15.5.8.5 Test requirement

Table 15.5.8.5-1 defines the primary level settings including test tolerances for the test.

Table 15.5.8.5-1: UE Rx-Tx time difference measurement accuracy test parameters.

Parameter	Unit	Test configuration	Cell 1	Cell 2
AoA setup		1	Setup 1 as specified in TS 38.133 clause A.3.15	
$BW_{channel}$	MHz	1	100: $N_{RB,c}$ = 66	
Beam Assumption Note 6		1	Rough	Rough
DRX	s	1	0.64	
Time offset with Cell 1	µs	1	N/A	3
TDD configuration		1	TDDConf.3.1	TDDConf.3.1
PDSCH RMC configuration		1	SR.3.1 TDD	N/A
RMSI CORESET RMC configuration		1	CR.3.1 TDD	N/A
Dedicated CORESET RMC configuration		1	CCR.3.1 TDD	N/A
OCNG Patterns		1	OP.1	OP.1
Initial BWP configuration		1	DLBWP.0.1 ULBWP.0.1	N/A
PRS configuration		1	PRS.1.5 FR2	PRS.1.5 FR2
PRS Resource slot offset	slot	1	0	4
SRS configuration		1	POS-SRS.3	N/A
N_{oc} Note 1	dBm/SCS	1	-89	
N_{oc} Note 1	dBm/15 kHz	1	-98	
PRS $\hat{E}_s / I_{ot}$	dB	1	-2.41	-12.12
PRS $\hat{E}_s / N_{oc}$	dB	1	-2	-10
PRS-RSRP Note 2	dBm/SCS kHz	1	-91	-99

Io	dBm/92.16 MHz	1	-57.6	-57.6
Propagation Condition		1	AWGN	

NOTE 1: Interference from other cells and noise sources not specified in the test is assumed to be constant over sub-carriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 2: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 3: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
NOTE 5: As observed with 0 dBi gain antenna at the centre of the quiet zone
NOTE 6: Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 7: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 36.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.

Table 15.5.8.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1	NR cell 1	(Measured value from step 12 - 63) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 63) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 65) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 65) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.5.8.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.5.9 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE with Rx FH

15.5.9.1 Test purpose

The purpose of this test is to verify that the UE Rx-Tx measurement accuracy in FR1 with FH by a RedCap UE in RRC_INACTIVE state is within the specified limits. This test will verify the requirements in TS 38.133 [50] clauses 10.1A.18.2.3 and 10.1A.18.2.4.

15.5.9.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method and DL-PRS measurement in RRC_INACTIVE and maximumPRS-BandwidthAcrossAllHopsFR1 for at least one band and PRS frequency hopping measurement and report.

15.5.9.3 Minimum conformance requirements

Same as clause 15.3.11.3.

15.5.9.4 Test description

The test defines three possible test configurations; specified in Table 15.5.9.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.5.9.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, cell bandwidth 50 MHz, FDD duplex mode
2	15 kHz SSB SCS, cell bandwidth 50 MHz, TDD duplex mode
3	30 kHz SSB SCS, cell bandwidth 100 MHz, TDD duplex mode
4	15 kHz SSB SCS, cell bandwidth 50 MHz, HD-FDD duplex mode
NOTE 1: The RedCap UE is only required to be tested in one of the supported test configurations. NOTE 2: This test case is applicable to the UE supporting per hop bandwidth ≥ 10 MHz for SCS 15 kHz. NOTE 3: This test case is applicable to the UE supporting per hop bandwidth = 20 MHz for SCS 30 kHz.	

15.5.9.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.5.9.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.5.9.5-1 and Table 15.5.9.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.5.9.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.5.9.4.2 Test procedure

Same as defined in clause 15.5.1.4.2.

15.5.9.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.5.9.4.3-1 replaces Table 15.4.1.4.3-7, Table 15.5.9.4.3-2 replaces Table 15.4.1.4.3-8, Table 15.5.9.4.3-3 replaces Table 15.4.1.4.3-12 and Table 15.5.9.4.3-4 replaces Table 15.4.1.4.3-13.

	dBm/48.6MHz	2	-60.51	-60.51
	dBm/48.6MHz	4	-60.51	-60.51
	dBm/98.28MHz	3	-57.46	-57.46
Propagation Condition		1, 2, 3, 4	AWGN	

NOTE 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

NOTE 3: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Table 15.5.9.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Cell	Lowest reported value	Highest reported value
1&2&4 (15kHz)	NR cell 1	(Measured value from step 12 - 135) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 135) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6

		(Measured value from step 12 – 135) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 135) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 166) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 166) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 172) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 172) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
3 (30kHz)	NR cell 1	(Measured value from step 12 - 105) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 105) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 102) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 102) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 126) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 126) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 130) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 130) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.5.9.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.5.10 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE with Rx FH

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

15.5.10.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement requirements with FH by RedCap UE in RRC_INACTIVE state are within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1A.18.2.3 and 10.1A.18.2.4. The test is conducted in AWGN propagation condition in FR2 in standalone scenario.

15.5.10.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method and DL-PRS measurement in RRC_INACTIVE and maximumPRS-BandwidthAcrossAllHopsFR2 for at least one band and PRS frequency hopping measurement and report.

15.5.10.3 Minimum conformance requirements

Same as clause 15.3.11.3.

15.5.10.4 Test description

The supported test configuration is listed in Table 15.5.10.4-1.

Table 15.5.10.4-1: Test Configuration

Configuration	Description
1	120 kHz SSB SCS, cell bandwidth 400 MHz, TDD duplex mode
NOTE 1: This test case is applicable to the UE supporting per hop bandwidth = 100 MHz for SCS 120 kHz.	

15.5.10.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.5.10.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.5.10.5-1 and Table 15.5.10.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.5.10.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.5.10.4.2 Test procedure

Same as defined in clause 15.5.1.4.2.

15.5.10.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.5.10.4.3-1 replaces Table 15.4.1.4.3-7, Table 15.5.10.4.3-2 replaces Table 15.4.1.4.3-8, Table 15.5.10.4.3-3 replaces Table 15.4.1.4.3-11, Table 15.5.10.4.3-4 replaces Table 15.4.1.4.3-12, and Table 15.5.10.4.3-5 replaces Table 15.4.1.4.3-13.

Propagation Condition		1	AWGN	

NOTE 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
NOTE 6: As observed with 0 dBi gain antenna at the centre of the quiet zone.
NOTE 7: Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 8: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 36.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.

Table 15.5.10.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Cell	Lowest reported value	Highest reported value
1	NR cell 1	(Measured value from step 12 - 63) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 63) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 83) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 83) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.5.10.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

16 NR PRS-RSRP measurement requirements

16.1 General

This clause defines the minimum performance requirements for NR UEs capable of PRS-RSRP measurements.

16.2 NR PRS-RSRP measurement period test cases in RRC_CONNECTED

16.2.1 PRS-RSRP measurement period test case for single positioning frequency layer in FR1 SA

16.2.1.1 Test purpose

The purpose of the test is to verify that the PRS-RSP measurement meets the requirements specified in TS 38.133 [50] Clause 9.9.2 in an environment with AWGN propagation conditions in FR1 in standalone scenario when single positioning frequency layer is configured.

16.2.1.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports DL-TDOA positioning and PRS-RSRP measurements in FR1.

16.2.1.3 Minimum conformance requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in Clause 9.9.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms.

$$T_{PRS-RSRP,\ total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max\left(T_{effect,i}\right)$$

where

i is the index of positioning frequency layer,

L is total number of positioning frequency layers,

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$T_{PRS-RSRP,i} = \left(CSSF_i * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last}$$

where

$CSSF_i$ is the carrier specific scaling factor for PRS-RSRP measurements specified in clause 9.1.5.2,

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including those overlapped with other MG occasions within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 and if positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],

N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

N_{sample} is the number of PRS-RSRP measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = [2] if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 4 otherwise.

$T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time, if not all PRS resources to be measured are available in the same measurement gap occasion during $T_{available_PRS,i}$, otherwise $T_{last,i} = T_i + MGL$,

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

T_i corresponds to durationOfPRS-ProcessingSymbolsInEveryTms in TS 37.355 [34],

$T_{available_PRS,\mathrm{i}} = LCM(T_{PRS,\mathrm{i}}, MGRP_{\mathrm{i}})$ is the least common multiple between $T_{PRS,\mathrm{i}}$ and $MGRP_{\mathrm{i}}$,

$T_{PRS,\mathrm{i}}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$MGRP_{\mathrm{i}}$ is the measurement gap repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,\mathrm{i}}$, where:

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

Note: For the purpose of calculating $T_{PRS,\mathrm{i}}$, only the PRS resources fully or partially covered by the MG are considered.

When PRS-RSRP measurements are configured for DL-AoD, except for deferred MT-LR as defined in clause 4.1a.5 [TS 23.273], the time $T_{PRS-RSRP,total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data after both the *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

For deferred MT-LR with other event than "Periodic Location" as defined in clause 4.1a.5.1 [TS 23.273], the time $T_{PRS-RSRP,total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event "Periodic Location" as defined in clause 4.1a.5.1 [TS 23.273], the UE shall perform the PRS-RSRP measurement in each reporting period and activate the location report at the time when the periodic timer expires.

Note: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When the PRS-RSRP measurement is configured together with RSTD measurement then the PRS-RSRP measurement shall meet the RSTD measurement requirements defined in clause 9.9.2.

When the PRS-RSRP measurement is configured together with UE Rx-Tx time difference measurement then the PRS-RSRP measurement shall meet the UE Rx-Tx time difference measurement requirements defined in clause 9.9.4.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource:

– if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,\mathrm{i}}$ or

– if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If during the measurement period of one or more positioning frequency layers, the MG pattern is reconfigured either per UE request or not per UE request, the measurement period can be longer.

The requirements in this section apply, provided no PRS symbols are dropped during the measurement period $T_{PRS-RSRP,total}$ within measurement gaps due to collisions with other signals; otherwise, a longer measurement period may be used.

The requirements in clause 9.9.3 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-AoD-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while PRS-RSRP measurements are being performed then the UE shall complete the ongoing PRS-RSRP measurements session. The PRS-RSRP measurement period can be longer. The UE shall meet the PRS-RSRP measurement accuracy requirements in clause 10.1.24.

16.2.1.4 Test description

16.2.1.4.1 Initial conditions

The test is defined with three possible Test Configurations. In the case that the UE supports more than one of these Test Configurations, then the UE is only required to be tested in one of the Test Configurations, chosen by the UE. The defined Test Configurations are specified in Table 16.2.1.4.1-1.

Table 16.2.1.4.1-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.12.
2. The general test parameter settings are set up according to Table 16.2.1.5-1 and Table 16.2.1.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.2.1.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the PCell. Cell 2 is the neighbour cell. The cells are on the same RF channel in FR1

16.2.1.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. Both cells transmit PRS during T2.

The *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message as defined in TS 37.355 [49] shall be provided to the UE during T1. The last slot containing the two messages for the assistance data and location information request is denoted as #n.

The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources that is ΔT after slot #n, where ΔT = 50 ms is the maximum processing time of the assistance data and location information request.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On,* according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.2.1.5-1 and Table 16.2.1.5-2 as appropriate. Propagation conditions are set according to clause 4.16.2.
4. T1 starts.
5. The SS shall send an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the NR-DL-AoD-ProvideCapabilities IE.

7. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the nr-DL-AoD-ProvideAssistanceData-r16 IE. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

8. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-DL-AoD-RequestLocationInformation-r16 such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.

9. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 16.2.1.5-2.

10. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the nr-DL-AoD-ProvideLocationInformation-r16 IE within the response time (see clause 4.16.3). The UE shall perform and report the PRS-RSRP measurements for both Cell 1 and Cell 2. If the UE transmits an nr-DL-AoD-ProvideLocationInformation-r16 IE including the nr-DL-PRS-RSRP-Result-r16 field for Cell 1 and Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the nr-DL-AoD-ProvideLocationInformation-r16IE with the DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.

11. If the UE message at step 10 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

12. Repeat step 2-11 until the confidence level according to Annex D is achieved.

16.2.1.5 Test requirement

Table 16.2.1.5-1 and Table 16.2.1.5-2 define the primary level settings including test tolerances for the test.

Table 16.2.1.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Reference cell		1, 2, 3	Cell 1	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		1, 2, 3	Cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
RF Channel Number		1, 2, 3	1: Cell 1 and Cell 2	
$BW_{channel}$	MHz	1	20: NRB,c = 106	
		2	20: NRB,c = 106	
		3	50: NRB,c = 133	
SSB configuration		1	SSB.1 FR1	
		2	SSB.1 FR1	
		3	SSB.2 FR1	
SMTC configuration		1	SMTC.2	
		2	SMTC.1	
		3	SMTC.1	
Measurement gap		1, 2, 3	GP#24 or GP#0 Note 1	
CP length		1, 2, 3	Normal	
DRX		1, 2, 3	NA	OFF
Time offset between serving and neighbour cells	µs	1, 2, 3	3	Synchronous cells
Expected RSTD	µs	1, 2, 3	3	
Expected RSTD uncertainty	µs	1, 2, 3	5	
Number of cells provided in assistance data		1, 2, 3	4	Including the reference cell
T1	s	1, 2, 3	2	
T2	s	1, 2, 3	5	
NOTE 1: GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

Propagation Condition		1, 2, 3	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE shall perform and report the PRS-RSRP measurements for Cell 1 and Cell 2, within the time limit specified in clause 16.2.1.3, starting from the beginning of time interval T2.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRP measurement period plus ΔT, where ΔT = 50 ms. The RSTD measurement period follows the equation:

$$T_{PRS-RSRP,i} = \left(CSSF_{PRS,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $CSSF_{PRS,i} = 1$, $N_{RxBeam,i} = 1$, $N_{PRS,i}^{slot} = 4$, $N_{sample} = 4$, $L_{available_PRS,i} = 1.143ms\ for\ SCS\ 15kHz\ and\ 0.571\ for\ SCS\ 30kHz$. N is the parameter *durationOfPRS-ProcessingSysmbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(\left\lceil \frac{4}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * 4 - 1 \right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities.

Depending on the UE Buffering defined in clause 5.1.6.5 of TS 38.214 [26]:

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 15kHz the LPP time IE ranges between 0.648s and 204.9s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 16.2.1.4.3-3. The LPP time IE ranges between 1s and 210s.

Similarly for Type 2 Buffering, Best Case result of 0.648s is 1s and for the worst-case result of 164160ms, rounded to the next multiple of ten-seconds, the final value is 17s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 210.3s.

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 30kHz the LPP time IE ranges between 0.648s and 102.56s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 16.2.1.4.3-3. The LPP time IE ranges between 1s and 103s.

Similarly for Type 2 Buffering, Best Case result of 0.648s is 1s and for the worst-case result of 82080ms, rounded to the next multiple of ten-seconds, the final value is 83s

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 103.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 16.2.1.5-4, Table 16.2.1.5-5 and Table 16.2.1.5-6 for reference.

n1280	1280	1440

The test tolerances are defined in clauses C.1.6, C 2.5 and C4.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.2.2 PRS-RSRP measurement period test case for dual positioning frequency layer in FR1 SA

16.2.2.1 Test purpose

The purpose of the test is to verify that the PRS-RSP measurement meets the requirements specified in TS 38.133 [50] Clause 9.9.2 in an environment with AWGN propagation conditions in FR1 in standalone scenario when dual positioning frequency layer is configured.

16.2.2.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports DL-TDOA positioning and PRS-RSRP measurements in FR1.

16.2.2.3 Minimum conformance requirements

Same as in clause 16.2.1.3.

16.2.2.4 Test description

16.2.2.4.1 Initial conditions

The test is defined with three possible Test Configurations. In the case that the UE supports more than one of these Test Configurations, then the UE is only required to be tested in one of the Test Configurations, chosen by the UE. The defined Test Configurations are specified in Table 16.2.2.4.1-1.

Table 16.2.2.4.1-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Low for RF channel #1 and High for RF channel #2, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.12.
2. The general test parameter settings are set up according to Table 16.2.2.5-1 and Table 16.2.2.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.2.2.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the RSTD reference as well as the PCell on NR RF channel #1 in FR1. Cell 2 is a neighbour cell on a different NR RF channel #2 in FR1.

16.2.2.4.2 Test procedure

Same as clause 16.2.1.4.2.

Propagation Condition		1, 2, 3	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE shall perform and report the PRS-RSRP measurements for Cell 1 and Cell 2, within the time limit specified in clause 16.2.2.3, starting from the beginning of time interval T2.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRP measurement period plus ΔT, where ΔT = 50 ms. The PRS-RSRP measurement period follows the equation:

$$T_{PRS-RSRP,Total} = T_{PRS-RSRP,1} + T_{PRS-RSRP,2} + Max(T_{effect,i})$$

Given that both PFLs have the same settings, it can be simplified:

$$T_{PRS-RSRP,Total} = 2 * T_{PRS-RSRP,i} + T_{effect,i}$$

$$T_{PRS-RSRP,i} = \left(CSSF_{PRS,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where $CSSF_{PRS,i} = 1$, $N_{RxBeam,i} = 1$, $N_{PRS,i}^{slot} 2$, $N_{sample} = 4$, $L_{available_PRS,i} = 0.571ms\ for\ SCS\ 15kHz\ and\ 0.286\ for\ SCS\ 30kHz$. N is the parameter *durationOfPRS-ProcessingSysmbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$T_{PRS-RSRP,i} = \left(\left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities.

Depending on the UE Buffering defined in clause 5.1.6.5 of TS 38.214 [26]:

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 15kHz the LPP time IE ranges between 1.456s and 104s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 16.2.2.4.3-3. The LPP time IE ranges between 2s and 104s.

Similarly for Type 2 Buffering, Best Case result of 1,456s is 2s and for the worst-case result of 164160ms, rounded to the next multiple of ten-seconds, the final value is 17s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 104.3s.

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 30kHz the LPP time IE ranges between 1.456s and 63.04s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.2.4.3-3. The LPP time IE ranges between 2s and 64s.

Similarly for Type 2 Buffering, Best Case result of 1,456s is 2s and for the worst-case result of 82240ms, rounded to the next multiple of ten-seconds, the final value is 83s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 83.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 16.2.2.5-4, Table 16.2.2.5-5 and Table 16.2.2.5-6 for reference.

The test tolerances are defined in clauses C.1.6, C 2.5 and C4.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.2.3 PRS-RSRP measurement period test case for single positioning frequency layer in FR2 SA

16.2.3.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements specified in TS 38.133 [50] Clause 9.9.3.5. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

16.2.3.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports DL-AoD positioning and PRS-RSRP measurements in FR2.

16.2.3.3 Minimum conformance requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [49], the UE shall be able to measure multiple (up to the UE capability specified in TS 38.133 Clause 9.9.3.3) PRS-RSRP measurements, defined in TS 38.215 [57], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms.

$$T_{PRS-RSRP,total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max\left(T_{effect,i}\right)$$

where

i is the index of positioning frequency layer,

L is total number of positioning frequency layers,

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$T_{PRS-RSRP,i} = \left(CSSF_i * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last}$$

where

$CSSF_i$ is the carrier specific scaling factor for PRS-RSRP measurements specified in TS38.133 clause 9.1.5.2,

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 and $N_{RxBeam,i}$=8 if positioning frequency layer *i* is in FR2,

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [49] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [49] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [49],

N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [49],

N_{sample} is the number of PRS-RSRP measurement samples and N_{sample}= 4,

$T_{last} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time,

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

T_i corresponds to durationOfPRS-ProcessingSymbolsInEveryTms in TS 37.355 [49],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$ is the least common multiple between $T_{PRS,i}$ and $MGRP_i$,

$T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$MGRP_i$ is the measurement gap repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

16.2.3.4 Test description

The supported test configurations in listed in Table 16.2.3.4-1.

Table 16.2.3.4-1: Supported test configurations for PRS RSRP measurement for FR2

Config	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

16.2.3.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.3.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.2.3.5-1 and Table 16.2.3.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.2.3.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

16.2.3.4.2 Test procedure

The test consists of two successive time periods, with time duration of T1 and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2. Both cells transmit PRS during T2.

The NR-DL-AoD-RequestLocationInformation message and NR-DL-AoD-ProvideAssistanceData message as defined in TS 37.355 shall be provided to the UE during T1. The last slot containing the two messages for the assistance data and location information request is denoted as #n. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources that is ΔT after slot #n, where ΔT = 50 ms is the maximum processing time of the assistance data and location information request.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.2.3.5-1 and Table 16.2.3.5-2 as appropriate. Propagation conditions are set according to clause 4.16.2.
4. T1 starts.
5. The SS shall send an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the NR-DL-AoD-ProvideCapabilities IE.
7. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the nr-DL-AoD-ProvideAssistanceData-r16 IE. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
8. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-DL-AoD-RequestLocationInformation-r16 such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.
9. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 16.2.3.5-2.
10. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the nr-DL-AoD-ProvideLocationInformation-r16 IE within the response time (see clause 4.16.3). The UE shall perform and report the PRS-RSRP measurements for both Cell 1 and Cell 2. If the UE transmits an nr-DL-AoD-

ProvideLocationInformation-r16 IE including the nr-DL-PRS-RSRP-Result-r16 field for Cell 1 and Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the nr-DL-AoD-ProvideLocationInformation-r16IE with the DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.

11. If the UE message at step 10 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

12. Repeat step 2-11 until the confidence level according to Annex D is achieved.

16.2.3.5 Test requirement

Table 16.2.3.5-1 and Table 16.2.3.5-2 define the primary level settings including the test tolerances for the test.

Table 16.2.3.5-1: General test parameters for PRS RSRP measurement reporting delay

Parameter	Unit	Test configuration	Value	Comment
NR RF Channel Number		Config 1	1: Cell 1 and Cell 2	One TDD carrier frequency is used for the NR cells.
Active cell		Config 1	NR cell 1 (Pcell)	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		Config 1	NR cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
Gap Pattern Id		Config 1	GP#13 or GP#24[Note1]	As specified in TS 38.133 [50] clause 9.1.2-1.
Measurement gap offset		Config 1	39	
SMTC parameters		Config 1	SMTC.1	As specified in TS 38.133 [50] clause A.3.11
SSB parameters		Config 1	SSB.3 FR2	As specified in TS 38.133 [50] clause A.3.10.2
A3-Offset	dB	Config 1	-6	
Hysteresis	dB	Config 1	0	
CP length		Config 1	Normal	
TimeToTrigger	s	Config 1	0	
Filter coefficient		Config 1	0	L3 filtering is not used
DRX		Config 1	OFF	DRX is not used
Time offset between serving and neighbour cells		Config 1	3μs	Synchronous cells

Expected RSTD	µs	Config 1	3	
Expected RSTD uncertainty	µs	Config 1	5	
Number of cells provided in assistance data		Config 1	4	Including the reference cell
T1	s	Config 1	5	
T2	s	Config 1	7	
Note 1: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.

Io Note3	dBm/95.04 MHz Note5	Config 1	-58.07	-55.69	-58.07	-55.69
Propagation Condition		Config 1	AWGN			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: SSB_RP/PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone.
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

The PRS RSRP measurement time fulfils the requirements specified in TS 38.133 [50] Clause 9.9.3.5.The UE shall perform and report the PRS RSRP measurements for both Cell1 and Cell within the time duration specified in TS 38.133 [50] section 9.9.3.5 starting from the beginning of time interval T2.

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRP measurement for each correct event shall be within the PRS RSRP reporting range specified in TS 38.133 [50] Clause 10.1.24.3, i.e., between PRS RSRP_0 and PRS RSRP_126.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRP measurement period plus ΔT, where ΔT = 50ms. The PRS-RSRP measurement period follows the equation:

$$T_{PRS-RSRP,i} = \left(CSSF_i * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last}$$

Where $CSSF_{PRS,i} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.142$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.142}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 5.178s and 164.05s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 16.2.3.4.3-3. The LPP time IE ranges between 6s and170s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 170.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 16.2.3.5-3, Table 16.2.3.5-4 and Table 16.2.3.5-5 for reference.

Table 16.2.3.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

maxNumOfDL-PRS-ResProcessedPerSlot	$\left\lceil \frac{2}{N'} \right\rceil$
n1	2
>=n2	1

Table 16.2.3.5-4: value of N based on *durationOfPRS-ProcessingSysmbols*

durationOfPRS-ProcessingSysmbols	$\left\lceil \frac{0.142}{N} \right\rceil$
nDot125	2
>= nDot25	1

Table 16.2.3.5-5: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	T_{effect}	T_{last}
n8	160	168
n16	160	176
n20	160	180
n30	160	190
n40	160	200
n80	160	240
n160	160	320
n320	320	480
n640	640	800
n1280	1280	1440

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.2.4 PRS-RSRP measurement period test case for dual positioning frequency layer in FR2 SA

16.2.4.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements specified in TS 38.133 [50] Clause 9.9.3.5. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when dual positioning frequency layers are configured.

16.2.4.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports DL-AoD positioning and PRS-RSRP measurements in FR2.

16.2.4.3 Minimum conformance requirements

Same as in clause 14.2.1.3.

16.2.4.4 Test description

The supported test configurations in listed in Table 16.2.4.4-1.

Table 16.2.4.4-1: Supported test configurations for PRS RSRP measurement for FR2

Config	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

16.2.4.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Low Range for Cell 1 and High Range for Cell 2, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.4.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.2.4.5-1 and Table 16.2.4.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.2.4.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the different RF channel in FR2.

16.2.4.4.2 Test procedure

Same as defined in clause 16.2.3.4.2.

Propagation Condition			Config 1	AWGN			

Note 1:	OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	SSB_RPPRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4:	PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5:	Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6:	As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7:	Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

The PRS RSRP measurement time fulfils the requirements specified in TS 38.133 [50] Clause 9.9.3.5.The UE shall perform and report the PRS RSRP measurements for both Cell1 and Cell 2 within the time duration specified in TS 38.133 [50] section 9.9.3.5 starting from the beginning of time interval T2.

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRP measurement for each correct event shall be within the PRS RSRP reporting range specified in TS 38.133 [50] Clause 10.1.24.3, i.e., between PRS RSRP_0 and PRS RSRP_126.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRP measurement period plus ΔT, where ΔT = 50ms. The PRS-RSRP measurement period follows the equation:

$$T_{PRS-RSRP,i} = \left(CSSF_i * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last}$$

Where $CSSF_{PRS,i} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 1$, $L_{available_PRS,i} = 0.071$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 8 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 10.466s and 83.57s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 16.2.4.4.3-3. The LPP time IE ranges between 11s and 84s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 11.3s and 84.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 16.2.4.5-3, Table 16.2.4.5-4 and Table 16.2.4.5-5 for reference.

Table 16.2.4.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

maxNumOfDL-PRS-ResProcessedPerSlot	$\left\lceil \frac{1}{N'} \right\rceil$
>=n1	1

Table 16.2.4.5-4: value of N based on *durationOfPRS-ProcessingSysmbols*

durationOfPRS-ProcessingSysmbols	$\left\lceil \frac{0.071}{N} \right\rceil$
>= nDot25	1

Table 16.2.4.5-5: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	T_{effect}	T_{last}
n8	160	168
n16	160	176
n20	160	180
n30	160	190
n40	160	200
n80	160	240
n160	160	320
n320	320	480
n640	640	800
n1280	1280	1440

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.2.5 PRS-RSRP measurement reporting delay test case for single positioning frequency with reduced number of samples in FR1 SA

16.2.5.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements for reduced number of samples specified in TS 38.133 [50] Clause 9.9.3.5 for single positioning frequency layer under AWGN propagation conditions in FR1 in standalone scenario.

16.2.5.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

16.2.5.3 Minimum conformance requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in Clause 9.9.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms.

$$T_{PRS-RSRP,\ total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max\left(T_{effect,i}\right)$$

where

i is the index of positioning frequency layer,

L is total number of positioning frequency layers,

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$T_{PRS-RSRP,i} = \left(CSSF_i * ceil(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last}$$

where

$CSSF_i$ is the carrier specific scaling factor for PRS-RSRP measurements specified in clause 9.1.5.2,

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 and if positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],

N' is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

N_{sample} is the number of PRS-RSRP measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 4 otherwise.

$T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time, if not all PRS resources to be measured are available in the same measurement gap occasion during $T_{available_PRS,i}$, otherwise $T_{last,i} = T_i + MGL$,

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer i,

T_i corresponds to durationOfPRS-ProcessingSymbolsInEveryTms in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$ is the least common multiple between $T_{PRS,i}$ and $MGRP_i$,

$T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$MGRP_i$ is the measurement gap repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

16.2.5.4 Test description

16.2.5.4.1 Initial conditions

The supported test configurations in listed in Table 16.2.5.4-1.

Table 16.2.5.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.5.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.2.5.5-1 and Table 16.2.5.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.2.5.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.2.5.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2. All two cells transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources.

The *NR-DL-AoD-ProvideAssistanceData* and *NR-DL-AoD-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.11 shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the *DL-AoD assistance* data and location information request.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.2.5.5-1 and Table 16.2.5.5-2. Propagation conditions are set according to clause 4.16.2.
4. T1 starts.
5. The SS shall transmit an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
7. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
8. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *NR-DL-AoD-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
9. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 16.2.5.5-2.
10. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-AoD-ProvideLocationInformation* IE within the response time (see clause 4.16.3). The UE shall perform and report the PRS-RSRP measurements for Cell 2 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-AoD-ProvideLocationInformation* IE including the nr-DL-PRS-RSRP-Result-r16 field for Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-AoD-ProvideLocationInformation* IE with both the nr-DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.
11. If the UE message at step 10 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
12. Repeat steps 2-11 in Table 16.2.5.4-1 until the confidence level according to Annex D is achieved.

	dBm/47.88 MHz	3		-57.20		-57.20
Propagation Condition		1, 2, 3	AWGN			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

The UE shall perform and report the PRS-RSRP measurements for Cell 1 and Cell 2, within the time limit for reduced number of samples specified in clause 9.9.3.5, starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of correct events observed during repeated tests shall be at least 90%.

$$T_{PRS-RSRP,i} = \left(CSSF_i * ceil(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last}$$

Analysing the equation for $T_{PRS-RSRP,i}$

$CSSF_{PRS,i} = 1$

$N_{RxBeam,i}$ = 1

$N_{PRS,i}^{slot} = 4$

N_{sample} = 1 (For reduced sample number)

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ and $T_{last,i} = T_i + T_{available_PRS,i}$

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 0.168s and 51.3s.

For SCS 30KHz The LPP time IE ranges between 0.168s and 25.7s

The LPP time IE ranges between 1s and 52s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 26.3

The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.7.5-4, Table 15.2.7.5-5 , Table 15.2.7.5-6 and Table 15.2.7.5-7 for reference.

n160	160	320
n320	320	480
n640	640	800
n1280	1280	1440

The test tolerances are defined in clauses C.1.6, C 2.5 and C4.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.2.6 PRS-RSRP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA

16.2.6.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement outside MG requirements specified in TS 38.133 [50] Clause 9.9.3.6 for single positioning frequency layer under AWGN propagation conditions in FR1 in standalone scenario.

16.2.6.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and prs-Processing Window.

16.2.6.3 Minimum conformance requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in Clause 9.9.3.3) PRS-RSRP measurements as defined in TS 38.215 [4] without measurement gap, on configured positioning frequency layer *i*, within $T_{PRS-RSRP,total}$ ms.

$T_{PRS-RSRP,\ total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max(T_{effect,i})$ if any of the positioning frequency layers are in Case 1, or

$T_{PRS-RSRP,\ total} = \max(T_{PRS-RSRP,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2,

Where,

i is the index of positioning frequency layer, and

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{PRS-RSRP,\ total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{PRS-RSRP,i}$ is the measurement period for PRS-RSRP measurement in positioning frequency layer *i* as specified below.

$$T_{PRS-RSRP,i} = \left(N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last}$$

where

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1. If positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$,

only unmuted PRS resource instances that meet the applicability conditions and fully or partially overlapped with PRS processing window are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

N_{sample} is the number of PRS-RSRP measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 4 otherwise.

T_{last} is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time.

If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

T_i corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$ is the least common multiple between $T_{PRS,i}$ and $PPWRP_i$,

$T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$PPWRP_i$ is the PRS processing window repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. If bitmap $\{b^1\}$ for higher-layer parameter *DL-*N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

16.2.6.4 Test description

16.2.6.4.1 Initial conditions

The supported test configurations in listed in Table 16.2.6.4-1.

Table 16.2.6.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.6.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.2.6.5-1, Table 16.2.6.5-2 and Table 16.2.6.5-3.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.2.6.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.2.6.4.2 Test procedure

The test consists of two sub-tests; Sub-test 1 is for Nsample = 1 and sub-test 2 is for Nsample = 4. Sub-test 2 is only conducted when UE also supporting supportedDL-PRS-ProcessingSamples-RRC-CONNECTED. The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2. All two cells transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first PRS processing window instance containing the PRS resources.

The *NR-DL-AoD-ProvideAssistanceData* and *NR-DL-AoD-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.11 shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the *DL-AoD assistance* data and location information request.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.2.6.5-1, Table 16.2.6.5-2 and Table 16.2.6.5-3. Propagation conditions are set according to clause 4.16.2.
4. T1 starts.

5. The SS shall transmit an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
7. The SS shall transmit an RRCReconfiguration message with the PPW configuration.
8. The UE shall transmit RRCReconfigurationComplete message.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *NR-DL-AoD-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
11. The SS sends a Positioning Measurement Gap Activation command containing an ID to activate the associated measurement gap
12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 16.2.6.5-3.
13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-AoD-ProvideLocationInformation* IE within the response time (see clause 4.16.3). The UE shall perform and report the PRS-RSRP measurements for Cell 2 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-AoD-ProvideLocationInformation* IE including the nr-DL-PRS-RSRP-Result-r16 field for Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-AoD-ProvideLocationInformation* IE with both the nr-DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.
14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
15. Repeat steps 2-14 in Table 16.2.6.4-1 until the confidence level according to Annex D is achieved.

16.2.6.5 Test requirement

Table 16.2.6.5-1 and Table 16.2.6.5-2 define the primary level settings including test tolerances for the test.

Table 16.2.6.5-1: General test parameters for PRS RSRP measurement reporting delay

Parameter	Unit	Test configuration	Value	Comment
Reference cell		1, 2, 3	Cell 1	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		1, 2, 3	Cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
RF Channel Number		1, 2, 3	1: Cell 1 and Cell 2	
$BW_{channel}$	MHz	1	20: $N_{RB,c}$ = 106	
		2	20: $N_{RB,c}$ = 106	
		3	50: $N_{RB,c}$ = 133	
SSB configuration		1	SSB.1 FR1	
		2	SSB.1 FR1	
		3	SSB.2 FR1	
SMTC configuration		1	SMTC.2	
		2	SMTC.1	
		3	SMTC.1	
PPW configuration		1	PPW.1	As defined in A.3.33
		2	PPW.1	As defined in A.3.33
		3	PPW.1	As defined in A.3.33
CP length		1, 2, 3	Normal	
DRX		1, 2, 3	NA	OFF
Time offset between serving and neighbour cells	µs	1	3	
		2	3	
		3	3 or 2.34 Note 1	
Expected RSTD	µs	1, 2, 3	0	
Expected RSTD uncertainty	µs	1, 2, 3	Same as time offset between serving and neighbour cells	
Number of cells provided in assistance data		1, 2, 3	4	Including the reference cell
T1	s	1, 2, 3	2	
T2	s	1, 2, 3	5	
NOTE 1: If UE indicates support of CP length for the receive time difference threshold, the time offset is set to 2.34us, otherwise 3us.

	dBm/19.08 MHz	2	-61.20	-64.57	-61.20	-64.57
	dBm/47.88 MHz	3	-57.20	-60.58	-57.20	-60.58
Propagation Condition		1, 2, 3	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE shall perform and report the PRS-RSRP measurements for Cell 1 and Cell 2, within the time limit specified in clause 9.9.3.6, starting from the beginning of time interval T2, with Nsample=1 for sub-test 1 and Nsample=4 for sub-test 2.

