | Value/remark |
|---|---|
| Identity type | Depending on test |
| Spare half octet | 0000 |

IMMEDIATE ASSIGNMENT

| Information element | Value/remark |
|---|---|
| L2 pseudo length | n, where n is the L2 pseudo length of the message |
| Page mode | arbitrary |
| Spare half octet | 0000 |
| Channel description | a valid description of an SDCCH + SACCH |
| Request reference | Corresponding to the last CHANNEL REQUEST received from the MS |
| Timing advance | arbitrary |
| Mobile allocation | chosen so that, together with the channel description IE, it describes a valid SDCCH + SACCH |
| Starting time | Omitted |
| IA rest octets | m octets, each coded as H'2B, where m = 22 - n |

IMMEDIATE ASSIGNMENT REJECT

| Information element | Value/remark |
|---|---|
| L2 pseudo length | 19 |
| Page mode | arbitrary |
| Spare half octet | 0000 |
| Request reference 1 | corresponding to the last CHANNEL REQUEST received from the MS |
| Wait indication 1 | 0 seconds |
| Request reference 2 | arbitrary |
| Wait indication 2 | 0 seconds |
| Request reference 3 | arbitrary |
| Wait indication 3 | 0 seconds |
| Request reference 4 | arbitrary |
| Wait indication 4 | 0 seconds |
| IA rest octets | 3 octets, each coded as H'2B |

PAGING REQUEST TYPE 1

| Information element | Value/remark |
|---|---|
| L2 pseudo length | n where n is the sum of the mobile identity 1 IE and 3 |
| Page Mode | Normal paging |
| Channels needed for Mobiles 1 and 2 | |
| Channel (first) | Any channel |
| Channel (second) | (spare) |
| Mobile identity 1 | IMSI or TMSI of MS under test |
| Mobile identity 2 | Omitted |
| P1 rest octets | m octets, each coded as H'2B, where m = 22 - n |

PAGING RESPONSE

RELEASE COMPLETE (MS -> SS)

No default requirements defined for this message.

RELEASE COMPLETE (SS -> MS)

| Information element | Value/remark |
|---|---|
| Cause | |
| Coding standard | Standard defined for the GSM PLMNS |
| Location | user |
| Cause value | #16 |

STATUS (MS -> SS)

| Information element | Value/remark |
|---|---|
| Cause | |
| Length | length of cause IE |
| Coding standard | Standard defined for the GSM PLMNS |
| Location | user |
| Cause value | as defined in test |
| Call state | as defined in test |

STATUS ENQUIRY (SS -> MS)

| Information element | Value/remark |
|---|---|
| Transaction identifier | relating to the active call |

# 26.6 Test of the elementary procedures for radio resource management

NOTE: For SS implementor: if tests are concatenated, it is important that unused fields in IMMEDIATE ASSIGNMENT REJECT messages do not use Request References that relate to CHANNEL REQUEST messages recently transmitted by the MS.

## 26.6.1 Immediate assignment

The immediate assignment procedure is used by the network to establish a dedicated control channel for the MS and network to communicate the detail of the service requested. If the Mobile Station does not implement the procedure correctly, radio resources can be wasted as the Mobile Station might use the wrong channels.

### 26.6.1.1 Immediate assignment / SDCCH or TCH assignment

#### 26.6.1.1.1 Conformance requirement

1. Following a PAGING REQUEST message, the MS shall correctly set up an RR connection on the SDCCH/8 described in the IMMEDIATE ASSIGNMENT message.
2. Following a PAGING REQUEST message, the MS shall correctly set up an RR connection on the TCH/FACCH described in the IMMEDIATE ASSIGNMENT message.

Reference(s)

GSM 04.08 section 3.3.1.1.2

#### 26.6.1.1.2 Test purpose

To verify that the MS can correctly set up a dedicated SDCCH control channel and that the MS can correctly set up a dedicated TCH/FACCH control channel.

#### 26.6.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, except that CCCH_CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statement(s)

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

Support rate(s) of TCH: TCH/F and/or TCH/H.

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST message the SS assigns an SDCCH. The MS shall go to the correct channel and send a PAGING RESPONSE message. Then the SS initiates RR-release by sending a CHANNEL RELEASE message.

If TCH/F is supported by the MS, the test is repeated with the SS assigning a TCH/F.

If TCH/H is supported by the MS, the test is repeated with the SS assigning a TCH/H.

#### Maximum Duration of Test

6 seconds per value of the execution timer.

#### Expected Sequence

This sequence is performed for execution counter, K = 1, 2, 3 (unless the TCH is not supported).

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Channel Type: see below |
| 4 | MS -> SS | PAGING RESPONSE | Shall be sent on the correct channel |
| 5 | SS -> MS | CHANNEL RELEASE | |

#### Specific Message Contents

IMMEDIATE ASSIGNMENT

K=1, SDCCH test: Channel Type = SDCCH/8

K=2, TCH/F test: Channel Type = Bm + ACCHs

K=3, TCH/H test: Channel Type = Lm + ACCHs, subchannel arbitrarily chosen

### 26.6.1.2 Immediate assignment / extended assignment

NOTE 2: In these tests the SS must send the immediate assignment messages in due time to allow for the MS to receive them and send a PAGING RESPONSE rather than another random access. This applies to the whole of section 26.

#### 26.6.1.2.1 Conformance requirements

1. The MS shall go to the allocated SDCCH/4 and send a PAGING RESPONSE message containing its identity and its classmark.

2. The MS shall go to the allocated SDCCH/8 and send a PAGING RESPONSE message containing its identity and its classmark.

3. The MS shall correctly identify its own assignment in either the Request Reference 1 or the Request Reference 2 information element in an extended assignment message.

4. The MS shall only react to an Immediate Assignment which references one of the last 3 CHANNEL REQUEST messages from the MS.

#### References

GSM 04.08 section 3.3.

#### 26.6.1.2.2 Test purpose

To verify that the MS goes to the allocated SDCCH/4 and sends a PAGING RESPONSE message containing its identity and its classmark.

To verify that the MS goes to the allocated SDCCH/8 and sends a PAGING RESPONSE message containing its identity and its classmark.

To verify that the MS can correctly identify its own assignment in either the Request Reference 1 or the Request Reference 2 information element in an extended assignment message.

To verify that the MS only reacts to an Immediate Assignment which references one of the last 3 CHANNEL REQUEST messages from the MS.

#### 26.6.1.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, Max-retrans is set to 7.

Mobile Station:

The MS is in the "idle, updated" state. with a TMSI allocated.

##### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

##### Foreseen Final State of the MS

"Idle, updated", with a TMSI allocated.

##### Test Procedure

In the first part of the test, the SS pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the n-th CHANNEL REQUEST message (n being arbitrarily chosen by the SS from the set {1, 2 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message, which references one of the last 3 CHANNEL REQUEST messages from the MS. The MS shall then go to the correct channel and send a PAGING RESPONSE message. The SS will then release the channel.

In the second part of the test, the SS again pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the k-th CHANNEL REQUEST message (k being arbitrarily chosen by the SS from the set {4, 5 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message which, instead of referencing one of the last 3 CHANNEL REQUEST messages from the MS, references an earlier CHANNEL REQUEST message. The MS shall then ignore the IMMEDIATE ASSIGNMENT EXTENDED message and continue to send CHANNEL REQUEST messages until the Max-Retrans value has been reached. Then a period of 7 seconds shall elapse in order to allow the MS to perform cell reselection (this allows for the time between the last CHANNEL REQUEST message and the beginning of cell reselection).

In the third part of the test, the CCCH_CONF of the SS is set to non-combined and the SS pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the r-th CHANNEL REQUEST message (r being arbitrarily chosen by the SS from the set {4, 5 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message which, in the second request reference, references one of the last 3 CHANNEL REQUEST messages from the MS. The associated Channel Description allocates SDCCH(S) (S being arbitrarily chosen by the SS from the set {0,1 ... 7}). The MS shall then go to the correct channel and send a PAGING RESPONSE message. The SS will then release the channel.

##### Maximum Duration of Test

90 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | n CHANNEL REQUESTs (n being arbitrarily chosen from {1.... 8} are sent, all with Establ. Cause = "Answer to paging". |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | see note 3. |
| 5 | MS -> SS | PAGING RESPONSE | |
| 6 | SS -> MS | CHANNEL RELEASE | |
| 7 | -------- | -------- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 9 | MS -> SS | CHANNEL REQUEST | k CHANNEL REQUESTs (k being arbitrarily chosen from the set {4, 5, 8}) are sent all with Establ. Cause = "Answer to paging". |
| 10 | MS -> SS | CHANNEL REQUEST | |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | see note 4. |
| 12 | MS -> SS | CHANNEL REQUEST | 8-k CHANNEL REQUESTs are sent, all with Establ. Cause = "Answer to paging". |
| 13 | MS -> SS | CHANNEL REQUEST | |
| 14 | SS | | The SS verifies that the MS does not transmit any Layer 2 frames for at least 3 seconds. |
| 15 | SS | | The SS sets CCCH_CONF to non-combined. |
| 16 | SS | | The SS waits 40 seconds to allow the MS to perform cell reselection and to read the BCCH information. |
| 17 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 18 | MS -> SS | CHANNEL REQUEST | r CHANNEL REQUESTs (r being arbitrarily chosenfrom {4, 5... 8} are sent, all with Establ. Cause = "Answer to paging". |
| 19 | MS -> SS | CHANNEL REQUEST | |
| 20 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | see note 5. |
| 21 | MS -> SS | PAGING RESPONSE | |
| 22 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

NOTE 3: The first Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {max (1,n-2) ... n}, its value being arbitrarily chosen by the SS. The second Request Reference shall be different from any Request Reference the MS has generated in this test.

NOTE 4: The first Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {1 ... k-3}, its value being arbitrarily chosen by the SS. The second Request Reference shall be different from any Request Reference the MS has generated in this test.

NOTE 5: The second Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {r-2, r-1, r}, its value being arbitrarily chosen by the SS. The first Request Reference shall be different from any Request Reference the MS has generated in this test.

## 26.6.1.3 Immediate assignment / assignment rejection

### 26.6.1.3.1 Conformance requirements

1. The MS shall respond to the Paging Request message by sending a Channel Request message with establishment cause set to "Answer to Paging". After the reception of IMMEDIATE ASSIGNMENT REJECT, the MS shall not transmit during the time indicated in the "Wait Indication" field of the IMMEDIATE ASSIGNMENT REJECT message, and then it shall answer to the new paging requests.

2. After an assignment rejection, the MS shall perform a cell reselection (idle mode operation) and the MS shall not transmit unless a different cell is selected.

References

GSM 04.08, section 3.3.1.1.3 and GSM 04.13 section 5.2.2.

### 26.6.1.3.2 Test purpose

To verify that the MS can accept an IMMEDIATE ASSIGNMENT REJECT.

To verify that the MS can respond to paging after an IMMEDIATE ASSIGNMENT REJECT is received on a different cell.

### 26.6.1.3.3 Method of test

Initial Conditions

System Simulator:

2 cells with the same LAI, Max-Retrans is 7.

Mobile Station:

The MS is camped on cell A and is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

Foreseen Final State of the MS

The MS is camped on cell B and is in the "idle, updated" state, with a TMSI allocated.

