Foreword

This European Telecommunication Standard (ETS) has been produced by the Special Mobile Group (SMG) of the European Telecommunications Standards Institute (ETSI).

This ETS describes the technical characteristics and methods of test for Mobile Stations (MSs), operating in the 900 MHz and 1 800 MHz frequency band (GSM 900 and DCS 1 800) within the digital cellular telecommunications system.

This ETS corresponds to GSM technical specification GSM 11.10-3 version 4.19.1.

This part of the ETS (Part 3), contains Tree and Tabular Combined Notation (TTCN) for Layer 3 conformity specifications for which mobile stations, within the digital cellular telecommunications system (Phase 2), are tested for compliance.

The graphical form ATS

The TTCN.GR representation of this ATS is contained in annex A of this ETS.

The machine processable ATS

The electronic forms of the machine processable files (TTCN MP format) corresponding to the ATS for Layer 3 are contained in the file L3-4191.mp[1)] (Layer 3) on the diskette included as a part of this ETS (Part 3).

ETS 300 607 consists of three parts, which have the following ETS numbers and titles:

ETS 300 607-1 — Digital cellular telecommunications system (Phase 2);
Mobile Station (MS) conformance specification;
Part 1: Conformance specification

Reference: GSM 11.10-1.

ETS 300 607-2 — Digital cellular telecommunications system (Phase 2);
Mobile Station (MS) conformance specification;

1 Scope

This European Telecommunication Standard (ETS) specifies the Abstract Test Suite (ATS) and partial IXIT proforma for the Network Layer (Layer 3) at the mobile radio interface of the GSM or DCS (Phase 2) mobile stations (MS) conforming to the ETSs for the Radio Resource management, the Mobility Management, the circuit-switched Call Control, the Supplementary Services and Short Message Services for the digital cellular telecommunications systems (Phase 2).

The ISO standards for the methodology of conformance testing are used as the basis for the test specifications.

4.3 Test groups

4.3.1 Valid Behaviour tests (BV)

Predefined state transitions are considered as valid. The test purposes in the valid behaviour test subgroup cover the verification of the normal and exceptional procedures of the various Finite State Machines (FSMs), i.e. a valid behaviour test is a test where the message sequence and the message contents are considered as valid.

4.3.2 Invalid Behaviour/Inopportune Behaviour tests (BI-BO)

This test sub group verifies that the Implementation Under Test (IUT) is able to react properly having received an invalid Protocol Data Unit (PDU) or in the case an inopportune protocol event occurs. An invalid PDU is defined as a syntactically incorrect message. An inopportune event is syntactically correct but occurs when it is not expected, e.g. a correctly coded operation is received in a wrong state (the IUT may respond Error UnexpectedComponentSequence).

4.4 Test Step Structure

4.4.1 Preambles

The preamble is defined for each test purpose.

4.4.2 Postambles

After each test case the IUT shall be brought to the state as defined in the postamble for each test purpose.

5 Test Purposes (TP)

For each conformance requirement a Test Purpose (TP) is defined. The test purposes are specified in the ATS Dynamic part (annex A).

5.1 TP and test case naming convention

In order clearly to map the conformance requirements specified in the prETS 300 607-1 and TTCN test cases in the ATS, the section numbers in the prETS 300 607-1 are used as test case names.

The identifier of each TP is identical to the name of the implemented TTCN test case.

"Test Purpose Identifier" = "Test Case Name" = TPI = TC_NN_A_B_C_D_E, where NN, A, B, C, D and E are digits used in the corresponding section numbers of prETS 300 607-1. For example, the test case name TC_26_5_6_2 is the TTCN specification corresponding to the conformance requirements in the section 26.5.6.1.2 in the prETS 300 607-1. In case where the section has been implemented in more than one test case sub numbering has been introduced. For example, the section 26.7.4.2.4 of prETS 300 607-1, Location updating/rejected/national roaming testing is split into 5 test cases. The corresponding TCs are identified as TC_26_7_4_2_4_1, TC_26_7_4_2_4_2, TC_26_7_4_2_4_3, TC_26_7_4_2_4_4 and TC_26_7_4_2_4_5, respectively.

6 Abstract test method and test configurations

The distributed test method applies to the L3 MS testing. The test method uses a lower tester and a Man-Machine Interface (MMI) as an upper tester at the SUT.

6.1 Test system model

The model of the L3 test system is based on the original protocol architecture at the air interface. The test system consists conceptually of a lower tester LT, the L3 test programme (executable test suite), a L2 radio link emulator, a management functional unit, the L1 service provider and a TRx set (see figure 1).

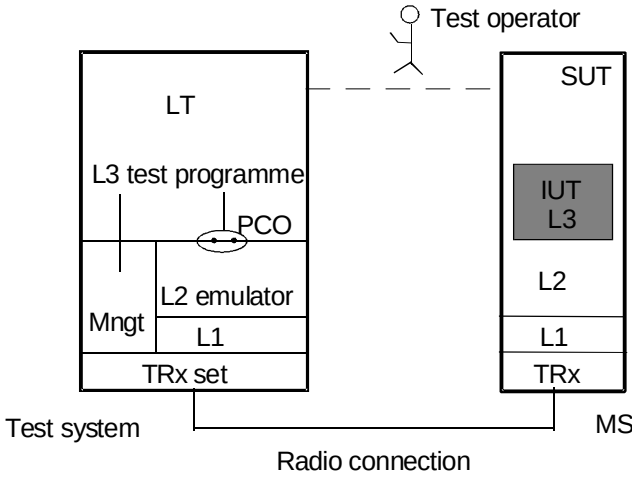

Figure 3: Test system and distributed test method

The LT provides the test environment and for test execution and the means of control and observation at the L3 lower service boundary within the test system.

The L3 TTCN test specification uses the three LT interfaces to communicate with the MS, the system under test, and with the other parts of the test system:

- Interface to the L2 emulator via the PCO;
- Interface to the management functional unit via TTCN test suite operations;
- Interface to the MS Man-Machine Interface (MMI) via a test operator.

6.2 Test Method

The PCO in the LT is defined as L2 SAP (SAP 0 + 3). The PCO has two FIFO queues (data buffers) to store all sending and receiving test events. The L2 primitives in the ATS which constitute mainly the interface to the L2 emulator are specified via the L2 primitives. In order to simulate multicell testing as required in some test cases, the defined primitives are able to address individual cells of the test system and the logic channels of each cell for the L3 message exchanges. The L2 emulator together with the underlying L1 and the TRx set support all message exchanges via correct radio links.

The management function unit has three management functions:

- L2 and L1 management;
- Channel management;
- TRx management;

The interface to the management function unit is presented in the ATS via a set of test suite operations. The major functions of the test suite management operations are:

- To load configuration parameters necessary for the test system.
- To control and get the necessary values of radio resources/ channels for tests.

The SUT (MS) has a more or less standardized MMI, such as keys, digital display, tones, etc. The ATS uses such kind of functions to provoke some procedures or to observe simple results at the SUT side. A human operator is needed during the test. The test system shall have an interface to the human operator to enable the test co-ordination.

Annex A: Abstract Test Suite

The machine processable ATS

The electronic forms of the machine processable files (TTCN MP format) corresponding to the ATS for Layer 3 are contained in the file L3-4190.mp[2)] (Layer 3) on the diskette included as a part of this ETS (Part 3).

The graphical form ATS

The TTCN.GR representation of this ATS is contained in the remainder of this annex.

Description

OC_BinAdd operation performs binary addition of two input parameters `bitstr1` and `bitstr2`, then returns the result of the addition. These two input parameters shall have the same length, the result of the operation has the same length as the input parameters.

for example:

OC_BinAdd('01000'B, '00110'B) = '01110'B;
OC_BinAdd('01000'B, '00011'B) = '01011'B;

Result Type:	BOOLEAN
Comments:	
Description	
the operation OC_CalledNumCHK to check whether the called party number `callednum`, which is represented by OCTETSTRING, is the same as the dialed number 'dialnum`, which is represented by IA5String. It returns TRUE if they are the same, otherwise FALSE.

Operation Name:	OC_ChkSRES(sres:OCTETSTRING; ki: BITSTRING; rand:BITSTRING)
Result Type:	BOOLEAN
Comments:	sres is 32 bits value.
Description	
OC_ChkSRES checks the input parameter `sres` according to the authentication algorithm defined in the following procedure. It returns TRUE if the `sres` is correct, otherwise it returns FALSE. - firstly the `ki` XOR to the `rand` results in RES1; - then compare the most significant 32 bits of the RES1 with the `sres`; - if they are equal, the `sres` is correct and the operation returns TRUE; - if they are not equal, the `sres` is wrong and the operation returns FALSE. NOTE: this procedure is the test algorithm for authentication defined by GSM.

Operation Name:	OC_CodeSMSCBMessage(firstoct: INTEGER; lastoct: INTEGER)
Result Type:	OCTETSTRING
Comments:	
Description	
The operation codes a part of the contents for a cell broadcast short message. The cell broadcast short message, is 82 octets long, i.e. 93 characters, each represented by 7 bits. As many as possible different characters are sent, the characters are those corresponding to the 7-bit representation of the integers 0, 1, 2, ..., 92. The bits are arranged acc. to GSM 03.38, clause 6.1.2.1.1. The result of this operation is the octetstring of the octets 'firstoct' to 'lastoct' (16 octets for the first message block, 22 octets for the 2nd, 3rd and 4th blocks), with the octets of the cell broadcast short message being numbered from 1 to 82.

Comments:	both ki and rand are 128 bits values, the result of the operation is 64 bits value
Description	
OC_CphKeyGen generates the ciphering key from the input parameters according to the following procedure: - firstly the `ki` XOR to the `rand` results in RES1; - then discard the most significant 32 bits of the RES; - the next 64 bits of RES1 are the ciphering key, the operation returns this value. - the 32 least singnificant bits are not used.

Test Suite Operation Definition

Operation Name: OC_RachSlots(fn1:FN; fn2:FN; cmbn: BOOLEAN; mode:INTEGER)

Result Type: INTEGER

Comments:

Description

OC_RachSlots calculates the number of RACH slots between frame number `fn1` and `fn2` excluding the slots in `fn1` and `fn2`, then return the result of the calculation.

If mode=0, 'fn1' denotes the (first) frame number for sending Paging Request, while 'fn2' denotes the (first) frame number for the received Channel Request. If mode=1 'fn1' and 'fn2' denote the (first) frame number for the received two subsequent Channel Requests. Any other values for mode is not allowed.

Since the number of RACH slots depends on the RACH being combined or not with dedicated channels, the parameter 'cmbn' is needed: TRUE --> combined, FALSE--> not combined.