NOTE: The actual overall delays measured in the test may be up to 2xTTI_{DCCH} higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

$T_{PRS-RSRP,\,total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max(T_{effect,i})$ if any of the positioning frequency layers are in Case 1, or

$T_{PRS-RSRP,\,total} = \max(T_{PRS-RSRP,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2,

$$T_{PRS-RSRP,i} = \left(N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last}$$

$N_{RxBeam,i} = 1$

$k_{multiTEG,i}=1$

$N_{PRS,i}^{slot} = 4$

$N_{sample}= 4.$

$T_{last,i} = T_i + PPWL$

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$; where Tprs = 160 ms, and the repetition periodicity $PPWRP_i$=160ms. Therefore, $T_{available_PRS,i} = 160$

Solving for Case 1 Nsamsple=1:

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 0.011s and 51.2s.

For SCS 30KHz The LPP time IE ranges between 0.011s and 25.6s.

The LPP time IE ranges between 1s and 52s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 52.3

Solving for Case 1 Nsamsple=4:

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 0.491s and 204.4s.

For SCS 30KHz The LPP time IE ranges between 0.491s and 102.4s.

The LPP time IE ranges between 1s and 205s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 205.3

Solving for Case 2 Nsamsple=1:

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 0.010s and 6.25s.

For SCS 30KHz The LPP time IE ranges between 0.010s and 3.05s.

The LPP time IE ranges between 1s and 7s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 7.3.

Solving for Case 2 Nsamsple=4:

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 0.491s and 25.4s.

For SCS 30KHz The LPP time IE ranges between 0.491s and 12.6s.

The LPP time IE ranges between 1s and 26s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 26.3

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.6.5-3, Table 15.2.6.5-4, Table 15.2.6.5-4 and Table 15.2.6.5-6 for reference.

The rate of correct events observed during repeated tests shall be at least 90%.

16.2.7 PRS-RSRP measurement reporting delay test case for single positioning frequency with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

16.2.7.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements for reduced number of samples specified in TS 38.133 [50] Clause 9.9.3.5 for single positioning frequency layer under AWGN propagation conditions in FR2 in standalone scenario.

16.2.7.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

16.2.7.3 Minimum conformance requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in Clause 9.9.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms.

$$T_{PRS-RSRP,\ total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max(T_{effect,i})$$

where

i is the index of positioning frequency layer,

L is total number of positioning frequency layers,

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$T_{PRS-RSRP,i} = \left(CSSF_i * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last}$$

where

$CSSF_i$ is the carrier specific scaling factor for PRS-RSRP measurements specified in clause 9.1.5.2,

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 and if positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,\mathrm{i}}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,\mathrm{i}}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$\mathrm{N}_{\mathrm{PRS,i}}^{\mathrm{slot}}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],

N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

N_{sample} is the number of PRS-RSRP measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 4 otherwise.

$T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time, if not all PRS resources to be measured are available in the same measurement gap occasion during $T_{available_PRS,\mathrm{i}}$, otherwise $\mathrm{T_{last,i}} = T_{\mathrm{i}} + \mathrm{MGL}$,

$\mathrm{T_{effect,i}} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

$\mathrm{T_i}$ corresponds to durationOfPRS-ProcessingSymbolsInEveryTms in TS 37.355 [34],

$T_{available_PRS,\mathrm{i}} = LCM\left(T_{PRS,\mathrm{i}}, MGRP_{\mathrm{i}}\right)$ is the least common multiple between $T_{PRS,\mathrm{i}}$ and $MGRP_{\mathrm{i}}$,

$\mathrm{T_{PRS,i}}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$MGRP_{\mathrm{i}}$ is the measurement gap repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $\mathrm{T_{PRS,i}}$, where:

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

16.2.7.4 Test description

16.2.7.4.1 Initial conditions

The supported test configurations in listed in Table 16.2.7.4-1.

Table 16.2.7.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.7.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.2.7.5-1 and Table 16.2.7.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.2.7.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.2.7.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2. All two cells transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources.

The *NR-DL-AoD-ProvideAssistanceData* and *NR-DL-AoD-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.11 shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the *DL-AoD assistance* data and location information request.

2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.2.7.5-1 and Table 16.2.7.5-2. Propagation conditions are set according to clause 4.16.2.
4. T1 starts.
5. The SS shall transmit an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
7. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

8. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *NR-DL-AoD-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.

9. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 16.2.7.5-2.

10. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-AoD-ProvideLocationInformation* IE within the response time (see clause 4.16.3). The UE shall perform and report the PRS-RSRP measurements for Cell 2 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-AoD-ProvideLocationInformation* IE including the nr-DL-PRS-RSRP-Result-r16 field for Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-AoD-ProvideLocationInformation* IE with both the nr-DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.

11. If the UE message at step 10 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

12. Repeat steps 2-11 in Table 16.2.7.4-1 until the confidence level according to Annex D is achieved.

16.2.7.5 Test requirement

Table 16.2.7.5-1 and Table 16.2.7.5-2 define the primary level settings including test tolerances for the test.

Table 16.2.7.5-1: General test parameters for PRS RSRP measurement reporting delay

Parameter	Unit	Test configuration	Value	Comment
NR RF Channel Number		Config 1	1: Cell 1 and Cell 2	One TDD carrier frequency is used for the NR cells.
Active cell		Config 1	NR cell 1 (PCell)	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		Config 1	NR cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
Gap Pattern Id		Config 1	GP#13 or GP#24[Note1]	As specified in TS 38.133 [50] clause 9.1.2-1.
Measurement gap offset		Config 1	39	
SMTC parameters		Config 1	SMTC.1	As specified in TS 38.133 [50] clause A.3.11
SSB parameters		Config 1	SSB.3 FR2	As specified in TS 38.133 [50] clause A.3.10.2
A3-Offset	dB	Config 1	-6	
Hysteresis	dB	Config 1	0	
CP length		Config 1	Normal	
TimeToTrigger	s	Config 1	0	
Filter coefficient		Config 1	0	L3 filtering is not used
DRX		Config 1	OFF	DRX is not used
Time offset between serving and neighbour cells		Config 1	3μs	Synchronous cells
Expected RSTD	μs	Config 1	3	
Expected RSTD uncertainty	μs	Config 1	5	
Number of cells provided in assistance data		Config 1	4	Including the reference cell
T1	s	Config 1	5	
T2	s	Config 1	7	
Note 1: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.

Io Note3		dBm/19 0.08 MHz Note5	Config 1	-55.73		-55.73	
Propagation Condition			Config 1	AWGN			

Note 1:	OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4:	PRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5:	Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6:	As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7:	Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation
Note 8:	Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

The PRS RSRP measurement time fulfils the requirements specified in clause 16.2.7.3.

The UE shall perform and report the PRS RSRP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified starting from the beginning of time interval T2.

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRP measurement for each correct event shall be within the PRS RSRP reporting range specified in Clause 10.1.24.3, i.e., between PRS RSRP_0 and PRS RSRP_126.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period plus ΔT, where ΔT = 50ms. The PRS RSRP measurement period follows the equation:

$$T_{PRS-RSRP,i} = \left(CSSF_i * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last}$$

Where $CSSF_{PRS,i} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.071\ ms$, $N_{sample} = 1$. N is the parameter *durationOfPRS-ProcessingSysmbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 1 - 1\right)$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 1.288s and 20.64s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 16.2.7.4.3-3. The LPP time IE ranges between 2s and 21s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 21.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 16.2.7.5-3, Table 16.2.7.5-4 and Table 16.2.7.5-5 for reference.

Table 16.2.7.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

maxNumOfDL-PRS-ResProcessedPerSlot	$\left\lceil \frac{2}{N'} \right\rceil$
n1	2
>=n2	1

Table 16.2.7.5-4: value of N based on *durationOfPRS-ProcessingSysmbols*

durationOfPRS-ProcessingSysmbols	$\lceil \frac{0.071}{N} \rceil$
>=nDot125	1

Table 16.2.7.5-5: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	T_{effect}	T_{last}
n8	160	168
n16	160	176
n20	160	180
n30	160	190
n40	160	200
n80	160	240
n160	160	320
n320	320	480
n640	640	800
n1280	1280	1440

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.2.8 PRS-RSRP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

16.2.8.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement outside MG requirements specified in TS 38.133 [50] Clause 9.9.3.6 for single positioning frequency layer under AWGN propagation conditions in FR2 in standalone scenario.

16.2.8.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and prs-Processing Window.

16.2.8.3 Minimum conformance requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in Clause 9.9.3.3) PRS-RSRP measurements as defined in TS 38.215 [4] without measurement gap, on configured positioning frequency layer *i*, within $T_{PRS-RSRP,total}$ ms.

$T_{PRS-RSRP,\,total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max(T_{effect,i})$ if any of the positioning frequency layers are in Case 1, or

$T_{PRS-RSRP,\,total} = \max(T_{PRS-RSRP,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2,

Where,

i is the index of positioning frequency layer, and

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{PRS-RSRP,\ total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{PRS-RSRP,i}$ is the measurement period for PRS-RSRP measurement in positioning frequency layer *i* as specified below.

$$T_{PRS-RSRP,i} = \left(N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last}$$

where

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1. If positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$,

only unmuted PRS resource instances that meet the applicability conditions and fully or partially overlapped with PRS processing window are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

N_{sample} is the number of PRS-RSRP measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and

- Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

- N_{sample} = 4 otherwise.

T_{last} is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time.

If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

T_i corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$ is the least common multiple between $T_{PRS,i}$ and $PPWRP_i$,

$T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$PPWRP_i$ is the PRS processing window repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. If bitmap $\{b^1\}$ for higher-layer parameter *DL-*
N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

16.2.8.4 Test description

16.2.8.4.1 Initial conditions

The supported test configurations in listed in Table 16.2.8.4-1.

Table 16.2.8.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.8.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.

2. The general test parameter settings are set up according to Table 16.2.8.5-1, Table 16.2.8.5-2 and Table 16.2.8.5-3.

3. Propagation conditions are set according to clause 4.16.2.

4. Message contents are defined in clause 16.2.8.4.3.

5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.2.8.4.2 Test procedure

The test consists of two sub-tests; Sub-test 1 is for Nsample = 1 and sub-test 2 is for Nsample = 4. Sub-test 2 is only conducted when UE also supporting supportedDL-PRS-ProcessingSamples-RRC-CONNECTED. The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2. All two cells transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first PRS processing window instance containing the PRS resources.

The *NR-DL-AoD-ProvideAssistanceData* and *NR-DL-AoD-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.11 shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the *DL-AoD assistance* data and location information request.

2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

3. Set the parameters according to Table 16.2.8.5-1, Table 16.2.8.5-2 and Table 16.2.8.5-3. Propagation conditions are set according to clause 4.16.2.

4. T1 starts.

5. The SS shall transmit an LPP REQUEST CAPABILITIES message.

6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.

7. The SS shall transmit an RRCReconfiguration message with the PPW configuration.

8. The UE shall transmit RRCReconfigurationComplete message.

9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *NR-DL-AoD-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.

11. The SS sends a Positioning Measurement Gap Activation command containing an ID to activate the associated measurement gap

12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 16.2.8.5-3.

13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-AoD-ProvideLocationInformation* IE within the response time (see clause 4.16.3). The UE shall perform and report the PRS-RSRP measurements for Cell 2 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-AoD-ProvideLocationInformation* IE including the nr-DL-PRS-RSRP-Result-r16 field for Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-AoD-ProvideLocationInformation* IE with both the nr-DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.

14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

15. Repeat steps 2-14 in Table 16.2.8.4-1 until the confidence level according to Annex D is achieved.

16.2.8.5 Test requirement

Table 16.2.8.5-1 and Table 16.2.8.5-2 define the primary level settings including test tolerances for the test.

Table 16.2.8.5-1: General test parameters for PRS RSRP measurement reporting delay

Parameter	Unit	Test configuration	Value	Comment
NR RF Channel Number		Config 1	1: Cell 1 and Cell 2	One TDD carrier frequency is used for the NR cells.
Active cell		Config 1	NR cell 1 (PCell)	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		Config 1	NR cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
PPW configuration		Config 1	PPW.1	As specified in clause A.3.33
SMTC parameters		Config 1	SMTC.1	As specified in TS 38.133 [50] clause A.3.11
SSB parameters		Config 1	SSB.3 FR2	As specified in TS 38.133 [50] clause A.3.10.2
CP length		Config 1	Normal	
DRX		Config 1	OFF	DRX is not used
Time offset between serving and neighbour cells	μs	Config 1	0.58, 2.0 or 3 Note 1	

Expected RSTD	µs	Config 1	0	
Expected RSTD uncertainty	µs	Config 1	Same as time offset between serving and neighbour cells	
Number of cells provided in assistance data		Config 1	4	Including the reference cell
T1	s	Config 1	5	
T2	s	Config 1	7	
NOTE 1: If UE indicates support of CP length for the receive time difference threshold, the time offset is set to 0.58us; If UE indicates support of 1/4 symbol length for the receive time difference threshold, the time offset is set to 2.0us, otherwise 3us.				

Table 16.2.8.5-2: Cell-specific test parameters during T2 for PRS RSRP measurement reporting delay

Parameter		Unit	Test configuration	Cell 1		Cell 2

PRS $\hat{E}_s/I_{ot}$	dB	Config 1	0.3	-2.7	-5.6	-12.3
PRS $\hat{E}_s/N_{oc}$	dB	Config 1	3.56	-2	-0.28	-10
Io Note3	dBm/95.04 MHz Note5	Config 1	-55.73	-55.69	-55.73	-55.69
Propagation Condition		Config 1	AWGN			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone

Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

Note 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

The PRS RSRP measurement time fulfils the requirements specified in Clause16.2.8.3, with Nsample=1 for sub-test 1 and Nsample=4 for sub-test 2. The UE shall perform and report the PRS RSRP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration starting from the beginning of time interval T2.

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRP measurement for each correct event shall be within the PRS RSRP reporting range specified in Clause 10.1.24.3, i.e., between PRS RSRP_0 and PRS RSRP_126.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period plus ΔT, where ΔT = 50ms. The LPP response time calculation procedure could be divided into two situations based on whether the UE support ppw-durationOfPRS-Processing1-r17 or ppw-durationOfPRS-Processing2-r17.The PRS-RSRP measurement period follows the equation:

$T_{\text{PRS-RSRP, total}} = \sum_{i=1}^{L} T_{\text{PRS-RSRP,i}} + (L-1) * \max(T_{\text{effect},i})$ if any of the positioning frequency layers are in Case 1, or

$T_{\text{PRS-RSRP, total}} = \max(T_{\text{PRS-RSRP,i}} + T_{\text{uncertainty,i}})$, if all the positioning frequency layers are in Case 2,

Where $N_{RxBeam,i}$ = 8, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.071$, N_{sample} = 1 for sub-test 1, N_{sample} = 4 for sub-test 2, $T_{uncertainty,i} = 0$. N is the parameter *ppw-durationOfPRS-ProcessingSymbolsN* from TS 37.355 [49], N' is the parameter *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $T_{\text{last,i}} = T_i$ +PPWL and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,\mathrm{i}} = LCM(T_{PRS,\mathrm{i}}, PPWRP_{\mathrm{i}})$; where Tprs = 160 ms, and the repetition periodicity $\mathrm{PPWRP_i}$=160ms. Therefore, $T_{available_PRS,i} = 160$

T_i depends on the UE parameter *ppw-durationOfPRS-ProcessingSymbolsT* from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * N_{sample} - 1\right) * T_{effect} + \mathrm{T_{last}}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 2s and 21s for sub-test 1. The LPP time IE ranges between 6s and 80s for sub-test 2. The value of the LPP time IE is rounded up to the next second. The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 16.2.8.4.3-8.

The test tolerance for the response time is 300ms. Therefore, the response time ranges for sub-test 1 is between 2.3s and 21.3s. The response time ranges for sub-test 2 is between 6.3s and 80.3s.

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.2.9 PRS-RSRP measurement delay in FR1 for Redcap UE without Rx FH

Editor's Note: This test case is incomplete in following aspects:

- TT analysis is missing.

16.2.9.1 Test purpose

The purpose of the test is to verify that the PRS-RSRP measurement meets the delay requirements specified in TS 38.133 [50] clause 9.9A.3.5 in an environment with AWGN propagation conditions. The test is applicable to 1 Rx or 2 Rx RedCap UE.

16.2.9.2 Test applicability

This test applies to FR1 Redcap UEs release 18 onwards that supports DL-AoD positioning.

16.2.9.3 Minimum conformance requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the RedCap UE shall be able to measure multiple (up to the RedCapUE capability specified in TS 38.133[50] clause 9.9A.3.3) PRS-RSRP measurements, defined in TS 38.215 [57], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $\mathrm{T_{PRS-RSRP,total}}$ ms.

$$\mathrm{T_{PRS-RSRP,total}} = \sum_{i=1}^{L} \mathrm{T_{PRS-RSRP,i}} + (L-1) * \max(\mathrm{T_{effect,}}_i)$$

where

i is the index of positioning frequency layer,

L is total number of positioning frequency layers,

$\mathrm{T_{effect,}}_i$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$\mathrm{T_{PRS-RSRP,i}} = \left(\mathrm{CSSF_{PRS_RedCap,i}} * \mathrm{ceil(K_{p,PRS,i})} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,\mathrm{i}}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,\mathrm{i}}}{N} \right\rceil * N_{sample} - 1\right) * \mathrm{T_{effect,i}} + \mathrm{T_{last}}$$

where

$CSSF_{PRS_RedCap,i}$ is the carrier specific scaling factor for PRS-RSRP measurements specified in TS 38.133[50] clause 9.1A.5.2,

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioining frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 (for 2 Rx or 1 Rx RedCap UE) and if positioning frequency layer *i* is in FR2 (for 2 Rx RedCap UE only), $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],

N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

N_{sample} is the number of PRS-RSRP measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- N_{sample} = 4 otherwise.

$T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time, if not all PRS resources to be measured are available in the same measurement gap occasion during $T_{available_PRS,i}$, otherwise $T_{last,i} = T_i + MGL$,

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer i,

T_i corresponds to durationOfPRS-ProcessingSymbolsInEveryTms in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$ is the least common multiple between $T_{PRS,i}$ and $MGRP_i$,

$T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$MGRP_i$ is the measurement gap repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

NOTE: For the purpose of calculating $T_{PRS,i}$, only the PRS resources fully or partially covered by the MG are considered.

When PRS-RSRP measurements are configured for DL-AoD, except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{PRS-RSRP,total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data after both the *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

For deferred MT-LR with other event than “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{PRS-RSRP,total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the UE shall perform the PRS-RSRP measurement in each reporting period and activate the location report at the time when the periodic timer expires.

Note: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When the PRS-RSRP measurement is configured together with RSTD measurement then the PRS-RSRP measurement shall meet the RSTD measurement requirements defined in clause 9.9.2.

When the PRS-RSRP measurement is configured together with UE Rx-Tx time difference measurement then the PRS-RSRP measurement shall meet the UE Rx-Tx time difference measurement requirements defined in clause 9.9.4.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource:

if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or

if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If during the measurement period of one or more positioning frequency layers, the MG pattern is reconfigured either per UE request or not per UE request, the measurement period can be longer.

The requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{PRS-RSRP,total}$ within measurement gaps due to collisions with other signals; otherwise, a longer measurement period may be used.

The requirements in clause 9.9A.3 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-AoD-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while PRS-RSRP measurements are being performed then the UE shall complete the ongoing PRS-RSRP measurements session. The PRS-RSRP measurement period can be longer. The UE shall meet the PRS-RSRP measurement accuracy requirements in TS 38.133[50] clause 10.1A.17.2.

The normative reference for this requirement is TS 38.133[50] clause 9.9A.3.5.

16.2.9.4 Test description

16.2.9.4.1 Initial conditions

The test is defined with four possible Test Configurations. In the case that the UE supports more than one of these Test Configurations, then the UE is only required to be tested in one of the Test Configurations, chosen by the UE. The defined Test Configurations are specified in Table 16.2.9.4.1-1.

Table 16.2.9.4.1-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.9.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.2.9.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.2.9.4.2.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR1.

16.2.9.4.2 Test procedures

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2. Both cells transmit PRS during T2.

The *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message as defined in TS 37.355 [49] shall be provided to the UE during T1. The last slot containing the two messages for the assistance data and location information request is denoted as #n.

The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources that is ΔT after slot #n, where ΔT = 50 ms is the maximum processing time of the assistance data and location information request.

The UE is configured with measurement gap pattern ID # 24 or measurement gap pattern ID # 0 before T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.2.9.5-1 and Table 16.2.9.5-2. Propagation conditions are set according to clause 4.15.2.
4. T1 starts.
5. The SS shall transmit an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
7. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
8. The SS shall send a LPP REQUEST LOCATION INFORMATION message such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
9. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 16.2.9.5-2.
10. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-AoD-ProvideLocationInformation* IE within the response time (see clause 4.16.4.1). The UE shall perform and report the PRS-RSRP measurements for both Cell1 and Cell 2.

    If the UE transmits an *NR-DL-AoD-ProvideLocationInformation* IE including the nr-DL-PRS-RSRP-Result-r16 field then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-AoD-ProvideLocationInformation* IE with the DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.
11. If the UE message at step 10 includes the ackRequested IE set to TRUE, the SS shall send a LPP acknowledgement message.
12. Repeat steps 2-11 until the confidence level according to Annex D is achieved.

Propagation Condition		1, 2, 3, 4	AWGN			

NOTE 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

NOTE 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The PRS-RSRP measurement time without FH for RedCap fulfils the requirements specified in clause 16.2.9.3.

The UE shall perform and report the PRS-RSRP measurements for Cell 1 and Cell 2, within the time limit specified in clause 16.2.9.3, starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time limit above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of correct events observed during repeated tests shall be at least 90%, where the reported PRS-RSRP measurement for each correct event shall be within the reporting range specified in TS 38.133[50] clause 10.1A.17.3.

16.2.10 PRS-RSRP measurement delay in FR2 for Redcap UE without Rx FH for single positioning frequency layer

Editor's Note: This test case is incomplete in following aspects:

- TT analysis is missing.

16.2.10.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements specified in TS 38.133 [50] clause 9.9A.3.5 for single positioning frequency layer under AWGN propagation conditions in FR2 standalone scenario.

16.2.10.2 Test applicability

This test applies to FR2 Redcap UEs release 18 onwards that supports DL-AoD positioning.

16.2.10.3 Minimum conformance requirements

Same minimum requirements as in clause 16.2.9.3

16.2.10.4 Test description

16.2.10.4.1 Initial conditions

The defined test configuration is specified in Table 16.2.10.4.1-1.

Table 16.2.10.4.1-1: supported test configurations for PRS RSRP measurement for FR2

Config	Description
1	120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.10.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.2.10.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.2.10.4.2.
5. There are two cells in the test, PCell (Cell 1) and a FR2 neighbour cell (Cell 2) on the same frequency as the PCell.

16.2.10.4.2 Test procedures

Same test procedure as in clause 16.2.9.4.2 with following exceptions:

The UE is configured with measurement gap pattern ID # 24 or measurement gap pattern ID # 13 before T2.

Table 16.2.10.5-1 replaces Table 16.2.9.5-1; Table 16.2.10.5-2 replaces Table 16.2.9.5-2.

16.2.10.4.3 Message contents

Same message contents as defined in clause 16.2.9.4.3, with the following exceptions:

Table 16.2.10.4.3-1 replaces Table 16.2.9.4.3-5 and Table 16.2.10.4.3-2 replaces Table 16.2.9.4.3-6.

16.2.10.5 Test requirement

Table 16.2.10.5-1 and Table 16.2.10.5-2 define the primary level settings including test tolerances for the test.

Table 16.2.10.5-1: General test parameters for PRS RSRP measurement reporting delay

Parameter	Unit	Test configuration	Value	Comment
NR RF Channel Number		1	1: Cell 1 and Cell 2	One TDD carrier frequency is used for the NR cells.
Active cell		1	NR cell 1 (Pcell)	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		1	NR cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
Gap Pattern Id		1	GP#13 or GP#24[Note1]	As specified in TS 38.133[50] clause 9.1.2-1.
Measurement gap offset		1	39	
SMTC parameters		1	SMTC.1	As specified in TS 38.133[50] clause A.3.11
SSB parameters		1	SSB.3 FR2	As specified in TS 38.133[50] clause A.3.10.2
A3-Offset	dB	1	-6	
Hysteresis	dB	1	0	
CP length		1	Normal	
TimeToTrigger	s	1	0	
Filter coefficient		1	0	L3 filtering is not used
DRX		1	OFF	DRX is not used
Time offset between serving and neighbour cells		1	3μs	Synchronous cells
Expected RSTD	μs	1	3	
Expected RSTD uncertainty	μs	1	5	
T1	s	1	5	
T2	s	1	7	
NOTE 1: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.				

Table 16.2.10.5-2: Cell-specific test parameters for PRS RSRP measurement reporting delay

Parameter		Unit	Test configuration	Cell 1		Cell 2	
				T1	T2	T1	T2

Io Note3	dBm/95.04 MHz Note5	1	-57.89	-57.63+TT	-57.89	-57.63+TT
Propagation Condition		1	AWGN			

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: SSB_RP/PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
NOTE 6: As observed with 0 dBi gain antenna at the centre of the quiet zone.
NOTE 7: Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.

The PRS RSRP measurement time fulfils the requirements specified in claus 16.2.10.3. The UE shall perform and report the PRS RSRP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in clause 9.9.3.5 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to 2xTTI_{DCCH} higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRP measurement for each correct event shall be within the PRS RSRP reporting range specified in TS 38.133[50] clause 10.1A.17.3.

16.2.11 PRS-RSRP measurement delay in FR2 for Redcap UE without Rx FH for dual positioning frequency layer

Editor's Note: This test case is incomplete in following aspects:

- TT analysis is missing.

16.2.11.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements specified in TS 38.133 [50] clause 9.9A.3.5 for dual positioning frequency layers under AWGN propagation conditions in FR2 standalone scenario.

16.2.11.2 Test applicability

This test applies to FR2 Redcap UEs release 18 onwards that supports DL-AoD positioning.

16.2.11.3 Minimum conformance requirements

Same minimum requirements as in clause 16.2.9.3

16.2.11.4.1 Initial conditions

The defined test configuration is specified in Table 16.2.11.4.1-1.

Table 16.2.11.4.1-1: supported test configurations for PRS RSRP measurement for FR2

Config	Description
1	120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.11.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.2.11.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.2.11.4.2.
5. There are two cells in the test, PCell (Cell 1) and a FR2 neighbour cell (Cell 2) on the same frequency as the PCell.

16.2.11.4.2 Test procedures

Same test procedure as in clause 16.2.9.4.2 with following exceptions:

The UE is configured with measurement gap pattern ID # 24 or measurement gap pattern ID # 13 before T2.

Table 16.2.11.5-1 replaces Table 16.2.9.5-1; Table 16.2.11.5-2 replaces Table 16.2.9.5-2.

16.2.11.4.3 Message contents

Same message contents as defined in clause 16.2.9.4.3, with the following exceptions:

Table 16.2.11.4.3-1 replaces Table 16.2.9.4.3-5 and Table 16.2.11.4.3-2 replaces Table 16.2.9.4.3-6.

16.2.11.5 Test requirement

Table 16.2.11.5-1 and Table 16.2.11.5-2 define the primary level settings including test tolerances for the test.

Table 16.2.11.5-1: General test parameters for PRS RSRP measurement reporting delay

Parameter	Unit	Test configuration	Value	Comment
Active cell		1	NR cell 1 (Pcell)	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		1	NR cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
Gap Pattern Id		1	GP#13 or GP#24[Note1]	As specified in clause 9.1.2-1.
Measurement gap offset		1	39	
SMTC parameters		1	SMTC.1	As specified in clause A.3.11
SSB parameters		1	SSB.3 FR2	As specified in clause A.3.10.2
A3-Offset	dB	1	-6	
Hysteresis	dB	1	0	
CP length		1	Normal	
TimeToTrigger	s	1	0	
Filter coefficient		1	0	L3 filtering is not used
DRX		1	OFF	DRX is not used
Time offset between serving and neighbour cells		1	3μs	Synchronous cells
Expected RSTD	μs	1	3	
Expected RSTD uncertainty	μs	1	5	
T1	s	1	5	
T2	s	1	7	
NOTE 1: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.				

Table 16.2.11.5-2: Cell-specific test parameters for PRS RSRP measurement reporting delay

Parameter		Unit	Test configuration	Cell 1		Cell 2	
				T1	T2	T1	T2
AoA setup			1	Setup 1 as specified in clause A.3.15			
Beam Assumption[Note 7]			1	Rough		Rough

Io Note3	dBm/95.04 MHz Note5	1	-58.25	-58.25 +TT	-60.01	-59.80+TT
Propagation Condition		1	AWGN			

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: SSB_RP/PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
NOTE 6: As observed with 0 dBi gain antenna at the centre of the quiet zone.
NOTE 7: Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.

The PRS RSRP measurement time fulfils the requirements specified in clause 16.2.11.3.The UE shall perform and report the PRS RSRP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in clause 9.9.3.5 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRP measurement for each correct event shall be within the PRS RSRP reporting range specified in TS 38.133 clause 10.1A.17.3.

16.2.12 PRS-RSRP measurement delay in FR1 for Redcap UE with Rx FH

Editor's Note: This test case is incomplete in following aspects:

- TT analysis is missing.

16.2.12.1 Test purpose

The purpose of the test is to verify that the PRS-RSRP measurement meets the delay requirements specified in TS 38.133 [50] clause 9.9A.3.6 in an environment with AWGN propagation conditions. The test is applicable to 1 Rx or 2 Rx RedCap UE.

16.2.12.2 Test applicability

This test applies to FR1 Redcap UEs release 18 onwards that supports DL-AoD positioning and PRS frequency hopping measurement and report.

16.2.12.3 Minimum conformance requirements

When the UE the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [49], requesting RedCap UE to measure PRS-RSRP measurement with FH, the RedCap UE shall be able to measure multiple (up to the RedCapUE capability specified in TS 38.133[50] clause 9.9A.3.3) PRS-RSRP measurements, defined in TS 38.215 [57], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms as defined TS 38.133[50] clause 9.9A.3.5.1 with using the following definition for N_{sample} and $L_{available_PRS,i}$:

- N_{sample} is the number of PRS-RSRP measurement samples, where
  - N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples.
  - N_{sample} = 4 otherwise.

- A measurement sample with FH is defined as a PRS measurement over multiple hops within a single measurement gap occasion.

- $L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured during a MG, and is calculated by:

$$L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$$

where,

- $N_{hop,i,j}$ is the number of hops that UE can do in an MG occasion *j* as defined in the following, and

- $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in MG instance *j* during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{per-hop,i,j}$, only the PRS resources unmuted and fully or partially overlapped with the sampling duration in each hop are considered;

- *J* is the number of MG instance during $T_{available_PRS,i}$.

The sampling window per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, T_{hop} is the applicable length per hop as defined in table 9.9A.3.6.1-1, and RRT_{FH} is the retuning time between Rx hops as reported by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability* [34]. The first hop within a MG instance starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the MG instance taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

Table 16.2.12.3-1 Applicable number of hops per slot and applicable length of each hop

RRT_{FH}	(comb size, Number of PRS symbols)	Applicable number of hops per slot (N_{hops}^{slot})	Applicable length per hop (T_{per}) in number of symbols
$RRT_{FH} \leq 2$ symbols	(2, 12) with SCS 15 kHz, 30 kHz, 60 kHz in FR2, 120 kHz	2	7
	All others	1	14
2 symbols $< RRT_{FH} \leq 6$ symbols	(≤ 6, any)	1	14
	(12, 12)	½	28
$RRT_{FH} > 6$ symbols	Any combination	½	28

The number of hops within a single MG occasion $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right)$$

where

- $N_{hop,max}$ is the maximum number of Rx hops signaled by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* as specified in [34] for positioning frequency layer *i*

- $N3_i$ is indicated via UE capability *processingPRS-SymbolsDurationN3-r18* for positioning frequency layer *i*

- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a MG instance *j*,

- $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot} = 2$,

- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1$,

- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} > 1$,

- $N_{hops,effect,i,j} = \left\lfloor \frac{(N_{rep}^{PRS}-1)}{2} \right\rfloor + 1$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} = 1$,

- where N_{rep}^{PRS} is the number of inter-slot PRS repetitions within the MG occasion, excluding the gap retuning times, which are unmuted and fully or partially overlapped with the sampling duration within each hop. M_{rep}^{PRS} is

the PRS repetition interval configured by *dl-PRS-ResourceTimeGap*, N_{hops}^{slot} is the applicable number of hops per slot as defined in table 16.2.11.3-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions $\left(N_{rep}^{PRS}\right)$ within an MG instance and the same PRS repetition interval $\left(M_{rep}^{PRS}\right)$, otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of BW_{total} defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop} * BW_{per-hop} - \left(N_{hop} - 1\right) * BW_{overlap}\right)$$

where

- BW_{PRS} is the minimum among
- configured PRS BW, and
- UE capability of maximum PRS BW across all hops indicated via *maximumPRS-BandwidthAcrossAllHopsFR1-r18* or *maximumPRS-BandwidthAcrossAllHopsFR2-r18*, and
- total BW of all hops requested by LMF via *nr-DL-PRS-RxHoppingTotalBandwidth-r18* as specified in [34],

$N_{hop,i,j}$ is number of hops within a single MG occasion as define above,

$BW_{per-hop}$ is the UE capability on PRS BW per hop indicated via *supportedBandwidthPRS-r16* as specified in [49],

$BW_{overlap}$ is the UE capability on BW of the overlapping RB indicated via *numOfOverlappingPRB-r18* as specified in [49].

16.2.12.4 Test description

16.2.12.4.1 Initial conditions

The test is defined with four possible Test Configurations. In the case that the UE supports more than one of these Test Configurations, then the UE is only required to be tested in one of the Test Configurations, chosen by the UE. The defined Test Configurations are specified in Table 16.2.12.4.1-1.

Table A.16.2.12.4.1-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, cell bandwidth 50 MHz, FDD duplex mode
2	15 kHz SSB SCS, cell bandwidth 50 MHz, TDD duplex mode
3	30 kHz SSB SCS, cell bandwidth 100 MHz, TDD duplex mode
4	15 kHz SSB SCS, cell bandwidth 50 MHz, HD-FDD duplex mode
NOTE 1: The UE is only required to be tested in one of the supported test configurations. NOTE 2: This test case is applicable to the UE supporting per hop bandwidth ≥ 10 MHz for SCS 15 kHz. NOTE 3: This test case is applicable to the UE supporting per hop bandwidth = 20 MHz for SCS 30 kHz.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.12.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.2.12.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.2.12.4.2.

5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR1.

16.2.12.4.2 Test procedures

Same test procedure as in clause 16.2.9.4.2 with following exceptions:

Table 16.2.12.5-1 replaces Table 16.2.9.5-1; Table 16.2.12.5-2 replaces Table 16.2.9.5-2.

16.2.12.5 Test requirement

Table 16.2.12.5-1 and Table 16.2.12.5-2 define the primary level settings including test tolerances for the test.

Table 16.2.12.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Reference cell		1, 2, 3, 4	Cell 1	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		1, 2, 3, 4	Cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
RF Channel Number		1, 2, 3, 4	1: Cell 1 and Cell 2	
$BW_{channel}$	MHz	1, 2, 4	50: $N_{RB,c}$ = 270	
		3	100: $N_{RB,c}$ = 273	
SSB configuration		1, 2, 4	SSB.1 FR1	
		3	SSB.1 RedCap FR1	
SMTC configuration		1, 2, 3, 4	SMTC.1 RedCap	
Measurement gap		1, 2, 3, 4	GP#24 or GP#0 Note 1	

CP length		1, 2, 3, 4	Normal	
DRX		1, 2, 3, 4	N/A	OFF
Time offset between serving and neighbour cells	µs	1, 2, 3, 4	3	Synchronous cells
Expected RSTD	µs	1, 2, 3, 4	3	
Expected RSTD uncertainty	µs	1, 2, 3, 4	5	
PRS RX hopping request		1, 2, 3, 4	Present	
T1	s	1, 2, 3, 4	2	
T2	s	1, 2, 3, 4	5	
NOTE 1: GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

	dBm/98.28 MHz	3	-49.43 +TT	-57.46 +TT	-67.13 +TT	-57.46 +TT
Propagation Condition		1, 2, 3, 4	AWGN			

NOTE 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP/SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.