Test Procedure

The SS pages the MS, which shall react by sending CHANNEL REQUESTs. Immediately after reception of the n-th CHANNEL REQUEST (n being an integer from the set {1, 2 ... 8}, arbitrarily chosen by the SS) the SS sends an IMMEDIATE ASSIGNMENT REJECT message, which references one of the last 3 CHANNEL REQUESTs from the MS, and with the Wait Indication set to x seconds (x being an integer from the set {5, 6 ... 255}, arbitrarily chosen by the SS). The SS continues to send paging messages for that mobile station in every block of the mobile station's paging subgroup for x+2 seconds. The MS shall not answer to the PAGING REQUEST TYPE 1 messages sent before x seconds have elapsed. The MS may respond to any one of the PAGING REQUEST TYPE 1 messages sent after x seconds have elapsed, but at the latest it shall respond to the first PAGING REQUEST TYPE 1 sent after x+1 seconds have elapsed.

The SS responds to this CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message with the Wait Indication set to 255 seconds.

Immediately afterwards the SS changes the power levels so the MS selects cell B. After 20 seconds have elapsed the SS pages the MS in cell B and the MS shall answer to this page. In order to avoid another cell reselection the SS then sends another IMMEDIATE ASSIGNMENT REJECT.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | n CHANNEL REQUESTs (n being arbitrarily chosen from the set {1, 2 |
| . | . | . | |
| . | . | . | ... 8}) are sent, all with |
| 1+n | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging" |
| 2+n | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | 1st, 3rd and 4th Request References are different to all n Request References received from the MS under test. 2nd Request Reference: see note 6. 2nd Wait Indication = x seconds (x being arbitrarily chosen from the set {5 ,6 ... 255}. |
| 3+n | SS -> MS | PAGING REQUEST TYPE 1 | The SS repeatedly pages the MS (on its paging subchannel) until a CHANNEL REQUEST message is received from the MS. |
| . | . | . | |
| . | . | . | |
| k | SS -> MS | PAGING REQUEST TYPE 1 | (note 7). |
| k+1 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". The MS may respond to any one of the PAGING REQUEST TYPE 1 messages sent after x seconds expire, but at the latest the MS shall respond to the first PAGING REQUEST TYPE 1 message sent after x+1 seconds expire. |
| k+2 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | 1st, 2nd and 4th Request References are different to all n Request References received from the MS. The 3rd Request Reference pertains to the last CHANNEL REQUEST sent by the MS. The 3rd Wait Indication is 255 seconds. |
| k+3 | -------- | ---------- | Raise power level of cell B, lower power level of cell A until the MS selects cell B. |
| k+4 | SS -> MS | PAGING REQUEST TYPE 1 | Sent once, 20 seconds after the change of levels. |
| k+5 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| k+6 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

NOTE 6: The Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer from the set {max(1,n-2) ... n}, its value being arbitrarily chosen by the SS.

NOTE 7: the value of k is not important in this test.

Specific Message Contents

None.

## 26.6.1.4 Immediate assignment / ignore assignment

### 26.6.1.4.1 Conformance requirements

1. An MS waiting for a response from the network, following the sending of a CHANNEL REQUEST, shall ignore an IMMEDIATE ASSIGNMENT message with a request reference containing a wrong frame number.

2. An MS is waiting for an assignment of its own, shall ignore an IMMEDIATE ASSIGNMENT message with a request reference containing a wrong random access information.

References

GSM 04.08 section 3.3.1.1.2

### 26.6.1.4.2 Test purpose

To verify that the MS ignores an assignment for another MS while it is waiting for an assignment of its own.

26.6.1.4.3 Method of test

Initial Conditions

System Simulator:

1 cell.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS pages the MS, which reacts with CHANNEL REQUESTs. The SS responds to the first CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT containing a wrong Request Reference (in the first run of the test the frame number is wrong, in the repetition it is the random access info that is wrong). It is verified for 2 seconds that the MS does not start signalling on the SDCCH. The MS shall ignore the assignment and send another CHANNEL REQUEST message. In order to avoid cell reselection the SS now answers with a correct IMMEDIATE ASSIGNMENT REJECT and repeats the test once.

Maximum Duration of Test

12 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Frame number in Request Reference is 2 too high. The MS shall not start signalling on the assigned SDCCH. This is verified for a period of 2 seconds. |
| 4 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 6 | SS | | SS waits for 6 seconds. |
| 7 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 8 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | Random access info in Request Reference is wrong. The MS shall not start signalling on the assigned SDCCH. This is verified for a period of 2 seconds. |
| 10 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

None.

## 26.6.1.5 Immediate assignment after immediate assignment reject

### 26.6.1.5.1 Conformance requirement

Following an IMMEDIATE ASSIGNMENT REJECT message, the MS shall listen for IMMEDIATE ASSIGNMENTS until T3126 expires.

#### Reference

GSM 04.08 section 3.3.1.1.3

### 26.6.1.5.2 Test purpose

To verify that the MS correctly responds to an IMMEDIATE ASSIGNMENT message sent after an IMMEDIATE ASSIGNMENT REJECT message.

### 26.6.1.5.3 Method of test

#### Initial conditions

System Simulator:

1 cell;

CCCH_CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs";

Max retrans is set to 7;

TX-integer is set to 7;

Mobile Station:

The MS is in "idle, updated" state, with a TMSI allocated.

#### Related PICS/PIXIT statement(s)

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

#### Foreseen final state of the MS

"idle, updated", with TMSI allocated.

#### Test Procedure

The SS pages the MS, which shall react by sending CHANNEL REQUESTs. Immediately after reception of the third CHANNEL REQUEST the SS sends an IMMEDIATE ASSIGNMENT REJECT message which references the first CHANNEL REQUEST from the MS and has the Wait Indication IE set to 6 seconds.

Between 0,75 seconds and 1,25 seconds after sending the IMMEDIATE ASSIGNMENT REJECT message the SS sends an IMMEDIATE ASSIGNMENT message referencing the second CHANNEL REQUEST message, and assigning an SDCCH. The MS shall go to the correct channel and send a PAGING RESPONSE message. Then the SS initiates RR-release by sending a CHANNEL RELEASE message.

#### Maximum duration of test

10 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | first request. |
| 3 | MS -> SS | CHANNEL REQUEST | second request. |
| 4 | MS -> SS | CHANNEL REQUEST | third request. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJ | references the first request from MS, Wait Indication IE set to 6 seconds. |
| 6 | SS -> MS | IMMEDIATE ASSIGNMENT | references the second request from the MS Channel type set to SDCCH/8 message sent between 0,75 s and 1,25 s after the completion of step 5. |
| 7 | MS -> SS | PAGING RESPONSE | shall be sent on the correct channel. |
| 8 | SS -> MS | CHANNEL RELEASE | |

Specific message contents

None.

## 26.6.2 Test of paging

The Paging procedure is used by the network to cause the Mobile Station to establish a radio connection. Normally the Mobile Station listens to its paging subchannel, but this can be modified by the use of different page modes. The correct implementation of the paging procedure in the Mobile Station is essential for the basic establishment of a connection.

### 26.6.2.1 Normal paging

#### 26.6.2.1.1 Paging / normal / type 1

##### 26.6.2.1.1.1 Conformance requirements

1. The MS shall respond correctly to various PAGING REQUEST TYPE 1 messages, when the page mode is set to normal paging, in the following cases:

   1.1 The MS is addressed with its IMSI in the first Mobile Identity field. The optional Mobile Identity field is not present.

   1.2. The MS is addressed with its TMSI in the first Mobile Identity field. The optional Mobile Identity field specifies an IMSI different from that of the MS.

   1.3. The first Mobile Identity field specifies a TMSI different from that of the MS. The optional Mobile Identity field addresses the MS by its IMSI.

   1.4 The first Mobile Identity field specifies a TMSI different from that of the MS. The optional Mobile Identity field contains the correct TMSI of the MS.

2. An MS shall ignore PAGING REQUEST TYPE 1 messages with incorrect information, when the page mode is set to normal paging, in the following case:

   2.1 The MS is addressed with its TMSI in the first Mobile Identity field, but the type of identity in this field is set to "No Identity". The optional Mobile Identity field is not present.

References

GSM 04.08 section 3.3.2, GSM 05.02 section 6.5.

#### 26.6.2.1.1.2 Test purpose

To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 1 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested. It is tested that the MS responds with the same type of identity that is used in the PAGING REQUEST TYPE 1 message. It is tested that the MS ignores fill paging.

#### 26.6.2.1.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKS_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

##### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The SS pages the MS 5 times with different PAGING REQUEST TYPE 1 messages on the paging subchannel which corresponds to the MS's IMSI.

In the first 4 cases, where the MS is addressed by its IMSI or its TMSI, the MS shall answer to the paging by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST by assigning a channel, and the MS shall then send a correct PAGING RESPONSE. The SS then releases the channel.

In the last case, it is tested that the MS does not answer to paging that does not address it.

##### Maximum Duration of Test

2 min.

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains IMSI of MS, 2nd Mobile Ident not present. |
| 2 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 3 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 3. |
| 5 | MS -> SS | PAGING RESPONSE | Mobile Ident: IMSI. |
| 6 | SS -> MS | CHANNEL RELEASE | |
| | -------- | -------- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 7 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains TMSI of MS, 2nd Mobile Ident contains IMSI of another MS. |
| 8 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 9 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 9. |
| 11 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 12 | SS -> MS | CHANNEL RELEASE | |
| | -------- | -------- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 13 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains TMSI of another MS, 2nd Mobile Ident contains IMSI of MS. |
| 14 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 15 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 16 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 15. |
| 17 | MS -> SS | PAGING RESPONSE | Mobile Ident: IMSI. |
| 18 | SS -> MS | CHANNEL RELEASE | |
| | -------- | -------- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 19 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains TMSI of another MS, 2nd Mobile Ident contains TMSI of MS. |
| 20 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 21 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |

### 26.6.2.1.2 Paging / normal / type 2

#### 26.6.2.1.2.1 Conformance requirements

1. The MS shall respond correctly (by sending CHANNEL REQUEST messages with an Establishment Cause set to "Answer to Paging") to various PAGING REQUEST TYPE 2 messages, when the page mode is set to normal paging, in the following cases:

   1.1 The MS is addressed in the first TMSI field.

   1.2 The MS is addressed in the second TMSI field.

   1.3 The MS is addressed in the optional Mobile Identity field with its TMSI.

   1.4 The MS is addressed in the optional Mobile Identity field with its IMSI.

2. The MS shall ignore PAGING REQUEST TYPE 2 messages with incorrect information, when the page mode is set to normal paging, in the following case:

   2.1 The MS is addressed in the optional Mobile Identity field with its TMSI, but the type of identity in this field is set to "No Identity".

##### References

GSM 04.08 section 3.3.2.

#### 26.6.2.1.2.2 Test purpose

To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 2 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested. It is tested that the MS responds with the same type of identity that is used in the PAGING REQUEST TYPE 2 message. It is tested that the MS ignores a PAGING REQUEST TYPE 2 message that does not address it.

#### 26.6.2.1.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKS_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

##### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The SS pages the MS 5 times with different PAGING REQUEST TYPE 2 messages on the paging subchannel which corresponds to the MS's IMSI.

In the first 4 cases, where the MS is addressed by its IMSI or by its TMSI, the MS shall answer to the paging by sending CHANNEL REQUESTs. The SS responds to the second request by assigning a channel, and the MS shall then send a correct PAGING RESPONSE. The SS then releases the channel.