It is assumed that the distance between fn1 and fn2 is not more than one group of 42432 TDMA frames (modulo 42432 is used to calculate t1' of fn1 and fn2). This is equivalent to approximately 196 seconds. The 51 TDMA frames in a multiframe are numbered 0 to 50.

fn1' := fn1 mod 51

fn2' := fn2 mod 51

CASE 1: cmbn is FALSE ('not combined')

When 'not combined', all slots are RACH slots.

1.1 mode=0 (sending paging message at fn1)

The paging uses the numbered frames 6 - 9, 12 -19, 22-29, 32-39 and 42-49.

1.1.1 If fn1 is not in the paging TDMA frame mapping, it leads testing to a test system error.

IF (fn1' < 6) OR (9 < fn1' < 12) OR (19 < fn1' < 22) OR (29 < fn1' < 32) OR (39 < fn1' < 42) OR (fn1' >49),
A test system error! The calling test case shall re-run again.
OTHERWISE

1.1.2 The number of RACH slots is equal to the number of frames between fn1 + 3 and fn2. The fn1 is added by 3 because a page message occupies 4 slots. The fn1 indicates the first slot of the paging message.

IF (fn1 + 3) < fn2, OC_RachSlots := fn2 - (fn1 + 3) -1 = fn2 - fn1 - 4,

1.1.3 If fn1+3 is equal to or greater than fn2, then this is due to fn2 being in the next group of 42432 frames. In this case 42432 frames have to be added.

IF fn2 <= (fn1 + 3), OC_RachSlots := fn2 -fn1 - 3 + 42432 -1 = fn2 -fn1 + 42428

1.2 mode=1 (receiving channel request at fn1)

The number of RACH slots is equal to the number of frames between fn1 and fn2

1.2.1 IF fn1 < fn2, OC_RachSlots := fn2 - fn1 - 1,

1.2.2 IF fn2 <= fn1, OC_RachSlots := fn2 -fn1 + 42432 -1 = fn2 -fn1 + 42431

CASE 2: cmbn is TRUE ('combined')

When combined only the slots of the numbered frames 4, 5, 14 to 36, 45 and 46 in each multiframe are RACH slots, i.e.total 27 frames per multiframe.

2.1 mode=0 (sending paging message at fn1)

The paging uses the numbered frames 6 - 9 and 12 -19.

2.1.1 If fn1 is not in the paging TDMA frame mapping, it leads testing to a test system error. If fn2 is not in the RACH TDMA frame mapping, it leads testing to fail.

IF (fn2` < 4) OR (5 < fn2` < 14) OR (36 < fn2` < 45) OR (fn2' > 46), OC_RachSlots := -9999
IF (fn1' < 6) OR (9 < fn1' < 12) OR (fn1' >19), A test system error! The calling test case shall re-run again.
OTHERWISE

2.1.2 Calculation of the number 'c' multiframes between fn1 + 3 and fn2. If fn1 + 3 is equal to or greater than fn2, then this is due to fn2 being in the next group of 42432 frames. In this case 42432 frames have to be added. '/' shall be the integer division, i.e. the result is also integer. Fractions are discarded.

2.1.2.1 IF (fn1 + 3) < fn2, c := fn2 / 51 - (fn1 + 3) / 51

2.1.2.2 IF fn2 <= (fn1 + 3), c := fn2 / 51 - (fn1 + 3) / 51 + 42432 / 51 = fn2 / 51 - (fn1 + 3) / 51 + 832

2.1.3 Calculation of the number of frames 'a' to be subtracted according to the position of fn1' within the multiframe

IF (5 < fn1` < 9) , a := 2

IF (fn1` =9), a := 3
IF (11<fn1` <20), a := fn1'-8

2.2 mode=1 (receiving channel request at fn1)

2.2.1 If fn1 or fn2 are not in the RACH TDMA frame mapping, it leads testing to fail.
IF (fn2` < 4) OR (5 < fn2` < 14) OR (36 < fn2` < 45) OR (fn2' > 46)
OR (fn1' < 6) OR (9 < fn1' < 12) OR (fn1' >19), OC_RachSlots := -9999

2.2.2 Calculation of the number 'c' multiframes between fn1 and fn2
2.2.2.1 IF fn1 < fn2, c := fn2 / 51 - fn1 / 51
2.2.2.2 IF fn2 <= fn1 c := fn2 / 51 - fn1 / 51 + 42432 / 51 = fn2 / 51 - fn1/ 51 + 832

2.2.3 Calculation of the number of frames 'a' to be subtracted according to the position of fn1' within the multiframe
IF (3 < fn1' < 6:), a:= fn1' - 3
IF (13 < fn1' < 37), a:= fn1' - 11
IF (44 < fn1' < 47), a:= fn1' - 19

2.3 Calculation of the number of slots 'b' to be added according to the position of fn2' within the multiframe
IF (3 < fn2' < 6:), b:= fn2' - 4
IF (13 < fn2' < 37), b:= fn2' - 12
IF (44 < fn2' < 47), b:= fn2' - 20

2.4 Calculation of the number of RACH slots. There are 27 RACH slots in each multiframe.
OC_RachSlots := 27 * c + b - a

Test Suite Operation Definition	
Operation Name:	OC_SaveAndProc1(val:INTEGER; mode :INTEGER; cnt:INTEGER; cmbnd:BOOLEAN)
Result Type:	BOOLEAN
Comments:	This operation is used for storing and analysing the CHANNEL REQUEST message distribution.

Description

The function of this operation is defined as an pseudo C code:

```
#define SAVE 0;
#define PROC 1;

OC_SaveAndProc(val, mode,cnt)
INTEGER       val, mode,cnt;
BOOLEAN     combined;
{
  static INTEGER   buf[200];
   int i, j, n;
   if (mode == SAVE)
       { cnt = cnt mod 200;
         if (cmbnd == C_NotCombined) AND (val<(151 + 8)) then
                 {  buf[cnt] = val;
                   return (TRUE);
                  }
         if (cmbnd == C_Combined) AND (val<(81 + 8)) then
                 {  buf[cnt] = val;
                   return (TRUE);
                  }
         else return (FALSE);
        }
   if (mode == PROC)
        {
          for (i=0,  i<200, i++)
                {  n=0;
                   for (j=0, j<200, j++)
                       if (buf[j] == buf[i])
                           n = n+1;
                   if (n > 41) return (FALSE);
                }
           return(TRUE);
         }
}
```

Detailed Comments:

This test suite operation has two operation modes :

- when the mode is SAVE and the val is less than 89 for combined or 159 for non-combined, it saves the value val into internal buffer and returns TRUE, otherwise returns FALSE. 200 values will be stored in the internal buffer when the operation is invoked 200 times.
- When the mode is PROC, it analyses the values stored in the internal buffer, if no more than 41 of them are equal the operation returns TRUE, otherwise returns FALSE. (i.e. for all n, CARD{ k|f(k) = n } <= 41)

Operation Name:	OC_SaveAndProc3(val:BITSTRING; mode :INTEGER; cnt:INTEGER)
Result Type:	BOOLEAN
Comments:	This operation is used for storing and analysing the random reference.

Description

The function of this operation is defined as an pseudo C code:

```
#define SAVE 0;
#define PROC 1;

OC_SaveAndProc(val, mode,cnt)
BITSTRING[8] val;
INTEGER       mode,cnt;
{
  static BITSTRING[8]   buf[7];
   int i, j, n=7;
   if (mode == SAVE)

                  return(TRUE)
          else    return (FALSE);
         }

}
```

Detailed Comments:	The function of this test suite operation is : - it saves the value val into internal buffer when the mode = SAVE. 7 values will be stored in the internal buffer when the operation is invoked 7 times. - it compares the values stored in the internal buffer when the mode = PROC, if 4 or more than 4 of them are different the operation returns TRUE, otherwise returns FALSE.

Test Suite Operation Definition

Operation Name:	OC_SaveAndRetrv(val:RQR; mode, idx, ex: INTEGER)
Result Type:	RQR
Comments:	This operation is used for storing and retrieving the random reference.

Description

The function of this test suite operation is (in prose):

- it saves the value val into internal buffer buf[idx] when the mode = SAVE and ex = 0. Maximum 9 values can be stored. The idx is ranged between 1-9.
- it returns the value stored in the internal buffer buf[idx] when the mode = RETRV and ex = 0.
- it returns a value which is different from any value stored in the buf and also different from any values which have been returned by the consecutive invocation of this operation with ex <> 0, if ex <> 0. The idx is ranged between 10-13.

The function of this operation is defined as an pseudo C code:

```
#define SAVE 0;
#define RETRV 1;

OC_SaveAndRetrv(val, mode, idx, ex)
RQR             val;
INTEGER         mode, idx, ex;
{
  int i, j;
  static RQR   buf[14];
   if ((mode == SAVE) AND (ex == 0))
       {
        buf[idx] = val;
        buf[10].ra = '00000000'B;
        buf[10].fn = '00'O;
        buf[11].ra = '00000000'B;
        buf[11].fn = '00'O;
        buf[12].ra = '00000000'B;
        buf[12].fn = '00'O;
        buf[13].ra = '00000000'B;
        buf[13].fn = '00'O;
        return (buf[10];
       }
   if ((mode == RETRV) AND (ex == 0))
        return (buf[idx]);
   if (ex != 0)
        {
          buf[0].ra = buf[1].ra + '00000001'B;
          buf[0].fn = buf[1].fn;
          for (j=1, j <13, j++)
             {
               for (i=1, i<14, i++)
                  if( buf[0] == buf[i])
                       { buf[0].ra = buf[i].ra + '00000001'B;
                          break;
                        }
               if (i == 14)
                {
                   buf[idx].ra = buf[0].ra:
                   return (buf[0]);
                }
             }
         buf[idx].ra = buf[i].ra+'00000001'B;
         return (buf[idx]);
        }
}
```

Detailed Comments:	0. The pseudo C code gives one of the possible implementations for the OC description in prose. 1. '00'O should be understood as equivalence of Fn_01, a TTCN structured type constraint. 2. The OC can save maximum 13 RQR values. In SAVE mode, idx is ranged between 1-9.

	3. For ex<>0, there are maximum 13 scans. In each scan a new value is assigned to buf[0].ra. If there is a 'non-match' in one of the 13 scans the buf[0] is returned. In case of 'all-match' for the 13 scans, the pair of (buf[i].ra + '00000001' at the last scan, buf[idx].fn is returned (idx is ranged between 10 - 13).

Description

OM_2Msgs puts the layer 2 emulator into a special operation mode then returns. In this special mode the layer 2 emulator sends the next two consecutive messages in the following way:

- send the first message on the paging subchannel indicated by the `pgg` and 'ch';

- if the `mode` = C_NxtButOne, send the second message in the next but one paging sub block;
- if the `mode` = C_FmrAGB, send the second message in a former access grant block;
- if the `mode` = C_BfReOcc, send the second message before the MS's original paging subchannel re-occurs but later than the next paging block of that CCCH (paging block not belong to the MS);
- if the `mode` = C_NxtButOneNxt, nothing is sent in the next but one paging sub block, then send the second message in the next paging subblock of the MS's paging subchannel.