The UE shall perform and report the PRS-RSRP measurements for Cell 1 and Cell 2, within the time limit specified in clause 16.2.12.3, starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time limit above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of correct events observed during repeated tests shall be at least 90%, where the reported PRS-RSRP measurement for each correct event shall be within the reporting range specified in TS 38.133[50] clause 10.1A.17.3.

16.2.13 PRS-RSRP measurement delay in FR2 for Redcap UE with Rx FH

Editor's Note: This test case is incomplete in following aspects:

- TT analysis is missing.

16.2.13.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement with FH by a RedCap UE meets requirements specified in TS 38.133[50] clause 9.9A.3.6 for single positioning frequency layer under AWGN propagation conditions in FR2 standalone scenario.

16.2.13.2 Test applicability

This test applies to FR2 Redcap UEs release 18 onwards that supports DL-AoD positioning and PRS frequency hopping measurement and report.

16.2.13.3 Minimum conformance requirements

Same minimum requirements as in clause 16.2.12.3.

16.2.13.4 Test description

16.2.13.4.1 Initial conditions

The defined test configuration is specified in Table 16.2.13.4.1-1.

Table 16.2.13.4.1-1: Supported test configurations for PRS RSRP measurement

Config	Description
1	120 kHz SSB SCS, UE bandwidth 100 MHz, cell bandwidth 400 MHz, TDD duplex mode
NOTE 1: This test case is applicable to the UE supporting per hop bandwidth = 100 MHz for SCS 120 kHz.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.2.13.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.2.13.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.2.13.4.2.
5. There are two cells in the test, PCell (Cell 1) and a FR2 neighbour cell (Cell 2) on the same frequency as the PCell.

16.2.13.4.2 Test procedures

Same test procedure as in clause 16.2.10.4.2 with following exceptions:

Table 16.2.13.5-1 replaces Table 16.2.10.5-1; Table 16.2.13.5-2 replaces Table 16.2.10.5-2.

16.2.13.4.3 Message contents

Same message contents as defined in clause 16.2.12.4.3, with the following exceptions:

Table 16.2.13.4.3-1 replaces Table 16.2.12.4.3-3, Table 16.2.13.4.3-2 replaces Table 16.2.12.4.3-5 and Table 16.2.13.4.3-3 replaces Table 16.2.12.4.3-6.

16.2.13.5 Test requirement

Table 16.2.13.5-1 and Table 16.2.13.5-2 define the primary level settings including test tolerances for the test.

Table 16.2.13.5-1: General test parameters for PRS RSRP measurement reporting delay

Parameter	Unit	Test configuration	Value	Comment
NR RF Channel Number		Config 1	1: Cell 1 and Cell 2	One TDD carrier frequency is used for the NR cells.
Active cell		Config 1	NR cell 1 (PCell)	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		Config 1	NR cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
Gap Pattern Id		Config 1	GP#13 or GP#24[Note1]	As specified in TS 38.133[50] clause 9.1.2-1.
Measurement gap offset		Config 1	39	
SMTC parameters		Config 1	SMTC.1	As specified in TS 38.133[50] clause A.3.11
SSB parameters		Config 1	SSB.3 FR2	As specified in TS 38.133[50] clause A.3.10.2
CP length		Config 1	Normal	
DRX		Config 1	OFF	DRX is not used
Time offset between serving and neighbour cells		Config 1	3μs	Synchronous cells.
Expected RSTD	μs	Config 1	3	
Expected RSTD uncertainty	μs	Config 1	5	
PRS RX hopping request		Config 1	Present	
T1	s	Config 1	5	
T2	s	Config 1	7	
NOTE 1: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.				

Table 16.2.13.5-2: Cell-specific test parameters for PRS RSRP measurement reporting delay

Parameter		Unit	Test configuration	Cell 1		Cell 2

Propagation Condition			Config 1	AWGN			

NOTE 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: SSB_RP/PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
NOTE 6: As observed with 0 dBi gain antenna at the centre of the quiet zone.
NOTE 7: Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.

The PRS RSRP measurement time fulfils the requirements specified in clause 16.2.13.3. The UE shall perform and report the PRS RSRP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in clause 16.2.13.3 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRP measurement for each correct event shall be within the PRS RSRP reporting range specified in TS 38.133[50] clause 10.1A.17.3, i.e., between PRS RSRP_0 and PRS RSRP_126.

16.3 NR PRS-RSRP measurement accuracy test case in RRC_CONNECTED

16.3.1 PRS-RSRP measurement accuracy with PRS in FR1

16.3.1.1 Test purpose

The purpose of the test is to verify that the PRS-RSRP measurement meets the accuracy requirements specified in TS 38.133 [50] clauses 10.1.24.2.1 and 10.1.24.2.2.

16.3.1.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports DL-TDOA positioning and PRS-RSRP measurements in FR1.

16.3.1.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRP measurement for FR1 defined in Table 16.3.1.3-1 are valid under the following conditions:

- Conditions defined in 38.101-1 Clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band
- UE does not support positioning measurements with reduced number of samples, or LMF does not indicate UE to perform positioning measurements with reduced number of samples

Table 16.3.1.3-1: PRS-RSRP absolute accuracy for FR1

Accuracy	Conditions

Normal condition	Extreme condition	PRS Ês/Iot	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	Io Note 7 range			
					NR operating band groups Note 8	Minimum Io Note 1 dBm / SCS_{PRS}		Maximum Io
						dBm / SCS_{PRS}		
dB	dB	dB	PRB	-		dBm/15kHz Note 6	dBm/30kHz Note 6	dBm/60kHz Note 6	dBm/$BW_{Channel}$

					NR_TDD_FR1_C	-126	-123	-120	-50
					NR_FDD_FR1_D, NR_TDD_FR1_D	-125.5	-122.5	-119.5	-50
					NR_FDD_FR1_E, NR_TDD_FR1_E	-125	-122	-119	-50
					NR_FDD_FR1_F	-124.5	-121.5	-118.5	-50
					NR_FDD_FR1_G	-124	-121	-118	-50
					NR_FDD_FR1_H	-123.5	-120.5	-117.5	-50
					Note 4				
					Note 4				
±8.5	±13	≥-13dB	24 ≤ BW ≤ 52	All	Note 4				
±6	±10.5		52< BW≤ 104	All	Note 4				
±4.5	±9		BW >104	All	Note 4				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in Section 3.5.2.

The relative PRS-RSRP accuracy is defined as accuracy of the difference between two PRS-RSRP measurements.

The relative PRS-RSRP accuracy requirements apply for the cases when PRS-RSRP is measured from PRS resources in the same PRS resource set in FR1.

The accuracy requirements for PRS-RSRP measurement for FR1 defined in Table 16.3.1.3-2 are valid under the following conditions:

Conditions defined in 38.101-1 Clause 7.3 for reference sensitivity are fulfilled.

PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band

Table 16.3.1.3-2: PRS-RSRP relative accuracy for FR1

Accuracy		Conditions							
					Io Note 7 range

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 RB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in Section 3.5.2.

16.3.1.4 Test description

16.3.1.4.1 Initial conditions

The test is defined with three possible Test Configurations. In the case that the UE supports more than one of these Test Configurations, then the UE is only required to be tested in one of the Test Configurations, chosen by the UE. The defined Test Configurations are specified in Table 16.3.1.4.1-1.

Table 16.3.1.4.1-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.3.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.3.1.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.3.1.4.3.
5. In the test there are three synchronous cells: Cell 1 and Cell 2. Cell 1 is the PCell. Cell 2 is the neighbour cell. The cells are on the same RF channel in FR1

16.3.1.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell.

The NR-DL-AoD-RequestLocationInformation message and NR-DL-AoD-ProvideAssistanceData message as defined in TS 37.355 shall be provided to the UE during T1. The last slot containing the two messages for the assistance data and location information request is denoted as #n. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources that is ΔT after slot #n, where $\Delta T = 50$ ms is the maximum processing time of the assistance data and location information request

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.3.1.5-1 as appropriate. Propagation conditions are set according to clause 4.15.2.
4. The SS shall send an LPP REQUEST CAPABILITIES message.
5. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the NR-DL-AoD-ProvideCapabilities IE.
6. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the nr-DL-AoD-ProvideAssistanceData-r16 IE. If the UE message at step 5 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
7. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-DL-AoD-RequestLocationInformation-r16 such that the UE receives the message ΔT ms before the start of the measurement period, where $\Delta T = 50$ ms.
8. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message, including the nr-DL-AoD-ProvideLocationInformation-r16 IE.
9. If the UE message at step 8 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

10. The SS shall check the nr-DL-PRS-RSRP-Result-r16 and nr-DL-PRS-RSRP-ResultDiff-r16 value for Cell 1 and Cell 2 in the nr-DL-AoD-SignalMeasurementInformation-r16 according to Tables 16.3.1.5-2 and 16.3.1.5-3.11. Repeat step 2-10 until the confidence level according to Annex D is achieved.

12. Repeat step 1-11 for the other sub-test defined in Table 16.3.1.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

	Config 3	dBm/47.88MHz	-60.59		-60.59	
Propagation condition			AWGN			
Antenna configuration			1x2			

Note 1:	OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4:	PRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5:	Void.
Note 6:	The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification
Note 7:	GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 16.2.1.5, with the following difference: , N_(PRS,i)^slot= 2 Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(\left\lceil\frac{2}{N'}\right\rceil\left\lceil\frac{L_{available_{PRS,i}}}{N}\right\rceil * 4 - 1\right) * T_{\text{effect}} + \text{T}_{\text{last}}$$

Table 16.3.1.5-2: PRS-RSRP absolute accuracy requirements for the reported values

Test Configuration	Subtest	Cell 1		Cell 2	
		Lowest reported value	Highest reported value	Lowest reported value	Highest reported value
1	Sub-test 1	51	62	38	59
	Sub-test 2	51	62	41	56
2	Sub-test 1	51	62	38	59
	Sub-test 2	51	62	41	56
3	Sub-test 1	54	65	41	62
	Sub-test 2	54	65	45	58

Table 16.3.1.5-3: PRS-RSRP relative accuracy requirements for the reported values

Test Configuration	Subtest	Cell 1		Cell 2	
		Lowest reported value	Highest reported value	Lowest reported value	Highest reported value
1	Sub-test 1	27	30	21	30
	Sub-test 2	27	30	24	30
2	Sub-test 1	27	30	21	30
	Sub-test 2	27	30	24	30
3	Sub-test 1	27	30	21	30
	Sub-test 2	27	30	25	30

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

16.3.2 PRS-RSRP measurement accuracy with PRS in FR2

16.3.2.1 Test purpose

The purpose of this test is to verify that the PRS-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [50] clauses 10.1.24.2.1 and 10.1.24.2.2.

16.3.2.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports DL-AoD positioning and PRS-RSRP measurements in FR2.

16.3.2.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRP measurement for FR2 defined in Table 16.3.2.3-1 are valid under the following conditions:

Conditions defined in 38.101-2 Clause 7.3 for reference sensitivity are fulfilled.

PRP $1,2|_{dBm}$ according to TS 38.133 [50] Annex B.2.14 for a corresponding Band

Table 16.3.2.3-1: PRS-RSRP absolute accuracy for FR2

Accuracy		Conditions				
					Io Note 7 range	
Normal condition	Extreme condition	PRS Ês/Iot	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	Minimum Io Note 1 dBm / SCS_{PRS}	Maximum Io
dB	dB	dB	PRB	-	dBm / SCS_{PRS}	dBm/$BW_{Channel}$
					dBm/120kHz Note 6 / dBm/60kHz Note 6	
±5	±8	≥-3dB	≥24	All	Same value as PRP in TS 38.133 [50] Table B.2.14 -2, according to UE Power class, operating band and angle of arrival	-50
					Note 4	
					Note 4	
±8.5	±11.5	≥-13dB	24 ≤ BW ≤ 64	All	Note 4	
±6	±9		BW >64	All	Note 4	

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in TS 37.355 [49].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 RB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in TS 38.133 [50] Sections B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in TS 38.133 [50] Section 3.5.2.

The accuracy requirements for PRS-RSRP measurement for FR2 defined in Table 116.3.2.3-2 are valid under the following conditions:

Conditions defined in 38.101-2 Clause 7.3 for reference sensitivity are fulfilled.

PRP $1,2|_{dBm}$ according to TS 38.133 [50] Annex B.2.14 for a corresponding Band

Table 16.3.2.3-2: PRS-RSRP relative accuracy for FR2

Accuracy		Conditions				
					Io Note 7 range	
Normal condition	Extreme condition	PRS Ês/Iot	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	Minimum Io Note 1 dBm / SCS_{PRS}	Maximum Io
dB	dB	dB	PRB	-	dBm / SCS_{PRS}	dBm/$BW_{Channel}$
					dBm/120kHz Note 6 / dBm/60kHz Note 6	

±5.0	±8.0	≥-3dB	≥24	All	Same value as PRP in TS 38.133 [50] Table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
					Note 4	
					Note 4	
±10	±13	≥-13dB	24 ≤ BW ≤ 64	All	Note 4	
±7.5	±10.5		BW >64	All	Note 4	

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in TS 37.355 [49].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 RB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in TS 38.133 [50] Sections B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in TS 38.133 [50] Section 3.5.2.

16.3.2.4 Test description

The supported test configurations in listed in Table 16.3.2.4-1.

Table 16.3.2.4-1: Supported test configurations for PRS RSRP measurement for FR2

Config	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

16.3.2.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.3.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.3.2.5-1 and Table 16.3.2.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.3.2.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

16.3.2.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration, PRS.1.3 FR2 and PRS.1.4 FR2. The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The NR-DL-AoD-RequestLocationInformation message and the DL-AoD assistance data as defined in clause 16.3.2.4.3 shall be provided to the UE during the set-up period. The last TTI containing the NR-DL-AoD-RequestLocationInformation message shall be provided to the UE ΔT ms before the start

of the measurement period, where ΔT = 50 ms is the maximum processing time of the NR-DL-AoD-RequestLocationInformation message and the DL-AoD assistance data in the UE.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.3.2.5-1 and Table 16.3.2.5-2 as appropriate. Propagation conditions are set according to clause 4.16.2.
4. The SS shall send an LPP REQUEST CAPABILITIES message.
5. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the NR-DL-AoD-ProvideCapabilities IE.
6. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the nr-DL-AoD-ProvideAssistanceData-r16 IE. If the UE message at step 5 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
7. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-DL-AoD-RequestLocationInformation-r16 IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.
8. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the nr-DL-AoD-ProvideLocationInformation-r16 IE within the response time (see clause 4.16.3). The UE shall perform and report the PRS-RSRP measurements for both Cell 1 and Cell 2.
9. If the UE message at step 8 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
10. The SS shall check the nr-DL-PRS-RSRP-Result-r16 and nr-DL-PRS-RSRP-ResultDiff-r16 value for Cell 1 and Cell 2 in the nr-DL-AoD-SignalMeasurementInformation-r16 according to Table 16.3.2.5-3.
11. Repeat step 2-10 until the confidence level according to Annex D is achieved.
12. Repeat step 1-11 for the other sub-test defined in Table 16.3.2.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

RMSI CORESET Reference Channel		CR.3.1 TDD	-	CR.3.1 TDD	-
Control channel RMC		CCR.3.1 TDD	-	CCR.3.1 TDD	-
OCNG Patterns		OP.1	OP.1	OP.1	OP.1
SSB configuration		SSB.3 FR2	SSB.3 FR2	SSB.3 FR2	SSB.3 FR2
SMTC configuration		SMTC.1	SMTC.1	SMTC.1	SMTC.1
Time offset with Cell 1	µs	-	3	-	3
Expected RSTD	µs	3			
Expected RSTD uncertainty	µs	5			
PRS configuration		PRS.1.3 FR2	PRS.1.3 FR2	PRS.1.4 FR2	PRS.1.4 FR2
PRS Resource slot offset	slot	0	2	0	2

PDSCH/PDCCH subcarrier spacing	kHz	120	120	120	120
EPRE ratio of PSS to SSS	dB	0	0	0	0
EPRE ratio of PBCH_DMRS to SSS					
EPRE ratio of PBCH to PBCH_DMRS					
EPRE ratio of PDCCH_DMRS to SSS					
EPRE ratio of PDCCH to PDCCH_DMRS					
EPRE ratio of PDSCH_DMRS to SSS					
EPRE ratio of PDSCH to PDSCH_DMRS					
EPRE ratio of OCNG DMRS to SSS Note 1					
EPRE ratio of OCNG to OCNG DMRS Note 1					
EPRE ratio of PRS to SSS	dB	0	0	0	0
Propagation conditions		AWGN	AWGN	AWGN	AWGN
Antenna configuration		1x2	1x2	1x2	1x2
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. Note 2: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.					

Table 16.3.2.5-2: PRS-RSRP OTA related test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to TS 38.133 [50] clause A.3.15.1			
Assumption for UE beams Note 7		Rough		Rough	
N_{oc} Note1	dBm/15kHz Note4	-99.1		-99.1	
N_{oc} Note1	dBm/SCS Note4	-90.1		-90.1	
PRS $\hat{E}_s / N_{oc}$	dB	-2	-10	-2	-10
PRP Note2	dBm/SCS	-92.1	-100.1	-92.1	-100.1
PRS $\hat{E}_s / I_{ot}$ BB Note6	dB	-2.55	-12.22	-2.55	-12.22
Io Note2	dBm/190.08 MHz Note4	-55.69		-55.69	
Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled. Note 2: PPRP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. Note 3: Void Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone Note 5: Void Note 6: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4. Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation					

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 16.2.3.5 Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.142}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation (see Table 16.3.2.4.3-3).

Table 16.3.2.5-3: PRS RSRP accuracy requirements for the reported values

Test Configuration	Report Mapping	Lowest reported value	Highest reported value
Sub-test 1	Absolute PRS RSRP accuracy for Cell 1	54	85
	Relative PRS RSRP accuracy for Cell 1	22	30
	Absolute PRS RSRP accuracy for Cell 2	46	77
	Relative PRS RSRP accuracy for Cell 2	20	30
Sub-test 2	Absolute PRS RSRP accuracy for Cell 1	54	85
	Relative PRS RSRP accuracy for Cell 1	24	30
	Absolute PRS RSRP accuracy for Cell 2	46	77
	Relative PRS RSRP accuracy for Cell 2	23	30

The PRS RSRP measurement period fulfils the requirements specified in clause 4.16.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.3.3 PRS-RSRP measurement accuracy with PRS in FR1 with reduced sample number

16.3.3.1 Test purpose

The purpose of this test is to verify that the accuracy of PRS-RSRP measurement with reduced sample number is within the specified limits. This test will verify the requirements in TS 38.133 [50] clauses 10.1.24.2.1 and 10.1.24.2.2.

16.3.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

16.3.3.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRP measurement for FR1 defined in Table in TS 38.133 [50] clause 10.1.24.2.1-3 are valid under the following conditions:

- Conditions defined in 38.101-2 Clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band
- UE supports positioning measurements with reduced number of samples, and LMF indicates UE to perform positioning measurements with reduced number of samples
- AWGN channel

Table 16.3.3.3-1: PRS-RSRP absolute accuracy for FR1 with reduced sample number

Accuracy		Conditions							
					Io Note 6 range				
Normal condition	Extreme condition	PRS $\hat{E}_s/I_{ot}$	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS}/K_{comb}^{PRS}$)	NR operating band groups Note 7	Minimum Io Note 1 dBm / SCS_{PRS}			Maximum Io
						dBm / SCS_{PRS}			dBm/$BW_{Channel}$
dB	dB	dB	PRB	-		dBm/15kHz Note 5	dBm/30kHz Note 5	dBm/60kHz Note 5	
±3.5	±8	≥0	≥48	All	NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A	-127	-124	-121	-50
					NR_FDD_FR1_B	-126.5	-123.5	-120.5	-50
					NR_TDD_FR1_C	-126	-123	-120	-50
					NR_FDD_FR1_D, NR_TDD_FR1_D	-125.5	-122.5	-119.5	-50
					NR_FDD_FR1_E, NR_TDD_FR1_E	-125	-122	-119	-50
					NR_FDD_FR1_F	-124.5	-121.5	-118.5	-50
					NR_FDD_FR1_G, NR_TDD_FR1_G	-124	-121	-118	-50
					NR_FDD_FR1_H	-123.5	-120.5	-117.5	-50
±8.5	±13	≥-6	48 ≤ BW ≤ 52	All	Note 3				
±6	±10.5		52< BW≤ 104	All	Note 3				
±4.5	±9		BW >104	All	Note 3				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 48 PRB.
NOTE 4: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 5: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 6: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 7: NR operating band groups are as defined in Section 3.5.2.

Table 16.3.3.3-2: PRS-RSRP relative accuracy for FR1 with reduced sample number

Accuracy		Conditions			
			PRS BW		Io Note 6 range

Normal condition	Extreme condition	PRS Ês/Iot		Repetition factor (T_{rep}^{PRS} * L_{PRS}/ K_{comb}^{PRS})	NR operating band groups Note 7	Minimum Io Note 1 dBm / SCS_{PRS}			Maximum Io
dB	dB	dB	PRB	-		dBm / SCS_{PRS}			dBm/$BW_{Channel}$
						dBm/15kHz Note 5	dBm/30kHz Note 5	dBm/60kHz Note 5	
±3.5	±5.0	≥0	≥48	All	NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A	-127	-124	-121	-50
					NR_FDD_FR1_B	-126.5	-123.5	-120.5	-50
					NR_TDD_FR1_C	-126	-123	-120	-50
					NR_FDD_FR1_D, NR_TDD_FR1_D	-125.5	-122.5	-119.5	-50
					NR_FDD_FR1_E, NR_TDD_FR1_E	-125	-122	-119	-50
					NR_FDD_FR1_F	-124.5	-121.5	-118.5	-50
					NR_FDD_FR1_G, NR_TDD_FR1_G	-124	-121	-118	-50
					NR_FDD_FR1_H	-123.5	-120.5	-117.5	-50
±9.5	±11.0	≥-6	48 ≤ BW ≤ 52	All	Note 3				
±6.5	±8.0		52< BW≤ 104	All	Note 3				
±5.0	±6.5		BW >104	All	Note 3				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 48 RB.
NOTE 4: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 5: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 6: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 7: NR operating band groups are as defined in Section 3.5.2.

16.3.3.4 Test description

16.3.3.4.1 Initial conditions

The supported test configurations in listed in Table 16.3.3.4-1.

Table 16.3.3.4-1: Test Configurations

Config	Description
1	NR 15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	NR 15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	NR 30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations in each supported band	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.3.3.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.3.3.5-1.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.3.3.4.3.

5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.3.3.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The NR-DL-AoD-ProvideAssistanceData and NR-DL-AoD-RequestLocationInformation as defined in TS 37.355 [49] shall be provided to the UE during the set-up period.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.3.3.5-1. Propagation conditions are set according to clause 4.16.2.
5. The SS shall transmit an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
7. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
8. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the reducedDL-PRS-ProcessingSamples-r17 in the NR-DL-AoD-RequestLocationInformation IE such that the UE receives the message T ms before the start of the measurement period, where T = 50 ms.
9. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-AoD-ProvideLocationInformation* IE within the response time (see clause 4.16.3). The UE shall perform and report the PRS-RSRP measurements for Cell 2 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-AoD-ProvideLocationInformation* IE including the nr-DL-PRS-RSRP-Result-r16 field for Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-AoD-ProvideLocationInformation* IE with both the nr-DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.
10. If the UE message at step 10 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
11. Repeat steps 2-10 in Table 16.3.3.4-1 until the confidence level according to Annex D is achieved.

	Config 3			-92.07	-95.92
I_o Note3	Config 1,2		dBm/19.08MHz	-61.20	
	Config 3		dBm/47.88MHz	-57.20	
Propagation condition				AWGN	
Antenna configuration				1x2	

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP and PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Void.

Note 6: Void.

Note 7: GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 16.2.5.5 Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(\left\lceil\frac{16}{N'}\right\rceil\left\lceil\frac{1}{N}\right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation (see Table 16.3.3.4.3-3).

Table 16.3.3.5-2: PRS-RSRP accuracy requirements for the reported values

Test Configuration	Configuration	Report Mapping	Lowest reported value	Highest reported value
Sub-test 1 Subtest 1	Config 1&2	Absolute PRS RSRP accuracy for Cell 1	56	66
		Relative PRS RSRP accuracy for Cell 1	27	30
		Absolute PRS RSRP accuracy for Cell 2	50	65
		Relative PRS RSRP accuracy for Cell 2	24	30
	Config 3	Absolute PRS RSRP accuracy for Cell 1	59	69
		Relative PRS RSRP accuracy for Cell 1	27	30
		Absolute PRS RSRP accuracy for Cell 2	55	67
		Relative PRS RSRP accuracy for Cell 2	25	30

The PRS RSRP measurement period fulfils the requirements specified in clause 4.16.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.3.4 PRS-RSRP measurement accuracy with PRS in FR2 with reduced sample number

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

16.3.4.1 Test purpose

The purpose of this test is to verify that the accuracy of PRS-RSRP measurement with reduced sample number is within the specified limits. This test will verify the requirements in TS 38.133 [50] clauses 10.1.24.2.1 and 10.1.24.2.2.

16.3.4.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

16.3.4.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRP measurement for FR2 defined in Table 10.1.24.2.1-4 are valid under the following conditions:

- Conditions defined in 38.101-2 Clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band
- UE supports positioning measurements with reduced number of samples, and LMF indicates UE to perform positioning measurements with reduced number of samples
- AWGN channel

…

Table 10.1.24.2.1-4: PRS-RSRP absolute accuracy for FR2 with reduced sample number

Accuracy		Conditions				
					Io Note 6 range	
Normal condition	Extreme condition	PRS Ês/Iot	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	Minimum Io Note 1 dBm / SCS_{PRS}	Maximum Io
dB	dB	dB	PRB	-	dBm / SCS_{PRS}	dBm/$BW_{Channel}$
					dBm/120kHz Note 5 / dBm/60kHz Note 5	
±5	±8	≥0	≥48	All	Same value as PRP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
±8.5	±11.5	≥-6	48 ≤ BW ≤ 64	All	Note 3	
±6	±9		BW >64	All	Note 3	

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 48 PRB.
NOTE 4: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 5: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.

NOTE 6: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 7: NR operating band groups are as defined in Section 3.5.2.

16.3.4.4 Test description

16.3.4.4.1 Initial conditions

The supported test configurations in listed in Table 16.3.4.4-1.

Table 16.3.4.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.3.4.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.3.4.5-1 and Table 16.3.4.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.3.4.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.3.4.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The NR-DL-AoD-ProvideAssistanceData and NR-DL-AoD-RequestLocationInformation as defined in TS 37.355 [49] shall be provided to the UE during the set-up period.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.3.4.5-1 and Table 16.3.4.5-2. Propagation conditions are set according to clause 4.16.2.
5. The SS shall transmit an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
7. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
8. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the reducedDL-PRS-ProcessingSamples-r17 in the NR-DL-AoD-RequestLocationInformation IE such that the UE receives the message T ms before the start of the measurement period, where T = 50 ms.

9. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-AoD-ProvideLocationInformation* IE within the response time (see clause 4.16.3). The UE shall perform and report the PRS-RSRP measurements for Cell 2 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-AoD-ProvideLocationInformation* IE including the nr-DL-PRS-RSRP-Result-r16 field for Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-AoD-ProvideLocationInformation* IE with both the nr-DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.

10. If the UE message at step 10 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

11. Repeat steps 2-10 in Table 16.3.4.4-1 until the confidence level according to Annex D is achieved.

16.3.4.5 Test requirement

Table 16.3.4.5-1 and Table 16.3.4.5-2 define the primary level settings including test tolerances for the test.

Table 16.3.4.5-1: PRS-RSRP general test parameters

Parameter	Unit	Test 1	
		Cell 1	Cell 2
Cell ID		489	0
SSB ARFCN		freq1	
Duplex mode		TDD	
TDD configuration		TDDConf.3.1	
$BW_{channel}$	MHz	200: $N_{RB,c}$ = 132	
Downlink initial BWP configuration		DLBWP.0.1	-
Downlink dedicated BWP configuration		DLBWP.1.1	-
Uplink initial BWP configuration		ULBWP.0.1	-
Uplink dedicated BWP configuration		ULBWP.1.1	-
DRX cycle configuration		Not applicable	-
Measurement gap		GP#13 or GP#24 Note2	
TRS configuration		TRS.2.1 TDD	-
TCI state		TCI.State.0	-
PDSCH Reference measurement channel		SR.3.1 TDD	-
RMSI CORESET Reference Channel		CR.3.1 TDD	-
Control channel RMC		CCR.3.1 TDD	-
OCNG Patterns		OP.3	OP.3
SSB configuration		SSB.3 FR2	SSB.3 FR2
SMTC configuration		SMTC.1	SMTC.1
Time offset with Cell 1	µs	-	3
PRS configuration		PRS.1.4 FR2	PRS.1.4 FR2
PRS BW	RB	64	64
PRS Resource slot offset	slot	0	2
PDSCH/PDCCH subcarrier spacing	kHz	120	120
EPRE ratio of PSS to SSS	dB	0	0
EPRE ratio of PBCH_DMRS to SSS			
EPRE ratio of PBCH to PBCH_DMRS			
EPRE ratio of PDCCH_DMRS to SSS			
EPRE ratio of PDCCH to PDCCH_DMRS			
EPRE ratio of PDSCH_DMRS to SSS			
EPRE ratio of PDSCH to PDSCH_DMRS			
EPRE ratio of OCNG DMRS to SSS Note 1			
EPRE ratio of OCNG to OCNG DMRS Note 1			
Propagation conditions		AWGN	AWGN
Antenna configuration		1x2	1x2

`Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.

Table 16.3.4.5-2: PRS-RSRP OTA related test parameters

Parameter	Unit	Test 1	
		Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to TS 38.133 [50] clause A.3.15.1	
Assumption for UE beams Note 7		Rough	
N_{OC} Note1	dBm/15kHz Note4	-103	
N_{OC} Note1	dBm/SCS Note4	-94	
PRS $\hat{E}_s / N_{oc}$	dB	3.56	-0.28
E_S	dBm/SCS Note4	-	-
PRS_RP Note2	dBm/SCS	-090.4	-94.2
SSB_RP Note2	dBm/SCS	-86.77	-90.73
$\hat{E}_s / I_{ot\ BB}$ Note6	dB	0.32	-5.64
Io Note2	dBm/190.08 MHz Note4	-55.73	

Note 1:	Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 2:	SSB_RP, PRS_RP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 3:	Void
Note 4:	Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 5:	Void
Note 6:	Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.
Note 7:	Information about types of UE beam is given in B.2.1.3, and does not limit UE implementation or test system implementation

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 16.2.7.5 Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lfloor \frac{0.071}{N} \right\rfloor * 1 - 1\right)$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation (see Table 16.3.4.4.3-3).

Table 16.3.4.5-3: PRS RSRP accuracy requirements for the reported values

Test Configuration	Report Mapping	Lowest reported value	Highest reported value
Test 1	Absolute PRS RSRP accuracy for Cell 1	66	76
	Relative PRS RSRP accuracy for Cell 1	25	30
	Absolute PRS RSRP accuracy for Cell 2	61	73
	Relative PRS RSRP accuracy for Cell 2	23	30

The PRS RSRP measurement period fulfils the requirements specified in clause 4.16.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.3.5 PRS-RSRP measurement accuracy test case in FR1 for Redcap UE without Rx FH

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

16.3.5.1 Test purpose

The purpose of this test is to verify that the accuracy of PRS-RSRP measurement in RRC_CONNECTED without FH by a RedCap UE is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1A.17.2.

16.3.5.2 Test applicability

This test applies to all types of NR FR1 RedCap UEs release 18 onwards that supports DL-AoD positioning.

16.3.5.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRP measurement for FR1 defined in table 10.1.24.2.1-1 are valid under the following conditions:

- Conditions defined in 38.101-1 clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band
- UE does not support positioning measurements with reduced number of samples, or LMF does not indicate UE to perform positioning measurements with reduced number of samples

Table 10.1.24.2.1-1: PRS-RSRP absolute accuracy for FR1

Accuracy		Conditions						
					Io Note 7 range			
Normal condition	Extreme condition	PRS Ês/Iot	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	NR operating band groups Note 8	Minimum Io Note 1 dBm / SCS_{PRS}		Maximum Io
						dBm / SCS_{PRS}		
dB	dB	dB	PRB	-		dBm/15 kHz Note 6	dBm/30 kHz Note 6	dBm/60 kHz Note 6	dBm/$BW_{Channel}$
±3.5	±8	≥-3 dB	≥24	All	NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A	-127	-124	-121	-50
					NR_FDD_FR1_B, NR_TDD_FR1_B	-126.5	-123.5	-120.5	-50
					NR_FDD_FR1_C, NR_TDD_FR1_C	-126	-123	-120	-50
					NR_FDD_FR1_D, NR_TDD_FR1_D	-125.5	-122.5	-119.5	-50
					NR_FDD_FR1_E, NR_TDD_FR1_E	-125	-122	-119	-50
					NR_FDD_FR1_F	-124.5	-121.5	-118.5	-50
					NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G	-124	-121	-118	-50
					NR_FDD_FR1_H	-123.5	-120.5	-117.5	-50
					NR_FDD_FR1_N	-120.5	-117.5	-114.5	-50
					Note 4				
					Note 4				
±8.5	±13	≥-13 dB	24 ≤ BW ≤ 52	All	Note 4				
±6	±10.5		52< BW≤ 104	All	Note 4				
±4.5	±9		BW >104	All	Note 4				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in clauses B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in clause 3.5.2.

Accuracy requirement in table 10.1A.17.2.1-1 and table 10.1A.17.2.1-2 apply to the PRS-RSRP measurement performed by 1Rx RedCap UE with RX FH, where the PRS bandwidth in table 10.1A.17.2.1-1 and table 10.1A.17.2.1-2 correspond to the PRS bandwidth measured by the RedCap UE per hop.

Table 10.1A.17.2.1-1: PRS-RSRP absolute accuracy for 1Rx RedCap UE in FR1 (without RX FH)

Accuracy		Conditions							
					Io Note 5 range				
Normal condition	Extreme condition	PRS $\hat{E}_s/I_{ot}$	PRS BW Note 2	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	NR operating band groups Note 6	Minimum Io Note 1 dBm / SCS_{PRS}			Maximum Io
						dBm / SCS_{PRS}			
dB	dB	dB	PRB			dBm/15kHz Note 4	dBm/30kHz Note 4	dBm/60kHz Note 4	$dBm/BW_{Channel}$
±7	±11.5	≥-3dB	≥24	All	NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A	-127	-124	-121	-50
					NR_FDD_FR1_B, NR_TDD_FR1_B	-126.5	-123.5	-120.5	-50
					NR_FDD_FR1_C, NR_TDD_FR1_C	-126	-123	-120	-50
					NR_FDD_FR1_D, NR_TDD_FR1_D	-125.5	-122.5	-119.5	-50
					NR_FDD_FR1_E, NR_TDD_FR1_E	-125	-122	-119	-50
					NR_FDD_FR1_F	-124.5	-121.5	-118.5	-50
					NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G	-124	-121	-118	-50
					NR_FDD_FR1_H	-123.5	-120.5	-117.5	-50
					NR_FDD_FR1_N	-120.5	-117.5	-114.5	-50
±7.5	±12	≥-10dB	24 ≤ BW ≤ 52	All	Note 3				
±6	±10.5		52< BW≤ 104	All	Note 3				
±5.5	±9.5		BW >104	All	Note 3				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: PRS bandwidth is as indicated in *dl-PRS-ResourceBandwidth* in the DL-TDOA or DL-AoD or multi-RTT assistance data defined in TS 37.355 34].
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 4: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 5: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 6: NR operating band groups are as defined in Section 3.5.2.