In the last case, it is tested that the MS does not answer to paging that does not address it.

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

### Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 2 | 1st TMSI addresses MS, 2nd TMSI addresses another MS, Mobile Identity IE not present. |
| 2 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 3 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 3. |
| 5 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 6 | SS -> MS | CHANNEL RELEASE | |
| | -------- | -------- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 7 | SS -> MS | PAGING REQUEST TYPE 2 | 1st TMSI addresses another MS, 2nd TMSI addresses MS, Mobile Identity IE not present. |
| 8 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 9 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 9. |
| 11 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 12 | SS -> MS | CHANNEL RELEASE | |
| | -------- | -------- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 13 | SS -> MS | PAGING REQUEST TYPE 2 | 1st TMSI addresses another MS, 2nd TMSI addresses another MS, Mobile Identity IE contains TMSI of MS. |
| 14 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 15 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging" |
| 16 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 15 |
| 17 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 18 | SS -> MS | CHANNEL RELEASE | |
| | -------- | -------- | The SS waits 12 seconds to allow the MS to perform cell reselection |
| 19 | SS -> MS | PAGING REQUEST TYPE 2 | 1st TMSI addresses another MS, 2nd TMSI addresses another MS, Mobile Identity IE contains IMSI of MS. |
| 20 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging" |
| 21 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging" |
| 22 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 21 |
| 23 | MS -> SS | PAGING RESPONSE | Mobile Ident: IMSI. |
| 24 | SS -> MS | CHANNEL RELEASE | |
| | -------- | -------- | The SS waits 12 seconds to allow the MS to perform cell reselection |
| 25 | SS -> MS | PAGING REQUEST TYPE 2 | 1st TMSI addresses another MS, 2nd TMSI addresses another MS, Mobile Identity IE contains TMSI of MS but with type of identity set to "no identity". |
| 26 | -------- | -------- | During 1 second, the SS checks that the MS does not produce any Layer 3 messages. |

### Specific Message Contents

None.

### 26.6.2.1.3 Paging / normal / type 3

#### 26.6.2.1.3.1 Conformance requirements

An MS shall respond correctly to various PAGING REQUEST TYPE 3 messages, when the page mode is set to normal paging. The MS shall send CHANNEL REQUEST messages, with an Establishment Cause set to "Answer to Paging", until the network answers. The number of CHANNEL REQUEST messages shall be limited by the parameter Max-retrans. After the assignment procedure, the MS shall send a PAGING RESPONSE message on the channel assigned by the network.

##### References

GSM 04.08 section 3.3.2.

#### 26.6.2.1.3.2 Test purpose

To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 3 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested.

#### 26.6.2.1.3.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKS_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

##### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The SS pages the MS 4 times with different PAGING REQUEST TYPE 3 messages on the paging subchannel which corresponds to the MS's IMSI.

In all the cases the MS shall answer to the paging by sending CHANNEL REQUESTs. The SS responds to the second request by assigning a channel, and the MS shall then send a correct PAGING RESPONSE. The SS then releases the channel.

##### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 3 | 1st TMSI addresses MS; 2nd, 3rd and 4th TMSIs address other MSs. |
| 2 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 3 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 3. |
| 5 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 6 | SS -> MS | CHANNEL RELEASE | |
| | -------- | -------- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 7 | SS -> MS | PAGING REQUEST TYPE 3 | 2nd TMSI addresses MS; 1st, 3rd and 4th TMSIs address other MSs. |
| 8 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 9 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 9. |
| 11 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 12 | SS -> MS | CHANNEL RELEASE | |
| | -------- | -------- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 13 | SS -> MS | PAGING REQUEST TYPE 3 | 3rd TMSI addresses MS; 1st, 2nd and 4th TMSIs address other MSs. |
| 14 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 15 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |

## 26.6.2.2 Paging / extended

### 26.6.2.2.1 Conformance requirements

1. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 1 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.

2. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 2 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.

3. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 3 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.

4. The MS shall operate in the extended page mode when this is ordered by the network in an IMMEDIATE ASSIGNMENT message on the paging subchannel which corresponds to the MS's identity.

5. The MS shall operate in the extended page mode when this is ordered by the network in an IMMEDIATE ASSIGNMENT EXTENDED message on the paging subchannel which corresponds to the MS's identity.

References

GSM 04.08 section 3.3.2.1; GSM 05.02, section 6.5.

#### 26.6.2.2.2 Test purpose

To test that the MS is operating in the extended page mode when this is ordered by the SS in either a PAGING REQUEST message or an IMMEDIATE ASSIGNMENT message.

#### 26.6.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKS_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond to the last page by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends an IMMEDIATE ASSIGNMENT on the paging subchannel which corresponds to the MS's identity. The random reference is different to those used by the Mobile Station in the last two CHANNEL REQUEST messages. (Phase 2 requires a Mobile Station to react on an IMMEDIATE ASSIGNMENT after a rejection.) The page mode is again set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 2 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond with CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends an IMMEDIATE ASSIGNMENT EXTENDED on the paging subchannel which corresponds to the MS's identity. The random references are different to those used by the Mobile Station in the last three CHANNEL REQUEST messages. The page mode is again set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 3 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond with CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends a PAGING REQUEST TYPE 3 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 2 message specifying an arbitrarily chosen page mode and addressing the MS by its IMSI. The MS shall respond to the last page by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends a PAGING REQUEST TYPE 2 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying an arbitrarily chosen page mode and addressing the MS by its IMSI. The MS shall respond to the last page by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

Maximum Duration of Test

10 sec.

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile Ident: IMSI of another MS, page mode = "extended paging". |
| 2 | SS -> MS | PAGING REQUEST TYPE 1 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen Mobile Ident: TMSI of the MS. |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 5 seconds. page mode = normal. |
| 6 | SS | | SS waits for 5 seconds. |
| | SS -> MS | IMMEDIATE ASSIGNMENT | Sent in the paging subblock of MS under test. Page mode = "extended paging", Request reference chosen arbitrarily by the SS, but different from all references used earlier in this test sequence. |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: TMSI of the MS. |
| 9 | MS -> SS | CHANNEL REQUEST | |
| 10 | MS -> SS | CHANNEL REQUEST | |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 5 seconds. page mode = normal. |
| 12 | SS | -- | SS waits for 5 seconds. |
| 13 | SS -> MS | IMMEDIATE ASSIGNMENT EXT | Sent in the paging subblock of MS under test. Page mode = "extended paging", Request references chosen arbitrarily by the SS, but different from all references used earlier in this test sequence. |
| 14 | SS -> MS | PAGING REQUEST TYPE 3 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: TMSI of the MS. |
| 15 | MS -> SS | CHANNEL REQUEST | |
| 16 | MS -> SS | CHANNEL REQUEST | |
| 17 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 5 seconds page mode = normal. |
| 18 | SS | -- | SS waits for 5 seconds. |
| 19 | SS -> MS | PAGING REQUEST TYPE 3 | Sent in the paging subblock of MS under test. Page mode = "extended paging". |
| 20 | SS -> MS | PAGING REQUEST TYPE 2 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: IMSI of the MS. |
| 21 | MS -> SS | CHANNEL REQUEST | |
| 22 | MS -> SS | CHANNEL REQUEST | |
| 23 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 5 seconds page mode = normal. |
| 24 | SS | -- | SS waits for 5 seconds |
| 25 | SS -> MS | PAGING REQUEST TYPE 2 | Sent in the paging subblock of MS under test. Page mode = "extended paging". |
| 26 | SS -> MS | PAGING REQUEST TYPE 1 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: IMSI of the MS. |
| 27 | MS -> SS | CHANNEL REQUEST | |
| 28 | MS -> SS | CHANNEL REQUEST | |
| 29 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 5 seconds. |

Specific Message Contents

## 26.6.2.3 Paging / reorganization

### 26.6.2.3.1 Paging / reorganization / procedure 1

#### 26.6.2.3.1.1 Conformance requirements

1. An MS, after reception of a message with page mode set to "paging reorganization", shall answer to paging messages (with page mode set to "normal paging") sent on its old CCCH in paging blocks which do not belong to the MS's paging sub-channel.

2. When the network changes the paging group of the MS by modifying BCCH parameters (to CCCH_CONF set to "1 basic physical channel used for CCCH combined with SDCCH", and BS_AG_BLKS_RES set to "2 blocks reserved for access grant"), the MS shall calculate its new paging group and answer to paging messages on its new paging subchannel.

3. When the network changes the paging group of the MS by modifying BCCH parameters (to CCCH_CONF set to "2 basic physical channels used for CCCH, not combined with SDCCHs" and BS_AG_BLKS_RES set to "2 blocks reserved for access grant"), the MS shall calculate its new paging group and answer to paging messages on its new paging subchannel.

References

GSM 04.08 section 3.3.2.1; GSM 05.02, section 6.5.

#### 26.6.2.3.1.2 Test purpose

To test that the MS correctly determines its new paging subchannel when the CCCH structure is changed from non-combined to combined and when the number of CCCHs is changed.

#### 26.6.2.3.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, CCCH_CONF set to "1 basic physical channel used for CCCH, not combined with SDCCHs", a legal combination of BS_AG_BLKS_RES and BS_PA_MFRMS is chosen arbitrarily by the SS, with the exception that BS_PA_MFRMS shall not be set to 9.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated. The IMSI of the MS is from a defined/default range that ensures its paging channel changes when the broadcast parameters are changed.

Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

### Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT EXTENDED message on the MS's paging subchannel, with the page mode element set to "paging reorganization" and Request References that do not pertain to the MS. Before the MS's original paging subchannel re-occurs, the SS pages it on the CCCH corresponding to the Mobile Station's IMSI with a PAGING REQUEST TYPE 2 message (page mode = normal paging) containing the MS's TMSI in some paging block which does not belong to the Mobile Station's paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection) on an arbitrarily selected paging subchannel.

Then the SS starts sending messages (PAGING REQUEST TYPE 1 or PAGING REQUEST TYPE 2 or PAGING REQUEST TYPE 3 or IMMEDIATE ASSIGNMENT or IMMEDIATE ASSIGNMENT EXTENDED or IMMEDIATE ASSIGNMENT REJECT) with page mode set to "paging reorganization" on all paging subchannels.

After 5 seconds (to ensure T3126 expires) the SS pages the MS with its TMSI on an arbitrarily selected paging subchannel (on the CCCH corresponding to the Mobile Station's IMSI). The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

The SS changes the paging parameters.

Then the SS sets the page mode to "normal paging".

The SS then waits for the duration of five 51-TDMA multiframes (4 to allow the MS to read all the system information type 1, 2, 3, and 4 messages on the BCCH, and one to calculate the new paging group). Not before 5 seconds after the last IMMEDIATE ASSIGNMENT REJECT message addressing the MS (to ensure T3126 expires), the MS is paged with a PAGING REQUEST TYPE 1 on its new paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection) and then waits 5 seconds (to ensure T3126 expires).

Then the MS is paged with a PAGING REQUEST TYPE 2 on its new paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

### Maximum Duration of Test

60 sec.