Description

OM_Assoc operation associates the sub logic channel identifiers `sublgch1` to `sublgch8` and `sublgch9` to `sublgch16` with the generic "parent" channel identifier ` lgch1` and `lgch2` respectively, therefore the subchannel identifiers can refer to the corresponding channels configured by OM_ChConf operation.

The `lgch1` can be an identifier for SDCCH4, SDCCH8, FACCHH and the `lgch2` can be SACCHC4, SACCHC8, and SACCHH.

"dummy" in the actual parameter list means the corresponding parameter is not used.

Naming convention for logical channel constants:

C_<channel type>[<rate>][<subchannel>][_<cell>][_<instance>]

e.g.: C_FACCH H 0 _C _3 => C_FACCHH0_C_3

channel type: FCCH, SCH, BCCH, CBCH, PCH, RACH, FACCH, SACCH, SDCCH, DCCH

rate: F(ull), H(alf), 4 (fourths, C4 for SACCHC4), 8 (eighths, C8 for SACCHC8).

subchannel: H: 0, 1
(C)4: 0, ..., 3
(C)8: 0, ..., 7

cell: A, ..., H

instance: 1, ..., 3 When several channels of the same type can exist in one cell simultaneously (in different time slots and / or on different frequencies) they are identified by their instance. The parameters of ChConf are used to specify the frequency and slot of this instance of the channel type.

Not all possible combinations of this naming syntax have been used. According to the elements that are used / omitted the name can have a special meaning.

Examples:	Comments:
C_FCCH_A	FCCH of cell A.
C_SCH_A	SCH of cell A.
C_BCCH_A_1	First instance of a BCCH in cell A.
C_CBCH_A	CBCH of cell A.
C_PCH_A_1	First instance of a PCH in cell A (there is one instance of the PCH per BCCH in the cell).
C_AGCH_A_1	First instance of a AGCH in cell A (there is one instance of the AGCH per BCCH in the cell).
C_RACH_A_1	First instance of a RACH in cell A.
C_FACCHF_A_1	First instance of a full rate FACCH in cell A.
C_FACCHH_A_1	First instance of a half rate FACCH in cell A (all subchannels).
C_FACCHH0_A_1	Subchannel 0 of the first instance of a half rate FACCH in cell A.
C_SACCHF_A_1	First instance of a full rate SACCH in cell A.
C_SACCHH_A_1	First instance of a half rate SACCH in cell A (all subchannels).
C_SACCHH1_A_1	Subchannel 1 of the first instance of a half rate SACCH in cell A.
C_SACCHC4_A	SACCH/4 of cell A (all subchannels).
C_SACCHC43_A	Subchannel 3 of the SACCH/4 of cell A.
C_SACCHC8_A_1	First instance of a SACCH/8 in cell A (all subchannels).
C_SACCHC87_A_1	Subchannel 7 of the first instance of a SACCH/8 in cell A.
C_SDCCH4_A	SDCCH/4 of cell A (all subchannels).
C_SDCCH42_A	Subchannel 2 of the SDCCH/4 of cell A.
C_SDCCH87_A_1	First instance of a SDCCH/8 in cell A (all subchannels).
C_SDCCH87_A_1	Subchannel 7 of the first instance of a SDCCH/8 in cell A.

This list covers all types of combinations used in the TTCN for the time being.

When the meaning refers to 'all' subchannels of a channel (eg. C_FACCHH_A_1), it means that all active subchannels of this channel activated previously by OM_ChConf, are associated with a logical channel identifier in the OM_Assoc.

Operation Name:	OM_ChangeRFOf2Cells(cellid1:CellID; bspwr1:INTEGER; cellid2:CellID; bspwr2:INTEGER)
Result Type:	BOOLEAN

Description

This TSO is to change the RF level of the cell 'cellid1' to the RF level 'bspwr1' and the RF level of the cell 'cellid2' to the RF level 'bspwr2' [dBuVemf], then the TSO returns TRUE.

The major purpose of the TSO is to force the MS to reselect a new cell according to the GSM 05.08, section 6.6.2. The following example shows the use of the TSO.

The default cell selection parameters in the ATS are set as:

Cell reselect hysteresis: 12db

MX TXPWR MX CCH: minimu level (0)

ACS: no additional cell selection parameter (0)

RXLEV ACCESS MIN: minimum (0).

Therefore the path loss criterion parameter C1 equals to the reselection criterion parameter C2. In the whole ATS the C1 and C2 keeps greater than 10 (e.g. TC_26_7_4_2_3) for a cell not suitable. The MS received level average from a not suitable cell keeps also greater than 10 (-100 dBm) corresponding to the reference sensitivity level of DCS 1800 MS.

For GSM arfcn = 20, F = 941 MHz , the fields strengths (E) on tester integral antenna:

E (dB microV/m) >= (-110 + 10) (dBm) + 20log(941) + 77.2 = 36.7,

For DCS arfcn = 590, F = (-110 + 10) (dBm) + 20log(1820.8) + 77.2 = 42.4 (the formula see GSM 05.05, section 5 and GSM 05.08, section 8.1.4).

In order to keep C1, C2 greater 10, a reasonable field strength making a cell not suitable

is set to C_E_notsuitable = 45 in comparison with the default field strength C_E_default = 63. Considering that the cell recelect hysteresis is set to 12 db, the field strength of a cell being reselected need to be set to greater than 57. In the ATS the default value C_E_default (63) and C_E_notsuitable (45) are used for this TSO to force MS making cell reselection assuming that the two cells have different location area..

If two cells have the same location area (e.g. in TC_26_6_1_3), or although two cells have different LAI, the test cases needs to lower a cell power to a certain low level (e.g. in TC_26_7_4_2_4_1 and TC_26_7_4_2_4_5),

C1 needs to be less than zero to force the MS reselect a better cell. For GSM, E <= 26.7, for DCS, E<=32.4. The value C_E_notsuitable_sameLAI = 24 applies to the TSO to force the MS making cell reselection.

Channel re-use whithiin OM_ChConf:

When an OM_ChConf calls is made then the following rules can be applied for deciding whether or not to re-use existing physical channel.

Decode the 'chcmbn' (channel combination) parameter to determine the new channel type.

If new channel = "C_FCCH_SCH_BCCH_CCCH_SDCCH4_SACCHC4" (combined) or

if new channel = "C_CBCH_FCCH_SCH_BCCH_CCCH_SDCCH4_SACCHC4" (combined + SMS) then re-use any existing control channel configuration with same CellID.

If new channel = "C_FCCH_SCH_BCCH_CCCH" (non-combined) then use any combined, combined + SMS or non-combined control channel configuration with the same CellID. If new channel = "C_BCCH_CCCH_2", "C_BCCH_CCCH_3" or "C_BCCH_CCCH_4" (ccch-group) then re-use any existing ccch-group control channel configuration with the same CellID and the slot, or re-use any existing combined, combined + SMS with the same CellID. If new channel = "C_TCHF_ACCHF_1", "C_TCHF_ACCHF_2", "C_TCHH_ACCHH_1", "C_TCHH_ACCHH_2" (traffic) or "C_SDCCH8_SACCHC8_1", "C_SDCCH8_SACCHC8_2", "C_SDCCH8_SACCHC8_3" (dedicated) then re-use any existing traffic or dedicated channel with the same channel description.

Description	
OM_ComingFn operation returns the frame number (FN modulo 42432) which is about 5 seconds later than current frame number and is able to carry L3 message on the channel `ch`.

Operation Name:	OM_Deactivate(ch1, ch2:LOGICCH)
Result Type:	BOOLEAN
Comments:	
Description	
OM_Deactivate operation deactivates the logical channels `ch1` and 'ch2', then returns TRUE. The ch1 can be a DCCH or a TCH, the ch2 is the associated SACCH. Deactivation of an active SDCCH channel can be done by stopping transmission; this means that for the bursts on the BCCH carriers, dummy bursts shall be transmitted, for other bursts nothing shall be transmitted. Alternatively the deactivation of a SDCCH can be done by transmitting bad blocks on the SACCH with the parity bits set incorrectly. This will lead to a radio link failure in the MS. Deactivation of a TCH channel can be done by stopping transmission if it is non-BCCH. Deactivation of a SACCH_T can be done by transmitting bad blocks on the SACCH_T with the parity bits set incorrectly. The wrong channel coding on the SACCH will lead to a radio link failure in the MS after several seconds depending on the system information messages..

Operation Name:	OM_FHCHK(ch:LOGICCH; ca:CCHD; ma:MA; cd:CHD; t :INTEGER; fn:FN)
Result Type:	BOOLEAN
Comments:	
Description	
After the SS has been configured to start / change frequency hopping at a particular start time, this TSO instructs the SS to check whether the MS correctly uses the hopping frequencies on and after the expected start time according to the frequency parameters. If `t` = 0 or 32024 <= `t` <= 42431 the operation checks that the new frequencies starts "without delay". If 0 < `t` <= 31000 the operation checks that the new frequencies starts "on" the frame number of (X + t) mod 42432, where x = 51 * ((fn.t3 - fn.t2) MOD 26) + fn.t3 + 1326 * fn.t1. If 31000 < `t` < 32024, or `t` < 0 or `t` > 42431 then the test has been configured incorrectly and should be re-run with a permitted value for `t`. This check is performed at the uplink RF burst level by sampling for a period of 3 seconds from the start time and should therefore be called immediately after the SS has been configured to start / change hopping. The operation returns TRUE if the MS behaviour is correct, otherwise it returns FALSE. Note: before this TSO is called, a layer 3 message must be sent to the MS to command the MS to start / change hopping using the same frequency hopping parameters.

Detailed Comments:	In some test cases (most of them are hanhover test cases) diffirent channels are needed while the test goes on. the purpose of the operation is to reuse lower layer resources (e.g. tranceivers), which have been allocated to the previous channel, for configing another channel required in the next testing step.

Operation Name:	OM_FreqDef(st:STRT; ma:MA; ch :LOGICCH; chd: CHD; ca:CCHD; frmn: FN)
Result Type:	BOOLEAN
Comments:	
Description	
OM_FreqDef operation passes the frequency hopping parameters for channel `ch` to lower layer emulator. The emulator starts using these frequency parameters at the frame number indicated by starting time `st`. The parameter 'frmn' indicates a reference frame number at which the first burst of the message, FREQUENCY REDEFINITION, ASSIGNMENT COMMAND or HANDOVER COMMAND, containing starting time is sent in the concerned cell. If 0 <= (st - frmn) mod 42432 <= 31623, the indicated time is the next time when frame number mod 42432 is equal to st. If 32024 <= (st - frmn) mod 42432 <= 42431, the indicated time has already elapsed. After completely sending out the message containing the parameter starting time the tester starts frequency hopping.