16.3.5.4 Test description

16.3.5.4.1 Initial conditions

The supported test configurations are specified in Table 16.3.5.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.3.5.4-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.3.5.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.3.5.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.3.5.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the PCell. Cell 2 is the neighbour cell. The cells are on the same RF channel in FR1

16.3.5.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell.

The NR-DL-AoD-RequestLocationInformation message and NR-DL-AoD-ProvideAssistanceData message as defined in TS 37.355 shall be provided to the UE during T1. The last slot containing the two messages for the assistance data and location information request is denoted as #n. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources that is ΔT after slot #n, where ΔT = 50 ms is the maximum processing time of the assistance data and location information request

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.3.5.5-1 as appropriate. Propagation conditions are set according to clause 4.15.2.
4. The SS shall send an LPP REQUEST CAPABILITIES message.
5. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities in the NR-DL-AoD-ProvideCapabilities IE.
6. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the nr-DL-AoD-ProvideAssistanceData-r16 IE. If the UE message at step 5 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

7. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-DL-AoD-RequestLocationInformation-r16 such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.

8. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message, including the nr-DL-AoD-ProvideLocationInformation-r16 IE.

9. If the UE message at step 8 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

10. The SS shall check the reported PRS-RSRP values for Cell 1 and Cell 2 against the requirements in clause 16.3.5.5.

11. Repeat steps 2-10 until the confidence level according to Annex D is achieved.

12. Repeat step 1-11 for the other sub-test defined in Table 16.3.5.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

16.3.5.5 Test requirement

FFS

16.3.6 PRS-RSRP measurement accuracy test case in FR2 for Redcap UE without Rx FH

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

16.3.6.1 Test purpose

The purpose of this test is to verify that the accuracy of PRS-RSRP measurement without FH by a RedCap UE is within the specified limits. This test will verify the requirements in TS 38.133 [50] clauses 10.1A.17.2.1 and 10.1A.17.2.2.

16.3.6.2 Test applicability

This test applies to all types of NR FR2 RedCap UEs release 18 onwards that supports DL-AoD positioning.

16.3.6.3 Minimum conformance requirements

The minimum conformance requirements for PRS-RSRP measurement are specified in TS 38.133 [50], clause 10.1A.17.2.1, under the test conditions defined in clause 16.3.6.5.

16.3.6.4 Test description

The supported test configurations are specified in Table 16.3.6.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.3.6.4-1: Supported test configurations

Configuration	Description
1	120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode

16.3.6.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.3.6.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.3.6.5-1 and Table 16.3.6.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.3.6.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

16.3.6.4.2 Test procedure

Same as defined in clause 16.3.5.4.2.

16.3.6.4.3 Message contents

As defined in clause 16.3.5.4.3, with the following exceptions:

Table 16.3.6.4.3-1 replaces Table 16.3.5.4.3-5 and Table 16.3.5.4.3-2 replaces Table 16.3.5.4.3-6.

16.3.6.5 Test requirement

FFS

16.3.7 PRS-RSRP measurement accuracy test case in FR1 for Redcap UE with Rx FH

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

16.3.7.1 Test purpose

The purpose of this test is to verify that the accuracy of PRS-RSRP measurement in RRC_CONNECTED with FH by a RedCap UE is within the specified limits. This test will verify the requirements in TS 38.133 [50] clauses 10.1A.17.2.

16.3.7.2 Test applicability

This test applies to all types of NR FR1 RedCap UEs release 18 onwards that supports DL-AoD positioning and PRS RX hopping.

16.3.7.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRP measurement for FR1 defined in table 10.1.24.2.1-1 are valid under the following conditions:

- Conditions defined in 38.101-1 clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band
- UE does not support positioning measurements with reduced number of samples, or LMF does not indicate UE to perform positioning measurements with reduced number of samples

The absolute accuracy requirements for PRS-RSRP measurement for FR2 defined in table 10.1.24.2.1-2 are valid under the following conditions:

- Conditions defined in 38.101-2 [19] clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band
- UE does not support positioning measurements with reduced number of samples, or LMF does not indicate UE to perform positioning measurements with reduced number of samples

Table 10.1.24.2.1-1: PRS-RSRP absolute accuracy for FR1

Accuracy		Conditions							
					Io Note 7 range				
Normal condition	Extreme condition	PRS Ês/Iot	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	NR operating band groups Note 8	Minimum Io Note 1 dBm / SCS_{PRS}			Maximum Io
						dBm / SCS_{PRS}

					Note 4				
					Note 4				
±8.5	±13	≥-13 dB	24 ≤ BW ≤ 52	All	Note 4				
±6	±10.5		52< BW≤ 104	All	Note 4				
±4.5	±9		BW >104	All	Note 4				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in clauses B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in clause 3.5.2.

Table 10.1.24.2.1-2: PRS-RSRP absolute accuracy for FR2

Accuracy	Conditions			
		PRS BW		Io Note 7 range

Normal condition	Extreme condition	PRS Ês/Iot		Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	Minimum Io Note 1 dBm / SCS_{PRS}		Maximum Io
dB	dB	dB	PRB	-	dBm / SCS_{PRS}		$dBm/BW_{Channel}$
					dBm/120 kHz Note 6	dBm/60 kHz Note 6	
±5	±8	≥-3 dB	≥24	All	Same value as PRP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival		-50
					Note 4		
					Note 4		
±8.5	±11.5	≥-13 dB	24 ≤ BW ≤ 64	All	Note 4		
±6	±9		BW >64	All	Note 4		

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in clauses B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in clause 3.5.2.

16.3.7.4 Test description

16.3.7.4.1 Initial conditions

The supported test configurations are specified in Table 16.3.7.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.3.7.4-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, cell bandwidth 50 MHz, FDD duplex mode
2	15 kHz SSB SCS, cell bandwidth 50 MHz, TDD duplex mode
3	30 kHz SSB SCS, cell bandwidth 100 MHz, TDD duplex mode
4	15 kHz SSB SCS, cell bandwidth 50 MHz, HD-FDD duplex mode

NOTE 1: The UE is only required to be tested in one of the supported test configurations.
NOTE 2: This test case is applicable to the UE supporting per hop bandwidth ≥ 10 MHz for SCS 15 kHz.
NOTE 3: This test case is applicable to the UE supporting per hop bandwidth = 20 MHz for SCS 30 kHz.

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.3.7.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.3.7.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.3.7.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the PCell. Cell 2 is the neighbour cell. The cells are on the same RF channel in FR1

16.3.7.4.2 Test procedure

Same as defined in clause 16.3.5.4.2.

16.3.7.4.3 Message contents

16.3.7.5 Test requirement

FFS

16.3.8 PRS-RSRP measurement accuracy test case in FR2 for Redcap UE with Rx FH

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

16.3.8.1 Test purpose

The purpose of this test is to verify that the accuracy of PRS-RSRP measurement with FH by a RedCap UE is within the specified limits. This test will verify the requirements in TS 38.133 [50] clauses 10.1A.17.2.1 and 10.1A.17.2.2.

16.3.8.2 Test applicability

This test applies to all types of NR FR1 RedCap UEs release 18 onwards that supports DL-AoD positioning and PRS RX hopping.

16.3.8.3 Minimum conformance requirements

Same as defined in clause 16.3.7.3.

16.3.8.4 Test description

The supported test configurations are specified in Table 16.3.8.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.3.8.4-1: Supported test configurations

Configuration	Description
1	120 kHz SSB SCS, cell bandwidth 400 MHz, TDD duplex mode
NOTE 1: This test case is applicable to the UE supporting per hop bandwidth = 100 MHz for SCS 120 kHz.	

16.3.8.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.3.8.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.3.8.5-1 and Table 16.3.8.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.3.8.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

16.3.8.4.2 Test procedure

Same as defined in clause 16.3.5.4.2.

16.3.8.4.3 Message contents

As defined in clause 16.3.5.4.3, with the following exceptions:

Table 16.3.8.4.3-1 replaces Table 16.3.5.4.3-3, Table 16.3.8.4.3-2 replaces Table 16.3.5.4.3-5 and Table 16.3.8.4.3-3 replaces Table 16.3.5.4.3-7.

16.3.8.5 Test requirement

FFS

16.4 NR PRS-RSRP measurement period test cases in RRC_INACTIVE

16.4.1 PRS-RSRP measurement reporting delay test case for single positioning frequency layer in FR1 SA

16.4.1.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements specified in TS 38.133 [50] Clause 5.6.3.5 for single positioning frequency layer under AWGN propagation conditions in RRC_INACTIVE in FR1 standalone scenario.

16.4.1.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and supports DL-PRS measurement in RRC_INACTIVE state.

16.4.1.3 Minimum conformance requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in Clause 5.6.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms.

$$T_{PRS-RSRP,\ total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max\left(T_{effect,i}\right)$$

Where:

- *i* is the index of positioning frequency layer,
- L is total number of positioning frequency layers,
- $T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$T_{PRS-RSRP,i} = \left(K_{carrier_PRS} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$Where:

- $K_{carrier_PRS}$ is a scaling factor for PRS-based NR positioning measurements in RRC_INACTIVE. If the UE supports *parallelPRS-MeasRRC-Inactive-r17*, $K_{carrier_PRS}$= 1. Otherwise,
- If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, $K_{carrier_PRS}$ equals to the sum of $K_{carrier}$ in 4.2.2.4 and one positioning layer.
- If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, $K_{carrier_PRS}$ equals to the sum of N_{layer} in 4.2.2.7 and one positioning layer.
- $N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping:
  - $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1, and if positioning frequency layer *i* is in FR2
  - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-AoD-RequestLocationInformation*.
  - $N_{RxBeam,i}$ equals to 8, otherwise.
- $L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,
- {N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms-r17*in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],
- N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* in clause 6.4.3 of TS 37.355 [34],
- N_{sample} is the number of PRS-RSRP measurement samples and
  - N_{sample}= 1, if UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF indicates the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34], and the following conditions are met:
    - PRS bandwidth is within the initial BWP and
    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

- N_{sample} = 2, if UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF indicates the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34], and the following conditions are not met:
  - PRS bandwidth is within the initial BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 4 otherwise

- $T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time,
  - $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,
  - T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34],
  - $T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$ is the least common multiple between $T_{PRS,i}$ and T_{DRX},
  - $T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,
  - T_{DRX} is the DRX cycle length.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

- T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.
- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

16.4.1.4 Test description

16.4.1.4.1 Initial conditions

The supported test configurations in listed in Table 16.4.1.4-1.

Table 16.4.1.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.4.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.4.1.5-1 and Table 16.4.1.5-2.
3. Propagation conditions are set according to clause 4.16.2.

4. Message contents are defined in clause 16.4.1.4.3.

5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.4.1.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During T2 UE shall be in RRC_INACTIVE state and all cells transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The *NR-DL-AoD-ProvideAssistanceData* and *NR-DL-AoD-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.11 shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where $\Delta T = 50$ ms is the maximum processing time of the *DL-AoD assistance* data and location information request.

The beginning of the time interval T2 shall be aligned with the first DRX cycle containing a DL PRS resource(s).

1. Configure the Cell for RA-SDT with SIB1 configured according to TS 38.508-1 [45], clause 4.6.1 with condition SDT
2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On,* according to TS 38.508-1 [45] clause 4.5.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

3. Set the parameters according to Table 16.4.1.5-1 and Table 16.4.1.5-2. Propagation conditions are set according to clause 4.16.2.

4. T1 starts.

5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.

6. The UE shall transmit RRCReconfigurationComplete message.

7. The SS shall transmit an LPP REQUEST CAPABILITIES message.

8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.

9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-DL-AoD-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where $\Delta T = 50$ ms.

11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.

12. When T1 expires, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and switch the power setting from T1 to T2 as specified in Table 16.4.1.5-1 and Table 16.4.1.5-2.

13. Wait for the UE monitors for occurrence of the periodic event requested.

14. The UE shall transmit the UE transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the RRCResumeRequest message and then go to step 18.

15. The SS transmits an *RRCResume* message.

16. The UE transmits an *RRCResumeComplete* message. The time between the start of T2 and the UE send the *RRCResumeRequest* message should meet the requirements specified in TS 38.133 [50] Clause 5.6.3.5.

17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the NR-DL-AoD-ProvideLocationInformation IE within the response time (see clause 4.16.3) plus the maximum RRC processing time 10ms between *RRCResume* message and *RRCResumeComplete* message.

18. The UE shall perform and report the RSTD measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1. If the UE transmits an NR-DL-AoD-ProvideLocationInformation IE including the nr-DL-PRS-RSRP-Result-r16 field for Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the NR-DL-AoD-ProvideLocationInformation IE with both the nr-DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.

19. If the UE message at step 17 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

20. Repeat steps 2-18 in Tables 16.4.1.4-1 until the confidence level according to Annex D is achieved.

	dBm/47.88 MHz	3		-60.58		-60.58
Propagation Condition		1, 2, 3	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE shall perform and report the PRS-RSRP measurements for Cell 1 and Cell 2, within the time limit specified in clause 5.6.3.5, starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be higher than the time duration above because of the uncertainty in acquiring the first available PRACH occasion to transition to RRC_CONNECTED state to report the measurements.

$$T_{PRS-RSRP,i} = \left(K_{carrier_PRS} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

$N_{RxBeam,i}$ = 1, $K_{carrier_PRS}$=1

$N_{PRS,i}^{slot} = 4$

For SCS 15KHz:

$$L_{available_{PRS},i} = \frac{10}{10 * 1 * 14} * 4 * 1 * 4 = 1.14ms$$

For SCS=30KHz

$$L_{available_{PRS},i} = \frac{10}{20 * 1 * 14} * 4 * 1 * 4 = 0.571ms$$

N_{sample}= 4

$T_{last,i} = T_i + T_{available_PRS,i}$

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$; where Tprs = 160 ms, and T_{DRX} is 1280msec (depending on UE capabilities. Therefore, $T_{available_PRS,i} = 1280$

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 5.12s and 206.08s.

For SCS 30KHz The LPP time IE ranges between 5.12s and 103.6s.

The LPP time IE ranges between 6s and 207s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 207.3

The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation.

The values of N', N and Ti and the effect in the response time equation are defined in Table 16.4.1.5-3 Table 16.4.1.5-4, Table 16.4.1.5-5 , Table 16.4.1.5-6 for reference.

N	$\left\lceil \frac{0.571}{N} \right\rceil$

nDot125	5
nDot25	2
>=nDot1	1

Table 16.4.1.5-6: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	Teffect	Tlast
n8	1280	1288
n16	1280	1296
n20	1280	1300
n30	1280	1310
n40	1280	1320
n80	1280	1360
n160	1280	1440
n320	1280	1600
n640	1280	1920
n1280	1280	2560

The test tolerances are defined in clauses C.1.6, C 2.5 and C4.

The rate of correct events observed during repeated tests shall be at least 90%.

16.4.2 PRS-RSRP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA

16.4.2.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements specified in TS 38.133 [50] Clause 5.6.3.5 for single positioning frequency layer under AWGN propagation conditions in RRC_INACTIVE in FR1 standalone scenario.

16.4.2.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, supports DL-PRS measurement in RRC_INACTIVE state and reduced number of samples for PRS measurement in RRC_INACTIVE state.

16.4.2.3 Minimum conformance requirements

Same as in clause 16.4.1.3.

16.4.2.4 Test description

16.4.2.4.1 Initial conditions

The supported test configurations in listed in Table 16.4.2.4-1.

Table 16.4.2.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.4.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.4.2.5-1 and Table 16.4.2.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.4.2.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.4.2.4.2 Test procedure

Same as in clause 16.4.3.4.2.

16.4.2.4.3 Message contents

As defined in clause 16.4.1.4.3, with the following exceptions:

Table 16.4.1.4.3-1 replaces Table 16.4.2.4.3-6 , Table 16.4.2.4.3-2 replaces Table16.4.1.4.3-7 and Table 16.4.1.4.3-3 replaces Table 16.4.2.4.3-9.

	dBm/47.88 MHz	3		-57.05		-57.05
Propagation Condition		1, 2, 3	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. Io levels apply only for symbols where PRS is transmitted.

Note 4: OCNG shall be used such that all active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols, except for slots where PRS is transmitted by any of the cells.

Note 5: Void.

The UE shall perform and report the PRS-RSRP measurements for Cell 1 and Cell 2, within the time limit specified in clause 5.6.3.5, starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be higher than the time duration above because of the uncertainty in acquiring the first available PRACH occasion to transition to RRC_CONNECTED state to report the measurements.

$$\mathrm{T}_{\mathrm{PRS-RSRP,i}} = \left(K_{\mathrm{carrier_PRS}} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,\mathrm{i}}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,\mathrm{i}}}{N} \right\rceil * N_{sample} - 1 \right) * \mathrm{T}_{\mathrm{effect,i}} + \mathrm{T}_{\mathrm{last,i}}$$

$N_{RxBeam,i}$ = 1, $K_{\mathrm{carrier_PRS}}$=1

$N_{PRS,i}^{slot} = 4$

For SCS 15KHz:

$$L_{available_{PRS},i} = \frac{10}{10 * 1 * 14} * 4 * 1 * 4 = 1.14ms$$

For SCS=30KHz

$$L_{available_{PRS},i} = \frac{10}{20 * 1 * 14} * 4 * 1 * 4 = 0.571ms$$

N_{sample}= 1

$\mathrm{T}_{\mathrm{last,i}} = T_{\mathrm{i}} + T_{available_PRS,\mathrm{i}}$

$T_{\mathrm{effect,i}} = \left\lceil \frac{T_{\mathrm{i}}}{T_{available_PRS,\mathrm{i}}} \right\rceil * T_{available_PRS,\mathrm{i}}$

$T_{available_PRS,i} = LCM(T_{PRS,\mathrm{i}}, T_{DRX})$; where Tprs = 160 ms, and T_{DRX} is 1280msec (depending on UE capabilities. Therefore, $T_{available_PRS,i} = 1280$

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 1.28s and 52.48s.

For SCS 30KHz The LPP time IE ranges between 1.28s and 26.88s.

The LPP time IE ranges between 2s and 53s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 53.3

The values of N', N and Ti and the effect in the response time equation are defined in Table 16.4.2.5-3 Table 16.4.2.5-4, Table 16.4.2.5-5 , Table 16.4.2.5-6 for reference.

Table 16.4.2.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17*

nDot125	5
nDot25	2
>=nDot1	1

Table 16.4.2.5-6: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	Teffect	Tlast
n8	1280	1288
n16	1280	1296
n20	1280	1300
n30	1280	1310
n40	1280	1320
n80	1280	1360
n160	1280	1440
n320	1280	1600
n640	1280	1920
n1280	1280	2560

The test tolerances are defined in clauses C.1.6, C 2.5 and C4.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.4.3 PRS-RSRP measurement reporting delay test case for single positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

16.4.3.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements specified in TS 38.133 [50] Clause 5.6.3.5 for single positioning frequency layer under AWGN propagation conditions in RRC_INACTIVE in FR2 standalone scenario.

16.4.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and supports DL-PRS measurement in RRC_INACTIVE state.

16.4.3.3 Minimum conformance requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in Clause 5.6.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms.

$$T_{PRS-RSRP,\ total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max\left(T_{effect,i}\right)$$

Where:

- *i* is the index of positioning frequency layer,
- L is total number of positioning frequency layers,
- $T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$T_{PRS-RSRP,i} = \left(K_{carrier_PRS_i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$Where:

- $K_{carrier_PRS}$ is a scaling factor for PRS-based NR positioning measurements in RRC_INACTIVE. If the UE supports *parallelPRS-MeasRRC-Inactive-r17*, $K_{carrier_PRS}$ = 1. Otherwise,
- If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, $K_{carrier_PRS}$ equals to the sum of $K_{carrier}$ in 4.2.2.4 and one positioning layer.
- If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, $K_{carrier_PRS}$ equals to the sum of N_{layer} in 4.2.2.7 and one positioning layer.
- $N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping:
  - $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1, and if positioning frequency layer *i* is in FR2
    - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-AoD-RequestLocationInformation*.
    - $N_{RxBeam,i}$ equals to 8, otherwise.
- $L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,
- {N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms-r17*in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],

- N' is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* in clause 6.4.3 of TS 37.355 [34],

- N_{sample} is the number of PRS-RSRP measurement samples and

  - N_{sample} = 1, if UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF indicates the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamplesrequestedDL-PRS-ProcessingSamples* [34], and the following conditions are met:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 2, if UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF indicates the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34], and the following conditions are not met:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 4 otherwise

- $T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time,

  - $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

  - T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34],

  - $T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$ is the least common multiple between $T_{PRS,i}$ and T_{DRX},

  - $T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

  - T_{DRX} is the DRX cycle length.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

- T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

16.4.3.4 Test description

16.4.3.4.1 Initial conditions

The supported test configurations in listed in Table 16.4.3.4-1.

Table 16.4.3.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.4.3.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.4.3.5-1 and Table 16.4.3.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.4.3.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.4.3.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During T2 UE shall be in RRC_INACTIVE state and all cells transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The *NR-DL-AoD-ProvideAssistanceData* and *NR-DL-AoD-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.11 shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where $\Delta T = 50$ ms is the maximum processing time of the *DL-AoD assistance* data and location information request.

The beginning of the time interval T2 shall be aligned with the first DRX cycle containing a DL PRS resource(s).

0. Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 16.4.3.4.3-0.
1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 16.4.3.5-1 and Table 16.4.3.5-2. Propagation conditions are set according to clause 4.16.2.
4. T1 starts.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-DL-AoD-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
12. When T1 expires, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and switch the power setting from T1 to T2 as specified in Table 16.4.3.5-1 and Table 16.4.3.5-2.

13. Wait for the UE monitors for occurrence of the periodic event requested.

14. The UE shall transmit the UE transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 17.

15. The SS transmits an *RRCResume* message.

16. The UE transmits an *RRCResumeComplete* message. The time between the start of T2 and the UE send the *RRCResumeRequest* message should meet the requirements specified in TS 38.133 [50] Clause 5.6.3.5.

17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the NR-DL-AoD-ProvideLocationInformation IE within the response time (see clause 4.16.3) plus the maximum RRC processing time 10ms between *RRCResume* message and *RRCResumeComplete* message. The UE shall perform and report the RSTD measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1. If the UE transmits an NR-DL-AoD-ProvideLocationInformation IE including the nr-DL-PRS-RSRP-Result-r16 field for Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the NR-DL-AoD-ProvideLocationInformation IE with both the nr-DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.

18. If the UE message at step 17 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

19. Repeat steps 2-18 in Tables 16.4.3.4-1 until the confidence level according to Annex D is achieved.

Io[Note3]	dBm/19 0.08 MHz Note5	Config 1	-55.69	-55.69
Propagation Condition		Config 1	AWGN	

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

The PRS-RSRP measurement time fulfils the requirements specified in clause 16.4.3.3.

The UE shall perform and report the PRS RSRP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 5.6.3.5 starting from the beginning of time interval T2

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS-RSRP measurement for each correct event shall be within the PRS-RSRP reporting range specified in clause TS 38.133 clause 10.1.24.3.1.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period. The PRS-RSRP measurement period follows the equation:

$$\mathrm{T}_{\mathrm{PRS-RSRP,i}} = \left(K_{\mathrm{carrier_{PRS}}} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,\mathrm{i}}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS,\mathrm{i}}}}{N} \right\rceil * N_{sample} - 1 \right) * \mathrm{T}_{\mathrm{effect,i}} + \mathrm{T}_{\mathrm{last,i}}$$

Where $K_{\mathrm{carrier_PRS}} = 1$, $N_{RxBeam,i}$ = 8, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,\mathrm{i}} = 0.035$, N_{sample}=4. N is the parameter *durationOfPRS-ProcessingSymbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive* from TS 37.355 [49], $\mathrm{T}_{\mathrm{last,i}} = T_{\mathrm{i}} + T_{available_PRS,\mathrm{i}}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$\mathrm{T}_{\mathrm{available_PRS,i}} = \mathrm{LCM}(\mathrm{T}_{\mathrm{PRS,i}}, \mathrm{T}_{\mathrm{DRX}})$, where Tprs = 160 ms, and $\mathrm{T}_{\mathrm{DRX}}$= 640ms depending on UE capabilities. Therefore, $\mathrm{T}_{\mathrm{available_PRS,i}} = 640$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.035}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T}_{\mathrm{last}}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 20.488s and 82.56s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 21s and 83s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 21.3s and 83.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 16.4.3.5-3, Table 16.4.3.5-4 and Table 16.4.3.5-5 for reference.

Table 16.4.3.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive*

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.4.4 PRS-RSRP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

16.4.4.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements specified in TS 38.133 [50] Clause 5.6.3.5 for single positioning frequency layer under AWGN propagation conditions in RRC_INACTIVE in FR2 standalone scenario.

16.4.4.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, supports DL-PRS measurement in RRC_INACTIVE state and reduced number of samples for PRS measurement in RRC_INACTIVE state.

16.4.4.3 Minimum conformance requirements

Same as in clause 16.4.3.3.

16.4.4.4 Test description

16.4.4.4.1 Initial conditions

The supported test configurations in listed in Table 16.4.4.4-1.

Table 16.4.4.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.4.4.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.4.4.5-1 and Table 16.4.4.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.4.4.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.4.4.4.2 Test procedure

Same as in clause 16.4.3.4.2.

16.4.4.4.3 Message contents

As defined in clause 16.4.3.4.3, with the following exceptions:

Table 16.4.4.4.3-1 replaces Table 16.4.3.4.3-6 and Table 16.4.4.4.3-2 replaces Table 16.4.3.4.3-9.

PRS $\hat{E}_s/N_{oc}$	dB	Config 1	-Infinity	3.56	-Infinity	-0.28
Io[Note3]	dBm/19 0.08 MHz Note5	Config 1	N/A	-55.73	N/A	-55.73
Propagation Condition		Config 1	AWGN			

Note 1:	OCNG shall be used such that all active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols, except for slots where PRS is transmitted by any of the cells.
Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. Io levels apply only for symbols where PRS is transmitted.
Note 4:	PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5:	Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6:	As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7:	Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation
Note 8:	Void.

The PRS-RSRP measurement time fulfils the requirements specified in clause 16.4.4.3.

The UE shall perform and report the PRS RSRP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 5.6.3.5 starting from the beginning of time interval T2

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS-RSRP measurement for each correct event shall be within the PRS-RSRP reporting range specified in clause TS 38.133 clause 10.1.24.3.1.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period. The PRS-RSRP measurement period follows the equation:

$$\mathrm{T}_{\mathrm{PRS-RSRP,i}} = \left(K_{\mathrm{carrier_{PRS}}} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,\mathrm{i}}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS},\mathrm{i}}}{N} \right\rceil * N_{sample} - 1 \right) * \mathrm{T}_{\mathrm{effect,i}} + \mathrm{T}_{\mathrm{last,i}}$$

Where $K_{\mathrm{carrier_PRS}} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,\mathrm{i}} = 0.035$, N_{sample}=1. N is the parameter *durationOfPRS-ProcessingSymbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive* from TS 37.355 [49], $\mathrm{T}_{\mathrm{last,i}} = T_{\mathrm{i}} + T_{available_PRS,\mathrm{i}}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$\mathrm{T}_{\mathrm{available_PRS,i}} = \mathrm{LCM}(\mathrm{T}_{\mathrm{PRS,i}}, \mathrm{T}_{\mathrm{DRX}})$, where Tprs = 160 ms, and $\mathrm{T}_{\mathrm{DRX}}$= 640ms depending on UE capabilities. Therefore, $\mathrm{T}_{\mathrm{available_PRS,i}} = 640$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.035}{N} \right\rceil * 1 - 1\right) * T_{effect} + \mathrm{T}_{\mathrm{last}}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 5.128s and 21.12s. The value of the LPP time IE is rounded up to the next second. The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 22s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 22.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 16.4.4.5-3, Table 16.4.4.5-4 and Table 16.4.4.5-5 for reference.

Table 16.4.4.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive*

n320	640	960
n640	640	1280
n1280	1280	1920

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.4.5 PRS-RSRP measurement reporting delay test case in FR1 for Redcap UE without Rx FH

Editor's note: This test case is incomplete. The following aspect is either missing or FFS:

- Test tolerance are not added in and analysis is missing

16.4.5.1 Test purpose

The purpose of the test is to verify that the PRS-RSRP measurement in RRC_INACTIVE meets the delay requirements specified in TS 38.133 [50] clause 9.9A.3.5 in an environment with AWGN propagation conditions.

16.4.5.2 Test applicability

This test applies to all NR FR1 RedCap UEs release 18 onwards that support PRS-RSRP measurement in RRC_INACTIVE.

16.4.5.3 Minimum conformance requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the RedCap UE shall be able to measure multiple (up to the RedCapUE capability specified in clause 9.9A.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms.

$$T_{PRS-RSRP,\,total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max\left(T_{effect,i}\right)$$

where

i is the index of positioning frequency layer,

L is total number of positioning frequency layers,

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$T_{PRS-RSRP,i} = \left(CSSF_{PRS_RedCap,i} * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last}$$

where

$CSSF_{PRS_RedCap,i}$ is the carrier specific scaling factor for PRS-RSRP measurements specified in clause 9.1A.5.2,

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioining frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 (for 2 Rx or 1 Rx RedCap UE) and if positioning frequency layer *i* is in FR2 (for 2 Rx RedCap UE only), $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],

N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

N_{sample} is the number of PRS-RSRP measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and

- Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

- N_{sample} = 4 otherwise.

$T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time, if not all PRS resources to be measured are available in the same measurement gap occasion during $T_{available_PRS,i}$, otherwise $T_{last,i} = T_i + MGL$,

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

T_i corresponds to durationOfPRS-ProcessingSymbolsInEveryTms in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$ is the least common multiple between $T_{PRS,i}$ and $MGRP_i$,

$T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$MGRP_i$ is the measurement gap repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

16.4.5.4 Test description

16.4.5.4.1 Initial conditions

The supported test configurations are specified in Table 16.4.5.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.4.5.4-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.4.5.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.4.5.5-1 and Table 16.4.5.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.4.5.4.3.

5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.4.5.4.2 Test procedure

Same as defined in clause 16.4.1.4.2.

16.4.5.5 Test requirement

FFS

16.4.6 PRS-RSRP measurement reporting delay test case in FR2 for Redcap UE without Rx FH

Editor's note: This test case is incomplete. The following aspect is either missing or FFS:

- Test tolerance are not added in and analysis is missing

16.4.6.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements specified in TS 38.133 [50] clause 9.9A.3.5 for single positioning frequency layer under AWGN propagation condition.

16.4.6.2 Test applicability

This test applies to all NR FR2 RedCap UEs release 18 onwards that support PRS-RSRP measurement in RRC_INACTIVE.

16.4.6.3 Minimum conformance requirements

Same as defined in clause 16.4.5.3.

16.4.6.4 Test description

16.4.6.4.1 Initial conditions

The supported test configurations are specified in Table 16.4.6.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.4.6.4-1: Supported test configurations

Config	Description
1	120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.4.6.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.4.6.5-1 and Table 16.4.6.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.4.6.4.3.

5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.4.6.4.2 Test procedure

Same as defined in clause 16.4.1.4.2.

16.4.6.4.3 Message contents

As defined in clause 16.4.5.4.3, with the following exceptions:

Table 16.4.6.4.3-1 replaces Table 16.4.5.4.3-5, Table 16.4.6.4.3-2 replaces Table 16.4.5.4.3-6 and Table 16.3.5.4.3-3 replaces Table 16.4.5.4.3-7.

16.4.6.5 Test requirement

FFS

16.4.7 PRS-RSRP measurement reporting delay test case in FR2 for Redcap UE with Rx FH

Editor's note: This test case is incomplete. The following aspect is either missing or FFS:

- Test tolerance are not added in and analysis is missing

16.4.7.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement with FH by a RedCap UE meets requirements specified in TS 38.133 [50] clause 5.6A.5.6 for single positioning frequency layer under AWGN propagation conditions in RRC_INACTIVE.

16.4.7.2 Test applicability

This test applies to all FR2 RedCap UEs release 18 onwards that support PRS-RSRP measurement in RRC_INACTIVE with PRS RX hopping.

16.4.7.3 Minimum conformance requirements

When physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [49], and UE is configured to perform PRS-RSRP measurement with RX FH via *nr-DL-PRS-RxHoppingRequest-r18* as defined in TS 37.355 [34], the UE shall be able to measure multiple (up to the UE capability specified in 5.6A.5.3) PRS-RSRP measurements, defined in TS 38.215 [4], during the measurement period $T_{PRS-RSRP,Total}$ defined in clause 5.6A.5.5 with using the following definition for N_{sample} and $L_{available_PRS,i}$.

N_{sample} is the number of PRS-RSRP measurement samples, where

- N_{sample} = 2 if the RedCap UE supports *reducedNumOfSampleForMeasurementWithFH-RRC-IdleAndInactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples.
- N_{sample} = 4 otherwise.

A measurement sample under RX FH is defined as a PRS measurement over multiple hops.

$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured, and is calculated by:

$$L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j} ,$$

where,

- $N_{hop,i,j}$ is the number of hops that UE can perform within a time window occasion *j* as defined in the following, and

- $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in a time window occasion *j* during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{per-hop,i,j}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered;

- *J* is the number of time window occasions during $T_{available_PRS,i}$.

The sampling duration per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, T_{hop} is the applicable length per hop as defined in table 5.6A.5.6-1, and RRT_{FH} is the retuning time between Rx hops indicated by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability* [34]. The first hop starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the measurement time window, defined in clause 5.6A.1, taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

Table5.6A.5.6-1: Applicable number of hops per slot and applicable length of each hop

RRT_{FH}	(comb size, Number of PRS symbols)	Applicable number of hops per slot (N_{hops}^{slot})	Applicable length per hop ($T_{per-hop}$) in number of symbols
$RRT_{FH} \leq 2$ symbols	(2, 12) with SCS 15 kHz, 30 kHz in FR1, and 60 kHz, 120 kHz in FR2	2	7
	All others	1	14
2 symbols $< RRT_{FH} \leq$ 6 symbols	(≤ 6, any)	1	14
	(12, 12)	½	28
$RRT_{FH} >$ 6 symbols	Any combination	½	28

The number of hops within a single time window $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right),$$

where

- $N_{hop,max,i}$ is the maximum number of Rx hops as reported by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* for positioning frequency layer *i* as specified in [34],

- $N3_i$ is indicated via UE capability *processingPRS-SymbolsDurationN3-r18* for positioning frequency layer *i*,

- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a single time window occasion *j*,

  - $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot} = 2$,

  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1$,

  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} > 1$,

  - $N_{hops,effect,i,j} = \left\lfloor \frac{(N_{rep}^{PRS}-1)}{2} \right\rfloor + 1$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} = 1$,

  - where N_{rep}^{PRS} is the number of inter-slot PRS repetitions within a single time window, which are unmuted and fully or partially overlapped with the sampling duration within each hop. M_{rep}^{PRS} is the PRS repetition interval configured by *dl-PRS-ResourceTimeGap*, N_{hops}^{slot} is the applicable number of hops per slot as defined in table 5.6A.5.6-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions (N_{rep}^{PRS}) within a time window instance and the same PRS repetition interval (M_{rep}^{PRS}), otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of BW_{total} defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop,i,j} * BW_{per-hop} - \left(N_{hop,i,j} - 1\right) * BW_{overlap}\right),$$

where

BW_{PRS} is the minimum among:

- configured PRS BW, and
- UE capability of maximum PRS BW across all hops indicated via *maximumPRS-BandwidthAcrossAllHopsFR1-r18* or *maximumPRS-BandwidthAcrossAllHopsFR2-r18* as specified in [34], and
- total BW of all hops requested by LMF via *nr-DL-PRS-RxHoppingTotalBandwidth-r18* as specified in [34],

$N_{hop,i,j}$ is number of hops within a single time window as define above,

$BW_{per-hop}$ is the UE capability on PRS BW per hop indicated via *supportedBandwidthPRS-r16* as specified in [34],

$BW_{overlap}$ is the UE capability on BW of the overlapping RB indicated via *numOfOverlappingPRB-r18* as specified in [34].