Expected Sequence

This sequence is performed for execution counter, K =1, 2.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | Sent on the MS's paging channel. Page mode set to "paging reorganization". Request Reference not pertaining to the MS. |
| 2 | SS -> MS | PAGING REQUEST TYPE 2 | Sent before the MS's original paging subchannel re-occurs, but later than the next paging block of that CCCH. |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 0 seconds. |
| 6 | -------- | -------- | All L3 messages sent on any paging subchannel are paging fill frames specify "paging re organization. |
| 7 | SS -> MS | PAGING REQUEST TYPE 2 | Sent on an arbitrarily selected paging subchannel Page mode "paging reorganization" Not sent before 5 seconds after step 5. |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | MS -> SS | CHANNEL REQUEST | |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 0 seconds. |
| 11 | | | Change of paging parameters in SYS INFO 3 as described below for K=1, 2. |
| 12 | | | The SS waits until it has sent all system information messages (page mode is still paging reorganization). |
| 13 | -------- | -------- | All L3 messages sent on any paging subchannel specify "normal paging. |
| 14 | -------- | -------- | Wait 3 seconds. |
| 15 | SS -> MS | PAGING REQUEST TYPE 1 | Sent on the new paging subchannel of the MS. Not sent before 5 seconds after step 10. |
| 16 | MS -> SS | CHANNEL REQUEST | |
| 17 | MS -> SS | CHANNEL REQUEST | |
| 18 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 0 seconds. |
| 19 | SS -> MS | PAGING REQUEST TYPE 2 | Sent on the new paging subchannel of the MS. Not sent before 5 seconds after step 18. |
| 20 | MS -> SS | CHANNEL REQUEST | |
| 21 | MS -> SS | CHANNEL REQUEST | |
| 22 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

For execution counter K:

K=1:

SYSTEM INFORMATION TYPE 3 shall have the Control Channel Description IE changed to:

CCCH_CONF "1 basic physical channel used for CCCH, combined with SDCCHs"

BS_AG_BLKS_RES 2

BS_PA_MFRMS 9

K=2:

SYSTEM INFORMATION TYPE 3 shall have the Control Channel Description IE changed to:

CCCH_CONF "2 basic physical channel used for CCCH, not combined with SDCCHs"

BS_AG_BLKS_RES 2

BS_PA_MFRMS 9

### 26.6.2.3.2 Paging / reorganization / procedure 2

#### 26.6.2.3.2.1 Conformance requirement

An MS, after reception of a message with page mode set to "paging reorganization", shall answer to paging messages (with page mode set to "normal paging") sent in a former Access Grant block.

References

GSM 04.08 section 3.3.2.1.

#### 26.6.2.3.2.2 Test purpose

To test that the MS is operating in the "paging reorganization" page mode when this is ordered by the SS and the MS is paged in its former access grant channel.

#### 26.6.2.3.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 1, with the constraint that BS_AG_BLKS_RES > 0, a legal combination of CCCH_CONF, BS_AG_BLKS_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated. The IMSI of the MS is from a defined\default range that ensures its paging channel changes when the broadcast parameters are changed.

Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT EXTENDED on the MS's paging subchannel, with the page mode element set to "paging reorganization". The MS is then paged immediately in a former Access Grant block with a PAGING REQUEST TYPE 2 message. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

Maximum Duration of Test

5 sec.

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | Page mode set to "paging reorganization" |
| 2 | SS -> MS | PAGING REQUEST TYPE 2 | Sent in a former access grant block. |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

None.

## 26.6.2.4 Paging / same as before

### 26.6.2.4.1 Conformance requirements

An MS, after first receiving a message on its paging subchannel with page mode set to "extended paging" and then the next message on its paging subchannel with page mode set to "same as before", shall remember the page mode from the previous message and answer to paging messages in the next but one paging sub block.

References

GSM 04.08 section 3.3.2.1; GSM 05.02, section 6.5.

### 26.6.2.4.2 Test purpose

To test that the MS remembers the page mode from the previous paging request message.

### 26.6.2.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKS_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT REJECT on the MS's paging subchannel, with the page mode element set to "extended paging". In the next but one subblock on the same CCCH, nothing addresses the MS. When the MS's specific paging subchannel reoccurs, a PAGING REQUEST TYPE 3 is sent, not addressing the MS under test and with page mode set to "same as before". In the next but one subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying paging reorganization and addressing the MS. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

Maximum Duration of Test

10 sec.

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Page mode set to "extended paging". |
| 2 | SS -> MS | XXXX | In the next but one subblock nothing addresses the MS. |
| 3 | SS -> MS | PAGING REQUEST TYPE 3 | This is sent in the next paging subblock on the MS's specific paging subchannel. The page mode is set to "same as before", and the MS under test is not addressed. |
| 4 | SS -> MS | PAGING REQUEST TYPE 1 | The MS is addressed in this "next but one subblock". Page mode set to "paging reorganization". |
| 5 | MS -> SS | CHANNEL REQUEST | |
| 6 | MS -> SS | CHANNEL REQUEST | |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

None.

## 26.6.2.5 Paging / multislot CCCH

### 26.6.2.5.1 Conformance requirements

The MS shall respond correctly to a PAGING REQUEST TYPE 1 message, when the page mode is set to normal paging, when a multislot CCCH is used and the MS is addressed with its IMSI in the first Mobile Identity field, the optional Mobile Identity field being not present.

References

GSM 04.08 section 3.3.2, GSM 05.02 section 6.5.

### 26.6.2.5.2 Test purpose

1) To test that the MS is able to determine its CCCH group and paging group correctly in the case of a CCCH configuration on more than one timeslot when it is paged on a timeslot other than 0. The MS is addressed with a PAGING REQUEST TYPE 1 message when the page mode is set to normal paging. The MS is paged with its IMSI in the 1st Mobile Identity field, the optional Mobile Identity field being not present, is the only way of addressing tested.

2) To test that in such conditions the MS answers to the paging message on the timeslot on which the paging message was sent.

### 26.6.2.5.3 Method of test

Initial Conditions

System Simulator:

1 cell, a legal combination of CCCH_CONF, BS_AG_BLKS_RES and BS_PA_MFRMS is chosen arbitrarily under the following constraint:

CCCH_CONF is in the set:

- 2 basic physical channels used for CCCH, not combined with SDCCHs
- 3 basic physical channels used for CCCH, not combined with SDCCHs
- 4 basic physical channels used for CCCH, not combined with SDCCHs

Mobile Station:

The IMSI last 3 digits are so that the CCCH_GROUP of the MS under test is other than 0. According to section 6.5.2 of recommendation GSM 05.02, this means that:

(IMSI mod 1000) mod (BS_CC_CHANS X N) is greater or equal to N, where
N = BS_PA_MFRMS X (9 - BS_AG_BLKS_RES).

The MS is in the "idle, updated" state.

#### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

#### Foreseen Final State of the MS

"Idle updated".

#### Test Procedure

The SS pages the MS once with a PAGING REQUEST TYPE 1 message on the timeslot and paging subchannel which correspond to the MS's IMSI.

The MS shall send the CHANNEL REQUEST on the same timeslot as the paging message.

The SS sends an IMMEDIATE ASSIGNMENT on the same timeslot as the paging message.

#### Maximum Duration of Test

10 s.

#### Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains IMSI of MS, 2nd Mobile Ident not present. |
| 2 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". on the same timeslot as the paging message. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | on the same timeslot as the paging message. |
| 4 | MS -> SS | PAGING RESPONSE | Mobile Ident: IMSI. |
| 5 | SS -> MS | CHANNEL RELEASE | |

#### Specific Message Contents

None.

## 26.6.3 Test of measurement report

When an RR-connection exists, the MS shall send measurement reports. These reports contain reception characteristics from serving and neighbouring cells. The measurement report procedure is described in section 3.4.1.2 of GSM 04.08.

NOTE 8: The capability to calculate RxLev and RxQual is tested in sections 15 and 16. In this test only the signalling aspect is verified.

### 26.6.3.1 Measurement / no neighbours

This test applies to GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 mobile stations.

#### 26.6.3.1.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH block and the measurement valid indication shall be set to valid (0) within the second block at the latest.

References

GSM 04.08 section 3.4.1.2, GSM 05.08 section 8.4.

26.6.3.1.2 Test purpose

To test that, when the SS gives absolutely no information about neighbouring cells, the MS does not report on neighbouring cells.

26.6.3.1.3 Method of test

Initial Conditions

System Simulator:

For GSM 900, DCS 1800 and PCS 1900: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM900) | ARFCN (DCS1800) | ARFCN (PCS1900 | Cell Identity |
|---|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 002 | 514 | 514 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 530 | 530 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 014 | 602 | 602 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 020 | 665 | 665 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 026 | 762 | 762 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 032 | 686 | 686 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 038 | 549 | 549 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 044 | 810 | 810 | 0008H |

For GSM 450 and GSM 480: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM450) | ARFCN (GSM 480) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 260 | 307 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 264 | 311 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 268 | 315 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 272 | 319 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 276 | 323 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 280 | 327 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 284 | 331 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 288 | 335 | 0008H |

For GSM 700 and GSM 850: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM850) | ARFCN (GSM700) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 129 | 439 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 135 | 445 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 141 | 451 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 147 | 457 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 153 | 463 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 159 | 469 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 165 | 475 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 171 | 481 | 0008H |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

### Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

### Foreseen Final State of the MS

Active state of a call (U10).

### Test Procedure

This test procedure is performed twice.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH. The BA is indicated as empty. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that no measurement results have been obtained.

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

### Expected Sequence

This sequence is performed for execution counter, k = 1, 2.

Since when k = 1, SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when k = 2 an additional SYSTEM INFORMATION TYPE 5bis is included) are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

### Specific Message Contents

GSM 450 and 480 begin:

SYSTEM INFORMATION TYPE 5:

| Information Element | value/remark |
|---|---|
| Neighbour Cells Description | |
| - Format Identifier | 128 range |
| - BCCH Allocation Sequence number | 1 |
| - BCCH Allocation ARFCN | No channels belong to the BCCH allocation. |
| - EXT IND | k = 1. Information Element carries the complete BA. k = 2. Information Element carries only a part of the BA. |

SYSTEM INFORMATION TYPE 5bis (Sent only when k = 2):

| Information Element | value/remark |
|---|---|
| Protocol Discriminator | RR management |
| Message Type | Sys Info 5bis. |
| Neighbour Cells Description | |
| - Format | 1024 range |
| - EXT IND | k = 2. Information Element carries only a part of the BA. |
| - W(i) | Only channel 500 belongs to the BCCH allocation. |

MEASUREMENT REPORT:

| Information Element | value/remark |
|---|---|

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

## 26.6.3.2 Measurement / all neighbours present

This test applies to GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 PCS 1900 mobile stations.

### 26.6.3.2.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. The MEASUREMENT REPORT message shall contain measurement results for the 6 strongest BCCH carriers with known and allowed NCC part of BSIC.

References

GSM 04.08 section 3.4.1.2, GSM 05.08 section 8.4.

### 26.6.3.2.2 Test purpose

To test that, when the SS gives information about neighbouring cells, the MS reports appropriate results.

### 26.6.3.2.3 Method of test

Initial Conditions

System Simulator:

For GSM 900, DCS 1800 and PCS 1900: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM900) | ARFCN (DCS1800) | ARFCN (PCS1900) | Cell Identity |
|---|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 002 | 514 | 514 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 530 | 530 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 014 | 602 | 602 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 020 | 665 | 665 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 026 | 762 | 762 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 032 | 686 | 686 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 038 | 549 | 549 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 044 | 810 | 810 | 0008H |

For GSM 450 and GSM 480: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM450) | ARFCN (GSM 480) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 260 | 307 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 264 | 311 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 268 | 315 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 272 | 319 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 276 | 323 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 280 | 327 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 284 | 331 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 288 | 335 | 0008H |

For GSM 700 and GSM 850: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM850) | ARFCN (GSM700) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 129 | 439 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 135 | 445 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 141 | 451 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 147 | 457 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 153 | 463 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 159 | 469 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 165 | 475 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 171 | 481 | 0008H |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

### Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

### Foreseen Final State of the MS

Active state of a call (U10).