PCO declarations

PCO Declarations			
PCO Name	**Type**	**Role**	**Comments**
L	SAP0_3	LT	
Detailed Comments:	1. The PCO consists of multiple SAPs: the SAP0 and SAP3. 2. The lower tester (LT) is the user of the data link layer service. 3. The SAP0 at the lower tester controlling and observing the exchange of CC, MM, RR and SS PDUs (messages) on the DCCH, SACCH and/or RACH, BCCH, CCCH channels. 4. The SAP3 at the lower tester controlling and observing the exchange of SMS PDUs (messages) on the DCCH or SACCH channels.		

Timer declarations

Timer Declarations			
Timer Name	**Duration**	**Unit**	**Comments**
T_dly		ms	general purpose delay timer
T_dly1		ms	general purpose delay timer
T_dly2		ms	general purpose delay timer
T_dlyAss	5000	ms	AssCmd timer, 1)
T_guard	300	s	guard timer
T_release	C_release_time	s	release timer
Detailed Comments:	1) In order to give to the lower tester enough time to dequeue and to send out the call SETUP and the other call establishment related messages in the sending buffer before starting sending of ASSINGMENT COMMAND message, the default value 5s is used in the test step AssCh_complete. In the test step AssCh_failure the timer value is set to 4s. For the TC_26_6_4_1, 600ms is used.

Detailed Comments:	'agressive' rest octet coding for 26.5.7.1.1. The first byte is coded in a manner that indicates comprehension required to a mobile that is incorrectly using the L2 pseudo length. The length of this IE is the octet after '09' and is set to 2. After the two bytes of content is the "next IEI". This is 78 which was the IEI allocated (but never used) in phase 1 to the RACH control parameters. The "RACH Control Parameters" are "set" to indicate that the cell barred and all access classes are prohibited.

Detailed Comments:	1. The values of t1, t2 and t3_ shall be correctly set by the L2 simulation module when this message is sent to air on the synchronization channel. It is assumed that there is a set of timebase counters in the L2 module, these counters run continuously and keep the correct timeslot number SN and TDMA frame number FN as long as the test system is poweron , the T1, T2, T3' (values for t1, t2 and t3_) can be derived from these counters.

Purpose:	1. To verify that the MS, for the case of the Multinumbering scheme or ISDN, accepts a SETUP message, where the Information Elements for Bearer Capability are compatible with the Bearer Services / Teleservices declared as supported by the MS, by sending a CALL CONFIRMED message. This is verified for all Mobile Terminated Bearer Services / Teleservices declared as supported by the MS. 2. To verify that the MS in the "Null" state, U0, when receiving a SETUP message containing incompatible Information Elements for Bearer Capability will respond with a RELEASE COMPLETE message. This is verified for all Mobile Terminated Bearer Services / Teleservices not declared as supported by the MS.

Test Case Dynamic Behaviour

Test Case Name: TC_11_1_2

Group: GSM_L3_MS_v4190/General/

Purpose: 1. To verify that the MS generates a SETUP message which includes a single or multiple Bearer Capability and a single LLC, according to the actual configuration on the MS.

This is verified for all Mobile Originated Bearer Services / Teleservices described in GSM 07.01 and declared as supported by the MS.

2. To verify that the MS includes a correctly encoded Repeat Indicator if it includes multiple Bearer Capabilities in the SETUP message.

Test Case Dynamic Behaviour

Test Case Name: TC_11_2

Group: GSM_L3_MS_v4190/General/

Purpose: 1. To verify that the MS, for the case of the Single Numbering Scheme, accepts a SETUP message, where the Information Elements for Brearer Capability and Lower and Higher Layer Compatibility are not present by sending a CALL CONFIRMED message which includes the single or multiple Bearer Capabilities, according to the actual configuration on the MS.

This is verified for one Mobile Terminated Bearer Services / Teleservices described in GSM 07.01 and declared as supported by the MS.

2. To verify that the MS includes a correctly encoded Repeat Indicator if it includes multiple Bearer Capabilities in the CALL CONFIRMED message.

Default: OtherEventsFail

Detailed Comments:

1. To generate a CALL COMKFIRMED based on the required basic service and IXIT parameters, and ask operator to configurate the MS for the required basic service.
2. To setup physical channel for BCCH,CCCH and SDCCH4 channels.
3. To send a SETUP_PDU without bearer capabilities and lower and higher layer compatibilities.
4. To check whether the received CALL COMFIRM PDU is correct.

Test Case Dynamic Behaviour

Test Case Name: TC_11_3

Group: GSM_L3_MS_v4190/General/

Purpose: 1. To verify that an MS claiming to not support AOCC and in the outgoing call / U4 call delivered state, on receipt of a CONNECT message containing AOCC information acknowledges the CONNECT message but ignores and does not acknowledge the AOCC information sent within the CONNECT.

2. To verify that an MS claiming to not support AOCC and in the outgoing call / U4 call delivered state, on receipt of a FACILITY message containing AOCC information ignores and does not acknowledge the AOCC information contained within the FACILITY.

3. To verify that an MS claiming to not support AOCC and in the incoming call / U9 call confirmed state, on receipt of a FACILITY message containing AOCC information ignores and does not acknowledge the AOCC information contained within the FACILITY.

4. To verify that an MS claiming to not support AOCC and in the U10 call active state, on receipt of a FACILITY message containing AOCC information ignores and does not acknowledge the AOCC information contained within the FACILITY.

Test Case Name: TC_26_2_1_1

Purpose: 1) To verify that the MS answers to a PAGING message by sending a CHANNEL REQUEST message within 0.7 seconds after reception of the PAGING message.

2) To verify that the MS does not always use the same delay between reception of paging message and sending of the CHANNEL REQUEST message. If an MS uses a fixed delay, there is a high probability that different MSs of the same product series use the same delay. There would then be a high risk of collision.

Purpose:

a) To verify that the MS having a mobile terminating call in CC-state U10, "active", on receipt of a DISCONNECT message which includes a transaction identifier which is not recognised as relating to an active call or a call in progress, sends a RELEASE COMPLETE message with cause value #81 and referring to the latter TI without changing the state of the active call (this is verified by use of the status enquiry procedure).

b) To verify that the MS having a mobile terminating call in CC-state U10, "active", on receipt of a

b1) RELEASE COMPLETE message which includes a transaction identifier with a value different from 111, which is not recognised as relating to an active call or a call in progress, or a

b2) SETUP message with TI flag referring to a transaction originated by the MS (in the special case where the TI value is equal to the TI value relating to the active call), or a

b3) SETUP message with TI referring to the active call, ignores that message without changing the state of the active call (this is verified by use of the status enquiry procedure).

c) To verify that the MS ignores a CC mesage with a TI value 111.

The test is only applicable to an MS supporting the call control protocol for at least one BC.

Test Case Dynamic Behaviour

Test Case Name: TC_26_5_5_2_1

Group: GSM_L3_MS_v4190/BiBo/

Purpose: To verify that an MS supporting at least one BC, having a CC entity in state U10, "active", ignores an MM message with syntactically incorrect IE except for the fact that it sends an MM-STATUS message with reject cause #96. This is tested in the special case of an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity; that the MS otherwise ignores the message is checked by means of the status enquiry procedure.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_2_1_3

Group: GSM_L3_MS_v4190/RR/

Purpose: To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 3 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested.

Default: OtherEventsFail_01

Comments: The configuration is Max-Retrans = 2, 2 non-combined CCCH/BCCH, BS-AG-BLKS-RES = 5, and BS-PA-MFRMS = 6.

Group: GSM_L3_MS_v4190/RR/
Purpose: To test that the MS is operating in the "paging reorganisation" page mode when this is ordered by the SS and the MS is paged in its former access grant channel.
Default: OtherEventsFail
Comments: The configuration is Max-Retrans = 1, CCCH-CONF, BS-AG-BLKS-RES and BS-PA-MFRMS are controlled by PIXIT parameters with the constraint that BS-AG-BLKS-RES > 0.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_2_4

Purpose: To test that the MS remembers the page mode from the previous paging request message.

Comments: The configuration is Tx-integer = 5, Max-Retrans = 2 and CCCH-CONF, BS-AG-BLKS-RES and BS-PA-MFRMS are from PIXIT paramerters.

Detailed Comments:
1. Tx-integer = 5, Max-Retrans = 2 and CCCH-CONF, BS-AG-BLKS-RES and BS-PA-MFRMS are from PIXIT paramerters.
2. extended paging mode.
3. not address the MS.
4. paging mode = "same as before", not address the MS,sent in the next paging subblock on the MS's specific paging subchannel.
5. paging mode = "paging reorgnisation", address the MS, sent in the next but one paging subblock.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_2_5

Group: GSM_L3_MS_v4190/RR/

Purpose: 1) To test that the MS is able to determine its CCCH group and paging group correctly in the case of a CCCH configuration on more than one timeslot when it is paged on a timeslot other than 0. The MS is addressed with a PAGING REQUEST TYPE 1 message when the page mode is set to normal paging. The MS is paged with its IMSI in the 1st Mobile Identity field, the optional Mobile Identity field being not present, is the only way of addressing tested.

2) To test that in such conditions the MS answers to the paging message on the timeslot on which the paging message was sent.

Default: OtherEventsFail

Comments: The configuration is Tx-integer = 5, Max-Retrans = 1 and CCCH-CONF, BS-AG-BLKS-RES and BS-PA-MFRMS are from PIXIT paramerters.

In the PIXITs CCCH-CONF is set to 3, BS-AG-BLKS-RES = 2 and BS-PA-MFRMS = 3.

For this test to be useful, we need

(((IMSI mod 10000) mod (cc * (9 - bsagres) * bspamfrms)) > (9 - bsagres) * bspamfrms)

ie. ((IMSI mod 1000) mod 3*7*9) > 7*9

thus if the last 3 digits of the IMSi are 065 then this test will work.

When the CCCHs that are not on timeslot zero are set, the SYNC channel must not be started on them. The SYNC channel is used by mobiles to identify TS zero. (the FCCH is supposed to be excluded as well)

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_4_1

Group: GSM_L3_MS_v4190/RR/

Purpose: 1. To verify that upon receipt of an ASSIGNMENT COMMAND, the MS switches to the channel defined in the ASSIGNMENT COMMAND, establishes the link and sends an ASSIGNMENT COMPLETE message. This is tested for an MS supporting TCH in the special cases of a transition

1.1 from non-hopping SDCCH to hopping TCH/F using a different timeslot

1.2 from hopping TCH/F to non-hopping TCH/F using a different timeslot

1.3 from non-hopping TCH/F to non-hopping TCH/F using a different timeslot

1.4 from non-hopping TCH/F to hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H

1.5 from hopping TCH/H to non-hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H

1.6 from non-hopping TCH/H to hopping TCH/F using a different timeslot; this test purpose is only applicable if the MS supports TCH/H.