16.4.7.4 Test description

16.4.7.4.1 Initial conditions

The supported test configurations are specified in Table 16.4.7.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.4.7.4-1: Supported test configurations

Config	Description
1	120 kHz SSB SCS, cell bandwidth 100 MHz, cell bandwidth 400 MHz, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.4.7.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.4.7.5-1 and Table 16.4.7.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.4.7.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.4.7.4.2 Test procedure

Same as defined in clause 16.4.1.4.2.

16.4.7.4.3 Message contents

As defined in clause 16.4.5.4.3, with the following exceptions:

Table 16.4.7.4.3-1 replaces Table 16.4.5.4.3-3, Table 16.4.7.4.3-2 replaces Table 16.4.5.4.3-9, Table 16.4.7.4.3-3 replaces Table 16.4.5.4.3-6 and Table 16.4.7.4.3-4 replaces Table 16.4.5.4.3-7.

16.4.7.5 Test requirement

FFS

16.4.8 PRS-RSRP measurement reporting delay test case for case 2 when eDRX > 10.24s for normal UE in FR1 SA

Editor's note: This test case is incomplete. The following aspect is either missing or FFS:

- Test tolerance are not added in and analysis is missing

16.4.8.1 Test purpose

The purpose of the test is to verify that the PRS-RSRP measurement in RRC_INACTIVE with eDRX meets the delay requirements specified in TS 38.133 [50] clause 5.6.3.5 in an environment with AWGN propagation conditions.

16.4.8.2 Test applicability

This test applies to all types of NR FR1 UE release 18 onwards that supports DL-AOD positioning and DL-PRS measurement in RRC_INACTIVE and extendedDRX-CycleInactive-r18.

16.4.8.3 Minimum conformance requirements

Same as defined in clause 16.4.1.3.

16.4.8.4 Test description

16.4.8.4.1 Initial conditions

The supported test configurations are specified in Table 16.4.8.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.4.8.4-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.4.8.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.4.8.5-1 and Table 16.4.8.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.4.8.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.4.8.4.2 Test procedure

Same as defined in clause 16.4.1.4.2.

16.4.8.4.3 Message contents

As defined in clause 16.4.5.4.3, with the following exceptions:

Table 16.4.8.4.3-1 replaces Table 16.4.5.4.3-6, Table 16.4.8.4.3-2 replaces Table 16.4.5.4.3-7, Table 16.4.8.4.3-3 replaces Table 16.4.5.4.3-10

16.4.8.5 Test requirement

FFS

16.4.9 PRS-RSRP measurement reporting delay test case for case 2 when eDRX > 10.24s for RedCap UE in FR1 SA

Editor's note: This test case is incomplete. The following aspect is either missing or FFS:

- Test tolerance are not added in and analysis is missing

16.4.9.1 Test purpose

The purpose of the test is to verify that the PRS-RSRP measurement for RedCap UE in RRC_INACTIVE with eDRX meets the delay requirements specified in TS 38.133 [50] clause 5.6A.3.5 in an environment with AWGN propagation conditions.

16.4.9.2 Test applicability

This test applies to all types of NR FR1 redcap UE release 18 onwards that supports DL-AoD positioning and DL-PRS measurement in RRC_INACTIVE and extendedDRX-CycleInactive-r18.

16.4.9.3 Minimum conformance requirements

Same as defined in clause 16.4.7.3.

16.4.9.4 Test description

16.4.9.4.1 Initial conditions

The supported test configurations are specified in Table 16.4.9.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.4.9.4-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.4.9.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.4.9.5-1 and Table 16.4.9.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.4.9.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.4.9.4.2 Test procedure

Same as defined in clause 16.4.1.4.2.

16.4.9.4.3 Message contents

As defined in clause 16.4.5.4.3, with the following exceptions:

16.4.9.5 Test requirement

FFS

16.4.10 PRS-RSRP measurement reporting delay test case for case 2 when eDRX > 10.24s for normal UE in FR2 SA

Editor's note: This test case is incomplete. The following aspect is either missing or FFS:

- Test tolerance are not added in and analysis is missing

16.4.10.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement requirements specified in TS 38.133 [50] clause 5.6.3.5 for single positioning frequency layer under AWGN propagation conditions in RRC_INACTIVE when configured with eDRX.

16.4.10.2 Test applicability

This test applies to all types of NR FR2 UE release 18 onwards that supports DL-AOD positioning and DL-PRS measurement in RRC_INACTIVE and extendedDRX-CycleInactive-r18.

16.4.10.3 Minimum conformance requirements

Same as defined in clause 16.4.1.3.

16.4.10.4 Test description

16.4.10.4.1 Initial conditions

The supported test configurations are specified in Table 16.4.10.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.4.10.4-1: Supported test configurations

Config	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.4.10.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.4.10.5-1 and Table 16.4.10.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.4.10.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.4.10.5 Test requirement

FFS

16.4.11 PRS-RSRP measurement reporting delay test case for case 2 when eDRX > 10.24s for RedCap UE in FR2 SA

Editor's note: This test case is incomplete. The following aspect is either missing or FFS:

- Test tolerance are not added in and analysis is missing

16.4.11.1 Test purpose

The purpose of the test is to verify a RedCap UE can meet the PRS RSRP measurement requirements specified in TS 38.133 [50] clause 5.6A.5.5 for single positioning frequency layer under AWGN propagation conditions in RRC_INACTIVE.

16.4.11.2 Test applicability

This test applies to all types of NR FR2 redcap UE release 18 onwards that supports DL-AoD positioning and DL-PRS measurement in RRC_INACTIVE and extendedDRX-CycleInactive-r18.

16.4.11.3 Minimum conformance requirements

Same as defined in clause 16.4.7.3.

16.4.11.4 Test description

16.4.11.4.1 Initial conditions

The supported test configurations are specified in Table 16.4.11.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.4.11.4-1: Supported test configurations

Config	Description
1	120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.4.11.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.4.11.5-1 and Table 16.4.11.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.4.11.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.4.11.5 Test requirement

FFS

16.5 NR PRS-RSRP measurement accuracy test case in RRC_INACTIVE

16.5.1 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR1 SA

16.5.1.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement accuracy requirements specified in TS 38.133 [50] Clause 10.1.24.2 for single positioning frequency layer under AWGN propagation conditions in RRC_INACTIVE in FR1 standalone scenario.

16.5.1.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and supports DL-PRS measurement in RRC_INACTIVE state.

16.5.1.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRP measurement for FR1 defined in Table 16.5.1.3-1 are valid under the following conditions:

- Conditions defined in 38.101-1 Clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band
- UE does not support positioning measurements with reduced number of samples, or LMF does not indicate UE to perform positioning measurements with reduced number of samples

Table 16.5.1.3-1: PRS-RSRP absolute accuracy for FR1

Accuracy		Conditions							
					Io Note 7 range				
Normal condition	Extreme condition	PRS Ês/Iot	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	NR operating band groups Note 8	Minimum Io Note 1 dBm / SCS_{PRS}			Maximum Io
						dBm / SCS_{PRS}			dBm/$BW_{Channel}$
dB	dB	dB	PRB	-		dBm/15kHz Note 6	dBm/30kHz Note 6	dBm/60kHz Note 6	
±3.5	±8	≥-3dB	≥24	All	NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A	-127	-124	-121	-50
					NR_FDD_FR1_B	-126.5	-123.5	-120.5	-50
					NR_TDD_FR1_C	-126	-123	-120	-50
					NR_FDD_FR1_D, NR_TDD_FR1_D	-125.5	-122.5	-119.5	-50
					NR_FDD_FR1_E, NR_TDD_FR1_E	-125	-122	-119	-50
					NR_FDD_FR1_F	-124.5	-121.5	-118.5	-50

					NR_FDD_FR1_G, NR_TDD_FR1_G	-124	-121	-118	-50
					NR_FDD_FR1_H	-123.5	-120.5	-117.5	-50
					Note 4				
					Note 4				
±8.5	±13	≥-13dB	24 ≤ BW ≤ 52	All	Note 4				
±6	±10.5		52< BW≤ 104	All	Note 4				
±4.5	±9		BW >104	All	Note 4				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in Section 3.5.2.

The accuracy requirements for PRS-RSRP measurement for FR1 defined in Table 16.5.1.3-2 are valid under the following conditions:

- Conditions defined in 38.101-1 Clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band
- UE does not support positioning measurements with reduced number of samples, or LMF does not indicate UE to perform positioning measurements with reduced number of samples

Table 16.5.1.3-2: PRS-RSRP relative accuracy for FR1

Accuracy		**Conditions**							
					Io Note 7 range				
Normal condition	**Extreme condition**	**PRS Ês/Iot**	**PRS BW**	**Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)**	**NR operating band groups Note 8**	**Minimum Io Note 1 dBm / SCS_{PRS}**			**Maximum Io**
						dBm / SCS_{PRS}

±6.5	±8.0		52< BW≤ 104	All	Note 4				
±5.0	±6.5		BW >104	All	Note 4				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 RB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in Section 3.5.2.

16.5.1.4 Test description

16.5.1.4.1 Initial conditions

The supported test configurations in listed in Table 16.5.1.4-1.

Table 16.5.1.4-1: Test Configurations

Config	Description
1	NR 15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	NR 15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	NR 30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations in each supported band	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.5.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.5.1.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.5.1.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.5.1.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration. The test consists of a set-up period and a measurement period. During the set-up period, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During the measurement period UE shall be in RRC_INACTIVE state

and all cells start to transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The NR-DL-AoD-RequestLocationInformation message and the DL-AoD assistance data as defined in clause 16.5.1.4.3 shall be provided to the UE during the set-up period. The beginning of the measurement period shall be aligned with the first DRX cycle containing a DL PRS resource(s).

1. Configure the Cell for RA-SDT with SIB1 configured according to TS 38.508-1 [45], clause 4.6.1 with condition SDT
2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set parameters other than PRSconfiguration according to the Table 16.5.1.5-1. Propagation conditions are set according to clause 4.15.2.
4. Set-up period starts.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-DL-AoD-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of measurement period, where ΔT = 50 ms.
11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
12. When set-up period ends, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and set the PRS parameters as specified in Table 16.5.1.5-1.
13. Wait for the UE monitors for occurrence of the periodic event requested.
14. The UE shall transmit the UE transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the RRCResumeRequest message and then go to step 17.
15. The SS transmits an *RRCResume* message.
16. The UE transmits an *RRCResumeComplete* message.
17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-AoD-ProvideLocationInformation* IE within the response time (see clause 4.15.3).
18. If the UE message at step 17 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
19. The SS shall check the nr-DL-PRS-RSRP-Result-r16 value for Cell 2 in the *NR-DL-AoD-SignalMeasurementInformation* according to Table 16.5.1.5-3.
20. Repeat steps 2-19 in Table 16.5.1.4-1 until the confidence level according to Annex D is achieved.
21. Repeat step 2-20 for the other sub-test defined in Table 16.5.1.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

16.5.1.4.3 Message contents

As defined in clause 16.4.1.4.3, with the following exceptions:

Table 16.5.1.4.3-1 replaces Table 16.4.1.4.3-6 and Table 16.5.1.4.3-2 replaces Table 16.4.1.4.3-7.

Propagation condition			AWGN			
Antenna configuration			1x2			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Void.

Note 6: Void

Table 16.5.1.5-2: PRS-RSRP accuracy requirements for the reported values

Test	Configuration	Report Mapping	Lowest reported value	Highest reported value
Sub-test 1	Config 1& 2	Absolute PRS RSRP accuracy for Cell 1	51	62
		Relative PRS RSRP accuracy for Cell 1	27	30
		Absolute PRS RSRP accuracy for Cell 2	38	59
		Relative PRS RSRP accuracy for Cell 2	21	30
	Config 3	Absolute PRS RSRP accuracy for Cell 1	54	65
		Relative PRS RSRP accuracy for Cell 1	27	30
		Absolute PRS RSRP accuracy for Cell 2	41	62
		Relative PRS RSRP accuracy for Cell 2	21	30
Sub-test 2	Config 1& 2	Absolute PRS RSRP accuracy for Cell 1	51	62
		Relative PRS RSRP accuracy for Cell 1	27	30
		Absolute PRS RSRP accuracy for Cell 2	41	56
		Relative PRS RSRP accuracy for Cell 2	24	30
	Config 3	Absolute PRS RSRP accuracy for Cell 1	54	65
		Relative PRS RSRP accuracy for Cell 1	27	30
		Absolute PRS RSRP accuracy for Cell 2	45	58
		Relative PRS RSRP accuracy for Cell 2	25	30

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

16.5.2 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR1 with reduced sample number

16.5.2.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement accuracy requirements specified in TS 38.133 [50] Clause 10.1.24.2 for single positioning frequency layer under AWGN propagation conditions in RRC_INACTIVE in FR1 standalone scenario.

16.5.2.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and supports DL-PRS measurement in RRC_INACTIVE state.

16.5.2.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRP measurement for FR1 defined in Table 16.5.2.3-2 are valid under the following conditions:

- Conditions defined in 38.101-1 Clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band
- UE supports positioning measurements with reduced number of samples, and LMF indicates UE to perform positioning measurements with reduced number of samples
- AWGN channel

Table 16.5.2.3-1: PRS-RSRP absolute accuracy for FR1 with reduced sample number

Accuracy	Conditions

Normal condition	Extreme condition	PRS Ês/Iot	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	Io Note 6 range				
					NR operating band groups Note 7	Minimum Io Note 1 dBm / SCS_{PRS}			Maximum Io
dB	dB	dB	PRB	-		dBm / SCS_{PRS}			dBm/$BW_{Channel}$
						dBm/15kHz Note 5	dBm/30kHz Note 5	dBm/60kHz Note 5	
±3.5	±8	≥0	≥48	All	NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A	-127	-124	-121	-50
					NR_FDD_FR1_B	-126.5	-123.5	-120.5	-50
					NR_TDD_FR1_C	-126	-123	-120	-50
					NR_FDD_FR1_D, NR_TDD_FR1_D	-125.5	-122.5	-119.5	-50
					NR_FDD_FR1_E, NR_TDD_FR1_E	-125	-122	-119	-50
					NR_FDD_FR1_F	-124.5	-121.5	-118.5	-50
					NR_FDD_FR1_G, NR_TDD_FR1_G	-124	-121	-118	-50
					NR_FDD_FR1_H	-123.5	-120.5	-117.5	-50
±8.5	±13	≥-6	48 ≤ BW ≤ 52	All	Note 3				
±6	±10.5		52< BW≤ 104	All	Note 3				
±4.5	±9		BW >104	All	Note 3				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 48 PRB.
NOTE 4: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 5: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 6: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 7: NR operating band groups are as defined in Section 3.5.2.

The relative PRS-RSRP accuracy is defined as accuracy of the difference between two PRS-RSRP measurements.

The relative PRS-RSRP accuracy requirements apply for the cases when PRS-RSRP is measured from PRS resources in the same PRS resource set in FR1.

The accuracy requirements for PRS-RSRP measurement for FR1 defined in Table 16.5.2.3-2 are valid under the following conditions:

- Conditions defined in 38.101-1 Clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band
- UE supports positioning measurements with reduced number of samples, and LMF indicates UE to perform positioning measurements with reduced number of samples
- AWGN channel

Table 16.5.2.3-2: PRS-RSRP relative accuracy for FR1 with reduced sample number

Accuracy		Conditions							
Normal condition	Extreme condition	PRS Ês/Iot	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	Io Note 6 range				
					NR operating band groups Note 7	Minimum Io Note 1 dBm / SCS_{PRS}			Maximum Io

					NR_FDD_FR1_H	-123.5	-120.5	-117.5	-50
±9.5	±11.0	≥-6	48 ≤ BW ≤ 52	All	Note 3				
±6.5	±8.0		52< BW≤ 104	All	Note 3				
±5.0	±6.5		BW >104	All	Note 3				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 48 RB.
NOTE 4: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 5: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 6: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 7: NR operating band groups are as defined in Section 3.5.2.

16.5.2.4 Test description

16.5.2.4.1 Initial conditions

The supported test configurations in listed in Table 16.5.2.4-1.

Table 16.5.2.4-1: Test Configurations

Config	Description
1	NR 15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	NR 15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	NR 30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations in each supported band	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.5.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.5.2.5-1 and Table 16.5.2.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.5.2.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.5.2.4.2 Test procedure

Same as in clause 16.5.1.4.2.

16.5.2.4.3 Message contents

As defined in clause 16.4.2.4.3, with the following exceptions:

Table 16.5.2.4.3-1 replaces Table 16.4.2.4.3-6 and Table 16.5.2.4.3-2 replaces Table 16.4.2.4.3-7.

	Config 3	dBm/47.88MHz	-57.03		-57.03	
Propagation condition			AWGN			
Antenna configuration			1x2			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Table 16.5.2.5-2: PRS-RSRP accuracy requirements for the reported values

Test Configuration	Configuration	Report Mapping	Lowest reported value	Highest reported value
Sub-test 1	Config 1& 2	Absolute PRS RSRP accuracy for Cell 1	57	67
		Relative PRS RSRP accuracy for Cell 1	27	30
		Absolute PRS RSRP accuracy for Cell 2	48	68
		Relative PRS RSRP accuracy for Cell 2	21	30
	Config 3	Absolute PRS RSRP accuracy for Cell 1	60	70
		Relative PRS RSRP accuracy for Cell 1	27	30
		Absolute PRS RSRP accuracy for Cell 2	51	71
		Relative PRS RSRP accuracy for Cell 2	21	30
Sub-test 2	Config 1& 2	Absolute PRS RSRP accuracy for Cell 1	57	67
		Relative PRS RSRP accuracy for Cell 1	27	30
		Absolute PRS RSRP accuracy for Cell 2	50	65
		Relative PRS RSRP accuracy for Cell 2	24	30
	Config 3	Absolute PRS RSRP accuracy for Cell 1	60	70
		Relative PRS RSRP accuracy for Cell 1	27	30
		Absolute PRS RSRP accuracy for Cell 2	55	67
		Relative PRS RSRP accuracy for Cell 2	25	30

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

16.5.3 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

16.5.3.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement accuracy requirements specified in TS 38.133 [50] Clause 10.1.24.2 for single positioning frequency layer under AWGN propagation conditions in RRC_INACTIVE in FR2 standalone scenario.

16.5.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and supports DL-PRS measurement in RRC_INACTIVE state.

16.5.3.3 Minimum conformance requirements

Same as in clause 16.3.2.3.

16.5.3.4 Test description

16.5.3.4.1 Initial conditions

The supported test configurations in listed in Table 16.5.3.4-1.

Table 16.5.3.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.5.3.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.5.3.5-1 and Table 16.5.3.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.5.3.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.5.3.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration, PRS.1.3 FR2 and PRS.1.4 FR2. The test consists of a set-up period and a measurement period. During the set-up period, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During the measurement period UE shall be in RRC_INACTIVE state and all cells start to transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The NR-DL-AoD-RequestLocationInformation message and the DL-AoD assistance data as defined in clause 16.5.3.4.3 shall be provided to the UE during the set-up period. The beginning of the measurement period shall be aligned with the first DRX cycle containing a DL PRS resource(s).

0. Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 16.4.3.4.3-0.
1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set parameters other than PRSconfiguration according to the Table 16.5.3.5-1 and Table 16.5.3.5-2. Propagation conditions are set according to clause 4.16.2.
4. Set-up period starts.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-DL-AoD-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of measurement period, where $\Delta T = 50$ ms.

11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
12. When set-up period ends, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and set the PRS parameters as specified in Table 16.5.3.5-1 and Table 16.5.3.5-2.
13. Wait for the UE monitors for occurrence of the periodic event requested.
14. The UE shall transmit the UE transmit an *RRCResumeRequest* message.
15. The SS transmits an *RRCResume* message.
16. The UE transmits an *RRCResumeComplete* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 19.
17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-AoD-ProvideLocationInformation* IE within the response time (see clause 4.16.3).
18. If the UE message at step 17 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
19. The SS shall check the nr-DL-PRS-RSRP-Result-r16 value for Cell 2 in the *NR-DL-AoD-SignalMeasurementInformation* according to Table 16.5.3.5-3.
20. Repeat steps 2-19 in Table 16.5.3.4-1 until the confidence level according to Annex D is achieved.
21. Repeat step 2-20 for the other sub-test defined in Table 16.5.3.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

16.5.3.4.3 Message contents

As defined in clause 16.4.3.4.3, with the following exceptions:

Table 16.5.3.4.3-1 replaces Table 16.4.3.4.3-6 and Table 16.5.3.4.3-2 replaces Table 16.4.3.4.3-7.

16.5.3.5 Test requirement

Table 16.5.3.5-1 and Table 16.5.3.5-2 define the primary level settings including the test tolerances for the test.

Table 16.5.3.5-1: PRS-RSRP general test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
Cell ID		489	0	489	0
SSB ARFCN		freq1		freq1	
Duplex mode		TDD		TDD	
TDD configuration		TDDConf.3.1		TDDConf.3.1	
$BW_{channel}$	MHz	200: $N_{RB,c}$ = 132		200: $N_{RB,c}$ = 132	
Downlink initial BWP configuration		DLBWP.0.1	-	DLBWP.0.1	-
Uplink initial BWP configuration		ULBWP.0.1	-	ULBWP.0.1	-
DRX cycle configuration		1.28s	-	1.28s	-
TCI state		TCI.State.0	-	TCI.State.0	-
PDSCH Reference measurement channel		SR.3.1 TDD	-	SR.3.1 TDD	-
RMSI CORESET Reference Channel		CR.3.1 TDD	-	CR.3.1 TDD	-
Control channel RMC		CCR.3.1 TDD	-	CCR.3.1 TDD	-
OCNG Patterns		OP.3	OP.3	OP.3	OP.3
SSB configuration		SSB.3 FR2	SSB.3 FR2	SSB.3 FR2	SSB.3 FR2

SMTC configuration		SMTC.1	SMTC.1	SMTC.1	SMTC.1
Time offset with Cell 1	µs	-	3	-	3
PRS configuration		PRS.1.3 FR2	PRS.1.3 FR2	PRS.1.4 FR2	PRS.1.4 FR2
PRS Resource slot offset	slot	0	4	0	4
PDSCH/PDCCH subcarrier spacing	kHz	120	120	120	120
EPRE ratio of PSS to SSS	dB	0	0	0	0
EPRE ratio of PBCH_DMRS to SSS					
EPRE ratio of PBCH to PBCH_DMRS					
EPRE ratio of PDCCH_DMRS to SSS					
EPRE ratio of PDCCH to PDCCH_DMRS					
EPRE ratio of PDSCH_DMRS to SSS					
EPRE ratio of PDSCH to PDSCH_DMRS					
EPRE ratio of OCNG DMRS to SSS Note 1					
EPRE ratio of OCNG to OCNG DMRS Note 1					
Propagation conditions		AWGN	AWGN	AWGN	AWGN
Antenna configuration		1x2	1x2	1x2	1x2
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.					

Table 16.5.3.5-2: PRS-RSRP OTA related test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to TS 38.133 [50] clause A.3.15.1			
Assumption for UE beams Note 7		Rough		Rough	
N_{oc} Note1	dBm/15kHz Note4	-99.1		Same as Test 1	
N_{oc} Note1	dBm/SCS Note4	-90.1		Same as Test 1	
$\hat{E}_s / N_{oc}$	dB	-2	-10	-2	-10
E_s	dBm/SCS Note4	-	-	-	-
PRS_RP Note2	dBm/SCS	-92.1	-100.1	-92.1	-100.1
$\hat{E}_s / I_{ot}$ BB Note6	dB	-2.68	-12.30	-2.68	-12.30
Io Note2	dBm/190.08 MHz Note4	-55.69		-55.69	

Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 2: PRS_RP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 3: Void
Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 5: Void
Note 6: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

The value of the LPP Time IE depends on the UE capabilities. The calculation procedure is the same as in clause 16.4.3.5 Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.142}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T}_{\mathrm{last}}$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation.

Table 16.5.3.5-3: PRS RSRP accuracy requirements for the reported values

Test Configuration	Report Mapping	Lowest reported value	Highest reported value
Sub-test 1	Absolute PRS RSRP accuracy for Cell 1	59	94
	Relative PRS RSRP accuracy for Cell 1	20	30
	Absolute PRS RSRP accuracy for Cell 2	52	86
	Relative PRS RSRP accuracy for Cell 2	20	30
Sub-test 2	Absolute PRS RSRP accuracy for Cell 1	61	93
	Relative PRS RSRP accuracy for Cell 1	23	30
	Absolute PRS RSRP accuracy for Cell 2	53	85
	Relative PRS RSRP accuracy for Cell 2	23	30

The PRS RSRP measurement period fulfils the requirements specified in clause 4.16.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.5.4 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR2 with reduced sample number

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

16.5.4.1 Test purpose

The purpose of the test is to verify the PRS RSRP measurement accuracy requirements specified in TS 38.133 [50] Clause 10.1.24.2 for single positioning frequency layer with reduced sample number under AWGN propagation conditions in RRC_INACTIVE in FR2 standalone scenario.

16.5.4.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, supports DL-PRS measurement in RRC_INACTIVE state and reduced number of samples for PRS measurement in RRC_INACTIVE state.

16.5.4.3 Minimum conformance requirements

Same as in clause 16.3.4.3.

16.5.4.4 Test description

16.5.4.4.1 Initial conditions

The supported test configurations in listed in Table 16.5.4.4-1.

Table 16.5.4.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.5.4.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.5.4.5-1 and Table 16.5.4.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.5.4.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.5.4.4.2 Test procedure

Same as in clause 16.5.3.4.2.

16.5.4.4.3 Message contents

As defined in clause 16.5.3.4.3, with the following exceptions:

Table 16.5.4.4.3-1 replaces Table 16.4.3.4.3-6, Table 16.5.4.4.3-2 replaces Table 16.4.3.4.3-7 and Table 16.5.4.4.3-3 replaces Table 16.4.3.4.3-9.

Note 5: Void
Note 6: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

The value of the LPP Time IE depends on the UE capabilities. The calculation procedure is the same as in clause 16.4.4.5 Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.142}{N} \right\rceil * 1 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation.

Table 16.5.4.5-3: PRS RSRP accuracy requirements for the reported values

Test Configuration	Report Mapping	Lowest reported value	Highest reported value
Sub-test 1	Absolute PRS RSRP accuracy for Cell 1	66	76
	Relative PRS RSRP accuracy for Cell 1	25	30
	Absolute PRS RSRP accuracy for Cell 2	59	76
	Relative PRS RSRP accuracy for Cell 2	20	30
Sub-test 2	Absolute PRS RSRP accuracy for Cell 1	66	76
	Relative PRS RSRP accuracy for Cell 1	25	30
	Absolute PRS RSRP accuracy for Cell 2	61	73
	Relative PRS RSRP accuracy for Cell 2	23	30

The PRS RSRP measurement period fulfils the requirements specified in clause 4.16.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

16.5.5 PRS-RSRP measurement accuracy test case in RRC_INACTIVE state in FR1 for Redcap UE without Rx FH

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missin

16.5.5.1 Test purpose

The purpose of this test is to verify that the accuracy of PRS-RSRP measurement in RRC_INACTIVE without FH by a RedCap UE is within the specified limits. This test will verify the requirements in TS 38.133 [50] clauses 10.1A.17.2.1 for absolute accuracy and 10.1A.17.2.1 for relative accuracy.

16.5.5.2 Test applicability

This test applies to all NR FR1 RedCap UEs release 18 onwards that support PRS-RSRP measurement in RRC_INACTIVE.

16.5.5.3 Minimum conformance requirements

Same as in clause 16.3.1.3.

16.5.5.4 Test description

16.5.5.4.1 Initial conditions

The supported test configurations are specified in Table 16.5.5.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.5.5.4-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.5.5.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.5.5.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.5.5.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.5.5.4.2 Test procedure

Same as defined in clause 16.5.1.4.2.

16.5.5.4.3 Message contents

As defined in clause 16.5.6.4.3, with the following exceptions:

Table 16.5.5.4.3-1 replaces Table 16.5.6.4.3-6 and Table 16.5.5.4.3-1 replaces Table 16.5.6.4.3-6.

16.5.6 PRS-RSRP measurement accuracy test case in RRC_INACTIVE state in FR2 for Redcap UE without Rx FH

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

16.5.6.1 Test purpose

The purpose of this test is to verify that the accuracy of PRS-RSRP measurement without FH by a RedCap UE in RRC_INACTIVE is within the specified limits. This test will verify the requirements in TS 38.133 [50] clauses 10.1A.17.2.1.

16.5.6.2 Test applicability

This test applies to all NR FR2 RedCap UEs release 18 onwards that support PRS-RSRP measurement in RRC_INACTIVE.

16.5.6.3 Minimum conformance requirements

Same as in clause 16.3.2.3.

16.5.6.4 Test description

16.5.6.4.1 Initial conditions

The supported test configurations are specified in Table 16.5.6.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.5.6.4-1: Supported test configurations

Configuration	Description
1	120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.5.6.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.5.6.5-1 and Table 16.5.6.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.5.6.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.5.6.4.2 Test procedure

Same as defined in clause 16.5.1.4.2.

16.5.6.5 Test requirement

FFS

16.5.7 PRS-RSRP measurement accuracy test case in RRC_INACTIVE state in FR1 for Redcap UE with Rx FH

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

16.5.7.1 Test purpose

The purpose of this test is to verify that the accuracy of PRS-RSRP measurement in RRC_INACTIVE with FH by a RedCap UE is within the specified limits. This test will verify the requirements in TS 38.133 [50] clauses 10.1A.17.2.1.

16.5.7.2 Test applicability

This test applies to all FR1 RedCap UEs release 17 onwards that support PRS-RSRP measurement in RRC_INACTIVE with PRS RX hopping.

16.5.7.3 Minimum conformance requirements

Same as in clause 16.3.7.3.

16.5.7.4 Test description

16.5.7.4.1 Initial conditions

The supported test configurations are specified in Table 16.5.7.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.5.7.4-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, cell bandwidth 50 MHz, FDD duplex mode
2	15 kHz SSB SCS, cell bandwidth 50 MHz, TDD duplex mode
3	30 kHz SSB SCS, cell bandwidth 100 MHz, TDD duplex mode
4	15 kHz SSB SCS, cell bandwidth 50 MHz, HD-FDD duplex mode
NOTE 1: The UE is only required to be tested in one of the supported test configurations. NOTE 2: This test case is applicable to the UE supporting per hop bandwidth ≥ 10 MHz for SCS 15 kHz. NOTE 3: This test case is applicable to the UE supporting per hop bandwidth = 20 MHz for SCS 30 kHz.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.5.7.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 16.5.7.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 16.5.7.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.5.7.4.2 Test procedure

Same as defined in clause 16.5.1.4.2.

16.5.7.4.3 Message contents

As defined in clause 16.5.6.4.3, with the following exceptions:

Table 16.5.7.4.3-1 replaces Table 16.5.6.4.3-9, Table 16.5.7.4.3-2 replaces Table 16.5.6.4.3-6 and Table 16.5.7.4.3-3 replaces Table 16.5.6.4.3-6.

16.5.7.5 Test requirement

FFS

16.5.8 PRS-RSRP measurement accuracy test case in RRC_INACTIVE state in FR2 for Redcap UE with Rx FH

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

16.5.8.1 Test purpose

The purpose of this test is to verify that the accuracy of PRS-RSRP measurement with FH by a RedCap UE in RRC_INACTIVE is within the specified limits. This test will verify the requirements in TS 38.133 [50] clauses 10.1A.17.2.1 for absolute accuracy and 10.1A.17.2.2 for relative accuracy.

16.5.8.2 Test applicability

This test applies to all FR2 RedCap UEs release 18 onwards that support PRS-RSRP measurement in RRC_INACTIVE with PRS RX hopping.

16.5.8.3 Minimum conformance requirements

Same as in clause 16.3.8.3.

16.5.8.4 Test description

16.5.8.4.1 Initial conditions

The supported test configurations are specified in Table 16.5.8.4-1. The UE is only required to be tested in one supported test configuration.

Table 16.5.8.4-1: Supported test configurations

Configuration	Description
1	120 kHz SSB SCS, cell bandwidth 400 MHz, TDD duplex mode
NOTE 1: This test case is applicable to the UE supporting per hop bandwidth = 100 MHz for SCS 120 kHz.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 16.5.8.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 16.5.8.5-1 and Table 16.5.8.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 16.5.8.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

16.5.8.4.2 Test procedure

Same as defined in clause 16.5.1.4.2.

16.5.8.4.3 Message contents

As defined in clause 16.5.6.4.3, with the following exceptions:

Table 16.5.8.4.3-1 replaces Table 16.5.6.4.3-9, Table 16.5.8.4.3-2 replaces Table 16.5.6.4.3-6 and Table 16.5.8.4.3-3 replaces Table 16.5.6.4.3-6.

16.5.8.5 Test requirement

FFS

17 NR PRS-RSRPP measurement requirements

17.1 General

This clause defines the minimum performance requirements for NR UEs capable of PRS-RSRPP measurements.

17.2 NR PRS-RSRPP measurement period test cases in RRC_CONNECTED

17.2.1 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR1 SA

17.2.1.1 Test purpose

The purpose of the test is to verify the PRS RSRPP measurement requirements specified in TS 38.133 [50] Clause 9.9.6.5 for single positioning frequency layer under AWGN propagation conditions in standalone scenario.

17.2.1.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and maxDL-PRS-FirstPathRSRP-MeasPerTRP.

17.2.1.3 Minimum conformance requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in Clause 9.9.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms.

$$T_{PRS-RSRP,\ total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max\left(T_{effect,i}\right)$$

where

i is the index of positioning frequency layer,

L is total number of positioning frequency layers,

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$T_{PRS-RSRP,i} = \left(CSSF_i * ceil(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last}$$

where

$CSSF_i$ is the carrier specific scaling factor for PRS-RSRP measurements specified in clause 9.1.5.2,

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 and if positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],

N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

N_{sample} is the number of PRS RSRP measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and

- Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

- N_{sample} = 4 otherwise.

$T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time, if not all PRS resources to be measured are available in the same measurement gap occasion during $T_{available_PRS,i}$, otherwise $T_{last,i} = T_i + MGL$,

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

T_i corresponds to durationOfPRS-ProcessingSymbolsInEveryTms in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$ is the least common multiple between $T_{PRS,i}$ and $MGRP_i$,

$T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$MGRP_i$ is the measurement gap repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

17.2.1.4 Test description

17.2.1.4.1 Initial conditions

The supported test configurations are listed in Table 17.2.1.4-1.

Table 17.2.1.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.2.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 17.2.1.5-1 and Table 17.2.1.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.2.1.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

17.2.1.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. Both cells transmit PRS during T2.The *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message as defined in TS 37.355 [49] shall be provided to the UE during T1. The last slot containing the two messages for the assistance data and location information request is denoted as #n.