### Test Procedure

This test procedure is performed twice.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH. All 8 of the BCCHs "on air" are

indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated within 20 seconds in these that measurement results for the 6 strongest carriers have been obtained.

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

### Expected Sequence

This sequence is performed for execution counter, k = 1, 2.

Since when k = 1, SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when k = 2 an additional SYSTEM INFORMATION TYPE 5bis is included) are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

### 26.6.3.3 Measurement / barred cells and non-permitted NCCs

This test applies to GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 mobile stations.

#### 26.6.3.3.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORTs on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 seconds the messages shall contain measurement results only for the 4 BCCH carriers on which the MS is allowed to report.

References

GSM 04.08 section 3.4.1.2, GSM 05.08 section 8.4.

#### 26.6.3.3.2 Test purpose

To test that, when a combination of normal neighbours, barred cells and non-permitted NCCs is "on air", the MS reports only on normal neighbours.

#### 26.6.3.3.3 Method of test

Initial Conditions

System Simulator:

For GSM 900, DCS 1800 and PCS 1900: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM900) | ARFCN (DCS1800) | ARFCN (PCS1900) | Cell Identity |
|---|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 002 | 514 | 514 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 530 | 530 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 014 | 602 | 602 | 0003H |
| Neighbour, N3 | -75 | 2 | 1 | 020 | 665 | 665 | 0004H |
| Neighbour, N4 | -55 | 3 | 3 | 026 | 762 | 762 | 0005H |
| Neighbour, N5 | -50 | 4 | 5 | 032 | 686 | 686 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 038 | 549 | 549 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 044 | 810 | 810 | 0008H |

For GSM 450 and GSM 480: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM450) | ARFCN (GSM 480) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 260 | 307 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 264 | 311 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 268 | 315 | 0003H |
| Neighbour, N3 | -75 | 2 | 1 | 272 | 319 | 0004H |
| Neighbour, N4 | -55 | 3 | 3 | 276 | 323 | 0005H |
| Neighbour, N5 | -50 | 4 | 5 | 280 | 327 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 284 | 331 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 288 | 335 | 0008H |

For GSM 700 and GSM 850: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM850) | ARFCN (GSM700) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 129 | 439 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 135 | 445 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 141 | 451 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 147 | 457 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 153 | 463 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 159 | 469 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 165 | 475 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 171 | 481 | 0008H |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

NOTE 1: The BA sent in SYSTEM INFORMATION TYPE 5 does not include N1, N4 and N5. N1 may be the case of a barred cell, N3 simulates the case where another operator is transmitting on the same frequency (e.g. in border areas), N4 & N5 simulate the case where other operators are transmitting on other frequencies.

Mobile Station:

The MS is in the active state of a call (U10).

### Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

### Foreseen Final State of the MS

Active state of a call (U10).

### Test Procedure

This test procedure is performed twice.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH. 5 of the 8 BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that measurement results for the 4 strongest permitted carriers have been obtained (one of the carriers in the BA belongs to a non-permitted NCC).

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

### Expected Sequence

This sequence is performed for execution counter, k = 1, 2.

Since when k = 1 SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when k = 2 an additional SYSTEM INFORMATION TYPE 5bis is included) messages are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

Specific Message Contents

GSM 450 begin:

SYSTEM INFORMATION TYPE 5:

| Information Element | value/remark |
|---|---|
| Neighbour Cells Description | |
| Format Identifier | 128 range |
| BCCH Allocation Sequence | 1 |
| BCCH Allocation ARFCN | only channel numbers 260, 268, 272, 284 and 288 belong to the BCCH allocation. |
| - EXT IND | k = 1. Information Element carries complete BA.<br>k = 2. Information Element carries only a part of the BA. |

SYSTEM INFORMATION TYPE 5bis (Sent only when k = 2):

| Information Element | value/remark |
|---|---|
| Protocol Discriminator | RR management |
| Message Type | Sys Info 5bis. |
| Neighbour Cells Description | |
| - Format | 1024 range |
| - EXT IND | k = 2. Information Element carries only a part of the BA. |
| - W(i) | Channel 0 and 800 belong to the BCCH allocation. |

MEASUREMENT REPORT:

| Information Element | value/remark |
|---|---|
| Protocol Discriminator | RR Management |
| Transaction Identifier | 0000 |
| Message Type | MEASUREMENT REPORT |

NOTE 2: These actual values are not checked.

NOTE 3: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

## 26.6.3.4 Measurement / DTX

This test applies to GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 mobile stations.

### 26.6.3.4.1 Conformance requirements

After the sending of the HANDOVER COMPLETE, the MS shall continuously send measurement reports in every SACCH blocks, the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 seconds the order of values in the MEASUREMENT REPORT message shall contain measurement results for the 6 strongest BCCH carriers among those monitored by the MS. Further, in a quiet environment, the DTX_USED field shall be set by the MS to "DTX used".

References

GSM 04.08 section 3.4.1.2, GSM 05.08 section 8.4.

26.6.3.4.2 Test purpose

To test that, in the case of the MS using DTX and the SS indicating that power control is in use, the MS reports appropriate results.

26.6.3.4.3 Method of test

Initial Conditions

System Simulator:

For GSM 900, DCS 1800 and PCS 1900: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM900) | ARFCN (DCS1800) | ARFCN (PCS1900) | Cell Identity |
|---|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 002 | 514 | 514 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 530 | 530 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 014 | 602 | 602 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 020 | 665 | 665 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 026 | 762 | 762 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 032 | 686 | 686 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 038 | 549 | 549 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 044 | 810 | 810 | 0008H |

For GSM 450 and GSM 480: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM450) | ARFCN (GSM 480) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 260 | 307 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 264 | 311 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 268 | 315 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 272 | 319 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 276 | 323 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 280 | 327 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 284 | 331 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 288 | 335 | 0008H |

For GSM 700 and GSM 850: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM850) | ARFCN (GSM700) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 129 | 439 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 135 | 445 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 141 | 451 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 147 | 457 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 153 | 463 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 159 | 469 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 165 | 475 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 171 | 481 | 0008H |

In the serving cell, the DTX indicator is set to "MS shall use discontinuous transmission".

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

The MS has just completed a handover into the serving cell, S1.

### Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Support for transparent data services only: yes/no.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

### Foreseen Final State of the MS

Active state of a call (U10).

### Test Procedure

This test procedure is performed twice.

With the MS having a call in progress on an arbitrary cell, the MS is handed over to cell S1. On cell S1, the SS sends SYSTEM INFORMATION TYPE 5 & 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH with all 8 of the BCCHs "on air" indicated in the BA. Cell S1 also indicates that DTX shall be used. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that measurement results for the 6 strongest carriers have been obtained and that DTX has been used. (The MS is positioned in an environment free from acoustic noise.)

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

### Expected Sequence

This sequence is performed twice for execution counter, k = 1, 2.

Since when k = 1, SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when k = 2 an additional SYSTEM INFORMATION TYPE 5bis is included) messages are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

### Specific Message Contents

GSM 450 begin:

SYSTEM INFORMATION TYPE 5:

| Information Element | value/remark |
|---|---|
| Neighbour Cells Description | |
| - Format Identifier | 128 range |
| - BCCH Allocation Sequence | 1 |
| - BCCH Allocation ARFCN | only channel numbers 260, 264, 268, 272, 276, 280, 284 and 288 belong to the BCCH allocation. |
| - EXT IND | k = 1. Information Element carries the complete BA. k = 2. Information Element carries only a part of the BA. |

SYSTEM INFORMATION TYPE 5bis (Sent only when k = 2):

| Information Element | value/remark |
|---|---|
| Protocol Discriminator | RR management |
| Message Type | Sys Info 5bis. |
| Neighbour Cells Description | |
| - Format | 1024 range |
| - EXT IND | k = 2. Information Element carries only a part of the BA. |
| - W(i) | Only channel 500 belongs to the BCCH allocation. |

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block after the HANDOVER COMPLETE message at the latest.

NOTE 3: For an MS that only supports transparent data services, the value of DTX_used shall not be checked.

## 26.6.3.5 Measurement / Frequency Formats

This test applies to GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 mobile stations.

### 26.6.3.5.1 Conformance Requirement

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 seconds the values in the MEASUREMENT REPORT message shall contain measurement results for the cells on which the mobile is allowed to report.

#### References

GSM 04.08 section 3.4.1.2, GSM 05.08 section 8.4.

### 26.6.3.5.2 Test Purpose

To test that, when the SS gives information about neighbouring cells, the MS reports appropriate results.

### 26.6.3.5.3 Method of test

#### Initial Conditions

System Simulator:

For GSM 900, DCS 1800 and PCS 1900: 2 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM900) | ARFCN (DCS1800) | ARFCN (PCS1900) | Cell Identity |
|---|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 002 | 715 | 715 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 815 | 805 | 0002H |

For GSM 400: 2 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM450) | ARFCN (GSM480) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 260 | 307 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 264 | 311 | 0002H |

For GSM 700, GSM 850: 2 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM700) | ARFCN (GSM850) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 439 | 129 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 445 | 135 | 0002H |

With the exception of the Cell Allocation, the rest of the parameters for both cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

#### Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed three times.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, 5bis & 6 on the SACCH. Both of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that no measurement results have been obtained.

For each iteration of the test the frequency format of the BA list contained in the System Information 5 and 5bis message shall change according to the specific message contents.

Maximum Duration Of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for execution counter, K = 1, 2, 3.

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION 5bis, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

Specific Message Contents

GSM 450 begin:

SYSTEM INFORMATION TYPE 5:

| Information Element | value/remark |
|---|---|
| Neighbour Cells Description | |
| Format Identifier | 128 range |
| BCCH Allocation Sequence | 1 |
| BCCH Allocation ARFCN | Channel numbers 260, 262 and 264 belong to the BCCH allocation. |
| - EXT IND | Information Element carries only a part of the BA. |

SYSTEM INFORMATION TYPE 5bis:

| Information Element | value/remark |

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

## 26.6.3.6 Measurement / multiband environment

This test applies to GSM 400, GSM 850, GSM 900 and DCS 1 800 mobile stations.

### 26.6.3.6.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. The MEASUREMENT REPORT message shall contain measurement results for up to the 6 strongest BCCH carriers among those with known and allowed NCC part of BSIC on which the mobile is asked to report.

#### References

GSM 04.08 section 3.4.1.2, GSM 05.08 section 8.4.

### 26.6.3.6.2 Test purpose

To test that, when the SS gives information about neighbouring cells using SYSTEM INFORMATION TYPE 2ter/5ter, the MS reports appropriate results.