2. To verify that an MS supporting TCH, having sent an MM- or CM message which was not acknowledged on L2 before the channel assignment procedure was initiated and before the MS has left the old channel, repeats that message after completion of the assignment procedure without incrementing N(SD). This is tested in the special case of MM message AUTHENTICATION RESPONSE.

3. To verify that, if an MS supporting TCH has received an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.

4. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, having sent an SABM frame to establish the main signalling link on the assigned channel, reports the power level specified in the ASSIGNMENT COMMAND message, in the uplink SACCH L1 header of the SACCH message sent in the SACCH period following the transmission of the SABM frame.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_4_2_1

Group: GSM_L3_MS_v4190/RR/

Purpose: To test that, when the MS fails to seize the new channel, the MS reactivates the old channel, reporting use of the last power level used on the old channel. This is tested in the special cases of a transition:

- from TCH/F to hopping TCH/F in state U10 if the MS supports TCH/F and call control
- from TCH/H to hopping TCH/H in state U10 if the MS supports TCH/H and call control

Detailed Comments:

1. Default parameters: CCCH combined with SDCCH4, Tx-integer = 5, Max-retrans = 1.
2. To assign a TCH/F hopping channel which is not activated.
3. To assign a TCH/H hopping channel which is not activated.
4. To setup a physical channel as TCH/F hopping channel.
5. To assign the TCH/F hopping channel which is now activated.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_5_1

Group: GSM_L3_MS_v4190/RR/

Purpose: To test that when the MS is ordered to make a non-synchronised handover it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly handles the values of any Starting Time IE in the HANDOVER COMMAND message and the Timing Advance IE in the PHYSICAL INFORMATION message. To test that the MS activates the new channel correctly.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_5_2_1

Group: GSM_L3_MS_v4190/RR/

Purpose: To test that when the MS is ordered to make a Non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_5_2_2

Group: GSM_L3_MS_v4190/RR/

Purpose: To test that when the MS is ordered to make a non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_5_2_6

Group: GSM_L3_MS_v4190/RR/

Purpose: To test that when the MS is ordered to make a non-synchronised handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION from the SS. To test that the MS correctly takes the values of the Timing Advance and Starting Time information elements into account. To test that the MS activates the new channel correctly. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_5_6

Group: GSM_L3_MS_v4190/RR/

Purpose: To test that when the MS is ordered to make a pseudo synchronised handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit. To test that the MS correctly reports the time difference between the cells.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_7_1

Group: GSM_L3_MS_v4190/RR/

Purpose: To verify that the MS, in an RR connected state, acknowledging a CHANNEL MODE MODIFY message by sending a CHANNEL MODE MODIFY ACKNOWLEDGEMENT message specifying and switching to the correct mode.

- the new mode if that mode is supported
- the old mode if the new mode is not supported.

This shall be verified for the channel modes

- signalling only
- speech full rate
- data 9.6 Kb/s
- data 4.8 Kb/s full rate
- data 2.4 Kb/s full rate.

Default: OtherEventsFail

Comments: apply only to the MS supporting TCH/F.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_7_2

Group: GSM_L3_MS_v4190/RR/

Purpose: To verify that the MS, in an RR connected state, acknowledges a CHANNEL MODE MODIFY message by sending a CHANNEL MODE MODIFY ACKNOWLEDGEMENT message specifying and switches to the correct mode

- the new mode if that mode is supported
- the old mode if the new mode is not supported.

This shall be verified for the channel modes

- signalling only
- speech half rate
- data 4.8 Kb/s half rate
- data 2.4 Kb/s half rate

Default: OtherEventsFail

Comments: apply only to the MS supporting TCH/H.

Test Case Dynamic Behaviour

Test Case Name: TC_26_6_8_4

Group: GSM_L3_MS_v4190/RR/

Purpose:

1 To verify that when the MS is in the "not ciphered" mode and receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "start ciphering", the MS uses the cipher key stored in the SIM to start ciphering and deciphering with the algorithm indicated by the "algorithm identifier" field and that the MS responds with a CIPHERING MODE COMPLETE message.

2 To verify that the MS is ready to transmit the CIPHERING MODE COMPLETE message before 500ms after the end of the CIPHERING MODE COMMAND message.

3 To verify that when the MS receives an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the assignment, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key.

4 To verify that when the MS receives a HANDOVER COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the handover, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key

5 To verify that when the MS is in the "ciphered" mode and receives the CIPHERING MODE COMMAND message with Cipher Mode Setting IE set to "no ciphering", the MS loads the cipher key stored in the SIM into the ME, stops ciphering and deciphering and, responds with a CIPHERING MODE COMPLETE message.

6 To verify that the MS responds to an AUTHENTICATION REQUEST message with an AUTHENTICATION RESPONSE message and continues to use the cipher key obtained from the previous authentication procedure.

7 To verify that when the MS is in the "not ciphered" mode and receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "no ciphering", the does not start ciphering or deciphering, but does respond with a CIPHERING MODE COMPLETE message.

8 To verify that when the MS receives a HANDOVER COMMAND message and the handover fails, the MS sends a HANDOVER FAILURE message on the old channel using the old ciphering mode and (if ciphered) the old algorithm and old key.

9 To verify that when the MS receives an ASSIGNMENT COMMAND message and the assignment fails, the MS sends an ASSIGNMENT FAILURE message on the old channel using the old ciphering mode and (if ciphered) the old algorithm and old key.

Test Case Name: TC_26_6_13_7

Group: GSM_L3_MS_v4190/RR/

Purpose: To verify that the MS, after receiving a FREQUENCY REDEFINITION message and then an HANDOVER COMMAND message with a starting time and channel descriptions both for before and after the starting time, failing the handover, and ready to access the old channel before the time indicated in the FREQUENCY REDEFINITION, resumes transmission on the channels used at the time of the reception of the FREQUENCY REDEFINITION message and eventually starts using the new frequency parameters at the time indicated in the FREQUENCY REDEFINITION message.

Test Case Dynamic Behaviour

Test Case Name: TC_26_7_2_2

Purpose: 1) To check that ,after reception of an Authentication Reject message, the Mobile Station:

1.1 does not perform normal location updating

1.2 does not perform periodic location updating

1.3 does not respond to paging with TMSI

1.4 rejects any request from CM entity for MM connection except for emergency call

1.5 does not perform IMSI detach if deactivated

2) To check that, after reception of an Authentication Reject message the Mobile Station, if it supports speech, accepts a request for an emergency call by sending a CHANNEL REQUEST message with the establishment cause set to "emergency call" and includes an IMEI as mobile identity in the CM SERVICE REQUEST message.

3) To check that, after reception of an Authentication Reject message and after having been deactivated and reactivated, the MS performs location updating using its IMSI as mobile identity and indicates deleted LAI and CKSN.

Test Case Dynamic Behaviour

Test Case Name: TC_26_7_3_2

Group: GSM_L3_MS_v4190/MM/

Purpose: To check that the MS behaves correctly when activated with an IMSI of length less than the maximum length. In this condition, the MS shall:

1. perform location updating
2. answer to paging with IMSI
3. give the correct IMSI when asked by an IDENTITY REQUEST
4. attempt CM connection establishment when requested to
5. attempt call re-establishment when needed
6. attempt IMSI detach when needed
7. erase its TMSI when the IMSI is sent by the network in a LOCATION UPDATING ACCEPT or a TMSI REALLOCATION COMMAND message.

Default: OtherEventsFail

Comments: Initial Conditions of MS:

The MS has no valid TMSI. It is "idle updated" on the cell. The IMSI has the value '001011234'.

This test case shall use the SIM Card 2 with 'IMSI=001011234' and HPLMN_search_period=6min.

Foreseen final state of the MS:

The MS has no valid TMSI. It is "idle updated" on the cell.

Test Case Dynamic Behaviour

Test Case Name: TC_26_7_4_1

Group: GSM_L3_MS_v4190/MM/

Purpose: To test the behaviour of the MS if the network accepts the location updating of the MS. For the network response three different cases are identified:

1) TMSI is allocated,
2) Location updating accept contains neither TMSI nor IMSI,
3) Location updating accept contains IMSI.

Default: OtherEventsFail

Comments: Initial Conditions of MS:

The MS has valid TMSI(TMSI1), CKSN(CKSN1) and Kc.It is "idle updated" on cell A.

Foreseen final state of the MS:

The MS has no valid TMSI and no CKSN. It is "idle updated" on cell B.

5) reject any request from CM entity for MM connection other than for emergency call.
6) switch to a new cell with a new PLMN.
7) perform normal location updating after entering in a new PLMN.
8. The PLMN of cell B is supressed on the SIM's forbidden PLMN list.

Test Case Dynamic Behaviour

Test Case Name: TC_26_7_4_2_4_1

Group: GSM_L3_MS_v4190/MM/

Purpose: Test purpose 1

To test that on receipt of a rejection using the Roaming cause code, the MS ceases trying to update on that cell, that this situation continues for at least one periodic location interval period, and that the corresponding list is re-set by powering down the MS (the requirement in TS GSM 04.08 is that the list shall be retained for at least 12 hours. This aspect is not formally tested).

Default: OtherEventsFail

Comments: This testcase includes only the procedure of part 1 of GSM 11.10-1, section 26.7.4.2.4.

Initial Conditions of MS:

The MS has valid TMSI, CKSN and Kc.It is "idle updated" on cell B.

Foreseen final state of the MS:

The MS has no valid TMSI and no CKSN. It is "idle updated" on cell A.

Detailed Comments: 1) MS shall selects cell A, cell B is not available.

	2) To send Max-Restrans+1 times Channel Requests in cell A 3) MS shall not try to establish a connection during a period of a cell reselection (4 seconds). 4) MS shall perform a normal location updating procedure as it is neccessary. The time difference between the channel request in the test step and the last channel request in the ltree_ra shall be in the range of 4-9 seconds. 5) Cell A is not available and MS shall switches to cell B 6) To send Max-Restrans+1 times Channel Requests in cell B 7) Cell A is available again. 8) MS shall not repeat the complete procedure if the original cause of the normal location updating procedure has disappeared.

Test Case Dynamic Behaviour

Test Case Name: TC_26_7_4_3_2

Group: GSM_L3_MS_v4190/MM/

Purpose: To verify that the MS performs normal location updating procedures when its attempt counter is smaller than 4. To check that the MS does not perform the IMSI detach procedure when "idle not updated". To verify that when "idle not updated" the MS can perform an emergency call. To verify that when "idle not updated" the MS uses requests from CM layer other than emergency call as triggering of a normal location updating procedure. To verify that the MS performs a normal location updating procedure if it enters a new cell while being "idle not updated".