The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources that is ΔT after slot #n, where ΔT = 50 ms is the maximum processing time of the assistance data and location information request.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 17.2.1.5-1 and Table 17.2.1.5-2 as appropriate. Propagation conditions are set according to clause 4.16.2.
4. T1 starts.
5. The SS shall send an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the NR-DL-AoD-ProvideCapabilities IE.
7. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the nr-DL-AoD-ProvideAssistanceData-r16 IE. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
8. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-DL-AoD-RequestLocationInformation-r16 such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.
9. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 17.2.1.5-2.
10. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the nr-DL-AoD-ProvideLocationInformation-r16 IE within the response time (see clause 4.16.3). The UE shall perform and report the PRS-RSRPP measurements for both Cell 1 and Cell 2. If the UE transmits an nr-DL-AoD-ProvideLocationInformation-r16 IE including the nr-DL-PRS-FirstPathRSRP-ResultDiff-r17 field for Cell 1 and Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the nr-DL-AoD-ProvideLocationInformation-r16IE with the nr-DL-PRS-FirstPathRSRP-ResultDiff-r17 fields included within the response time then the number of failure tests is increased by one.
11. If the UE message at step 10 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
12. Repeat step 2-11 until the confidence level according to Annex D is achieved.

	dBm/47.88 MHz	3		-60.59		-60.59
Propagation Condition		1, 2, 3	Two-tap channel defined in 38.101-4 Annex B.2.4, a = 1, τ_d = 0.45 μs and f_D = 5 Hz			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The PRS-RSRPP measurement time fulfils the requirements specified in clause 17.2.1.3.

The UE shall perform and report the PRS RSRPP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 9.9.6.5 starting from the beginning of time interval T2

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRPP measurement for each correct event shall be within the PRS RSRPP reporting range specified in TS 38.133 Clause 10.1.38, i.e., between PRS RSRPP_0 and PRS RSRPP_126..

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRPP measurement period. The PRS-RSRPP measurement period follows the equation:

$$T_{\mathrm{PRS-RSRP,i}} = \left(\mathrm{CSSF_i} * \mathrm{ceil}(\mathrm{K_{p,PRS,i}}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,\mathrm{i}}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,\mathrm{i}}}{N} \right\rceil * N_{sample} - 1 \right) * \mathrm{T_{effect,i}} + \mathrm{T_{last}}$$

Where $\mathrm{CSSF_{PRS,i}} = 1, \mathrm{K_{p,PRS,i}} = 1,\ N_{RxBeam,i} = 1,\ N_{PRS,i}^{slot} = 2, L_{available_PRS,\mathrm{i}} = 0.285, N_{sample} = 4$. N is the parameter *durationOfPRS-ProcessingSysmbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $\mathrm{T_{last,i}} = T_i + T_{available_PRS,\mathrm{i}}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM\left(T_{PRS,i}, MGRP_i\right)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $\mathrm{T_{available_PRS,i}} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.285}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 0.648s and 30.88s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 1s and 31s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 31.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 17.2.1.5-3, Table 17.2.1.5-4 and Table 17.2.1.5-5 for reference.

Table 17.2.1.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

maxNumOfDL-PRS-ResProcessedPerSlot	$\left\lceil \frac{2}{N'} \right\rceil$
n1	2

>=n2	1

durationOfPRS-ProcessingSysmbols	$\lceil \frac{0.285}{N} \rceil$
nDot125	3
nDot25	2
>=nDot5	1

Table 17.2.1.5-5: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	T_{effect}	T_{last}
n8	160	168
n16	160	176
n20	160	180
n30	160	190
n40	160	200
n80	160	240
n160	160	320
n320	320	480
n640	640	800
n1280	1280	1440

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

17.2.2 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA

17.2.2.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement meets the reduced sample measurement delay requirements specified in TS 38.133 [50] clause 9.9.6.5 in an environment with AWGN propagation conditions for reduced number of samples.

17.2.2.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and supportedDL-PRS-ProcessingSamples.

17.2.2.3 Minimum conformance requirements

Same as clause 17.2.1.3.

17.2.2.4 Test description

17.2.2.4.1 Initial conditions

The supported test configurations are listed in Table 17.2.2.4-1.

Table 17.2.2.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode

2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.2.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 17.2.2.5-1 and Table 17.2.2.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.2.2.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

17.2.2.4.2 Test procedure

Same as clause 17.2.1.4.2.

	dBm/47.88 MHz	3		-61.77		-61.77
Propagation Condition		1, 2, 3	Two-tap channel defined in 38.101-4 Annex B.2.4, *a* = 1, $\tau_d = 0.45$ μs and $f_D = 5$ Hz			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The PRS-RSRPP measurement time fulfils the requirements specified in clause 17.2.2.3.

The UE shall perform and report the PRS RSRPP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 9.9.6.5 starting from the beginning of time interval T2

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRPP measurement for each correct event shall be within the PRS RSRPP reporting range specified in TS 38.133 Clause 10.1.38, i.e., between PRS RSRPP_0 and PRS RSRPP_126..

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRPP measurement period. The PRS-RSRPP measurement period follows the equation:

$$\mathrm{T}_{\mathrm{PRS-RSRP,i}} = \left(\mathrm{CSSF_i} * \mathrm{ceil}(\mathrm{K_{p,PRS,i}}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,\mathrm{i}}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,\mathrm{i}}}{N} \right\rceil * N_{sample} - 1 \right) * \mathrm{T_{effect,i}} + \mathrm{T_{last}}$$

Where $\mathrm{CSSF_{PRS,i}} = 1, \mathrm{K_{p,PRS,i}} = 1,\ N_{RxBeam,i} = 1,\ N_{PRS,i}^{slot} = 2, L_{available_PRS,\mathrm{i}} = 0.285, N_{sample} = 1$. N is the parameter *durationOfPRS-ProcessingSysmbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $\mathrm{T_{last,i}} = T_{\mathrm{i}} + T_{available_PRS,\mathrm{i}}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $\mathrm{T_{available_PRS,i}} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.285}{N} \right\rceil * 1 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 0.168s and 7.84s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 1s and 8s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 8.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 17.2.2.5-3, Table 17.2.2.5-4 and Table 17.2.2.5-5 for reference.

Table 17.2.2.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

maxNumOfDL-PRS-ResProcessedPerSlot	$\left\lceil \frac{2}{N'} \right\rceil$

n320	320	480
n640	640	800
n1280	1280	1440

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

17.2.3 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA

17.2.3.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement meets the reporting delay requirements without measurement gaps specified in TS 38.133 [50] clause 9.9.6.6 in an environment with AWGN propagation conditions.

17.2.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP, supportedDL-PRS-ProcessingSamples and prs-Processing Window.

17.2.3.3 Minimum conformance requirements

Same as clause 17.2.1.3.

17.2.3.4 Test description

17.2.3.4.1 Initial conditions

The supported test configurations are listed in Table 17.2.3.4-1.

Table 17.2.3.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.2.3.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 17.2.3.5-1 and Table 17.2.3.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.2.3.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

17.2.3.4.2 Test procedure

The test consists of two sub-tests; Sub-test 1 is for Nsample = 4 and sub-test 2 is for Nsample = 1. Sub-test 2 is only conducted when UE also supporting supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2. All two cells transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first PRS processing window instance containing the PRS resources.

The *NR-DL-AoD-ProvideAssistanceData* and *NR-DL-AoD-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.11 shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the *DL-AoD assistance* data and location information request.

3. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On,* according to TS 38.508-1 [45] clause 4.5.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 17.2.3.5-1 and Table 17.2.3.5-2. Propagation conditions are set according to clause 4.16.2.
4. T1 starts.
5. The SS shall transmit an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
7. The SS shall transmit an RRCReconfiguration message with the PPW configuration.
8. The UE shall transmit RRCReconfigurationComplete message.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *NR-DL-AoD-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
11. The SS sends a Positioning Measurement Gap Activation command containing an ID to activate the associated measurement gap
12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 17.2.3.5-2.
13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-AoD-ProvideLocationInformation* IE within the response time (see clause 4.16.3). The UE shall perform and report the PRS-RSRPP measurements for Cell 2 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-AoD-ProvideLocationInformation* IE including the nr-DL-PRS-FirstPathRSRP-Result-r17 field for Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-AoD-ProvideLocationInformation* IE with both the nr-DL-PRS-RSRP-Result-r16 fields included within the response time then the number of failure tests is increased by one.
14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
15. Repeat steps 2-14 in Table 17.2.3.4-1 until the confidence level according to Annex D is achieved.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

17.2.3.5 Test requirement

Table 17.2.3.5-1 and Table 17.2.3.5-2 define the primary level settings including the test tolerances for the test.

Table 17.2.3.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Reference cell		1, 2, 3	Cell 1	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		1, 2, 3	Cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
RF Channel Number		1, 2, 3	1: Cell 1 and Cell 2	
$BW_{channel}$	MHz	1	20: $N_{RB,c}$ = 106	
		2	20: $N_{RB,c}$ = 106	
		3	50: $N_{RB,c}$ = 133	
SSB configuration		1	SSB.1 FR1	
		2	SSB.1 FR1	
		3	SSB.2 FR1	
SMTC configuration		1	SMTC.2	
		2	SMTC.1	
		3	SMTC.1	
PPW configuration		1,2,3	PPW.1	As defined in TS 38.133 [50] A.3.33
CP length		1, 2, 3	Normal	
DRX		1, 2, 3	NA	OFF
Time offset between serving and neighbour cells	µs	1, 2, 3	- set to the UE reported capability for receive time difference threshold if the UE reported value is < 3µs - 3µs otherwise	Synchronous cells
Expected RSTD	µs	1, 2, 3	0	
Expected RSTD uncertainty	µs	1, 2, 3	Same as time offset	
T1	s	1, 2, 3	2	
T2	ms	1, 2, 3	10	In this test UE is configured to measure single PFL within the configured PPW.

Propagation Condition		1, 2, 3	Two-tap channel defined in 38.101-4 Annex B.2.4, a = 1, $\tau_d = 0.45$ µs and $f_D = 5$ Hz			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The PRS-RSRPP measurement time fulfils the requirements specified in clause 17.2.3.3.

The UE shall perform and report the PRS RSRPP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 9.9.6.6 starting from the beginning of time interval T2

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRPP measurement for each correct event shall be within the PRS RSRPP reporting range specified in TS 38.133 Clause 10.1.38, i.e., between PRS RSRPP_0 and PRS RSRPP_126..

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period plus ΔT, where ΔT = 50ms. The LPP response time calculation procedure could be divided into two situations based on whether the UE support ppw-durationOfPRS-Processing1-r17 or ppw-durationOfPRS-Processing2-r17.The PRS-RSRPP measurement period follows the equation:

$T_{\text{PRS-RSRP, total}} = \sum_{i=1}^{L} T_{\text{PRS-RSRP,i}} + (L-1) * \max(T_{\text{effect},i})$ if any of the positioning frequency layers are in Case 1, or

$T_{\text{PRS-RSRP, total}} = \max(T_{\text{PRS-RSRP,i}} + T_{\text{uncertainty,i}})$, if all the positioning frequency layers are in Case 2,

$$T_{PRS-RSRP,i} = \left(N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last}$$

Where $N_{RxBeam,i} = 1$ $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 285$, N_{sample}=4 for sub-test 1, N_{sample}=1 for sub-test 2. N is the parameter *ppw-durationOfPRS-ProcessingSymbolsN* from TS 37.355 [49], N' is the parameter *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $T_{last,i} = T_i$ +PPWL and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$; where Tprs = 160 ms, and the repetition periodicity $PPWRP_i$ =160ms. Therefore, $T_{available_PRS,i} = 160$

T_i depends on the UE parameter *ppw-durationOfPRS-ProcessingSymbolsT* from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.285}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 0.641s and 30.88s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 1s and 31s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 31.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 17.2.3.5-3, Table 17.2.3.5-4 and Table 17.2.3.5-5 for reference.

Table 17.2.3.5-3: value of N' based on ppw-maxNumOfDL-PRS-ResProcessedPerSlot

ms160	160	320
ms320	320	480
ms640	640	800
ms1280	1280	1440

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

17.2.4 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

17.2.4.1 Test purpose

The purpose of the test is to verify the PRS RSRPP measurement requirements specified in TS 38.133 [50] Clause 9.9.6.5 for single positioning frequency layer in FR2 SA under AWGN propagation conditions in standalone scenario.

17.2.4.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and supportedDL-PRS-ProcessingSamples.

17.2.4.3 Minimum conformance requirements

Same as clause 17.2.1.3.

17.2.4.4 Test description

17.2.4.4.1 Initial conditions

The supported test configuration is listed in Table 17.2.4.4-1.

Table 17.2.4.4-1: Test Configurations

Config	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.2.4.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 17.2.4.5-1 and Table 17.2.4.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.2.4.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

17.2.4.4.2 Test procedure

Same as clause 17.2.1.4.2.

17.2.4.5 Test requirement

Table 17.2.4.5-1 and Table 17.2.4.5-2 define the primary level settings including the test tolerances for the test.

Table 17.2.4.5-1: General test parameters for PRS RSRPP measurement reporting delay

Parameter	Unit	Test configuration	Value	Comment
NR RF Channel Number		Config 1	1: Cell 1 and Cell 2	One TDD carrier frequency is used for the NR cells.
Active cell		Config 1	NR cell 1 (PCell)	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		Config 1	NR cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
Gap Pattern Id		Config 1	GP#13 or GP#24[Note1]	As specified in TS 38.133 [50] clause 9.1.2-1.
Measurement gap offset		Config 1	39	
SMTC parameters		Config 1	SMTC.1	As specified in TS 38.133 [50] clause A.3.11
SSB parameters		Config 1	SSB.3 FR2	As specified in TS 38.133 [50] clause A.3.10.2
A3-Offset	dB	Config 1	-6	
Hysteresis	dB	Config 1	0	
CP length		Config 1	Normal	
TimeToTrigger	s	Config 1	0	
Filter coefficient		Config 1	0	L3 filtering is not used
DRX		Config 1	OFF	DRX is not used
Time offset between serving and neighbour cells		Config 1	3μs	Synchronous cells
Expected RSTD	μs	Config 1	3	
Expected RSTD uncertainty	μs	Config 1	5	
T1	s	Config 1	5	
T2	s	Config 1	7	
Note 1: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.

Propagation Condition		Config 1	Two-tap channel defined in 38.101-4 Annex B.2.4, a = 1, $\tau_d = 0.45$ µs and $f_D = 5$ Hz			

Note 1:	OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4:	PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5:	Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6:	As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7:	Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation
Note 8:	Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

The PRS-RSRPP measurement time fulfils the requirements specified in clause 17.2.4.3.

The UE shall perform and report the PRS RSRPP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 9.9.6.5 starting from the beginning of time interval T2

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRPP measurement for each correct event shall be within the PRS RSRPP reporting range specified in TS 38.133 Clause 10.1.38, i.e., between PRS RSRPP_0 and PRS RSRPP_126..

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRPP measurement period. The PRS-RSRPP measurement period follows the equation:

$$T_{\mathrm{PRS-RSRP,i}} = \left(\mathrm{CSSF_i} * \mathrm{ceil}(\mathrm{K_{p,PRS,i}}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,\mathrm{i}}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,\mathrm{i}}}{N} \right\rceil * N_{sample} - 1 \right) * \mathrm{T_{effect,i}} + \mathrm{T_{last}}$$

Where $\mathrm{CSSF_{PRS,i}} = 1, \mathrm{K_{p,PRS,i}} = 1,\ N_{RxBeam,i} = 8,\ N_{PRS,i}^{slot} = 2, L_{available_PRS,\mathrm{i}} = 0.035, N_{sample} = 4$. N is the parameter *durationOfPRS-ProcessingSysmbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $\mathrm{T_{last,i}} = T_{\mathrm{i}} + T_{available_PRS,\mathrm{i}}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM\left(T_{PRS,i}, MGRP_i\right)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $\mathrm{T_{available_PRS,i}} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.035}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 5.128s and 82.08s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 83s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 83.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 17.2.4.5-3, Table 17.2.4.5-4 and Table 17.2.4.5-5 for reference.

Table 17.2.4.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

n160	160	320
n320	320	480
n640	640	800
n1280	1280	1440

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

17.2.5 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

17.2.5.1 Test purpose

The purpose of the test is to verify the PRS RSRPP measurement requirements for reduced number of samples specified in TS 38.133 [50] Clause 9.9.6.5 for single positioning frequency layer under AWGN propagation conditions in standalone scenario.

17.2.5.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

17.2.5.3 Minimum conformance requirements

Same as clause 17.2.2.3.

17.2.5.4 Test description

17.2.5.4.1 Initial conditions

The supported test configuration is listed in Table 17.2.5.4-1.

Table 17.2.5.4-1: Test Configurations

Config	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.2.5.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 17.2.5.5-1 and Table 17.2.5.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.2.5.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

17.2.5.4.2 Test procedure

Same as clause 17.2.2.4.2.

17.2.5.4.3 Message contents

17.2.5.5 Test requirement

Table 17.2.5.5-1 and Table 17.2.5.5-2 define the primary level settings including the test tolerances for the test.

Table 17.2.5.5-1: General test parameters for PRS RSRPP measurement reporting delay

Parameter	Unit	Test configuration	Value	Comment
NR RF Channel Number		Config 1	1: Cell 1 and Cell 2	One TDD carrier frequency is used for the NR cells.
Active cell		Config 1	NR cell 1 (PCell)	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		Config 1	NR cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
Gap Pattern Id		Config 1	GP#13 or GP#24[Note1]	As specified in TS 38.133 [50] clause 9.1.2-1.
Measurement gap offset		Config 1	39	
SMTC parameters		Config 1	SMTC.1	As specified in TS 38.133 [50] clause A.3.11
SSB parameters		Config 1	SSB.3 FR2	As specified in TS 38.133 [50] clause A.3.10.2
A3-Offset	dB	Config 1	-6	
Hysteresis	dB	Config 1	0	
CP length		Config 1	Normal	
TimeToTrigger	s	Config 1	0	
Filter coefficient		Config 1	0	L3 filtering is not used
DRX		Config 1	OFF	DRX is not used
Time offset between serving and neighbour cells		Config 1	3μs	Synchronous cells
Expected RSTD	μs	Config 1	3	

Expected RSTD uncertainty	µs	Config 1	5	
T1	s	Config 1	5	
T2	s	Config 1	7	
Note 1: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.

Propagation Condition		Config 1	Two-tap channel defined in 38.101-4 Annex B.2.4, a = 1, τ_d = 0.45 µs and f_D = 5 Hz			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation
Note 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMBP from TS 38.101-2 [55] Table 6.2.1.3-4.

The PRS-RSRPP measurement time fulfils the requirements specified in clause 17.2.5.3.

The UE shall perform and report the PRS RSRPP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 9.9.6.5 starting from the beginning of time interval T2

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRPP measurement for each correct event shall be within the PRS RSRPP reporting range specified in TS 38.133 Clause 10.1.38, i.e., between PRS RSRPP_0 and PRS RSRPP_126..

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRPP measurement period. The PRS-RSRPP measurement period follows the equation:

$$T_{PRS-RSRP,i} = \left(CSSF_i * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last}$$

Where $CSSF_{PRS,i} = 1, K_{p,PRS,i} = 1,\ N_{RxBeam,i} = 8,\ N_{PRS,i}^{slot} = 2, L_{available_PRS,i} = 0.035, N_{sample} = 1$. N is the parameter *durationOfPRS-ProcessingSysmbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.035}{N} \right\rceil * 1 - 1\right) * T_{effect} + \mathrm{T}_{\mathrm{last}}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 1.288s and 20.64s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 2s and 21s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 21.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 17.2.5.5-3, Table 17.2.5.5-4 and Table 17.2.5.5-5 for reference.

Table 17.2.5.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

maxNumOfDL-PRS-ResProcessedPerSlot	$\left\lceil \frac{2}{N'} \right\rceil$

Table 17.2.5.5-5: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	T_{effect}	T_{last}
n8	160	168
n16	160	176
n20	160	180
n30	160	190
n40	160	200
n80	160	240
n160	160	320
n320	320	480
n640	640	800
n1280	1280	1440

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

17.2.6 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

17.2.6.1 Test purpose

The purpose of the test is to verify the PRS RSRPP measurement outside MG requirements specified in TS 38.133 [50] Clause 9.9.6.6 for single positioning frequency layer under AWGN propagation conditions in FR2 in standalone scenario.

17.2.6.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and prs-Processing Window..

17.2.6.3 Minimum conformance requirements

Same as clause 17.2.3.3.

17.2.6.4 Test description

17.2.6.4.1 Initial conditions

The supported test configuration is listed in Table 17.2.6.4-1.

Table 17.2.6.4-1: Test Configurations

Config	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.2.6.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 17.2.6.5-1 and Table 17.2.6.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.2.6.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

17.2.6.4.2 Test procedure

Same as clause 17.2.3.4.2.

17.2.6.5 Test requirement

Table 17.2.6.5-1 and Table 17.2.6.5-2 define the primary level settings including the test tolerances for the test.

Table 17.2.6.5-1: General test parameters for PRS RSRPP measurement reporting delay

Parameter	Unit	Test configuration	Value	Comment
NR RF Channel Number		Config 1	1: Cell 1 and Cell 2	One TDD carrier frequency is used for the NR cells.
Active cell		Config 1	NR cell 1 (PCell)	Cell 1 is the PCell and the DL-AoD reference cell in the positioning assistance data.
Neighbour cell		Config 1	NR cell 2	Cell 2 is a neighbour cell in the positioning assistance data.
PPW configuration		Config 1	Table A.3.33-1: Reference PPW configuration	As defined in TS 38.133 [50] clause A.3.33

SMTC parameters		Config 1	SMTC.1	As specified in TS 38.133 [50] clause A.3.11
SSB parameters		Config 1	SSB.3 FR2	As specified in TS 38.133 [50] clause A.3.10.2
A3-Offset	dB	Config 1	-6	
Hysteresis	dB	Config 1	0	
CP length		Config 1	Normal	
TimeToTrigger	s	Config 1	0	
Filter coefficient		Config 1	0	L3 filtering is not used
DRX		Config 1	OFF	DRX is not used
Time offset between serving and neighbour cells	µs	1, 2, 3	- set to the UE reported capability for receive time difference threshold if the UE reported value is < 3µs - 3µs otherwise	Synchronous cells
Expected RSTD	µs	1, 2, 3	0	
Expected RSTD uncertainty	µs	1, 2, 3	Same as time offset	
T1	s	Config 1	5	
T2	ms	Config 1	10	In this test UE is configured to measure single PFL within the configured PPW.

Table 17.2.6.5-2: Cell-specific test parameters during T2

Propagation Condition		Config 1	Two-tap channel defined in 38.101-4 Annex B.2.4, a = 1, $\tau_d = 0.45$ µs and $f_D = 5$ Hz			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone

Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

Note 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMBP from TS 38.101-2 [55] Table 6.2.1.3-4.

The PRS-RSRPP measurement time fulfils the requirements specified in clause 17.2.6.3.

The UE shall perform and report the PRS RSRPP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 9.9.6.6 starting from the beginning of time interval T2

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRPP measurement for each correct event shall be within the PRS RSRPP reporting range specified in TS 38.133 Clause 10.1.38, i.e., between PRS RSRPP_0 and PRS RSRPP_126..

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period plus ΔT, where ΔT = 50ms. The LPP response time calculation procedure could be divided into two situations based on whether the UE support ppw-durationOfPRS-Processing1-r17 or ppw-durationOfPRS-Processing2-r17.The PRS-RSRPP measurement period follows the equation:

$T_{\text{PRS-RSRP, total}} = \sum_{i=1}^{L} T_{\text{PRS-RSRP,i}} + (L-1) * \max\left(T_{\text{effect},i}\right)$ if any of the positioning frequency layers are in Case 1, or

$T_{\text{PRS-RSRP, total}} = \max\left(T_{\text{PRS-RSRP,i}} + T_{\text{uncertainty,i}}\right)$, if all the positioning frequency layers are in Case 2,

$$T_{\text{PRS-RSRP,i}} = \left(N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{\text{effect,i}} + T_{\text{last}}$$

Where $N_{RxBeam,i}$ = 8, $N_{PRS,i}^{slot}$ = 2, $L_{available_PRS,i}$ = 0.035, N_{sample}=4 for sub-test 1, N_{sample}=1 for sub-test 2. N is the parameter *ppw-durationOfPRS-ProcessingSymbolsN* from TS 37.355 [49], N' is the parameter *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $T_{\text{last,i}} = T_i$ +PPWL and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM\left(T_{PRS,i}, PPWRP_i\right)$; where Tprs = 160 ms, and the repetition periodicity $PPWRP_i$ =160ms. Therefore, $T_{\text{available_PRS,i}} = 160$

T_i depends on the UE parameter *ppw-durationOfPRS-ProcessingSymbolsT* from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.035}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{\text{last}}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 5.121s and 82.08s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 83s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 83.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 17.2.6.5-3, Table 17.2.6.5-4 and Table 17.2.6.5-5 for reference.

Table 17.2.6.5-3: value of N' based on *ppw-maxNumOfDL-PRS-ResProcessedPerSlot*

ms640	640	800
ms1280	1280	1440

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

17.3 NR PRS-RSRPP measurement accuracy test case in RRC_CONNECTED

17.3.1 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR1 SA

17.3.1.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.38.2 in an environment with two-tap channel conditions.

17.3.1.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and maxDL-PRS-FirstPathRSRP-MeasPerTRP.

17.3.1.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRPP measurement for FR1 defined in Table 10.1.38.2.1-1 and Table 10.1.38.2.1-3 are valid under the following conditions:

- Conditions defined in 38.101-1 Clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band

…

					Note 4				
±5.8	±10.3	≥-13	24 ≤ BW ≤ 52	All	Note 4				
±4.9	±9.4		BW > 52	All	Note 4				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the DL-TDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 RB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in Section 3.5.2.

17.3.1.4 Test description

17.3.1.4.1 Initial conditions

The test is defined with three possible Test Configurations. In the case that the UE supports more than one of these Test Configurations, then the UE is only required to be tested in one of the Test Configurations, chosen by the UE. The defined Test Configurations are specified in Table 17.3.1.4.1-1.

Table 17.3.1.4.1-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.3.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.

2. The general test parameter settings are set up according to Table 17.3.1.5-1 and Table 17.3.1.5-2.

3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.3.1.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

17.3.1.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration.

The NR-DL-AoD-RequestLocationInformation message and NR-DL-AoD-ProvideAssistanceData message as defined in TS 37.355 shall be provided to the UE during T1. The last slot containing the two messages for the assistance data and location information request is denoted as #n. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources that is ΔT after slot #n, where ΔT = 50 ms is the maximum processing time of the assistance data and location information request

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release On, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 17.3.1.5-1 as appropriate. Propagation conditions are set according to clause 4.16.2.
4. The SS shall send an LPP REQUEST CAPABILITIES message.
5. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the NR-DL-AoD-ProvideCapabilities IE.
6. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the nr-DL-AoD-ProvideAssistanceData-r16 IE. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
7. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-DL-AoD-RequestLocationInformation-r16 such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.
8. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message, including the nr-DL-AoD-ProvideLocationInformation-r16 IE.
9. If the UE message at step 8 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
10. The SS shall check the nr-DL-PRS-FirstPathRSRP-ResultDiff-r17 field for Cell 2 in the nr-DL-AoD-SignalMeasurementInformation-r16 according to Table 17.3.1.5-2.
11. Repeat step 2-10 until the confidence level according to Annex D is achieved.
12. Repeat step 1-11 for the other sub-test defined in Table 17.3.1.4-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

	Config 3		dBm/47.88 MHz	-60.59		-60.59	
Propagation condition				Two-tap channel defined in 38.101-4 Annex B.2.4, a = 1, $\tau_d = 0.45$ µs and $f_D = 5$ Hz			
Antenna configuration				1x2			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRS-RSRPP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Void.
Note 6: Void.
Note 7: GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

The value of the LPP Time IE depends on the UE capabilities. The calculation is as defined in clause 17.2.1.5. The ideal PRS-RSRPP is calculated by the following equation in the real tests:

$$\mathrm{RSRPP}_p \propto \left| \sum_k H_k \exp\left(j 2\pi D_p \frac{k}{N_{\mathrm{IFFT}}} \right) \right|^2$$

Where:

H_k is the effective channel frequency response (over REs occupied by PRS) measured without receiver noise.

D_p is the exact delay of the p-th path in the channel model.

Table 17.3.1.5-2: PRS-RSRPP accuracy requirements for the reported values

Test Configuration	Subtest	Cell 1		Cell 2	
		Lowest reported value	Highest reported value	Lowest reported value	Highest reported value
1	Sub-test 1	PRS_RSRPP_49	PRS_RSRPP_58	PRS_RSRPP_40	PRS_RSRPP_51
	Sub-test 2	PRS_RSRPP_49	PRS_RSRPP_58	PRS_RSRPP_41	PRS_RSRPP_50
2	Sub-test 1	PRS_RSRPP_49	PRS_RSRPP_58	PRS_RSRPP_40	PRS_RSRPP_51
	Sub-test 2	PRS_RSRPP_49	PRS_RSRPP_58	PRS_RSRPP_41	PRS_RSRPP_50
3	Sub-test 1	PRS_RSRPP_52	PRS_RSRPP_61	PRS_RSRPP_43	PRS_RSRPP_54
	Sub-test 2	PRS_RSRPP_52	PRS_RSRPP_61	PRS_RSRPP_44	PRS_RSRPP_53

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

17.3.2 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR1 SA

17.3.2.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement with reduce number of samples meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.38.2 in an environment with two-tap channel conditions.

17.3.2.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and maxDL-PRS-FirstPathRSRP-MeasPerTRP and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

17.3.2.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRPP measurement for FR1 defined in Table 10.1.38.2.1-1 and Table 10.1.38.2.1-3 are valid under the following conditions:

- Conditions defined in 38.101-1 Clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band

…

Table 10.1.38.2.1-3: PRS-RSRPP absolute accuracy for FR1 for reduced number of samples

Accuracy		Conditions						
					Io Note 7 range			
Normal condition	Extreme condition	PRS $\hat{E}_s/I_{ot}$	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS}/K_{comb}^{PRS}$)	NR operating band groups Note 8	Minimum Io Note 1 dBm / SCS_{PRS}		Maximum Io
						dBm / SCS_{PRS}		
dB	dB	dB	PRB	-		dBm/15kHz Note 6	dBm/30kHz Note 6	dBm/60kHz Note 6	dBm/$BW_{Channel}$
±3.9	±8.4	≥0	≥48	All	NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A	-127	-124	-121	-50
					NR_FDD_FR1_B	-126.5	-123.5	-120.5	-50

					NR_TDD_FR1_C	-126	-123	-120	-50
					NR_FDD_FR1_D, NR_TDD_FR1_D	-125.5	-122.5	-119.5	-50
					NR_FDD_FR1_E, NR_TDD_FR1_E	-125	-122	-119	-50
					NR_FDD_FR1_F	-124.5	-121.5	-118.5	-50
					NR_FDD_FR1_G	-124	-121	-118	-50
					NR_FDD_FR1_H	-123.5	-120.5	-117.5	-50
					Note 4				
					Note 4				
±4.2	±8.7	≥-6	48 ≤ BW ≤ 52	All	Note 4				
±4.1	±8.6		BW >52	All	Note 4				

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the DL-TDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 48 RB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in Section 3.5.2.

17.3.2.4 Test description

17.3.2.4.1 Initial conditions

The test is defined with three possible Test Configurations. In the case that the UE supports more than one of these Test Configurations, then the UE is only required to be tested in one of the Test Configurations, chosen by the UE. The defined Test Configurations are specified in Table 17.3.2.4.1-1.

Table 17.3.2.4.1-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.3.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 17.3.2.5-1 and Table 17.3.2.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.3.2.4.3.

5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

17.3.2.4.2 Test procedure

Same as defined in clause 17.3.1.4.2.

17.3.2.4.3 Message contents

As defined in clause 17.3.1.4.3, with the following exceptions:

Table 17.3.2.4.3-1 replaces Table 17.3.1.4.3-4, Table 17.3.2.4.3-2 replaces Table 17.3.1.4.3-5 and Table 17.3.2.4.3-3 replaces Table 17.3.1.4.3-6.

	Config 3	dBm/47.88MHz	-57.24	
Propagation condition			Two-tap channel Note6	
Antenna configuration			1x2	
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.				

Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4:	PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5:	GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.
Note 6:	The two-tap channel model is defined in 38.101-4 Annex B.2.4 (a = 1, τ_d=0.45 μs and f_D=5 Hz).

The value of the LPP Time IE depends on the UE capabilities. The calculation is as defined in clause 17.2.2.5. The ideal PRS-RSRPP is calculated by the following equation in the real tests:

$$\mathrm{RSRPP}_p \propto \left| \sum_k H_k \exp\left(j 2\pi D_p \frac{k}{N_{\mathrm{IFFT}}} \right) \right|^2$$

Where:

H_k is the effective channel frequency response (over REs occupied by PRS) measured without receiver noise.

D_p is the exact delay of the p-th path in the channel model.

Table 17.3.2.5-2: PRS-RSRPP accuracy requirements for the reported values

Test Configuration	Cell 1		Cell 2	
	Lowest reported value	Highest reported value	Lowest reported value	Highest reported value
1	PRS_RSRPP_54	PRS_RSRPP_62	PRS_RSRPP_50	PRS_RSRPP_59
2	PRS_RSRPP_54	PRS_RSRPP_62	PRS_RSRPP_50	PRS_RSRPP_59
3	PRS_RSRPP_57	PRS_RSRPP_65	PRS_RSRPP_53	PRS_RSRPP_62

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

17.3.3 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

17.3.3.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.38.2 in an environment with two-tap channel conditions.

17.3.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and maxDL-PRS-FirstPathRSRP-MeasPerTRP.

17.3.3.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRPP measurement for FR2 defined in Table 10.1.38.2.1-2 and Table 10.1.38.2.1-4 are valid under the following conditions:

- Conditions defined in 38.101-2 Clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band

…

Table 10.1.38.2.1-2: PRS-RSRPP absolute accuracy for FR2

Accuracy		Conditions				
					Io Note 7 range	
Normal condition	Extreme condition	PRS Ês/Iot	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	Minimum Io Note 1 dBm / SCS_{PRS}	Maximum Io
dB	dB	dB	PRB	-	dBm / SCS_{PRS}	dBm/$BW_{Channel}$
					dBm/120kHz Note 6 / dBm/60kHz Note 6	
±6.0	±9.0	≥-3	≥24	All	Same value as PRP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
					Note 4	
					Note 4	
±7.3	±10.3	≥-13	24 ≤ BW ≤ 64	All	Note 4	
±6.2	±9.2		BW >64	All	Note 4	

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the DL-TDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 RB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by $\Delta>0$, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in Section 3.5.2.

17.3.3.4 Test description

17.3.3.4.1 Initial conditions

The supported test configurations in listed in Table 17.3.3.4.1-1.

Table 17.3.3.4.1-1: Test Configurations

Configuration	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.3.3.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 17.3.3.5-1 and Table 17.3.3.5-2.
3. Propagation conditions are set according to clause 4.16.2.

4. Message contents are defined in clause 17.3.3.4.3.

5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

17.3.3.4.2 Test procedure

Same as defined in clause 17.3.1.4.2.

17.3.3.4.3 Message contents

As defined in clause 17.3.1.4.3, with the following exceptions:

Table 17.3.3.4.3-1 replaces Table 17.3.1.4.3-4 and Table 17.3.3.4.3-2 replaces Table 17.3.1.4.3-5.

Propagation conditions		Two-tap channel defined in 38.101-4 Annex B.2.4, a = 1, $\tau_d = 0.45$ µs and $f_D = 5$ Hz			
Antenna configuration		1x2	1x2	1x2	1x2

Note 1:	OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2:	GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.