### 26.6.3.6.3 Method of test

#### Initial Conditions

System Simulator:

For GSM 900 and DCS 1800: 8 cells with the following settings:

| Transmitter | Level | NCC | BSCC | ARFCN (GSM900) | ARFCN (DCS1800) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 002 | 514 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 530 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 014 | 602 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 020 | 665 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 026 | 762 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 032 | 686 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 038 | 549 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 044 | 810 | 0008H |

For GSM 450 and GSM 480: 8 cells with the following settings:

| Transmitter | Level | NCC | BSCC | ARFCN (GSM450) | ARFCN (GSM480) | Cell identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 260 | 307 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 264 | 311 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 268 | 315 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 272 | 319 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 276 | 323 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 280 | 327 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 284 | 331 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 288 | 335 | 0008H |

For GSM 850: 8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM850) | Cell Identity |
|---|---|---|---|---|---|
| Serving, S1 | -60 | 1 | 3 | 129 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 135 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 141 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 147 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 153 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 159 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 165 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 171 | 0008H |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1, 2 and 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

### Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).

### Foreseen Final State of the MS

Active state of a call (U10).

### Test Procedure

This test procedure is performed once.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, 5ter & 6 on the SACCH. All 8 of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated within 20 seconds in these that measurement results for the 6 strongest carriers, on which the mobile is asked to report, have been obtained.

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

### Expected Sequence

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 5ter, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

Specific Message Contents

GSM 450 begin:

SYSTEM INFORMATION TYPE 2ter:

| Information Element | value/remark |
|---|---|
| Additional Multiband information | |
| - Multiband reporting | Minimum 2 cells reported from each band supported excluding the frequency band of the serving cell. |
| Extension of the BCCH Frequency list | |
| - Format identifier | Range 512 |
| - BCCH Allocation Sequence | 0 |
| - BCCH Allocation ARFCN | ARFCN 514, 530, 549, 602, 665, 686, 762, 810 |
| - EXT IND | Information Element carries the complete BA. |

SYSTEM INFORMATION TYPE 3:

as default except:

| Information Element | value/remark |
|---|---|
| SI 3 rest octets | |
| - SI 2ter indicator | System Information 2ter is available |
| - Early Classmark Sending Control | Early Sending is explicitly accepted |

SYSTEM INFORMATION TYPE 5:

| Information Element | value/remark |
|---|---|
| Protocol Descriminator | RR management |
| Message Type | Sys Info 5. |
| Neighbour Cells Description | |
| - Format Identifier | 128 range |
| - BCCH Allocation Sequence | 1 |
| - BCCH Allocation ARFCN | ARFCN 260, 264, 268, 272, 276, 280, 284 and 288 |
| - EXT IND | Information Element carries the complete BA. |

SYSTEM INFORMATION TYPE 5ter:

| Information Element | value/remark |
|---|---|
| Protocol Descriminator | RR management |
| Message Type | Sys Info 5ter. |
| Additional Multiband information | |
| - Multiband reporting | Minimum 2 cells reported from each band supported excluding the frequency band of the serving cell. |
| Extension of the BCCH Frequency list | |
| - Format identifier | Range 512 |
| - BCCH Allocation Sequence | 0 |
| - BCCH Allocation ARFCN | ARFCN 514, 530, 549, 602, 665, 686, 762, 810 |
| - EXT IND | Information Element carries the complete BA. |

MEASUREMENT REPORT:

| Information Element | value/remark |
|---|---|

## 26.6.3.7 Measurement / new cell reporting

This test applies to GSM 400 and GSM 700 and GSM 850 and GSM 900 and DCS 1 800 and PCS 1900 mobile stations.

### 26.6.3.7.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. The MS shall report a new strongest cell in the measurement report at the latest 5 s after a new strongest cell (which is part of the BA(SACCH)) has been activated under the following network conditions: Initial serving cell at RXLEV= -70 dBm, with 6 neighbours at RXLEV= -75 dBm. Then the new BCCH carrier is switched on at RXLEV= -60 dBm.

NOTE: Because of test equipment limitations it is acceptable to activate the new carrier to replace one of the 6 neighbours.

References

GSM 04.08 clause 3.4.1.2, GSM 05.08 clause 7.2.

26.6.3.7.2 Test purpose

To test that, when the SS activates a new strongest neighbour cell, the MS reports that cell with a maximum delay of 5 s.

26.6.3.7.3 Method of test

Initial Conditions

System Simulator:

For GSM 900 or DCS 1800 or PCS 1900: 7 cells with the following settings:

| Transmitter | Level | NCC | BSCC | ARFCN (GSM900) | ARFCN (DCS1800) | ARFCN (PCS 1900) | Cell identity |
|---|---|---|---|---|---|---|---|
| Serving, S1 | -70 | 1 | 3 | 002 | 514 | 514 | 0001H |
| Neighbour, N1 | -75 | 1 | 5 | 008 | 530 | 530 | 0002H |
| Neighbour, N2 | -75 | 1 | 7 | 014 | 602 | 602 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 020 | 665 | 665 | 0004H |
| Neighbour, N4 | -75 | 1 | 3 | 026 | 762 | 762 | 0005H |
| Neighbour, N5 | -75 | 1 | 5 | 032 | 686 | 686 | 0006H |
| Neighbour, N6 | -75 | 1 | 7 | 038 | 549 | 549 | 0007H |

For GSM 450 or GSM 480: 7 cells with the following settings:

| Transmitter | Level | NCC | BSCC | ARFCN (GSM 450) | ARFCN (GSM 480) | Cell identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -70 | 1 | 3 | 260 | 307 | 0001H |
| Neighbour, N1 | -75 | 1 | 5 | 264 | 311 | 0002H |
| Neighbour, N2 | -75 | 1 | 7 | 268 | 315 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 272 | 319 | 0004H |
| Neighbour, N4 | -75 | 1 | 3 | 276 | 323 | 0005H |
| Neighbour, N5 | -75 | 1 | 5 | 280 | 327 | 0006H |
| Neighbour, N6 | -75 | 1 | 7 | 284 | 331 | 0007H |

For GSM 700 and GSM 850: 7 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM850) | ARFCN (GSM700) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -70 | 1 | 3 | 129 | 439 | 0001H |
| Neighbour, N1 | -75 | 1 | 5 | 135 | 445 | 0002H |
| Neighbour, N2 | -75 | 1 | 7 | 141 | 451 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 147 | 457 | 0004H |
| Neighbour, N4 | -75 | 1 | 3 | 153 | 463 | 0005H |
| Neighbour, N5 | -75 | 1 | 5 | 159 | 469 | 0006H |
| Neighbour, N6 | -75 | 1 | 7 | 165 | 475 | 0007H |

With the exception of the Cell Allocation, the rest of the parameters for all seven cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

### Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM or E-GSM or R-GSM or DCS 1 800 or PCS 1900).

### Foreseen Final State of the MS

Active state of a call (U10).

### Test Procedure

The test is performed in two steps a) and b).

Step a)

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 on the SACCH. All 7 of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated within 20 seconds in these that measurement results for the 6 strongest carriers have been obtained.

Step b)

The SS replaces neighbour cell N1 with neighbour cell N7 with a signal strenght of –60 dBm, in order to have the following new settings:

For GSM 900 or DCS 1800 or PCS 1900:

| Transmitter | Level | NCC | BSCC | ARFCN (GSM900) | ARFCN (DCS1800) | ARFCN PCS 1900 | Cell identity |
|---|---|---|---|---|---|---|---|
| Serving, S1 | -70 | 1 | 3 | 002 | 514 | 514 | 0001H |
| Neighbour, N7 | -60 | 1 | 1 | 044 | 810 | 530 | 0008H |
| Neighbour, N2 | -75 | 1 | 7 | 014 | 602 | 602 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 020 | 665 | 665 | 0004H |
| Neighbour, N4 | -75 | 1 | 3 | 026 | 762 | 762 | 0005H |
| Neighbour, N5 | -75 | 1 | 5 | 032 | 686 | 686 | 0006H |
| Neighbour, N6 | -75 | 1 | 7 | 038 | 549 | 549 | 0007H |

For GSM 450 or GSM 480:

| Transmitter | Level | NCC | BSCC | ARFCN (GSM450) | ARFCN (GSM480) | Cell identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -70 | 1 | 3 | 260 | 307 | 0001H |
| Neighbour, N7 | -60 | 1 | 1 | 288 | 335 | 0008H |

| | | | | | | |
|---|---|---|---|---|---|---|
| Neighbour, N2 | -75 | 1 | 7 | 268 | 315 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 272 | 319 | 0004H |
| Neighbour, N4 | -75 | 1 | 3 | 276 | 323 | 0005H |
| Neighbour, N5 | -75 | 1 | 5 | 280 | 327 | 0006H |
| Neighbour, N6 | -75 | 1 | 7 | 284 | 331 | 0007H |

For GSM 700 and GSM 850: 7 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM850) | ARFCN (GSM700) | Cell Identity |
|---|---|---|---|---|---|---|
| Serving, S1 | -70 | 1 | 3 | 129 | 439 | 0001H |
| Neighbour, N7 | -60 | 1 | 5 | 171 | 481 | 0002H |
| Neighbour, N2 | -75 | 1 | 7 | 141 | 451 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 147 | 457 | 0004H |
| Neighbour, N4 | -75 | 1 | 3 | 153 | 463 | 0005H |
| Neighbour, N5 | -75 | 1 | 5 | 159 | 469 | 0006H |
| Neighbour, N6 | -75 | 1 | 7 | 165 | 475 | 0007H |

With a maximum delay of 5 s, the neighbour cell N7 is included in the measurement report messages.

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

### Expected Sequence

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

### Specific Message Contents

GSM 450 begin:

SYSTEM INFORMATION TYPE 5:

| Information Element | value/remark |
|---|---|
| Neighbour Cells Description | |
| Format Identifier | variable bit map |
| BCCH Allocation Sequence | 1 |
| BCCH Allocation ARFCN | The channel numbers 259, 261, 262, 263, 264, 265, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291 and 292 belong to the BCCH allocation. |
| - EXT IND | Information Element carries complete BA. |

MEASUREMENT REPORT: Step a)

| Information Element | value/remark |

GSM 850 end:

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

NOTE 3: Cell S1 shall be included in the Measurement Report sent by the MS.

## 26.6.4 Test of the channel assignment procedure

An intracell change of channel can be requested by upper layers in order to change the channel type, or it may be initiated by the RR-sublayer, e.g. for an intra cell handover. This change is performed using the channel assignment procedure. If the procedure is incorrectly implemented in the MS, the establishment and maintenance of connections is endangered. This applies for the successful case and for the assignment failure: the MS's correct return to the old channel after assignment failure is a necessary part of the GSM system design.

### 26.6.4.1 Dedicated assignment / successful case

This test is only applicable to an MS supporting a TCH.

#### 26.6.4.1.1 Conformance requirements

1. Upon receipt of the ASSIGNMENT COMMAND message, the mobile station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the main signalling links).

2. MM-messages and CM-messages using SAPI=0 sent from the mobile station to the network can be duplicated by the data link layer in the following case:

   a channel change of dedicated channels is required (assignment or handover procedure) and the last layer 2 frame has not been acknowledged by the peer data link layer before the mobile station leaves the old channel.

   In this case, the mobile station does not know whether the network has received the message correctly. Therefore, the mobile station has to send the message again after the new dedicated channel is established.

3. An ASSIGNMENT COMMAND message may indicate a frequency change in progress, with a starting time and possibly alternative channel descriptions.

   In the case of the reception of an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.

4. The MS shall establish the link with the power level specified in the ASSIGNMENT COMMAND message.

   The MS shall confirm the power control level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the mobile for the last burst of the previous SACCH period.