Default: OtherEventsFail

Comments: Initial Conditions of MS:
The MS has valid TMSI and CKSN. It is "idle updated" on cell A.

Foreseen final state of the MS:
The MS has valid TMSI and CKSN. It is "idle updated" on cell A.

Test Case Dynamic Behaviour

Test Case Name: TC_26_7_4_3_4

Group: GSM_L3_MS_v4190/MM/

Purpose: To verify that in the case when the attempt counter is smaller than 4 and the broadcast LAI is equal to the stored LAI, the MS is in the MM-IDLE state and NORMAL SERVICE substate. To verify that timer T3211 is stopped after a MM connection establishment. To verify that the MS uses the T3211 timer. and that it enters the MM-IDLE state and NORMAL SERVICE substate when its attempt counter reaches value

Default: OtherEventsFail

Comments: Initial Conditions of MS:

Test Case Dynamic Behaviour

Test Case Name: TC_26_7_5_8_3

Group: GSM_L3_MS_v4190/MM/

Purpose:
1) To check that a MS that has no CM application request pending sets the Follow-On-Request bit to No follow-on request pending in a LOCATION UPDATING REQUEST message.
2) To check that when the network includes the follow on proceed IE in a LOCATION UPDATING ACCEPT message, a MS that has no CM application request pending does not attempt to establish a new MM connection on that RR connection.
3) To check that the MS accepts establishment by the network of a new MM connection on the existing RR connection.

Default: OtherEventsFail

Comments: Initial Conditions of MS: The MS has valid TMSI and is deactivated.

Test Case Dynamic Behaviour

Test Case Name: TC_26_8_1_4_5_1

Group: GSM_L3_MS_v4190/CC/

Purpose: 1) To verify that the procedure is initiated by the MS in the "active" state of the call. It sends a MODIFY message including the new mode to be changed to; and enters the "mobile originating modify" state. The new mode given in the MODIFY message is one of those already negotiated and agreed during the establishment phase of the call. The MODIFY originating side stops sending Bm-channel information.

2) To verify that upon receipt of the MODIFY COMPLETE message the MS starts sending channel information according to the new call mode and enters the "active" state.

5. The expected HANDOVER FAILURE message received.
6. To check whether the MS is still in the state U26.

Test Group StructureProc

Test Case Dynamic Behaviour

Test Case Name: TC_26_9_2

Group: GSM_L3_MS_v4190/StructureProc/

Purpose: 1) To verify that the MS in MM state "idle, updated" with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS as declared in a PICS/PIXIT statement, displays the dialled number in the way described in a PICS/PIXIT statement.

2) To verify that the MS in MM state "idle, updated" and in RR idle mode, with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS as declared in a PICS/PIXIT statement, starts to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message with correct establishment cause.

3) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after having successfully performed the authentication and cipher mode setting procedures, the MS sends a SETUP message with correct parameters.

4) To verify that subsequently, after receipt of a CALL PROCEEDING message and of an ASSIGNMENT COMMAND message allocating an appropriate TCH, after having completed the traffic channel early assignment procedure by replying with the ASSIGNMENT COMPLETE message, after receipt of an ALERTING message and a CONNECT message, the MS returns a CONNECT ACKNOWLEDGE message.

5) To verify that subsequently the MS has attached the user connection to the radio path. (This is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT message, where the MS is sending appropriate speech or data frames whenever it doesn't have to transmit or acknowledge an I frame on layer 2 of the FACCH.)

6) To verify that subsequently upon the network initiating call clearing by sending a DISCONNECT message, the MS proceed to release the call with RELEASE.

7) To verify that subsequently, on receipt of a RELEASE COMPLETE message followed by a CHANNEL RELEASE message, the MS disconnects the main signalling link.

These test purposes are tested for all rates supported by the MS (full rate/half rate).

Test Case Dynamic Behaviour

Test Case Name: TC_26_9_3

Group: GSM_L3_MS_v4190/StructureProc/

Purpose: 1) To verify that the MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS as declared in a PICS/PIXIT statement, starts to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message.

2) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after having successfully performed authentication and cipher mode setting procedures, after having sent a SETUP message, after having received a CALL PROCEEDING message followed by an ALERTING message and an ASSIGNMENT COMMAND message allocating an appropriate TCH, the MS sends an ASSIGNMENT COMPLETE message.

3) To verify that subsequently, after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message returns a CONNECT ACKNOWLEDGE message.

4) To verify that after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message attaches the user connection to the radio path. (This is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT message, where the MS is sending appropriate speech or data frames whenever it doesn't have to transmit or acknowledge an I frame on layer 2 of the FACCH.)

These test purposes are tested for all rates supported by the MS (full rate/half rate).

Test Case Dynamic Behaviour

Test Case Name: TC_26_9_4

Group: GSM_L3_MS_v4190/StructureProc/

Purpose: 1) To verify that the MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, after being paged by the network on the correct paging subchannel, after initiating the immediate assignment procedure by sending the CHANNEL REQUEST message, after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after having sent a PAGING RESPONSE message on the allocated SDCCH, after having performed successful authentication and cipher mode setting procedures, after receipt of a SETUP message not containing a signal information element, returns a CALL CONFIRMED message.

2) To verify that subsequently, the SS sending an ASSIGNMENT COMMAND message, the MS successfully continues a mobile terminating call establishment with early assignment of traffic channel

a) by replying to the ASSIGNMENT COMMAND with an ASSIGNMENT COMPLETE message, and

b) by continuing the call establishment by either sending a CONNECT message and through connecting the TCH in both directions, or, sending an ALERTING message.

3) To verify that if after sending a CALL PROCEEDING message, the MS sends an ALERTING message during MTC establishment with early assignment, it generates an alerting indication.

4) To verify that if an ALERTING had been sent, subsequently, when the user accepts the call (possibly internal action as declared in PICS/PIXIT statement), the MS returns a CONNECT message.

5) To verify that the MS:

- if the call is a speech call: after sending the CONNECT message has through connected the TCH in both directions (this is checked by verifying that after transmission of the first L2 frame containing the (complete) CONNECT message, the MS is sending appropriate speech or data frames whenever it doesn't have to transmit or acknowledge an I frame on layer 2 of the FACCH.)

6) To verify that subsequently, the MS can initiate call clearing by sending a DISCONNECT message.

7) To verify that the MS in this phase of call release, upon receipt of a RELEASE message, returns a RELEASE COMPLETE message.

8) To verify that subsequently the MS, upon receipt of a CHANNEL RELEASE message, disconnects the main signalling link.

Test Case Dynamic Behaviour

Test Case Name: TC_26_9_6_1_1

Group: GSM_L3_MS_v4190/StructureProc/

Purpose: 1) To verify that an MS supporting speech in the MM state "idle, updated", when made to call the number 112, sends a CHANNEL REQUEST message with establishment cause "emergency call".

2) To verify that after assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel is a CM SERVICE REQUEST message specifying the correct CKSN and TMSI, with CM Service Type "emergency call establishment" .

3) To verify that authentication and cipher mode setting are performed successfully.

4) To verify that after cipher mode setting acceptance by the SS, the MS sends an EMERGENCY SETUP message.

5) To verify that subsequently, the SS having sent a CALL PROCEEDING message and then an ALERT message and having initiated the assignment procedure of an appropriate speech traffic channel, which, if the MS supports both TCH/FS and TCH/HS, is at the preferred rate, the MS performs correctly that assignment procedure.

6) To verify subsequent correct performance of a connect procedure.

7) To verify that subsequently the MS has through connected the TCH in both directions.

8) To verify that the call is cleared correctly.

Test Case Dynamic Behaviour

Test Case Name: TC_26_9_6_2_2

Group: GSM_L3_MS_v4190/StructureProc/

Purpose: 1) To verify that the MS in the "idle, no IMSI" state (no SIM inserted) when made to call the number 112, sends a CHANNEL REQUEST message with establishment cause "emergency call".

2) To verify that after assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel is a CM SERVICE REQUEST message in which the cipher key sequence number IE indicates "no key is available", the CM service type IE indicates "emergency call establishment", and the mobile identity IE specifies the IMEI of the MS.

3) To verify that after receipt of a CM SERVICE REJECT message from the SS, the MS abandons the emergency call establishment.

Default: OtherEventsFail

Comments: For this test case the SIM card shall be removed form the MS.

Detailed Comments:

1. To setup a physical channel as BCCH CCCH and SDCCH4.
2. CHANNEL REQUEST with "emergency call" received.
3. CM SERVICE REQUEST with "emergency call establishment", IMEI, "no key available" and classmark received.
4. To check whether the MS sends any L 3 messages, the test case fails in the default tree if the MS does.
5. To check whether the MS initiates an RR connection establishment, the test case fails in the default tree if the MS does.

Test Case Dynamic Behaviour

Test Case Name: TC_26_10_2_4_1

Group: GSM_L3_MS_v4190/EGSMSignalling/

Purpose: To check that the MS correctly performs a non-synchronized handover, from a non hopping primary band SDCCH to a hopping TCH or SDCCH using E-GSM frequencies, whatever the coding used for the hopping sequence description and that it activates the new channel correctly.

This tested in the following case:

E-GSM signalling/ Handover / successful / call under establishment / non-synchronized /

- from SDCCH/8 to TCH/F if the MS supports a TCH
- from SDCCH/8 to SDCCH/8 if not

Default: OtherEventsFail

Detailed Comments:

1. If the MS supports the bearer capabilities, which are give in Setup message, it has to accept them. Therefor, they are no bearer capabilites expected in Call Confirm message.
2. TCH/F or SDCCH/4 with non hopping in selected cell.

Test Case Dynamic Behaviour

Test Case Name: TC_26_10_3_1

Group: GSM_L3_MS_v4190/EGSMSignalling/

Purpose: 1) To verify that the MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported ba the MS as declared in a PICS/PIXIT statement, starts to initiate an immediate assignment procedure bz sending the CHANNEL REQUEST message.

2) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after having successfully performed authenticiation and cipher mode setting procedures, after having sent a SETUP message, after having received a CALL PROCEEDING message followed by an ALERTING message and an ASSIGNMENT COMMAND message allocating an appropriate TCH, the MS sends an ASSIGNMENT COMPLETE message.

3) To verify that subsequently, after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message returns a CONNECT ACKNOWLEDGE message.

4) To verify that after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message attaches the user connection to the radion path. (This is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT message, where the MS is sending appropriate speech or data frames whenever it doesn't have to transmit or acknowledge an I frame on layer 2 of the FACCH.)