Table 17.3.3.5-2: PRS-RSRPP OTA related test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to TS 38.133 [50] clause A.3.15.1			
Assumption for UE beams Note 7		Rough		Rough	
N_{oc} Note1	dBm/15kHz Note4	-99.1		Same as Test 1	
N_{oc} Note1	dBm/SCS Note4	-90.1		Same as Test 1	
$\hat{E}_s / N_{oc}$	dB	-2	-10	-2	-10
E_s	dBm/SCS Note4	-	-	-	-
PRS_RP Note2	dBm/SCS	-92.1	-100.1	-92.1	-100.1
$\hat{E}_s / I_{ot\ BB}$ Note6	dB	-2.68	-12.30	-2.68	-12.30
Io Note2	dBm/190.08 MHz Note4	-55.69		-55.69	

Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 2: PRS_RP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 3: Void
Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 5: Void
Note 6: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

The value of the LPP Time IE depends on the UE capabilities. The calculation is as defined in clause 17.2.4.5. The ideal PRS-RSRPP is calculated by the following equation in the real tests:

$$\mathrm{RSRPP}_p \propto \left| \sum_k H_k \exp\left(j 2\pi D_p \frac{k}{N_{\mathrm{IFFT}}} \right) \right|^2$$

Where:

H_k is the effective channel frequency response (over REs occupied by PRS) measured without receiver noise.

D_p is the exact delay of the p-th path in the channel model.

Table 17.3.3.5-3: PRS-RSRPP accuracy requirements for the reported values

Sub-test	Cell 1		Cell 2	
	Lowest reported value	Highest reported value	Lowest reported value	Highest reported value
1	PRS_RSRPP_50	PRS_RSRPP_83	PRS_RSRPP_42	PRS_RSRPP_75
2	PRS_RSRPP_50	PRS_RSRPP_83	PRS_RSRPP_42	PRS_RSRPP_75

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

17.3.4 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

17.3.4.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement with reduce number of samples meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.38.2 in an environment with two-tap channel conditions.

17.3.4.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning and maxDL-PRS-FirstPathRSRP-MeasPerTRP and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

17.3.4.3 Minimum conformance requirements

The absolute accuracy requirements for PRS-RSRPP measurement for FR2 defined in Table 10.1.38.2.1-2 and Table 10.1.38.2.1-4 are valid under the following conditions:

- Conditions defined in 38.101-2 Clause 7.3 for reference sensitivity are fulfilled.

- PRP $1,2|_{dBm}$ according to Annex B.2.14 for a corresponding Band

…

Table 10.1.38.2.1-4: PRS-RSRPP absolute accuracy for FR2 for reduced number of samples

Accuracy		Conditions				
					Io Note 7 range	
Normal condition	Extreme condition	PRS Ês/Iot	PRS BW	Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$)	Minimum Io Note 1 dBm / SCS_{PRS}	Maximum Io
dB	dB	dB	PRB	-	dBm / SCS_{PRS}	$dBm/BW_{Channel}$
					dBm/120kHz Note 6 / dBm/60kHz Note 6	
±5.9	±8.9	≥0	≥48	All	Same value as PRP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
					Note 4	
					Note 4	
±5.6	±8.6	≥-6	48 ≤ BW ≤ 64	All	Note 4	
±5.4	±8.4		BW >64	All	Note 4	

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the DL-TDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 48 RB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.

NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in Section 3.5.2.

17.3.4.4 Test description

17.3.4.4.1 Initial conditions

The supported test configurations in listed in Table 17.3.4.4.1-1.

Table 17.3.4.4.1-1: Test Configurations

Configuration	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.3.4.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 17.3.4.5-1 and Table 17.3.4.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.3.4.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is the neighbour cell. All cells are on the same RF channel distributed in single positioning frequency layer.

17.3.4.4.2 Test procedure

Same as defined in clause 17.3.1.4.2.

17.3.4.4.3 Message contents

As defined in clause 17.3.1.4.3, with the following exceptions:

Table 17.3.4.4.3-1 replaces Table 17.3.1.4.3-4, Table 17.3.4.4.3-2 replaces Table 17.3.1.4.3-5 and Table 17.3.4.4.3-3 replaces Table 17.3.1.4.3-6.

17.3.4.5 Test requirement

Table 17.3.4.5-1 and Table 17.3.4.5-2 define the primary level settings including test tolerances for the test.

Table 17.3.4.5-1: PRS-RSRPP general test parameters

Parameter	Unit	Test 1	
		Cell 1	Cell 2
Cell ID		489	0
SSB ARFCN		freq1	
Duplex mode		TDD	
TDD configuration		TDDConf.3.1	
$BW_{channel}$	MHz	200: $N_{RB,c}$ = 132	
Downlink initial BWP configuration		DLBWP.0.1	-
Downlink dedicated BWP configuration		DLBWP.1.1	-
Uplink initial BWP configuration		ULBWP.0.1	-
Uplink dedicated BWP configuration		ULBWP.1.1	-
DRX cycle configuration		Not applicable	-
Measurement gap		GP#13 or GP#24 Note2	
TRS configuration		TRS.2.1 TDD	-
TCI state		TCI.State.0	-
PDSCH Reference measurement channel		SR.3.1 TDD	-
RMSI CORESET Reference Channel		CR.3.1 TDD	-
Control channel RMC		CCR.3.1 TDD	-
OCNG Patterns		OP.3	OP.3
SSB configuration		SSB.3 FR2	SSB.3 FR2
SMTC configuration		SMTC.1	SMTC.1
Time offset with Cell 1	µs	-	3
PRS configuration		PRS.1.4 FR2	PRS.1.4 FR2
PRS bandwidth		48 PRBs	48 PRBs
PRS Resource slot offset	slot	0	4
PDSCH/PDCCH subcarrier spacing	kHz	120	120
EPRE ratio of PSS to SSS	dB	0	0
EPRE ratio of PBCH_DMRS to SSS			
EPRE ratio of PBCH to PBCH_DMRS			
EPRE ratio of PDCCH_DMRS to SSS			
EPRE ratio of PDCCH to PDCCH_DMRS			
EPRE ratio of PDSCH_DMRS to SSS			
EPRE ratio of PDSCH to PDSCH_DMRS			
EPRE ratio of OCNG DMRS to SSS Note 1			
EPRE ratio of OCNG to OCNG DMRS Note 1			
Propagation conditions		Two-tap channel Note3	
Antenna configuration		1x2	

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.
Note 3: The two-tap channel model is defined in 38.101-4 Annex B.2.4 (a = 1, τ_d=0.45 µs and f_D=5 Hz).

Table 17.3.4.5-2: PRS-RSRPP OTA related test parameters

Parameter	Unit	Test 1	
		Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to TS 38.133 [50] clause A.3.15.1	
Assumption for UE beams Note 7		Rough	
N_{oc} Note1	dBm/15kHz Note4	-103	
N_{oc} Note1	dBm/SCS Note4	-94	

$\hat{E}_s / N_{oc}$	dB	3.55	-0.29
E_s	dBm/SCS Note4	-	-
PRS_RP Note2	dBm/SCS	-90.42	-94.26
SS_RP Note2	dBm/SCS	-86.77	-90.73
$\hat{E}_s / I_{ot}$ BB Note6	dB	0	-6
Io Note2	dBm/190.08 MHz Note4	-55.74	

Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 2: PRS_RP, SS_RP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 3: Void

Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

Note 5: Void

Note 6: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation.

The value of the LPP Time IE depends on the UE capabilities. The calculation is as defined in clause 17.2.4.5. The ideal PRS-RSRPP is calculated by the following equation in the real tests:

$$\mathrm{RSRPP}_p \propto \left| \sum_k H_k \exp\left(j 2\pi D_p \frac{k}{N_{\mathrm{IFFT}}} \right) \right|^2$$

Where:

H_k is the effective channel frequency response (over REs occupied by PRS) measured without receiver noise.

D_p is the exact delay of the p-th path in the channel model.

Table 17.3.4.5-3: PRS-RSRPP accuracy requirements for the reported values

Config	Cell 1		Cell 2	
	Lowest reported value	Highest reported value	Lowest reported value	Highest reported value
1	PRS_RSRPP_52	PRS_RSRPP_84	PRS_RSRPP_48	PRS_RSRPP_80

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

17.4 NR PRS-RSRPP measurement period test cases in RRC_INACTIVE

17.4.1 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR1 SA

17.4.1.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement in RRC_INACTIVE state meets the requirements specified in TS 38.133 [50] clause 5.6.5.5 in FR1 in standalone scenario when single positioning frequency layer is configured.

17.4.1.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and DL-PRS measurement in RRC_INACTIVE state.

17.4.1.3 Minimum conformance requirements

Same as defined in clause 16.4.3.3.

17.4.1.4 Test description

17.4.1.4.1 Initial conditions

The test defines three possible test configurations; specified in Table 17.4.1.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 17.4.1.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.4.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 17.4.1.5-1 and Table 17.4.1.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.4.1.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

17.4.1.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During T2 UE shall be in RRC_INACTIVE state and all cells transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The *NR-DL-AoD-ProvideAssistanceData* and *NR-DL-AoD-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.11 shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where $\Delta T = 50$ ms is the maximum processing time of the *DL-AoD assistance* data and location information request.

The beginning of the time interval T2 shall be aligned with the first DRX cycle containing a DL PRS resource(s).

3. Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 17.4.1.4.3-1.
4. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.

3. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

4. Set the parameters according to Table 17.4.1.5-1 and Table 17.4.1.5-2. Propagation conditions are set according to clause 4.16.2.
5. T1 starts.
6. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
7. The UE shall transmit RRCReconfigurationComplete message.
8. The SS shall transmit an LPP REQUEST CAPABILITIES message.
9. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 9 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
11. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-DL-AoD-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
12. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
13. When T1 expires, the SS shall transmit an RRCRelease message including SDT configuration to transit the UE to RRC_INACTIVE state and switch the power setting from T1 to T2 as specified in Table 17.4.1.5-1 and Table 17.4.1.5-2.
14. Wait for the UE monitors for occurrence of the periodic event requested.
15. The UE shall transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 19.
16. The SS transmits an *RRCResume* message.
17. The UE transmits an *RRCResumeComplete* message. The time between the start of T2 and the UE send the *RRCResumeRequest* message should meet the requirements specified in TS 38.133 [50] Clause 5.6.3.5.
18. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the NR-DL-AoD-ProvideLocationInformation IE within the response time (see clause 4.16.3) plus the maximum RRC processing time 10ms between *RRCResume* message and *RRCResumeComplete* message.
19. The UE shall perform and report the PRS-RSRPP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1. If the UE transmits an NR-DL-AoD-ProvideLocationInformation IE including the nr-DL-PRS-FirstPathRSRP-ResultDiff-r17 field for Cell 2 field within the response time then the number of successful tests is increased by one. If the UE fails to report the NR-DL-AoD-ProvideLocationInformation IE with the nr-DL-PRS-FirstPathRSRP-ResultDiff-r17 field included within the response time then the number of failure tests is increased by one.
20. If the UE message at step 19 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
21. UE shall be released and moved to RRC_IDLE.
22. Repeat steps 2-21 in Tables 17.4.1.4-1 until the confidence level according to Annex D is achieved.

	dBm/19.08 MHz	2		-64.57		-64.57
	dBm/47.88 MHz	3		-60.59		-60.59
Propagation Condition		1, 2, 3	Two-tap channel defined in 38.101-4 Annex B.2.4, a = 1, τ_d = 0.45 μs and f_D = 5 Hz			

Note 1: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The PRS-RSRPP measurement time fulfils the requirements specified in clause 17.4.1.3.

The UE shall perform and report the PRS RSRPP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 5.6.3.5 starting from the beginning of time interval T2

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRPP measurement for each correct event shall be within the PRS RSRPP reporting range specified in TS 38.133 Clause 10.1.38, i.e., between PRS RSRPP_0 and PRS RSRPP_126..

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRPP measurement period. The PRS-RSRPP measurement period follows the equation:

$$T_{PRS-RSRP,i} = \left(K_{carrier_PRS} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxBeam,i}$=1, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.285$, N_{sample}=4. N is the parameter durationOfPRS-ProcessingSymbols-r17 from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17 from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$. $T_{available_{PRS,i}} = LCM(T_{PRS,i}, T_{DRX})$, where Tprs = 160 ms, and T_{DRX}= 1280ms depending on UE capabilities. Therefore, $T_{available_{PRS,i}} = 1280$ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms-r17 from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.285}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 5.128s and 32s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 32s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 32.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 17.4.1.5-3, Table 17.4.1.5-4 and Table 17.4.1.5-5 for reference.

Table 17.4.1.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive*

maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive	$\left\lceil \frac{2}{N'} \right\rceil$

nDot25	2
>=nDot5	1

Table 17.4.1.5-5: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	**T_{effect}**	**T_{last}**
n8	1280	1288
n16	1280	1296
n20	1280	1300
n30	1280	1310
n40	1280	1320
n80	1280	1360
n160	1280	1440
n320	1280	1600
n640	1280	1920

n1280	1280	2560

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

17.4.2 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA

17.4.2.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement in RRC_INACTIVE state meets the requirements specified in TS 38.133 [50] clause 5.6.5.5 in FR1 in standalone scenario when single positioning frequency layer is configured and reduce sample measurements are requested by the LMF.

17.4.2.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and supportedDL-PRS-ProcessingSamples-RRC-Inactive.

17.4.2.3 Minimum conformance requirements

Same as defined in clause 16.4.3.3.

17.4.2.4 Test description

17.4.2.4.1 Initial conditions

The test defines three possible test configurations; specified in Table 17.4.2.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 17.4.2.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.4.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 17.4.2.5-1 and Table 17.4.2.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.4.2.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

17.4.2.4.2 Test procedure

Same as defined in clause 17.4.1.4.2.

17.4.2.4.3 Message contents

As defined in clause 17.4.1.4.3, with the following exceptions:

Table 17.4.2.4.3-1 replaces Table 17.4.1.4.3-6 and Table 17.4.2.4.3-2 replaces Table 17.4.1.4.3-9.

Propagation Condition		1, 2, 3	Two-tap channel defined in 38.101-4 Annex B.2.4, a = 1, τ_d = 0.45 μs and f_D = 5 Hz			
Note 1: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.						
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.						
Note 3: SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.						

The PRS-RSRPP measurement time fulfils the requirements specified in clause 17.4.2.3.

The UE shall perform and report the PRS RSRPP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 5.6.3.5 starting from the beginning of time interval T2

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRPP measurement for each correct event shall be within the PRS RSRPP reporting range specified in TS 38.133 Clause 10.1.38, i.e., between PRS RSRPP_0 and PRS RSRPP_126..

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRPP measurement period. The PRS-RSRPP measurement period follows the equation:

$$T_{PRS-RSRP,i} = \left(K_{carrier_PRS} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxBeam,i}$=1, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.285$, N_{sample}=1. N is the parameter durationOfPRS-ProcessingSymbols-r17 from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17 from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$. $T_{available_{PRS,i}} = LCM(T_{PRS,i}, T_{DRX})$, where Tprs = 160 ms, and T_{DRX}= 1280ms depending on UE capabilities. Therefore, $T_{available_{PRS,i}} = 1280$ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms-r17 from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.285}{N} \right\rceil * 1 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 1.288s and 8.96s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 2s and 9s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 9.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 17.4.2.5-3, Table 17.4.2.5-4 and Table 17.4.2.5-5 for reference.

n640	1280	1920
n1280	1280	2560

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

17.4.3 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

17.4.3.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement in RRC_INACTIVE state meets the requirements specified in TS 38.133 [50] clause 5.6.3.5 in FR2 in standalone scenario when single positioning frequency layer is configured.

17.4.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and DL-PRS measurement in RRC_INACTIVE state.

17.4.3.3 Minimum conformance requirements

Same as defined in clause 16.4.3.3.

17.4.3.4 Test description

17.4.3.4.1 Initial conditions

The supported test configurations in listed in Table 17.4.3.4.1-1

Table 17.4.3.4.1-1: Supported test configurations

Config	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.4.3.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 17.4.3.5-1 and Table 17.4.3.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.4.3.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

17.4.3.4.2 Test procedure

Same as defined in clause 17.4.1.4.2.

17.4.3.4.3 Message contents

As defined in clause 17.4.1.4.3, with the following exceptions:

Table 17.4.3.4.3-1 replaces Table 17.4.1.4.3-3, Table 17.4.3.4.3-2 replaces Table 17.4.1.4.3-6 and Table 17.4.3.4.3-3 replaces Table 17.4.1.4.3-7.

Io Note3	dBm/19 0.08 MHz Note5	Config 1	-58.37	-55.99	-58.37	-55.99
Propagation Condition		Config 1	Two-tap channel defined in 38.101-4 Annex B.2.4, a = 1, $\tau_d = 0.45$ μs and $f_D = 5$ Hz			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone

Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

The PRS-RSRPP measurement time fulfils the requirements specified in clause 17.4.3.3.

The UE shall perform and report the PRS RSRPP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 5.6.3.5 starting from the beginning of time interval T2

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRPP measurement for each correct event shall be within the PRS RSRPP reporting range specified in TS 38.133 Clause 10.1.38, i.e., between PRS RSRPP_0 and PRS RSRPP_126.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRPP measurement period. The PRS-RSRPP measurement period follows the equation:

$$T_{PRS-RSRP,i} = \left(K_{carrier_PRS} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxBeam,i}$=8, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.035$, N_{sample}=4. N is the parameter durationOfPRS-ProcessingSymbols-r17 from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17 from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$. $T_{available_{PRS,i}} = LCM(T_{PRS,i}, T_{DRX})$, where Tprs = 160 ms, and T_{DRX}= 640ms depending on UE capabilities. Therefore, $T_{available_{PRS,i}} = 640$ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms-r17 from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.035}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 20.488s and 82.56s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 21s and 83s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 21.3s and 83.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 17.4.3.5-3, Table 17.4.3.5-4 and Table 17.4.3.5-5 for reference.

Table 17.4.3.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive*

n1280	1280	1920

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

17.4.4 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

17.4.4.1 Test purpose

The purpose of the test is to verify the PRS RSRPP measurement requirements specified in TS 38.133 [50] clause 5.6.5.5 for single positioning frequency layer under AWGN propagation conditions in FR2 standalone scenario for reduced number of samples

17.4.4.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and supportedDL-PRS-ProcessingSamples-RRC-Inactive.

17.4.4.3 Minimum conformance requirements

Same as defined in clause 16.4.3.3.

17.4.4.4 Test description

17.4.4.4.1 Initial conditions

The supported test configurations in listed in Table 17.4.4.4.1-1

Table 17.4.4.4.1-1: Supported test configurations

Config	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.4.4.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 17.4.4.5-1 and Table 17.4.4.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.4.4.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

17.4.4.4.2 Test procedure

Same as defined in clause 17.4.1.4.2.

17.4.4.4.3 Message contents

As defined in clause 17.4.1.4.3, with the following exceptions:

Table 17.4.4.4.3-1 replaces Table 17.4.1.4.3-3, Table 17.4.4.4.3-2 replaces Table 17.4.1.4.3-6, Table 17.4.4.4.3-3 replaces Table 17.4.1.4.3-7 and Table 17.4.4.4.3-4 replaces Table 17.4.1.4.3-9.

Propagation Condition		Config 1	Two-tap channel defined in 38.101-4 Annex B.2.4, a = 1, $\tau_d = 0.45$ µs and $f_D = 5$ Hz			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone

Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

Note 8: Calculation of Es/Iot$_{BB}$ includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB$_P$ from TS 38.101-2 [55] Table 6.2.1.3-4.

The PRS-RSRPP measurement time fulfils the requirements specified in clause 17.4.4.3.

The UE shall perform and report the PRS RSRPP measurements for Cell 2 with respect to the reference cell in the DL-AoD assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 5.6.3.5 starting from the beginning of time interval T2

The rate of the correct events for the neighbour cell observed during repeated tests shall be at least 90%, where the reported PRS RSRPP measurement for each correct event shall be within the PRS RSRPP reporting range specified in TS 38.133 Clause 10.1.38, i.e., between PRS RSRPP_0 and PRS RSRPP_126.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the PRS-RSRPP measurement period. The PRS-RSRPP measurement period follows the equation:

$$T_{PRS-RSRP,i} = \left(K_{carrier_PRS} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxBeam,i}$=8, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.035$, N_{sample}=1. N is the parameter durationOfPRS-ProcessingSymbols-r17 from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17 from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$. $T_{available_{PRS,i}} = LCM(T_{PRS,i}, T_{DRX})$, where Tprs = 160 ms, and T_{DRX}= 640ms depending on UE capabilities. Therefore, $T_{available_{PRS,i}} = 640$ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms-r17 from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.035}{N} \right\rceil * 1 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 5.128s and 17.28s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 18s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and ss.

The values of N', N and Ti and the effect in the response time equation are defined in Table 17.4.4.5-3, Table 17.4.4.5-4 and Table 17.4.4.5-5 for reference.

Table 17.4.4.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive*

maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive	$\left\lceil \frac{2}{N'} \right\rceil$

n320	640	960
n640	640	1280
n1280	1280	1920

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

17.5 NR PRS-RSRPP measurement accuracy test case in RRC_INACTIVE

17.5.1 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR1 SA

17.5.1.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement in RRC_INACTIVE state meets the requirements specified in TS 38.133 [50] clause 10.1.38.2 in FR1 in standalone scenario when single positioning frequency layer is configured.

17.5.1.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and DL-PRS measurement in RRC_INACTIVE state.

17.5.1.3 Minimum conformance requirements

Same as defined in clause 17.3.1.3.

17.5.1.4 Test description

17.5.1.4.1 Initial conditions

The test defines three possible test configurations; specified in Table 17.5.1.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 17.5.1.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.5.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 17.5.1.5-1.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.5.1.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

17.5.1.4.2 Test procedure

The test consists of a set-up period and a measurement period. During the set-up period, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During measurement period, the UE shall be in RRC_INACTIVE state and all cells transmit PRS resources within initial DL BWP of the UE and with the

same numerology as the initial DL BWP. The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration.

The *NR-DL-AoD-ProvideAssistanceData* and *NR-DL-AoD-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.11 shall be provided to the UE during set-up period. The beginning of the measurement period shall be aligned with the first DRX cycle containing a DL PRS resource(s).

5. Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 17.4.1.4.3-1.
6. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
3. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
4. Set the parameters according to Table 17.5.1.5-1. Propagation conditions are set according to clause 4.16.2.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-AoD capabilities supported by the UE in the *NR-DL-AoD-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-AoD-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-DL-AoD-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of measurement period, where ΔT = 50 ms.
11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
12. When set-up period ends, the SS shall transmit an RRCRelease message including SDT configuration to transit the UE to RRC_INACTIVE state.
13. Wait for the UE monitors for occurrence of the periodic event requested.
14. The UE shall transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 19.
15. The SS transmits an *RRCResume* message.
16. The UE transmits an *RRCResumeComplete* message.
17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message, including the nr-DL-AoD-ProvideLocationInformation-r16 IE.
18. If the UE message at step 17 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
19. The SS shall check the nr-DL-PRS-FirstPathRSRP-ResultDiff-r17 field for Cell 2 in the nr-DL-AoD-SignalMeasurementInformation-r16 according to Table 17.5.1.5-2
20. UE shall be released and moved to RRC_IDLE.
21. Repeat steps 2-20 in Tables 17.5.1.4-1 until the confidence level according to Annex D is achieved.
22. Repeat step 1-21 for the other sub-test defined in Table 17.5.1.4-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

17.5.1.4.3 Message contents

As defined in clause 17.4.1.4.3, with the following exceptions:

Propagation condition				Two-tap channel Note 7			
Antenna configuration				1x2			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Void.

Note 6: Void

Note 7: The two-tap channel model is defined in 38.101-4 Annex B.2.4 (a = 1, τ_d=0.45 µs and f_D=5 Hz).

The value of the LPP Time IE depends on the UE capabilities. The calculation is as defined in clause 17.4.1.5. The ideal PRS-RSRPP is calculated by the following equation in the real tests:

$$\mathrm{RSRPP}_p \propto \left| \sum_k H_k \exp\left(j 2\pi D_p \frac{k}{N_{\mathrm{IFFT}}} \right) \right|^2$$

Where:

H_k is the effective channel frequency response (over REs occupied by PRS) measured without receiver noise.

D_p is the exact delay of the p-th path in the channel model.

Table 17.5.1.5-2: PRS-RSRPP accuracy requirements for the reported values

Test Configuration	Subtest	Cell 1		Cell 2	
		Lowest reported value	Highest reported value	Lowest reported value	Highest reported value
1	Sub-test 1	PRS_RSRPP_49	PRS_RSRPP_58	PRS_RSRPP_40	PRS_RSRPP_51
	Sub-test 2	PRS_RSRPP_49	PRS_RSRPP_58	PRS_RSRPP_41	PRS_RSRPP_50
2	Sub-test 1	PRS_RSRPP_49	PRS_RSRPP_58	PRS_RSRPP_40	PRS_RSRPP_51
	Sub-test 2	PRS_RSRPP_49	PRS_RSRPP_58	PRS_RSRPP_41	PRS_RSRPP_50
3	Sub-test 1	PRS_RSRPP_52	PRS_RSRPP_61	PRS_RSRPP_43	PRS_RSRPP_54
	Sub-test 2	PRS_RSRPP_52	PRS_RSRPP_61	PRS_RSRPP_44	PRS_RSRPP_53

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

17.5.2 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR1 SA

17.5.2.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement in RRC_INACTIVE state with reduce number of samples meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.38.2 in FR1 in standalone scenario when single positioning frequency layer is configured.

17.5.2.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and supportedDL-PRS-ProcessingSamples-RRC-Inactive.

17.5.2.3 Minimum conformance requirements

Same as defined in clause 17.3.2.3.

17.5.2.4 Test description

17.5.2.4.1 Initial conditions

The test defines three possible test configurations; specified in Table 17.5.2.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 17.5.2.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode

Note: The UE is only required to be tested in one of the supported test configurations.

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.5.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 17.5.2.5-1.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.5.2.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

17.5.2.4.2 Test procedure

Same as defined in clause 17.5.1.4.2.

17.5.2.4.3 Message contents

As defined in clause 17.4.1.4.3, with the following exceptions:

Table 17.5.2.4.3-1 replaces Table 17.4.1.4.3-6, Table 17.5.2.4.3-2 replaces Table 17.4.1.4.3-7 and Table 17.5.2.4.3-3 replaces Table 17.4.1.4.3-9.

Propagation condition			Two-tap channel Note5	
Antenna configuration			1x2	

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRS-RSRP, SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: The two-tap channel model is defined in 38.101-4 Annex B.2.4 (a = 1, τ_d=0.45 μs and f_D=5 Hz).

The value of the LPP Time IE depends on the UE capabilities. The calculation is as defined in clause 17.4.2.5. The ideal PRS-RSRPP is calculated by the following equation in the real tests:

$$\mathrm{RSRPP}_p \propto \left| \sum_k H_k \exp\left(j 2\pi D_p \frac{k}{N_{\mathrm{IFFT}}} \right) \right|^2$$

Where:

H_k is the effective channel frequency response (over REs occupied by PRS) measured without receiver noise.

D_p is the exact delay of the p-th path in the channel model.

Table 17.5.2.5-2: PRS-RSRPP accuracy requirements for the reported values

Test Configuration	Cell 1		Cell 2	
	Lowest reported value	Highest reported value	Lowest reported value	Highest reported value
1	PRS_RSRPP_54	PRS_RSRPP_62	PRS_RSRPP_50	PRS_RSRPP_59
2	PRS_RSRPP_54	PRS_RSRPP_62	PRS_RSRPP_50	PRS_RSRPP_59
3	PRS_RSRPP_57	PRS_RSRPP_65	PRS_RSRPP_53	PRS_RSRPP_62

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

17.5.3 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

17.5.3.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement in RRC_INACTIVE state meets the requirements specified in TS 38.133 [50] clause 10.1.38.2 in FR2 in standalone scenario when single positioning frequency layer is configured.

17.5.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and DL-PRS measurement in RRC_INACTIVE state.

17.5.3.3 Minimum conformance requirements

Same as defined in clause 17.3.3.3.

17.5.3.4 Test description

17.5.3.4.1 Initial conditions

The supported test configurations in listed in Table 17.5.3.4.1-1

Table 17.5.3.4.1-1: Supported test configurations

Config	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 17.5.3.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 17.5.3.5-1 and Table 17.5.3.5-2.
3. Propagation conditions are set according to clause 4.16.2.
4. Message contents are defined in clause 17.5.3.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

17.5.3.4.2 Test procedure

Same as defined in clause 17.5.1.4.2.

17.5.3.4.3 Message contents

As defined in clause 17.4.1.4.3, with the following exceptions:

Antenna configuration		1x2
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.		
Note 2: The two-tap channel model is defined in 38.101-4 Annex B.2.4 (a = 1, τ_d=0.45 μs and f_D=5 Hz).		

Table17.5.3.5-2: PRS-RSRPP OTA related test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to TS 38.133 [50] clause A.3.15.1			
Assumption for UE beams Note 7		Rough		Rough	
N_{oc} Note1	dBm/15kHz Note4	-99.1		Same as Test 1	
N_{oc} Note1	dBm/SCS Note4	-90.1		Same as Test 1	
$\hat{E}_s / N_{oc}$	dB	-2	-10	-2	-10
E_s	dBm/SCS Note4	-	-	-	-
PRS_RP Note2	dBm/SCS	-92.1	-92.1	-100.1	-99
$\hat{E}_s / I_{ot}$ BB Note6	dB	-2.68	-2.68	-12.30	-12.12
Io Note2	dBm/190.08 MHz Note4	-55.69		-55.69	

Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 2: PRS_RP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 3: Void
Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 5: Void
Note 6: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

The value of the LPP Time IE depends on the UE capabilities. The calculation is as defined in clause 17.4.3.5. The ideal PRS-RSRPP is calculated by the following equation in the real tests:

$$\mathrm{RSRPP}_p \propto \left| \sum_k H_k \exp\left(j 2\pi D_p \frac{k}{N_{\mathrm{IFFT}}} \right) \right|^2$$

Where:

H_k is the effective channel frequency response (over REs occupied by PRS) measured without receiver noise.

D_p is the exact delay of the p-th path in the channel model.

Table 17.5.3.5-3: PRS-RSRPP accuracy requirements for the reported values

Sub-test	Cell 1		Cell 2	
	Lowest reported value	Highest reported value	Lowest reported value	Highest reported value
1	PRS_RSRPP_50	PRS_RSRPP_83	PRS_RSRPP_42	PRS_RSRPP_75
2	PRS_RSRPP_50	PRS_RSRPP_83	PRS_RSRPP_42	PRS_RSRPP_75

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

17.5.4 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

17.5.4.1 Test purpose

The purpose of the test is to verify that the PRS-RSRPP measurement in RRC_INACTIVE state with reduce number of samples meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.38.2 in FR2 in standalone scenario when single positioning frequency layer is configured.

17.5.4.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-AoD positioning, maxDL-PRS-FirstPathRSRP-MeasPerTRP and supportedDL-PRS-ProcessingSamples-RRC-Inactive

17.5.4.3 Minimum conformance requirements

Same as defined in clause 17.3.4.3.

17.5.4.4 Test description

17.5.4.4.1 Initial conditions

The supported test configurations in listed in Table 17.5.4.4.1-1

Table 17.5.4.4.1-1: Supported test configurations

Config	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Propagation conditions		Two-tap channel Note 2	
Antenna configuration		1x2	

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: The two-tap channel model is defined in 38.101-4 Annex B.2.4 (a = 1, τ_d=0.45 µs and f_D=5 Hz).

17.5.4.5-2: PRS-RSRPP OTA related test parameters

Parameter	Unit	Test 1	
		Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to TS 38.133 [50] clause A.3.15.1	
Assumption for UE beams Note 7		Rough	
N_{oc} Note1	dBm/15kHz Note4	-103	
N_{oc} Note1	dBm/SCS Note4	-94	
$\hat{E}_s / N_{oc}$	dB	3.55	-0.29
E_s	dBm/SCS Note4	-	-
PRS_RP Note2	dBm/SCS	-90.42	-94.26
SS_RP Note2	dBm/SCS	-86.77	-90.73
$\hat{E}_s / I_{ot\ BB}$ Note6	dB	0	-6
Io Note2	dBm/190.08 MHz Note4	-55.74	

Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 2: PRS_RP, SS_RP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 3: Void

Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

Note 5: Void

Note 6: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation.

The value of the LPP Time IE depends on the UE capabilities. The calculation is as defined in clause 17.4.4.5. The ideal PRS-RSRPP is calculated by the following equation in the real tests:

$$\mathrm{RSRPP}_p \propto \left| \sum_k H_k \exp\left(j 2\pi D_p \frac{k}{N_{\mathrm{IFFT}}} \right) \right|^2$$

Where:

H_k is the effective channel frequency response (over REs occupied by PRS) measured without receiver noise.

D_p is the exact delay of the p-th path in the channel model.

Table 17.5.4.5-3: PRS-RSRPP accuracy requirements for the reported values

Config	Cell 1		Cell 2	
	Lowest reported value	Highest reported value	Lowest reported value	Highest reported value
1	PRS_RSRPP_52	PRS_RSRPP_84	PRS_RSRPP_48	PRS_RSRPP_80

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

18

19 RSCP with UE Rx-Tx time difference measurement requirements

19.1 General

This clause defines the minimum performance requirements for NR UEs capable of RSCP with UE Rx-Tx time difference measurements.

19.2 RSCP with UE Rx-Tx time difference measurement period test cases in RRC_CONNECTED

19.2.1 RSCP with UE Rx-Tx time difference measurement reporting delay test case in FR1 SA

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

19.2.1.1 Test purpose

The purpose of the test is to verify that the DL RSCP and UE Rx-Tx time difference measurements meet the requirements specified in TS 38.133 [50] clause 9.9.8.5 in AWGN propagation condition in FR1 in standalone scenario when a single positioning frequency layer is configured for both DL RSCP measurement and UE Rx-Tx time difference measurement.

19.2.1.2 Test applicability

This test applies to all types of NR FR1 UE release 18 onwards that support Multi-RTT positioning and DL RSCP measurement in RRC_CONNECTED state and support RSCP measurements inside the indicated time window.

19.2.1.3 Minimum conformance requirements

If a one-shot time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.8.3) UE Rx-Tx time difference and DL RSCP measurements, defined in TS 38.215 [4], based on the indicated PRS resource sets occurring inside the one-shot time window during the measurement period $T_{\text{DL RSCP with UERxTx,Total}}$ defined as:

$$T_{\text{DL RSCP with UERxTx,Total}} = \min(L_{window}, \text{MGL}) + T_i \quad ,$$

and the UE shall be able to measure multiple UE Rx-Tx time difference measurements, defined in TS 38.215 [4], during the measurement period $T_{UERxTx,Total,with\ one\ shot\ window}$ defined as:

$$T_{UERxTx,Total,with\ one\ shot\ window} = T_{\text{DL RSCP with UERxTx,Total}} + max(T_{effect,i}) + T_{UERxTx,Total}$$

Where:

- the start of the measurement is the start of the one-shot time window, and
- L_{window} is the length of the one-shot window, and
- $T_{\text{effect},i}$ and T_i are defined in the following of this clause, and

- $T_{UERxTx,Total}$ is defined in clause 9.9.4.5, and
- MGL is the measurement gap length.

The requirements with one-shot window assume scaling factors equal to 1 for the PFLs, for which the one-shot time window is configured.

If a periodic time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.8.3) UE Rx-Tx and DL RSCP measurements, defined in TS 38.215 [4], during the measurement period $T_{RSCP\ with\ UERxTx,Total}$ defined as:

$$T_{\text{DL RSCP with UERxTx,Total}} = \sum_{i=1}^{L} T_{\text{DL RSCP with UERxTx,i}} + (L-1) * \max\left(T_{\text{effect,i}}\right),$$

where:

- i is the index of positioning frequency layer,
- L is total number of positioning frequency layers, and
- $T_{\text{effect},i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer i.