5. The MS shall apply the hopping frequencies specified in ASSIGNMENT COMMAND message in the Mobile Allocation IE or the Frequency List IE at the time of accessing the new channel using the last received Cell Allocation.

6. After receipt of the ASSIGNMENT COMMAND the MS shall perform the assignment and return an ASSIGNMENT COMPLETE without undue delay.

References

1, 3, 5. GSM 04.08, subclause 3.4.3.

2. GSM 04.08, subclause 3.1.4.3.

4. GSM 04.08, subclause 3.4.3; GSM 05.08, subclause 4.2.

6. GSM 04.13, subclause 5.2.4.

#### 26.6.4.1.2 Test purpose

1. To verify that upon receipt of an ASSIGNMENT COMMAND, the MS switches to the channel defined in the ASSIGNMENT COMMAND, establishes the link and sends an ASSIGNMENT COMPLETE message. This is tested for an MS supporting TCH in the special cases of a transition.

   1.1 from non-hopping SDCCH to hopping TCH/F using a different timeslot;

   1.2 from hopping TCH/F to non-hopping TCH/F using a different timeslot;

   1.3 from non-hopping TCH/F to non-hopping TCH/F using a different timeslot;

   1.4 from non-hopping TCH/F to hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H;

   1.5 from hopping TCH/H to non-hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H;

   1.6 from non-hopping TCH/H to hopping TCH/F using a different timeslot; this test purpose is only applicable if the MS supports TCH/H.

2. To verify that an MS supporting TCH, having sent an MM- or CM message which was not acknowledged on L2 before the channel assignment procedure was initiated and before the MS has left the old channel, repeats that message after completion of the assignment procedure without incrementing N(SD). This is tested in the special case of MM message AUTHENTICATION RESPONSE.

3. To verify that, if an MS supporting TCH has received an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.

4. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, having sent an SABM frame to establish the main signalling link on the assigned channel, reports the power level specified in the ASSIGNMENT COMMAND message, in the uplink SACCH L1 header of the SACCH message sent in the SACCH period following the transmission of the SABM frame.

5. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, is able in the case of frequency hopping to decode the Mobile Allocation and Frequency List IEs correctly and applies the specified frequencies using the correct Cell Allocation.

6. To verify that after receipt of the ASSIGNMENT COMMAND the MS returns an ASSIGNMENT COMPLETE without undue delay.

#### 26.6.4.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default parameters except:

GSM 450:

BCCH ARFCN =263.

Throughout the test, the CA broadcast in System Information 1 is (259, 261, 263, 265, 267, 269, 271, 273, 275 and 277).

Note that the actual CA of the cell contains other frequencies.

GSM 480:

BCCH ARFCN =310.

Throughout the test, the CA broadcast in System Information 1 is (306, 308, 310, 312, 314, 316, 318, 320, 322 and 324).

Note that the actual CA of the cell contains other frequencies.

GSM 900:

BCCH ARFCN =20.

Throughout the test, the CA broadcast in System Information 1 is (10, 17, 20, 26, 34, 42, 45, 46, 52, 59).

Note that the actual CA of the cell contains other frequencies.

DCS 1 800:

BCCH ARFCN =747.

Throughout the test, the CA broadcast in System Information 1 is (734, 741, 747, 754, 759, 766, 773, 775, 779, 782).

Note that the actual CA of the cell contains other frequencies.

PCS 1900:

BCCH ARFCN =647.

Throughout the test, the CA broadcast in System Information 1 is (634, 641, 647, 654, 659, 666, 673, 675, 679, 682).

Note that the actual CA of the cell contains other frequencies.

GSM 700:

BCCH ARFCN = 457.

Throughout the test, the CA broadcast in System Information 1 is (447, 454, 457, 463, 471, 479, 482, 483, 489, 496).

Note that the actual CA of the cell contains other frequencies.

GSM 850:

BCCH ARFCN = 147.

Throughout the test, the CA broadcast in System Information 1 is (137, 144, 147, 153, 161, 169, 172, 173, 179, 186).

Note that the actual CA of the cell contains other frequencies.

Mobile Station:

The MS is in the "idle, updated" state with a TMSI allocated.

### Related PICS/PIXIT Statements

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- The supported frequencies (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800 or PCS 1900).

### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

### Test Procedure

The SS pages the MS and allocates an SDCCH. Then 2 different channels are assigned with ASSIGNMENT COMMANDs. Each time the MS shall switch to the assigned channel, establish the link and send an ASSIGNMENT COMPLETE message.

Then the SS sends a AUTHENTICATION REQUEST message. The MS shall answer with an AUTHENTICATION RESPONSE message, which is not acknowledged on L2 by the SS. Immediately after the AUTHENTICATION RESPONSE message is received, the SS sends an ASSIGNMENT COMMAND. The MS shall switch to the assigned channel, establish the link with the commanded power level and send as ASSIGNMENT COMPLETE message. Then MS shall repeat the AUTHENTICATION RESPONSE message, with the same N(SD) value.

Then the SS sends an ASSIGNMENT COMMAND, which includes a Starting Time IE. The MS shall react as specified above, but this shall be done at the time specified in Starting Time IE.

For an MS not supporting TCH/H, the SS initiates the channel release procedure and the test ends here. For an MS supporting TCH/H, the channel assignment procedure is performed another three times, with half rate channels involved, and again it is checked that the MS correctly completes the procedures, before the SS initiates the channel release procedure.

Maximum Duration of Test

30 s.

Expected Sequence

NOTE: TS GSM 04.08 appears to be unclear as to whether timer T3240 shall or shall not be started as a result of the AUTHENTICATION REQUEST message sent in step 10. To allow a variety of test equipment implementations, the IDENTITY REQUEST message is included in order to avoid an unexpected expiry of timer T3240 prior to the end of the expected sequence.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | See specific message contents. |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| 6 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 5. |
| 7 | SS | | The SS checks that the MS reports the requested power level in the layer 1 header of the SACCH message that is sent in the first SACCH multiframe following the SABM. |
| 8 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| 9 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 8. |
| 10 | SS -> MS | AUTHENTICATION REQUEST | |
| 11 | MS -> SS | AUTHENTICATION RESPONSE | This message is not L2 acknowledged by the SS. |
| 12 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| 13 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 12. |
| 14 | MS -> SS | AUTHENTICATION RESPONSE | N(SD) shall be the same as in step 10. |
| 15 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| 16 | SS | | The SS checks that there is no radio transmission on the new channel before the starting time. |
| 17 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. |
| A | | | This test part is performed if the MS does not support TCH/H (see PICS/PIXIT). |
| A18 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |
| B | | | This test part is performed if the MS supports TCH/H (see PICS/PIXIT). |
| B18 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| B19 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 19. |
| B20 | SS -> MS | IDENTITY REQUEST | |
| B21 | MS -> SS | IDENTITY RESPONSE | |
| B22 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| B23 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 22. |
| B24 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| B25 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 24. |
| B26 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |

Specific Message Contents

GSM 450 begin:

Step 3

IMMEDIATE ASSIGNMENT:

| | |
|---|---|
| As default message contents except | |
| Channel Description | |
| - Channel Type | SDCCH/8 |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | N, chosen arbitrarily |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |

Step 5

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Frequency list IE | Not included |
| Channel Mode | |
| - Mode | Signalling |
| Mobile Allocation | Indicates all of the CA (broadcast on the BCCH) except for the BCCH carrier. |
| Starting Time | Not included |

Step 8

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+3) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Frequency list IE | Not Included |
| Cell Channel Description | 128 range encodes (271, 273, 275, 277, 278, 279, 281, 282, 284, 287 and 289) |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 12

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+4) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included (thus the CA from step 8 is used to decode the MA) |
| Mobile Allocation | Indicates frequencies (271, 273, 279, 281, 282, 284, 287 and 289) |
| Starting Time | Not included |

Step 15

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+5) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | 259 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | signalling |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | indicates (current frame number + 100 frames) mod 42 432 |

Step 19

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+6) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - HSN | 0 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS |
| Cell Channel Description | Not included |
| Frequency list IE | Uses 128 range to indicate (259, 267, 275, 279, 287 and 289). |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 21

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+7) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | Chosen arbitrarily, but not the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 23

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Cell Channel Description | Uses 128 range to indicate (261 and 263) |
| Frequency list IE | Not included |
| Mobile Allocation | Indicates ARFCN 261 only |
| Starting Time | Not included |

GSM 450 end:

GSM 480 begin:

Step 3

IMMEDIATE ASSIGNMENT:

| | |
|---|---|
| As default message contents except | |
| Channel Description | |
| - Channel Type | SDCCH/8 |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | N, chosen arbitrarily |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |

Step 5

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Frequency list IE | Not included |
| Channel Mode | |
| - Mode | Signalling |
| Mobile Allocation | Indicates all of the CA (broadcast on the BCCH) except for the BCCH carrier. |
| Starting Time | Not included |

Step 8

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+3) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Frequency list IE | Not Included |
| Cell Channel Description | Range 128 encodes (318, 320, 322, 324, 325, 326, 328, 329, 331, 334 and 336) |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 12

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+4) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included (thus the CA from step 8 is used to decode the MA) |
| Mobile Allocation | Indicates frequencies (318, 320, 326, 328, 329, 331, 334 and 336). |
| Starting Time | Not included |

Step 15

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+5) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | 306 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | signalling |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | indicates (current frame number + 100 frames) mod 42 432 |

Step 19

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+6) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - HSN | 0 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS |
| Cell Channel Description | Not included |
| Frequency list IE | Uses 128 range to indicate (306, 314, 322, 326, 334 and 336 ). |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 21

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+7) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | Chosen arbitrarily, but not the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 23

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Cell Channel Description | Uses 128 range to indicate (308,310) |
| Frequency list IE | Not included |
| Mobile Allocation | Indicates ARFCN 308 only |
| Starting Time | Not included |

GSM 480 end:

GSM 900 begin:

Step 3

IMMEDIATE ASSIGNMENT:

| | |
|---|---|
| As default message contents except | |
| Channel Description | |
| - Channel Type | SDCCH/8 |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | N, chosen arbitrarily |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |

Step 5

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Frequency list IE | Not included |
| Channel Mode | |
| - Mode | Signalling |
| Mobile Allocation | Indicates all of the CA (broadcast on the BCCH) except for the BCCH carrier. |
| Starting Time | Not included |

Step 8

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+3) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Frequency list IE | Not Included |
| Cell Channel Description | Bit map zero encodes (45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114) |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 12

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+4) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included (thus the CA from step 8 is used to decode the MA) |
| Mobile Allocation | Indicates frequencies (45, 46, 73, 74, 75, 76, 108, 114) |
| Starting Time | Not included |

Step 15

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+5) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | 10 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | signalling |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | indicates (current frame number + 100 frames) mod 42 432 |

Step 19

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+6) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - HSN | 0 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS |
| Cell Channel Description | Not included |
| Frequency list IE | Uses bit map 0 to indicate (10, 34, 52, 73, 108, 114). |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 21

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+7) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | Chosen arbitrarily, but not the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 23

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Cell Channel Description | Uses bit map 0 to indicate (17, 20) |
| Frequency list IE | Not included |
| Mobile Allocation | Indicates ARFCN 17 only |
| Starting Time | Not included |

GSM 900 end:

DCS 1 800 begin:

Step 3

IMMEDIATE ASSIGNMENT:

| | |
|---|---|
| As default message contents except | |
| Channel Description | |
| - Channel Type | SDCCH/8 |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | N, chosen arbitrarily |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |

Step 5

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Frequency list IE | Not included |
| Channel Mode | |
| - Mode | Signalling |
| Mobile Allocation | Indicates all of the CA (broadcast on the BCCH) except for the BCCH carrier. |
| Starting Time | Not included |

Step 8

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+3) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Frequency list IE | Not Included |
| Cell Channel Description | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844) |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 12

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+4) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included (thus the CA from step 8 is used to decode the MA) |
| Mobile Allocation | Indicates frequencies (773, 775, 779, 829, 832, 844) |
| Starting Time | Not included |

Step 15

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+5) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | 734 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | signalling |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | indicates (current frame number + 100 frames) mod 42 432 |

Step 19

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+6) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - HSN | 0 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS |
| Cell Channel Description | Not included |
| Frequency list IE | Uses Range 1024 to indicate (734, 741, 759, 766, 773, 832, 844) |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 21

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+7) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | Chosen arbitrarily, but not the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 23

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Cell Channel Description | Uses Variable Range Format to indicate (741, 747) |
| Frequency list IE | Not included |
| Mobile Allocation | Indicates ARFCN 741 only |
| Starting Time | Not included |

DCS 1 800 end:

PCS 1900 begin:

Step 3

IMMEDIATE ASSIGNMENT:

| | |
|---|---|
| As default message contents except | |
| Channel Description | |
| - Channel Type | SDCCH/8 |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | N, chosen arbitrarily |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |

Step 5

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Frequency list IE | Not included |
| Channel Mode | |
| - Mode | Signalling |
| Mobile Allocation | Indicates all of the CA (broadcast on the BCCH) except for the BCCH carrier. |
| Starting Time | Not included |

Step 8

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+3) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Frequency list IE | Not Included |
| Cell Channel Description | Use Range 128 to encode (673, 675, 679, 682, 691, 698, 729, 732, 744) |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 12

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+4) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included (thus the CA from step 8 is used to decode the MA) |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Indicates frequencies (673, 675, 679, 722, 732, 744) |
| Starting Time | Not included |

Step 15

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+5) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | 634 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | signalling |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | indicates (current frame number + 100 frames) mod 42 432 |

Step 19

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+6) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - HSN | 0 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS |
| Cell Channel Description | Not included |
| Frequency list IE | Uses Range 1024 to indicate (634, 641, 659, 666, 673, 732, 744) |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 21

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+7) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | Chosen arbitrarily, but not the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 23

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Cell Channel Description | Uses Variable Range Format to indicate (641, 647) |
| Frequency list IE | Not included |
| Mobile Allocation | Indicates ARFCN 641 only |
| Starting Time | Not included |

PCS 1900 end:

GSM 700 begin:

Step 3

IMMEDIATE ASSIGNMENT:

| | |
|---|---|
| As default message contents except | |
| Channel Description | |
| - Channel Type | SDCCH/8 |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | N, chosen arbitrarily |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |

Step 5

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Frequency list IE | Not included |
| Channel Mode | |
| - Mode | Signalling |
| Mobile Allocation | Indicates all of the CA (broadcast on the BCCH) except for the BCCH carrier. |
| Starting Time | Not included |

Step 8

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+3) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Frequency list IE | Not Included |
| Cell Channel Description | 128 range encodes (482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508) |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 12

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+4) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included (thus the CA from step 8 is used to decode the MA) |
| Mobile Allocation | Indicates frequencies (482, 483, 500, 501, 502, 503, 506, 508) |
| Starting Time | Not included |

Step 15

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+5) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | 447 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Signalling |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | Indicates (current frame number + 100 frames) mod 42 432 |

Step 19

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+6) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - HSN | 0 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS |
| Cell Channel Description | Not included |
| Frequency list IE | Uses 128 range to indicate (447, 471, 489, 500, 506, 508). |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 21

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+7) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | Chosen arbitrarily, but not the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 23

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Cell Channel Description | Uses 128 range to indicate (454, 457) |
| Frequency list IE | Not included |
| Mobile Allocation | Indicates ARFCN 454 only |
| Starting Time | Not included |

GSM 700 end:

GSM 850 begin:

Step 3

IMMEDIATE ASSIGNMENT:

| | |
|---|---|
| As default message contents except | |
| Channel Description | |
| - Channel Type | SDCCH/8 |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | N, chosen arbitrarily |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |

Step 5

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Frequency list IE | Not included |
| Channel Mode | |
| - Mode | Signalling |
| Mobile Allocation | Indicates all of the CA (broadcast on the BCCH) except for the BCCH carrier. |
| Starting Time | Not included |

Step 8

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+3) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Frequency list IE | Not Included |
| Cell Channel Description | 128 range encodes (172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241) |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 12

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+4) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included (thus the CA from step 8 is used to decode the MA) |
| Mobile Allocation | Indicates frequencies (172, 173, 200, 201, 202, 203, 235, 241) |
| Starting Time | Not included |

Step 15

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+5) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | 10 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Signalling |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | Indicates (current frame number + 100 frames) mod 42 432 |

Step 19

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+6) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - HSN | 0 |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS |
| Cell Channel Description | Not included |
| Frequency list IE | Uses 128 range to indicate (137, 161, 179, 200, 235, 241). |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 21

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type | TCH/H |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | (N+7) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | Chosen arbitrarily, but not the BCCH carrier |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 23

ASSIGNMENT COMMAND:

| | |
|---|---|
| Channel Description | |
| - Channel Type and TDMA offset | TCH/F |
| - Timeslot Number | (N+1) mod 8 |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | RF hopping channel |
| - MAIO | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN | Chosen arbitrarily from the set (1 to 63) |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Cell Channel Description | Uses 128 range to indicate (144, 147) |
| Frequency list IE | Not included |
| Mobile Allocation | Indicates ARFCN 144 only |
| Starting Time | Not included |

GSM 850 end:

## 26.6.4.2 Dedicated assignment / failure

### 26.6.4.2.1 Dedicated assignment / failure / failure during active state

This test is only applicable to an MS supporting the call control protocol.

#### 26.6.4.2.1.1 Conformance requirements

On the mobile station side, if a lower layer failure happens on the new channel before the ASSIGNMENT COMPLETE message has been sent, the mobile station deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends a ASSIGNMENT FAILURE message, cause "protocol error unspecified" on the main DCCH and resumes the normal operation, as if no assignment attempt had occurred. The operational parameters (e.g. ciphering mode) when returning on the old channel are those applied before the procedure.

References

GSM 04.08 section 3.4.3.3.

GSM 05.08 section 4.2.

GSM 05.05 section 4.1.1.

#### 26.6.4.2.1.2 Test purpose

To test that, when the MS fails to seize the new channel, the MS reactivates the old channel, reporting use of the last power level used on the old channel.

This is tested in the special cases of a transition:

- from TCH/F to hopping TCH/F in state U10 if the MS supports TCH/F and call control;
- rom TCH/H to hopping TCH/H in state U10 if the MS supports TCH/H and call control.

#### 26.6.4.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default parameters. The SS orders the MS to use a power level P. Where P is a power level within the range supported by the Type of MS.

Mobile Station:

The MS is in the active state (U10) of a mobile terminated call.

Related PICS/PIXIT Statements

- Support for TCH/F.
- Support for TCH/H.
- Support for state U10 of the Call Control protocol.
- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).
- Power Class of MS.

Foreseen Final State of the MS

The active state (U10) of a mobile terminated call.

Test Procedure

The MS is in the active state (U10) of a mobile terminated call. The SS sends an ASSIGNMENT COMMAND allocating a new TCH/F, but does not activate the new channel. It is checked that the MS triggers the establishment of the main signalling link on the old channel and then sends an ASSIGNMENT FAILURE.

Maximum Duration of Test

30 s.

Expected Sequence

The test is repeated for execution counter k = 1, 2 if the MS supports TCH/H.

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/F, if k = 1, Channel Type = TCH/H, if k = 2. Power level specified in power command is different to P, again where P is a power level within the range supported by the Type of MS. The MS attempts (and fails) to establish a signalling link on the new channel. |
| 2 | | | The MS re-establishes the signalling link on the old channel. |
| 3 | MS -> SS | ASSIGNMENT FAILURE | RR cause value = “protocol error unspecified". |
| 4 | SS | | The SS checks that the MS reports power level P in the L1 header of the SACCH message that is sent in the first SACCH multiframe following the SABM. |

Specific Message Contents

None.

### 26.6.4.2.2 Dedicated assignment / failure / general case

#### 26.6.4.2.2.1 Conformance requirements

On the mobile station side, if a lower layer failure happens on the new channel before the ASSIGNMENT COMPLETE message has been sent, the mobile station deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends a ASSIGNMENT FAILURE message, cause "protocol error unspecified" on the main DCCH and resumes the normal operation, as if no assignment attempt had occurred. The operational parameters (e.g. ciphering mode) when returning on the old channel are those applied before the procedure.

References

GSM 04.08 section 3.4.3.3.

#### 26.6.4.2.2.2 Test purpose

To test that, when the MS fails to seize the new channel, the MS reactivates the old channel.

This is tested in the special cases of a transition:

- from SDCCH to hopping TCH/F; this test part is only applicable if the MS supports TCH/F.
- from non-hopping SDCCH to hopping TCH/H; this test part is only applicable if the MS supports TCH/H.
- from hopping TCH/F to hopping TCH/H; this test part is only applicable if the MS supports TCH/H.

NOTE: 26.6.8.4 contains the case of an assignment failure SDCCH -> SDCCH.

#### 26.6.4.2.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

##### Related PICS/PIXIT Statements

- Support for TCH/F.
- Support for TCH/H.
- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1900).

##### Foreseen Final State of the MS

The MS is "idle updated".

##### Test Procedure

A mobile terminated RR connection is established on an SDCCH. The SS sends an ASSIGNMENT COMMAND message allocating a hopping TCH/F, but does not activate the assigned channels. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel and trigger the establishment of the main signalling link on the old channel. Then the MS shall send an ASSIGNMENT FAILURE.

For an MS not supporting TCH/H, the SS initiates the channel release procedure and the test ends here. For an MS supporting TCH/H, the test sequence is repeated another two times, with half rate channels involved, and again it is checked that the MS correctly returns to the old channels, before the SS initiates the channel release procedure.

##### Maximum Duration of Test

30 s.

Expected Sequence

| Step | Direction | Message | Comments |
|---|---|---|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Channel Type: SDCCH. |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/F, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| 6 | | | The MS re-establishes the signalling link on the old channel. |
| 7 | MS -> SS | ASSIGNMENT FAILURE | RR cause value = “protocol error unspecified". |
| A | | | This test part is performed if the MS does not support TCH/H. |
| A8 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |
| B | | | This test part is performed if the MS supports TCH/H. |
| B8 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/H, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| B9 | | | The MS re-establishes the signalling link on the old channel. |
| B10 | MS -> SS | ASSIGNMENT FAILURE | RR cause value = “protocol error unspecified". |
| B11 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/F, hopping. |
| B12 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the assigned channel after establishment of the main signalling link. |
| B13 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/H, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| B14 | | | The MS re-establishes the signalling link on the old channel. |
| B15 | MS -> SS | ASSIGNMENT FAILURE | RR cause value = “protocol error unspecified". |
| B16 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |

Specific Message Contents

None.

## 26.6.5 Test of handover