Test Case Name: TC_26_10_3_2

Group: GSM_L3_MS_v4190/EGSMSignalling/

Purpose: 1) To verify that the MS in the "idle, no IMSI" state (no SIM inserted) when made to call the number 112, sends a CHANNEL REQUEST message with establishment cause "emergency call".

2) To verify that after assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel is a CM SERVICE REQUEST message specifiying the correct CKSN and TMSI, with CM Service Type "emergency call establishment".

3) To verify that after receipt of a CM SERVICE ACCEPT message from the SS, the MS sends an EMERGENCY SETUP message.

4) To verify that subsequently, the SS having sent a CALL PROCEEDING message and then an ALERT message and having initiated the assignment procedure, the MS performs correctly that assignment procedure.

5) To verify subsequent correct performance of a connect procedure.

6) To verify that subsequently the MS has throught connected the TCH in both directions.

7) To verify that the call is cleared correctly.

Test Case Dynamic Behaviour

Test Case Name: TC_31_2_1_1_1

Group: GSM_L3_MS_v4190/SS/

Purpose: 1) To check that the MS correctly requests a supplementary service transaction for registration of call forwarding in CHANNEL REQUEST message.

2) To check that the MS correctly requests a supplementary service transaction for registration of call forwarding in the subsequent CM-SERVICE REQUEST.

3) To check that the MS sends a REGISTER message containing the invoke of the RegisterSS operation with the expected parameter values for registration of call forwarding.

4) To check that upon receipt of the result of the operation (in a RELEASE COMPLETE message), the MS provides the appropriate user indication (as described by the manufacturer).

These checks are done for :

a) CFNRy, for basic service group speech,

b) CFU, for basic service group all facsimile.

Test Case Name: TC_31_2_1_1_2

Group: GSM_L3_MS_v4190/SS/

Purpose: 1) To check that the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of registration of call forwarding, sending a CM-SERVICE REQUEST.

2) To check that the MS sends a REGISTER message containing the invoke of the RegisterSS operation with the expected parameter values for registration of call forwarding.

3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.

4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

These checks are performed with a call transaction already established for :

a) CFB, for all asynchronous services, the RELEASE COMPLETE message being sent with a facility IE containing a return_error(error) where error is "Bearer Service not provisioned".

b) CF, for all facsimile, the RELEASE COMPLETE message being sent with a facility IE containing a reject(invoke_problem) where invoke_problem is "resource limitation".

1. To setup a physical channel as BCCH, CCCH and SDCCH4 with default parameters.
2. To initiate an ActivateSS operation of call forwarding service for CF (all synchronous services).
3. To initiate an ActivateSS operation of call forwarding service for CFU (all basic services).
4. To return the ReturnResult of SSoperation by FACILITY message.
5. To return the ReturnResult of SSoperation by RELEASE COMPLETE message.

Test Case Name: TC_31_2_1_4

Group: GSM_L3_MS_v4190/SS/

Purpose: 1) To check that the MS correctly requests a supplementary service transaction for deactivation of call forwarding in CHANNEL REQUEST message.

2) To check that the MS correctly requests a supplementary service transaction for deactivation of call forwarding in the subsequent CM-SERVICE REQUEST.

3) To check that the MS sends a REGISTER message containing the invoke of the DeactivateSS operation with the expected parameter values for deactivation of call forwarding.

4) To check that upon receipt of the result of the operation (in a RELEASE COMPLETE message), the MS provides the appropriate user indication (as described by the manufacturer).

These checks are done for :

a) CFC, for basic service group speech.

b) CFNRc, for basic service group all facsimile.

Test Case Dynamic Behaviour

Test Case Name: TC_31_2_1_6_2

Group: GSM_L3_MS_v4190/SS/

Purpose: 1) To check that the MS correctly requests the establishmnt of a parallel MM transaction for supplementary service transaction of interrogation of a specific call forwarding service, sending a CM-SERVICE REQUEST.

2) To check that the MS sends a REGISTER message containing the invoke of the InterrogateSS operation with the expected parameter values for interrogation of call forwarding.

3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.

4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

These checks are performed with a call transaction already established for :

a) CFNRc, for all basic service group, the RELEASE COMPLETE message being sent with a facility IE containing a return_error(error) where error is "SS not available".

b) CFB, for all facsimile, the RELEASE COMPLETE message being sent with a facility IE containing a reject(invoke_problem) where invoke_problem is "resource limitation".

Group: GSM_L3_MS_v4190/SS/

Purpose: 1) To check that when an outgoing call is being established, if the ALERTING message is received with the facility information element containing an SS notification, the MS correctly reaches CC state U4. This is tested for CFU.

2) As an outgoing call is being established, if the ALERTING message is received with the facility information element containing an SS notification, the MS provides the appropriate user indication (which is to be described by the manufacturer). This is tested for CFU.

3) As an outgoing call is being established, if the CONNECT message is received with the facility information element containing an SS notification, the MS normally sends a CONNECT ACK message and enter CC state U10. This is tested for CFC.

4) As an outgoing call is being established, if the CONNECT message is received with the facility information element containaining an SS notification (for CFU or CFC), the MS provides the appropriate user indication (which is to be described by the manufacturer). This is tested for CFC.

Test Case Dynamic Behaviour

Test Case Name: TC_31_6_1_7

Group: GSM_L3_MS_v4190/SS/

Purpose: 1) To verify that when the MS invokes a Call Hold call and hence receives Facility IEs containing AOCC e-parameters for each chargeable call the MS returns a FACILITY message containing the AOCC acknowledgement within 1 second of transmission of each set of e-parameters.

2) To verify that when the MS invokes a Call Hold call and hence receives Facility IEs containing CAI elements for each chargeable call the CCM records the sum of all the charges for the services currently being used and hence that the ME inserts the correct charge in the ACM field of the SIM.

Purpose: 1) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum value, the ACMM, any outgoing calls in progress for which a non-zero CAI exists are terminated by the ME, once the chargeable interval determinined by the CAI has elapsed, with an appropriate indication given to the user.

2) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum limit, the ACMM, the making of non-emergency calls is inhibited

3) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum limit, the ACMM, the making of emergency calls is uninhibited

Default: OtherEventsFail

Comments: The ACM is reset to zero and the ACMmax is set to 2 units before starting the test

Test Case Name: TC_31_6_2_5

Group: GSM_L3_MS_v4190/SS/

Purpose: 1) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum value, the ACMM, any mobile terminating calls in progress for which a non-zero CAI exists are terminated by the ME, once the chargeable interval determinined by the CAI has elapsed, with an appropriate indication given to the user.

2) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum value, the ACMM, and an incoming call is received for which subsequently a non-zero CAI is received, then the call is terminated by the ME with an appropriate indication given to the user.

3) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum limit,

Purpose: 1) To check that the MS correctly requests a supplementary service transaction for registration of a password for all call restriction services in CHANNEL REQUEST message.

2) To check that the MS correctly requests a supplementary service transaction for registration of a password for all call restriction services in the subsequent CM-SERVICE REQUEST.

3) To check that the MS sends a REGISTER message containing the invoke of the RegisterPassword operation with the expected parameter values for registration of a password for all barring services.

4) To check that when the mobile subscriber wants to register a new password, the old password the new and the repeat of the new password shall be entered into the MS before the MS sends to the network a CHANNEL REQUEST..

5) To check that the MS is able to send a password by sending a FACILITY message in accordance to the user request (MMI actions).

6) To check that upon receipt of the result of the procedure, contained in RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the manufacturer).

These checks are done for:

all barring services, the result of the operation being sent in a RELEASE COMPLETE message

1. To set up traffic channel.
2. To establish a mobile originating call, bring the MS into state U10.
3. To initiate the Registration of password supplementary service.
4. Received the wrong password.
5. Negative password check, indefinite form.
6. Check whether the MS provides correct MMI user indication.

Test Case Dynamic Behaviour

Test Case Name: TC_31_8_1_2_3

Group: GSM_L3_MS_v4190/SS/

Purpose: 1) To check that, when a call transaction is already established, the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of registration of a password for all call restriction services, sending a CM-SERVICE REQUEST.

2) To check that the MS sends a REGISTER message containing the invoke of the RegisterPassword operation with the expected parameter values for registration of a password for all call restriction services.

3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.

4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

Those checks are performed with a call transaction already established for :

all call restriction services, the RELEASE COMPLETE message being sent at the end of the procedure with a facility IE containing a return_error(error) where error is "PasswordRegistrationFailure" with diagnostic "new password mismatch".

Test Case Dynamic Behaviour

Test Case Name: TC_31_8_3_1

Group: GSM_L3_MS_v4190/SS/

Purpose: 1) To check that the MS correctly requests a supplementary service transaction for activation of a specific call restriction service in CHANNEL REQUEST message.

2) To check that the MS correctly requests a supplementary service transaction for activation of call restriction service in the subsequent CM-SERVICE REQUEST.

3) To check that the MS sends a REGISTER message containing the invoke of the ActivateSS operation with the expected parameter values for activation of a specific call restriction service.

4) To check that upon receipt of FACILITY message requiring the password, the MS provides the appropriate user indication (as described by the manufacturer).

5) To check that the MS is able to send a password by sending a FACILITY message in accordance to the user request (MMI actions).

6) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (which is to be described by the manufacturer).

These checks are done for:

a) BAOC, for basic service group "all synchronous services" the result of the operation being sent in a FACILITY message.

b) BICRoam, for all basic service groups, the result of the operation being sent in a RELEASE COMPLETE message.

2. To establish a mobile originating call, bring the MS into state U10.
3. To initiate the Activation supplementary service.
4. To enter password.
5. ReturnError indication negative password checking.
6. The user indication is correct, pass.

Test Case Dynamic Behaviour

Test Case Name: TC_31_8_4_1

Group: GSM_L3_MS_v4190/SS/

Purpose: 1) To check that the MS correctly requests a supplementary service transaction for deactivation of a group of call barring services in CHANNEL REQUEST message.

2) To check that the MS correctly requests a supplementary service transaction for deactivation of a group of call barring services in the subsequent CM-SERVICE REQUEST.

3) To check that the MS sends a REGISTER message containing the invoke of the DeactivateSS operation with the expected parameter values for deactivation of a group of call restriction services.

4) To check that upon receipt of FACILITY message requiring the password, the MS provides the appropriate user indication (as described by the manufacturer).

5) To check that the MS is able to send a password by sending a FACILITY message in accordance to the user request (MMI actions).

6) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (which is to be described by the manufacturer).

These checks are done for:

a) all restrictions, for basic service group "speech".

b) barring of outgoing calls, for all facsimile.

Purpose: 1) To check that, when a call transaction is already established, the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of a group of call barring services, sending a CM-SERVICE REQUEST.

2) To check that the MS sends a REGISTER message containing the invoke of the DeactivateSS operation with the expected parameter values for a group of call barring services.

Test Case Dynamic Behaviour

Test Case Name: TC_31_9_1_1

Group: GSM_L3_MS_v4190/SS/

Purpose: 1)To verify that the mobile station invokes an USSD request by sending a REGISTER message to the network containing a ProcessUnstructruredSS-Request invoke component. This message will contain the alphabet indicator set to "SMS default alphabet" and the lenguage indicator set to "language unspecified". The ussd-string parameter shall contain the following digits and symbols depending on the operation initiated:

Activation *NN(N)# (no supplementary information included)
*NN(N)*SI#(one field of supplementary information included)
*NN(N)*SIA*SIB#(two fields of supplementary information included)

Dectivation #NN(N)# (no supplementary information included)
#NN(N)*SI#(one field of supplementary information included)
#NN(N)*SIA*SIB#(two fields of supplementary information included)

Interrogation *#NN(N)# (no supplementary information included)
*#NN(N)*SI#(one field of supplementary information included)
*#NN(N)*SIA*SIB#(two fields of supplementary information included)

Registration **NN(N)# (no supplementary information included)
**NN(N)*SI#(one field of supplementary information included)
**NN(N)*SIA*SIB#(two fields of supplementary information included)

Erasure ##NN(N)# (no supplementary information included)
##NN(N)*SI#(one field of supplementary information included)
##NN(N)*SIA*SIB#(two fields of supplementary information included)

Operations not yet defined in GSM 02.30 (see 2)

NN(N) features a set of service codes which have not yet been allocated for GSM supplementary services (see GSM 02.30 for service codes already specified).
N is a digit within 1..9 and SI, SIA, SIB strings of characters.

2)To check that the entry of 1 or 2 characters defined in the GSM 03.38 default alphabet followed by "SEND" shall be interpreted by the MS as an USSD request unless the MS is not engaged in a call and the first of the two character entry followed by "SEND " is a "1".

3) To verify that, for supplementary service procedures independent of any call, the initating side must establish a MM-connection between the network and the mobile station according to the rules in TS GSM 4.07 and 4.08.

4) To verify that, within a call the MS shall transmit a USSD request if any. See TS GSM 4.07 and 4.08 for the hanndling of multiple MM connections.

5) To check that upon receipt of the RELEASE COMPLETE message, the MS shall display the information contained to the user in a way described by the manufacturer.

Test Case Dynamic Behaviour

Test Case Name: TC_31_9_1_2

Group: GSM_L3_MS_v4190/SS/

Purpose: 1)To verify that if a mobile initiated USSD request using protocole version 2 is rejected by the network, and the reason for the rejection is indicated either by the problem code "unrecognized operation" or a cause "facility rejected", the mobile station shall assume that the network only supports protocole version 1 of USSD operation. The mobile station shall re-attempt the request by using the appropriate protocole version 1 USSD operation without a SS version indicator if the unstructured data entered by teh user can be coded as an IA5 string.

2)To check that, upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer). If ussd-string information is included this shall be given to the user (in a way described by the manufacturer).

Purpose: 1) To verify that for a USSD request, the MS shall display the text provided and await user input. If the user enters a response, the MS shall acknowledge the operation by sending a FACILITY message containing an empty result component to the network

2) To verify that the MS includes alphabet and language indicators in the response to the network. The alphabet indicator shall indicate "SMS default alphabet". The language indicator shall indicate "language unspecified".

3)To check that the MS is able to process the opeation during a call or out of a call.

Group: GSM_L3_MS_v4190/SS/

Purpose: To check that the entry of two digits in the form !X (X in the set 0..9) followed by SEND is accepted by the mobile station in idle mode as a normal call establishment for the 1X number. It is checked that the MS sends a CHANNEL REQUEST, sends CM SERVICE REQUEST message for mobile originated call (after having received an IMMEDIATE ASSIGNMENT), and then sends the SETUP message containing the 1X phone number as called number (after having received the CM SERVICE ACCEPT message)

Test Case Dynamic Behaviour

Test Case Name: TC_34_2_3

Group: GSM_L3_MS_v4190/SM/

Purpose: 1. To verify that the MS sends the correct acknowledgement when its memory in the SIM becomes full.

2. To verify that the MS sends the correct acknowledgement when its memory in the ME and the SIM becomes full, and sets the "memory exceeded" notification flag in the SIM.

3. To verify that the MS performs the "memory available" procedure when its message store becomes available for receiving short messages, and only at this moment.

Purpose: To verify that the MS acts correctly on receiving a class 2 message, i.e. that it stores the message correctly in the SIM, and if this is not possible, returns a protocol error message, with the correct error cuase, to the network. There are 2 cases. (1) If the MS supports storing of short messages in the SIM and in the ME, and storage in the ME is not full, and the short message cannot be stored in the SIM, the error cause shall be "protocol error, unspecified". (2) If the MS supports storing of short message in the SIM and not in the ME and short message cannot be stored in the SIM, the error cause shall be "memory capacity exceeded".

Detailed Comments:

The BS2x Bearer Capabilities and SETUP messages for MO is constructed according to section 11.8.2.1.1.1, section 11.8.2.1.1.2, section 11.8.2.1.1.3 and section 11.8.2.1.1.4 of GSM 11.10 and section B.1.2.1, section B.1.2.2, section B.1.2.1 and section B.2.2.2 of GSM 07.01.

The algorithm for selecting parameters:

```
IF (TSPX_BS_2x_T_NT)
        TCV_ce := C_notransparent
ELSE
        TCV_ce := TSPX_BS_2x_ce
```

2. validate IXIT values.
3. generate SETUP.
4. IXIT error, BS31 does not support X32.
5. IXIT error, UDI non-X32 case has no non transparent mode.
6. IXIT error, 3.1kHz non-X32 case has no non transparent mode.
7. IXIT error, UDI X32 case has no transparent mode.
8. IXIT error, 3.1kHz case has no X21 signalling access protocol.

Detailed Comments:

The BS4x Bearer Capabilities and SETUP messages for MO is constructed according to section 11.8.2.3.1.1 and section 11.8.2.3.1.2 of GSM 11.10 and section B.1.4 and section B.2.2.1 of GSM 07.01.

The algorithm for selecting parameters:

```
IF (TSPX_BS_4x_T_NT)
        IF (user rate is one of the C_300bs, C_120075bs, C_4800bs)
                TCV_ce := C_notransparent
        ELSE   /* user rate is one of C_1200bs, C_2400bs, C_9600bs \

4. The BS61 or BS81 Bearer Capabilities and SETUP messages for MO is constructed according to section 11.8.2.5.1, section 11.8.2.5.2 and section 11.8.2.5.3 of GSM 11.10 and section B.1.6.1, section B.1.6.2.1, section B.1.6.2.2, section B.2.2.2 and section B.2.3.2 of GSM 07.01.

The algorithm for selecting parameters for BS61 basice service:

Detailed Comments:

The algorithm for derivation of BS61 Bearer Capabilities:

The data Bearer Capability for 1st SETUP (used for an MT call):

```
IF TSPX_BS_61_A
    ur= TSPX_BS_61_A_ur1
    IF TSPX_BS_61_A_ur1_T_NT OR (TSPX_BS_61_A_ur1_ce = NT)
        use coding of sec. 11.8.1.3.2 with (ur & ce=NT)
    ELSE
        use coding of sec. 11.8.1.3.1 with (ur & ce=T)
ELSE
   IF TSPX_BS_61_S
    ur= TSPX_BS_61_S_ur1 use coding of sec. 11.8.1.3.3 with (ur & ce=T)
```

The 2nd Bearer Capability for second SETUP (used for TC_11_1_1):

```
    Note: the 2nd BC is derived IF
     (TSPX_BS_61_A OR (TSPX_BS_61_S AND TSPX_BS_61_S_more_ur))

IF TSPX_BS_61_A AND TSPX_BS_61_S
    ur= TSPX_BS_61_S_ur1 use coding of sec. 11.8.1.3.3 with (ur & ce= T)
ELSE
    IF TSPX_BS_61_A_more_ur  AND TSPX_BS_61_A
          ur= TSPX_BS_61_A_ur2
        IF TSPX_BS_61_A_ur2_T_NT
            use coding of sec. 11.8.1.3.1 with (ur & ce=T)
        ELSE
            use coding of sec. 11.8.1.3.2 with (ur & ce=both/T)
    ELSE
        IF TSPX_BS_61_S AND TSPX_BS_61_S_more_ur
            ur=TSPX_BS_61_S_ur2
            use coding of sec. 11.8.1.3.3 with (ur & ce= T)
        ELSE
            IF TSPX_BS_61_A
                ur= TSPX_BS_61_A_ ur1
              IF TSPX_BS_61_A_ur1_T_NT
                use coding of sec. 11.8.1.3.1 with (ur & ce=T)
              ELSE
                use coding of sec. 11.8.1.3.2 with (ur & ce=both/T)
```

The algorithm for derivation of BS81 Bearer Capabilities is same as above except all parameters are changed to corresponding BS81's parameters.

Test Step Dynamic Behaviour

Test Step Name: CallCfmGen(svc:SERVICES; rate:RATE)
Group: GSM_L3_MS_v4190/Preambles/
Objective: To generate a CALL COMFIRMED based on the service and rate, as well as on several IXIT parameters, itc, ce, ur, synchronous bit for verifying received CALL COMFIRMED message.
Default: OtherEvents
Comments: Used only for TC_11_2

Test Step Dynamic Behaviour

Test Step Name: Chmod(rate:RATE; ce:B_2; ur:B_4; svc:SERVICES)

Group: GSM_L3_MS_v4190/Preambles/

Objective: To assign correct values to the test case variables TCV_ChMod and TCV_ChModb.

Default: OtherEvents

Comments: The rules for assignment are in Table 10-1 of GSM 11.10 section 10.3. If the value for ce is "BothT", the rule for transparent is used. If the value for ce is "BothNT", the rule for non transparent is used. That means the preferred value will be used in test configuration.

Annex B: Partial IXIT proforma

Notwithstanding the provisions of the copyright clause related to the text of this ETS, ETSI grants that users of this ETS may freely reproduce the PIXIT proforma in this annex so that it can be used for its intended purposes and may further publish the completed PIXIT.

Introduction

This partial IXIT proforma contained in this ETS, after augmented by the Test Realizer, is proposed to be provided to the client for completion, when the related Abstract Test Suite is to be used against client's Implementation Under Test (IUT).

Text in *italics* is comments for guidance for the production of a IXIT, and is not to be included in the actual IXIT.

The completed IXIT will normally be used in conjunction with the completed ICS, as it adds precision to the information provided by the ICS.

B.1 Identification Summary

This table is completed by the test laboratory. The item "Contract References" is optional.