$T_{\text{DL RSCP with UERxTx,i}}$ is the measurement period for DL RSCP with UE Rx-Tx measurement in positioning frequency layer i as specified below:

$$T_{\text{DL RSCP with UERxTx,i}} = \left(k_{multiTEG,i} * \text{CSSF}_{\text{PRS,i}} * \text{ceil}(K_{\text{p,PRS,i}}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS},i}}{N} \right\rceil * N_{sample} - 1\right) * T_{\text{effect,i}} + T_{\text{last,i}},$$

where:

- DL RSCP performed during $T_{\text{DL RSCP with UERxTx}}$ is a single sample measurement where DL RSCP and UE Rx-Tx measurements are performed on the same PFL.
- $N_{RxBeam,i}$, $CSSF_{PRS,i}$, $k_{multiTEG,i}$, N_{sample}, $N_{PRS,i}^{slot}$, N, N', $T_{\text{effect,i}}$, and $T_{\text{last,i}}$ are defined in clause 9.9.4.5.
- N_{sample} = 1 or 2 or 4 as defined in clause 9.9.4.
- $K_{\text{p,PRS,i}}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{\text{p,PRS,i}} = N_{\text{total}} / N_{\text{available}}$ for UE configured with concurrent measurement gap, and $K_{\text{p,PRS,i}} = 1$ for UE not configured with concurrent measurement gap.

  When periodic time window(s) are configured by the LMF, for a window W of duration max($T_{PRS,i}$, MGRP_max, T_{window}), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion and the periodic time window:

  N_{total} is the total number of associated gap occasions covering PRS occasions and the periodic time window(s) within the window W, including both dropped and non-dropped instances of the associated measurement gap within the window W, and

  $N_{\text{available}}$ is the number of non-dropped associated gap occasions covering PRS occasions and the periodic time window(s) within the window W, after further accounting for MG collisions by applying the selected gap collision rule.

  Requirements do not apply if $N_{\text{available}}$ =0.

  Otherwise, for a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

  N_{total} is the total number of associated gap occasions covering PRS occasions within the window W, including both dropped and non-dropped instances of the associated measurement gap within the window W, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

- $L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer, to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26].
- When periodic time window(s) are configured by the LMF and PFL *i* is associated with the configured time window, $T_{available_{PRS,i}} = LCM(T_{PRS,i}, MGRP, T_{window})$, the least common multiple between $T_{PRS,i}$, MGRP , and T_{window}, T_{window} being the maximum periodicity of the indicated time window(s).
- When periodic time window(s) are configured by the LMF and the PFL *i* is not associated with the configured time window, $T_{available_{PRS,i}} = LCM(T_{PRS,i}, MGRP)$.
- $T_{PRS,i}$ and MGRP are defined in clause 9.9.8.5.
- $L_{available_PRS,i}$ and $T_{PRS,i}$ are calculated by only considering the PRS resources in the indicated resources sets overlapping with both the MG and the indicated time window(s).

19.2.1.4 Test description

The test defines three supported test configurations, specified in Table 19.2.1.4-1. The UE is only required to be tested in one supported test configuration.

Table 19.2.1.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

19.2.1.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 19.2.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 19.2.1.5-1 and Table 19.2.1.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 19.2.1.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

19.2.1.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. Cell 1 and Cell 2 mute PRS transmission during T1 and transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources. The UE is configured to transmit SRS during T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command T_A = 31 which indicates a timing advance adjustment value N_{TA} = 0 T_c.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. The SS adjusts the downlink timing for Cell 1 to a delay of +512 T_c, compared to the current value.
4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
5. T1 starts.
6. The SS shall transmit an RRCReconfiguration message with the SRS configuration.
7. The UE shall transmit RRCReconfigurationComplete message.
8. The SS shall transmit an LPP REQUEST CAPABILITIES message.
9. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 MS. If the UE message at step 9 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
11. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the NR-Multi-RTT-RequestLocationInformation IE. The NR-Multi-RTT-RequestLocationInformation IE shall request both UE Rx-Tx time difference and DL RSCP by setting nr-RequestedMeasurements-r16 accordingly. It shall include nr-DL-PRS-MeasurementTimeWindowsConfig-r18 configured as MTW.1 and request ueRxTx and rscp in nr-MeasurementsToPerformInTimeWindow-r18.
12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 19.2.1.5-2.
13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the NR-Multi-RTT-ProvideLocationInformation IE within the response time (see clause 19.2.1.4.3). The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2. If the UE transmits an NR-Multi-RTT-ProvideLocationInformation IE including the nr-UE-RxTxTimeDiff and nr-RSCP-r18 for Cell 1 and Cell 2 within the response time then the number of successful tests is increased by one.

If the UE fails to report the NR-Multi-RTT-ProvideLocationInformation IE with both the nr-UE-RxTxTimeDiff field and nr-RSCP-r18 included within the response time then the number of failure tests is increased by one. The UE shall report nr-UE-RxTxTimeDiff-r16 and nr-RSCP-r18 for both Cell 1 and Cell 2. A test event is successful only when both measurements are reported within the required response time.

14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
15. Repeat steps 1-14 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

19.2.1.5 Test requirement

FFS

19.2.2 RSCP with UE Rx-Tx time difference measurement reporting delay test case in FR2 SA

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

19.2.2.1 Test purpose

The purpose of the test is to verify that the DL RSCP and UE Rx-Tx time difference measurements meet the requirements specified in TS 38.133 [50] clause 9.9.8.5 in AWGN propagation condition in FR2 in standalone scenario when a single positioning frequency layer is configured for both DL RSCP measurement and UE Rx-Tx time difference measurement.

19.2.2.2 Test applicability

This test applies to all types of NR FR2 UE release 18 onwards that support Multi-RTT positioning and DL RSCP measurement in RRC_CONNECTED state and support RSCP measurements inside the indicated time window.

19.2.2.3 Minimum conformance requirements

Same as defined in clause 19.2.1.3.

19.2.2.4 Test description

The test defines one supported test configuration, specified in Table 19.2.2.4-1. The UE is only required to be tested in one supported test configuration.

Table 19.2.2.4-1: Test Configurations

Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

19.2.2.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 19.2.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 19.2.2.5-1 and Table 19.2.2.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 19.2.2.4.3.

5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

19.2.2.4.2 Test procedure

Same as defined in clause 19.2.1.4.2.

19.2.2.4.3 Message contents

19.2.2.5 Test requirement

FFS

19.3 RSCP with UE Rx-Tx time difference measurement accuracy test cases in RRC_CONNECTED

19.3.1 RSCP with UE Rx-Tx time difference measurement accuracy test case in FR1 SA

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

19.3.1.1 Test purpose

The purpose of the test is to verify that the accuracy of DL RSCP measurement reported with UE Rx-Tx time difference measurement is within the limits specified in TS 38.133 [50] clause 10.1.44.2. The test is conducted in AWGN propagation condition in FR1 in standalone scenario when a single positioning frequency layer is configured.

19.3.1.2 Test applicability

This test applies to all types of NR UE release 18 onwards that support Multi-RTT positioning and DL RSCP measurement in RRC_CONNECTED.

19.3.1.3 Minimum conformance requirements

The DL RSCP relative measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within the range from -160 ms to 160 ms of at least one DL PRS resource of each of the TRPs in the assistance data.

If the uplink transmission timing changes during the DL RSCP with UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1.2 then:

- DL RSCP and UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in section 7.1.1) for SRS transmission.

- UE Rx-Tx measurement accuracy requirements shall not apply for a cell, which is not the downlink reference cell (defined in section 7.1.1) for SRS transmission.

When a serving cell change occurs during the DL RSCP with UE Rx-Tx measurement period, UE Rx-Tx measurement accuracy requirements and DL RSCP measurement requirements do not apply.

The relative DL RSCP accuracy requirements defined in clause 10.1.44 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled for FR1.

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled for FR2.

- Conditions for DL RSCP measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.

- DL RSCP measurements to derive the relative accuracy are performed on PRS resources within the same set of symbols.

- DL RSCPD measurements are based on PRS resources with comb size other than 12.

The accuracy requirement for relative DL-RSCP shall be within ±(X+Y) degree.

The values of X for accuracy requirements for relative DL-RSCP measurement in FR1 are defined in table 10.1.44.2-1 for AWGN channel and in table 10.1.44.2-2 for two-tap channel and is derived assuming no carrier frequency offset at TRP.

The values of X for accuracy requirements for relative DL-RSCP measurement in FR2 are defined in table 10.1.44.2-3 for AWGN channel and in table 10.1.44.2-4 for two-tap channel and is derived assuming no carrier frequency offset at TRP.

Y is 14 degrees for FR1 and 28 degrees for FR2.

Table 19.3.1.3-1: DL RSCP relative accuracy in FR1 for AWGN channel

Accuracy $(\hat{E}s/Iot)_{ref} \geq$ -3dB $(\hat{E}s/Iot)_i \geq$ -13dB	Accuracy $(\hat{E}s/Iot)_{ref} \geq$ 0dB $(\hat{E}s/Iot)_i \geq$ -6dB	Conditions

10	4		≥ 64	≥ 1	Note 5	Note 5	Note 5
7	3		≥ 132	≥ 1	Note 5	Note 5	Note 5
NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of the reference resource and the measured neighbour resource i.							
NOTE 2: Minimum number of PRS resource repetitions among the reference resource and the measured neighbour resource i. $T_{\text{rep}}^{\text{PRS}}$, L_{PRS} , $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.							
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.							
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.							
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest RB number for the corresponding SCS.							

19.3.1.4 Test description

The test defines three supported test configurations, specified in Table 19.3.1.4-1. The UE is only required to be tested in one supported test configuration.

Table 19.3.1.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

19.3.1.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 19.3.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 19.3.1.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 19.3.1.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

19.3.1.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The NR-Multi-RTT-ProvideAssistanceData and NR-Multi-RTT-RequestLocationInformation as defined in clause 19.3.1.4.3 shall be provided to the UE during the set-up period. The last TTI containing the NR-Multi-RTT-RequestLocationInformation message shall be provided to the UE ΔT ms before the start of the measurement period, where ΔT = 50 ms is the maximum processing time of the NR-Multi-RTT-RequestLocationInformation message and the Multi-RTT assistance data in the UE.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
5. The SS shall transmit an RRCReconfiguration message with the SRS configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE.If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the NR-Multi-RTT-RequestLocationInformation IE such that the UE receives the messageΔT ms before the start of T2, where ΔT = 50 ms. The NR-Multi-RTT-RequestLocationInformation IE shall request both UE Rx-Tx time difference and DL RSCP by setting nr-RequestedMeasurements-r16 accordingly.
11. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the NR-Multi-RTT-ProvideLocationInformation IE. The UE shall report nr-UE-RxTxTimeDiff-r16 and nr-RSCP-r18 for both Cell 1 and Cell 2. The SS shall verify the DL RSCP results against the limits specified in clause 19.3.1.5.
12. As soon as possible after step 11 the SS shall measure the transmit timing of the UE using the transmitted SRS, relative to the current downlink timing.
13. If the UE message at step 11 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
14. The SS shall check the reported value of nr-UE-RxTxTimeDiff in the NR-Multi-RTT-SignalMeasurementInformation IE provided by the UE in step 11 and compare it with the value measured in step 12. The SS shall check that the reported value is within the limits specified in table 19.3.1.5-2 compared to the measured value. If the reported value is within the limits the number of successful results is increased by one. If the reported value is not within the limits or the UE reports an error in the LPP PROVIDE LOCATION INFORMATION message in step 11, or does not respond at step 11 within the time given by the time IE in the CommonIEsRequestLocationInformation IE in step 10, then the number of unsuccessful results for is increased by one. The UE shall report nr-UE-RxTxTimeDiff-r16 and nr-RSCP-r18 for both Cell 1 and Cell 2. The SS shall verify the DL RSCP results against the limits specified in clause 19.3.1.5.
15. Repeat steps 1-14 until the confidence level according to Annex D is achieved.
16. Repeat step 1-15 for the other sub-test defined in Table 19.3.1.4-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

19.3.1.4.3 Message contents

As defined in clause 19.2.1.4.3, with the following exceptions:

Table 19.3.1.4.3-1 replaces Table 19.2.1.4.3-5, Table 19.3.1.4.3-2 replaces Table 19.2.1.4.3-7 and Table 19.3.1.4.3-3 replaces Table 19.2.1.4.3-8.

19.3.1.5 Test requirement

FFS

19.3.2 RSCP with UE Rx-Tx time difference measurement accuracy test case in FR2 SA

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

19.3.2.1 Test purpose

The purpose of the test is to verify that the accuracy of DL RSCP measurement reported with UE Rx-Tx time difference measurement is within the limits specified in TS 38.133 [50] clause 10.1.44.2. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when a single positioning frequency layer is configured.

19.3.2.2 Test applicability

This test applies to all types of NR UE release 18 onwards that support Multi-RTT positioning and DL RSCP measurement in RRC_CONNECTED and operate in FR2.

19.3.2.3 Minimum conformance requirements

The relative accuracy of DL RSCP measurement in this clause is defined as accuracy of the difference between two DL RSCP measurements, each based on single measurement sample in single PFL.

The requirements in this clause are derived based on AWGN channel and based on two-tap channel defined in 38.101-4 [21] annex B.2.4 (a = 1, τ_d=0.45 μs and f_D=5 Hz).

The DL RSCP relative measurement accuracy requirements in this clause shall not apply, if:

- N_{TA_offset} defined in table 7.1.2-2 changes during the DL RSCP with UE Rx-Tx measurement period, or

- if the uplink transmission timing changes during the DL RSCP with UE Rx-Tx measurement period due to the network-configured Timing Advance.

The DL RSCP relative measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within the range from -160 ms to 160 ms of at least one DL PRS resource of each of the TRPs in the assistance data.

If the uplink transmission timing changes during the DL RSCP with UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1.2 then:

- DL RSCP and UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in section 7.1.1) for SRS transmission.

- UE Rx-Tx measurement accuracy requirements shall not apply for a cell, which is not the downlink reference cell (defined in section 7.1.1) for SRS transmission.

When a serving cell change occurs during the DL RSCP with UE Rx-Tx measurement period, UE Rx-Tx measurement accuracy requirements and DL RSCP measurement requirements do not apply.

The relative DL RSCP accuracy requirements defined in clause 10.1.44 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled for FR1.

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled for FR2.

- Conditions for DL RSCP measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.

- DL RSCP measurements to derive the relative accuracy are performed on PRS resources within the same set of symbols.

- DL RSCPD measurements are based on PRS resources with comb size other than 12.

The accuracy requirement for relative DL-RSCP shall be within ±(X+Y) degree.

The values of X for accuracy requirements for relative DL-RSCP measurement in FR1 are defined in table 10.1.44.2-1 for AWGN channel and in table 10.1.44.2-2 for two-tap channel and is derived assuming no carrier frequency offset at TRP.

The values of X for accuracy requirements for relative DL-RSCP measurement in FR2 are defined in table 10.1.44.2-3 for AWGN channel and in table 10.1.44.2-4 for two-tap channel and is derived assuming no carrier frequency offset at TRP.

Y is 14 degrees for FR1 and 28 degrees for FR2.

Table 10.1.44.2-3: DL RSCP relative accuracy in FR2 for AWGN channel

Accuracy $(\hat{E}s/Iot)_{ref} \geq -3dB$, $(\hat{E}s/Iot)_i \geq -13dB$	Accuracy $(\hat{E}s/Iot)_{ref} \geq 0dB$, $(\hat{E}s/Iot)_i \geq -6dB$	Conditions				
		PRS SCS	PRS bandwidth Note 1	PRS resource repetition ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$) Note 2	Io Note 3 range	
					Minimum Io	Maximum Io
degree	degree	kHz	PRB		dBm/SCS	$dBm/BW_{Channel}$
14	4	60	≥ 24	≥ 4	Same value as PRS_RP in table B.2.14-2, according to UE Power class,	-50

					operating band and angle of arrival	
8	4		≥ 64	≥ 1	Note 4	Note 4
6	3		≥ 132	≥ 1	Note 4	Note 4
16	5	120	≥ 32	≥ 4	Same value as PRS_RP in table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
9	4		≥ 64	≥ 1	Note 4	Note 4
7	3		≥ 128	≥ 1	Note 4	Note 4

NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of the reference resource and the measured neighbour resource i.
NOTE 2: Minimum number of PRS resource repetitions among the reference resource and the measured neighbour resource i. $T_{\text{rep}}^{\text{PRS}}$, L_{PRS}, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest RB number for the corresponding SCS.

19.3.2.4 Test description

The test defines one supported test configuration, specified in Table 19.3.2.4-1. The UE is only required to be tested in one supported test configuration.

Table 19.3.2.4-1: Test Configurations

Config	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

19.3.2.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 19.3.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 19.3.2.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 19.3.2.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

19.3.2.4.2 Test procedure

Same as in clause 19.3.1.4.2.

19.3.2.4.3 Message contents

As defined in clause 19.2.2.4.3, with the following exceptions:

Table 19.3.2.4.3-1 replaces Table 19.2.2.4.3-5 and Table 19.3.2.4.3-2 replaces Table 19.2.2.4.3-7.

19.3.2.5 Test requirement

FFS

19.4 RSCP with UE Rx-Tx time difference measurement period test cases in RRC_INACTIVE

19.4.1 RSCP with UE Rx-Tx time difference measurement reporting delay test case in FR1 SA

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

19.4.1.1 Test purpose

The purpose of the test is to verify that the DL RSCP and UE Rx-Tx time difference measurements in RRC_INACTIVE meet the requirements specified in TS 38.133 [50] clause 5.6.8.5 in AWGN propagation condition in FR1 in standalone scenario when a single positioning frequency layer is configured for both measurements.

19.4.1.2 Test applicability

This test applies to all types of NR UE release 18 onwards that support Multi-RTT positioning, DL RSCP measurement, measurement time windows and positioning measurements in RRC_INACTIVE.

19.4.1.3 Minimum conformance requirements

When the physical layer receives the last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34] with *dl-PRS-RSCP-Request-r18* and configuring a measurement time window via *nr-DL-PRS-MeasurementTimeWindowsConfig*, subject to UE capabilities *supportOfRSCP-MeasurementInTimeWindow* and *supportOfLegacyMeasurementInTimeWindow*, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.8.3) UE Rx-Tx and DL RSCP measurements, defined in TS 38.215 [4], during the time window only.

When LMF does not configure measurement time window(s):

- When a single PFL is configured, requirements in clause 5.6.4.5 apply to both RSCP and UE Rx-Tx measurements.
- When multiple PFLs are configured for legacy measurements, the UE performs RSCP measurement on a single PFL that is common between the reference TRP and the target TRP. The requirement in clause 5.6.4.5 apply to both RSCP and UE Rx-Tx measurements.

When LMF configures measurement time window(s), but does not configure UE to perform RSCP measurement inside time window as indicated in *nr-MeasurementsToPerformInTimeWindow-r18*:

- The UE performs RSCP measurement on the indicated PFL by the network. The requirement in clause 5.6.4.5 apply to both UE Rx-Tx and RSCP measurements.

When LMF configures measurement time window(s), but subject to UE capability, configures UE to perform RSCP but not UE Rx-Tx measurement inside time window as indicated in *nr-MeasurementsToPerformInTimeWindow-r18*:

- The requirements in the clause 5.6.4.5 apply to UE Rx-Tx measurement.
- The requirements in clause 5.6.8.5 apply to RSCP measurement for the PRS resource(s) that have occasions only within the measurement time window.

When LMF configures measurement time window(s), and subject to UE capability, configures UE to perform both RSCP and UE Rx-Tx measurement inside time window as indicated in *nr-MeasurementsToPerformInTimeWindow-r18*:

- The requirements in Clause 5.6.8.5 apply to UE Rx-Tx measurement and DL RSCP measurement.

If a one-shot time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.8.3) UE Rx-Tx and DL RSCP measurements, defined in TS 38.215 [4], based on the indicated PRS resource sets occurring inside the one-shot time window during the measurement period $T_{\text{DL RSCP with UERxTx,Total}}$ defined as:

$$T_{\text{DL RSCP with UERxTx,Total}} = \min(L_{window}, 10\text{ ms}) + T_i \quad ,$$

and the UE shall be able to measure multiple UE Rx-Tx measurements, defined in TS 38.215 [4], during the measurement period $T_{UERxTx,Total,with\ one\ shot\ window}$ defined as:

$$T_{UERxTx,Total,with\ one\ shot\ window} = T_{\text{DL RSCP with UERxTx,Total}} + max(T_{effect,i}) + T_{UERxTx,Total}$$

Where:

- the start of the measurement is the start of the one-shot time window, and
- L_{window} is the length of the one-shot window, and
- $T_{\text{effect},i}$ and T_i are defined in the following of this clause, and
- $T_{UERxTx,Total}$ is defined in clause 5.6.4.5.

The requirements with one-shot window assume scaling factors equal to 1 for the PFLs, for which the one-shot time window is configured.

If a periodic time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.8.3) UE Rx-Tx and DL RSCP measurements, defined in TS 38.215 [4], during the measurement period $T_{\text{DL RSCP with UERxTx,Total}}$ defined as:

$$T_{\text{RSCP with UERxTx,Total}} = \sum_{i=1}^{L} T_{\text{DL RSCP with UERxTx,i}} + (L-1) * \max(T_{\text{effect,i}})$$

where:

- i is the index of positioning frequency layer,
- L is total number of positioning frequency layers, and
- $T_{\text{effect},i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer i.

$T_{\text{DL RSCP with UERxTx,i}}$ is the measurement period for DL RSCP with UE Rx-Tx measurement in positioning frequency layer i as specified below:

$$T_{\text{DL RSCP with UERxTx,i}} = \left(K_{\text{carrier_PRS}} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * N_{sample} - 1\right) * T_{\text{effect,i}} + T_{\text{last,i}},$$

where:

- $K_{\text{carrier_PRS}}$, $N_{RxTx,TEG,i}$, $N_{RxBeam,i}$, $N_{PRS,i}^{slot}$, N, N', N_{sample}, $T_{\text{effect,i}}$ and $T_{\text{last,i}}$ are defined in clause 5.6.4.5.
- DL-RSCP performed during $T_{\text{DL RSCP with UERxTx}}$ is a single sample measurement where DL RSCP and UE Rx-Tx measurements are performed on the same PFL.
- $L_{available_{PRS,i}}$ is the time duration of available PRS resources in the positioning frequency layer i, to be measured during $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_{PRS,i}}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- When periodic time window(s) are configured by the LMF and PFL i is associated with the configured time window, $T_{available_{PRS,i}} = LCM(T_{PRS,i}, T_{DRX}, T_{window})$, the least common multiple between $T_{\text{PRS,i}}$, T_{DRX} and T_{window} being the maximum periodicity of the indicated time window(s).
- When periodic time window(s) are configured by the LMF and PFL i is not associated with the configured time window(s), $T_{available_{PRS,i}} = LCM(T_{PRS,i}, T_{DRX})$, the least common multiple between $T_{PRS,i}$ and the DRX cycle length T_{DRX} .
- $L_{available_{PRS,i}}$ and $T_{PRS,i}$ are calculated by only considering the PRS resources in the indicated resources sets overlapping with the indicated time window(s).

19.4.1.4 Test description

19.4.1.4.1 Initial conditions

The test defines three supported test configurations, specified in Table 19.4.1.4-1. The UE is only required to be tested in one supported test configuration.

Table 19.4.1.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 19.4.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 19.4.1.5-1 and Table 19.4.1.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 19.4.1.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

19.4.1.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During T2 UE shall be in RRC_INACTIVE state and all cells transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

1. Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 19.4.1.4.3-1.
2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
3. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
4. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
5. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
6. Set the parameters for T1 according to Table 19.4.1.5-1 and Table 19.4.1.5-2.
7. T1 starts.
8. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
9. The UE shall transmit RRCReconfigurationComplete message.
10. The SS shall transmit an LPP REQUEST CAPABILITIES message.
11. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilitie* IE.
12. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 11 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
13. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the NR-Multi-RTT-RequestLocationInformation IE such that the UE receives the message ΔT ms before the start of T2, where $\Delta T = 50$ ms. The NR-Multi-RTT-RequestLocationInformation IE shall request both UE Rx-Tx time difference and DL RSCP by setting nr-RequestedMeasurements-r16 accordingly. It shall include nr-DL-PRS-MeasurementTimeWindowsConfig-r18 configured as MTW.2 and request ueRxTx and rscp in nr-MeasurementsToPerformInTimeWindow-r18.
14. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
15. When T1 expires, the SS shall transmit an RRCRelease message with the UL configuration and SDT configuration to transit the UE to RRC_INACTIVE state.
16. Switch the power setting from T1 to T2 as specified in Table 19.4.1.5-1 and Table 19.4.1.5-2.

17. Wait for the UE monitors for occurrence of the periodic event requested.

18. The UE shall transmit an RRCResumeRequest message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the RRCResumeRequest message and then go to step 21. The UE shall report nr-UE-RxTxTimeDiff-r16 and nr-RSCP-r18 for both Cell 1 and Cell 2. A test event is successful only when both measurements are reported within the required response time.

18. The SS transmits an *RRCResume* message.

19. The UE transmits an *RRCResumeComplete* message.

20. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the nr-UE-RxTxTimeDiff and nr-RSCP-r18 within the response time (see clause 19.4.1.4.3) plus the maximum RRC processing time 10ms between RRCResume message and RRCResumeComplete message. The UE shall report nr-UE-RxTxTimeDiff-r16 and nr-RSCP-r18 for both Cell 1 and Cell 2. A test event is successful only when both measurements are reported within the required response time.

21. The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2. If the UE transmits an nr-UE-RxTxTimeDiff and nr-RSCP-r18 IE for Cell 1 and Cell 2 within the response time, then the number of successful tests is increased by one. If the UE fails to report the *NR-Multi-RTT-ProvideLocationInformation* IE with the nr-UE-RxTxTimeDiff field included within the response time then the number of failure tests is increased by one.

22. If the UE message at step 20 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

23. Repeat steps 1-22 in Tables 19.4.1.4-1 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

19.4.1.5 Test requirement

FFS

19.4.2 RSCP with UE Rx-Tx time difference measurement reporting delay test case in FR2 SA

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

19.4.2.1 Test purpose

The purpose of the test is to verify that the DL RSCP and UE Rx-Tx time difference measurements in RRC_INACTIVE meet the requirements specified in TS 38.133 [50] clause 5.6.8.5 in AWGN propagation condition in FR2 in standalone scenario when a single positioning frequency layer is configured for both measurements.

19.4.2.2 Test applicability

This test applies to all types of NR UE release 18 onwards that support Multi-RTT positioning, DL RSCP measurement, measurement time windows and positioning measurements in RRC_INACTIVE and operate in FR2.

19.4.2.3 Minimum conformance requirements

Same as defined in clause 19.4.1.3.

19.4.2.4 Test description

19.4.2.4.1 Initial conditions

The test defines one supported test configuration, specified in Table 19.4.2.4-1. The UE is only required to be tested in one supported test configuration.

Table 19.4.2.4-1: Test Configurations

Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 19.4.2.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 19.4.2.5-1 and Table 19.4.2.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 19.4.2.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

19.4.2.4.2 Test procedure

Same as clause 19.4.1.4.2.

19.4.2.4.3 Message contents

As defined in clause 19.4.1.4.3, with the following exceptions:

Table 19.4.2.4.3-1 replaces Table 19.4.1.4.3-3, Table 19.4.2.4.3-2 replaces Table 19.4.1.4.3-6, Table 19.4.2.4.3-3 replaces Table 19.4.1.4.3-7, Table 19.4.2.4.3-4 replaces Table 19.4.1.4.3-10 and Table 19.4.2.4.3-5 replaces Table 19.4.1.4.3-12.

19.4.2.5 Test requirement

FFS

19.5 RSCP with UE Rx-Tx time difference measurement accuracy test cases in RRC_INACTIVE

19.5.1 RSCP with UE Rx-Tx time difference measurement accuracy test case in FR1 SA

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

19.5.1.1 Test purpose

The purpose of the test is to verify that the accuracy of DL RSCP measurement reported with UE Rx-Tx time difference measurement in RRC_INACTIVE is within the limits specified in TS 38.133 [50] clause 10.1.44.2. The test is conducted in AWGN propagation condition in FR1 in standalone scenario when a single positioning frequency layer is configured.

19.5.1.2 Test applicability

This test applies to all types of NR UE release 18 onwards that support Multi-RTT positioning, DL RSCP measurement and positioning measurements in RRC_INACTIVE.

19.5.1.3 Minimum conformance requirements

Same as defined in clause 19.3.1.3.

19.5.1.4 Test description

19.5.1.4.1 Initial conditions

The test defines three supported test configurations, specified in Table 19.5.1.4-1. The UE is only required to be tested in one supported test configuration.

Table 19.5.1.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 19.5.1.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 19.5.1.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 19.5.1.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). Both cells are on the same RF channel in FR1.

19.5.1.4.2 Test procedure

The test consists of a set-up period and a measurement period. The *NR-Multi-RTT-ProvideAssistanceData* and *NR-Multi-RTT-RequestLocationInformation* shall be provided to the UE during the set-up period.

1. Configure the Cell for RA-SDT with SIB1 configured according to the message contents 19.5.1.4.3.

2. State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command T_A = 31 which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.

3. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

4. The SS adjusts the downlink timing for Cell 1 to a delay of +512 T_c, compared to the current value.

5. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.

6. The SS shall transmit an *RRCReconfiguration* message with DRX configuration.

7. The UE shall transmit *RRCReconfigurationComplete* message.

8. The SS shall transmit an LPP REQUEST CAPABILITIES message.

9. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.

10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 9 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

11. The SS shall send a LCS Periodic-Triggered Invoke Request message with LPP LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the NR-Multi-RTT-RequestLocationInformation IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms. The NR-Multi-RTT-RequestLocationInformation IE shall request both UE Rx-Tx time difference and DL RSCP by setting nr-RequestedMeasurements-r16 accordingly.

12. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.

13. The SS transmits an *RRCRelease* message including UL configuration and SDT configuration to transit the UE to RRC_INACTIVE state.

14. Wait for the UE as it monitors for occurrence of the periodic event requested.

15. The UE shall transmit an RRCResumeRequest message. If the UE supports SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the RRCResumeRequest message and then go to step 19. The UE shall report nr-UE-RxTxTimeDiff-r16 and nr-RSCP-r18 for both Cell 1 and Cell 2. The SS shall verify the DL RSCP results against the limits specified in clause 19.5.1.5.

16. The SS transmits an *RRCResume* message

17. The UE transmits an *RRCResumeComplete* message.

18. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the NR-Multi-RTT-ProvideLocationInformation IE within the response time (see clause 19.5.1.4.3) and RRCResumeComplete message. The UE shall report nr-UE-RxTxTimeDiff-r16 and nr-RSCP-r18 for both Cell 1 and Cell 2. The SS shall verify the DL RSCP results against the limits specified in clause 19.5.1.5.

19. If the UE message at step 18 includes the *ackRequested* IE set to TRUE, the SS shall send LPP acknowledgment message.

20. The SS shall check nr-UE-RxTxTimeDiff-r16 and nr-RSCP-r18 for Cell 1 and Cell 2 against the applicable DL RSCP limits.

21. UE shall be released and moved to RRC_IDLE.

22. Repeat steps 1-21 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

19.5.1.4.3 Message contents

19.5.1.5 Test requirement

FFS

19.5.2 RSCP with UE Rx-Tx time difference measurement accuracy test case in FR2 SA

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test tolerance are not added in and analysis is missing

19.5.2.1 Test purpose

The purpose of the test is to verify that the accuracy of DL RSCP measurement reported with UE Rx-Tx time difference measurement in RRC_INACTIVE is within the limits specified in TS 38.133 [50] clause 10.1.44.2. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when a single positioning frequency layer is configured.

19.5.2.2 Test applicability

This test applies to all types of NR UE release 18 onwards that support Multi-RTT positioning, DL RSCP measurement and positioning measurements in RRC_INACTIVE and operate in FR2.

19.5.2.3 Minimum conformance requirements

Same as defined in clause 19.3.2.3.

19.5.2.4 Test description

19.5.2.4.1 Initial conditions

The test defines one supported test configuration, specified in Table 19.5.2.4-1. The UE is only required to be tested in one supported test configuration.

Table 19.5.2.4-1: Test Configurations

Config	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 19.5.2.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 19.5.2.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 19.5.2.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). Both cells are on the same RF channel in FR2.

19.5.2.4.2 Test procedure

Same as defined in clause 19.5.1.4.2.

19.5.2.4.3 Message contents

19.5.2.5 Test requirement

FFS

Annex A (informative): Connection Diagrams

Definition of Terms

GNSS: In this clause the term GNSS also includes the case where the only satellite system used is GPS.

System Simulator or SS: A device or system, which is capable of generating simulated NodeB and/or eNodeB signalling and analysing UE signalling responses on one RF channel, in order to create the required test environment for the UE under test. It will also include the following capabilities:

1. Control of the UE Tx output power through TPC commands
2. Measurement of signalling timing and delays.
3. Ability to simulate UTRAN and/or E-UTRAN and/or NR signalling.

GNSS System Simulator or GSS: A device or system, which is capable of generating simulated GNSS satellite transmissions in order to create the required test environment for the UE under test. It will also include the following capabilities:

1. Control of the output power of individual satellites and the simulation of atmospheric delays and multi-path.
2. Generation of appropriate assistance data to be transmitted to the UE via the SS.
3. Ability to synchronize with UTRAN and/or E-UTRAN and/or NR timing in the SS.

MBS System Simulator or MSS: A device or system, which is capable of generating simulated MBS transmissions in order to create the required test environment for the UE under test. It will also include the following capabilities:

1. Control of the output power of individual beacons and the simulation of delays and multi-path.
2. Generation of appropriate messaging to be transmitted to the UE via the SS.

WLAN System Simulator or WSS: A device or system, which is capable of generating simulated WLAN beacons in order to create the required test environment for the UE under test. It will also include the following capabilities:

1. Control of the output power of individual beacons and the simulation of delays and AWGN.

BLE System Simulator or BSS: A device or system, which is capable of generating simulated BLE advertising signals in order to create the required test environment for the UE under test. It will also include the following capabilities:

1. Control of the output power of individual BLE signals and the simulation of delays and AWGN.

Test System: A combination of devices brought together into a system for the purpose of making one or more measurements on a UE in accordance with the test case requirements. The following diagrams are all examples of Test Systems.

NOTE: The above terms are logical definitions to be used to describe the test methods used in the present document, in practice, real devices called "System Simulators" may also include additional measurement capabilities or may only support those features required for the test cases they are designed to perform.

Annex B (normative): Converting A-GNSS UE-assisted measurement reports into position estimates

B.1 Introduction

In this clause the terms GNSS and A-GNSS also include the cases where the only satellite system used is GPS unless otherwise stated.

To convert the A-GNSS UE measurement reports in case of UE-assisted mode of A-GNSS into position errors, a transformation between the "measurement domain" (code-phases, etc.) into the "state" domain (position estimate) is necessary. Such a transformation procedure is outlined in the following clauses. The details can be found in [8-10] and [12-17].

B.2 UTRAN UE measurement reports for A-GPS L1 C/A only

In case of UTRAN UE-assisted A-GPS L1 C/A only, the measurement parameters are contained in the RRC UE POSITIONING GPS MEASURED RESULTS IE (clause 10.3.7.93 in 3GPP TS 25.331 [30]). The measurement parameters required for calculating the UE position are:

1) Reference Time: The UE has two choices for the Reference Time:
   a) "UE GPS timing of cell frames";
   b) "GPS TOW msec".
2) Measurement Parameters: 1 to <maxSat>:
   a) "Satellite ID (SV PRN)";
   b) "Whole GPS chips";
   c) "Fractional GPS Chips";
   d) "Pseudorange RMS Error".

Additional information required at the system simulator:

1) "UE positioning GPS reference UE position" (clause 10.3.8.4c in 3GPP TS 25.331 [30]):
   Used for initial approximate receiver coordinates.
2) "UE positioning GPS navigation model" (clause 10.3.7.94 in 3GPP TS 25.331 [30]):
   Contains the GPS ephemeris and clock correction parameters as specified in [8]; used for calculating the satellite positions and clock corrections.
3) "UE positioning GPS ionospheric model" (clause 10.3.7.92 in 3GPP TS 25.331 [30]):
   Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in [8] for computation of the ionospheric delay.

B.3 UTRAN UE measurement reports for A-GNSS

In case of UTRAN UE-assisted A-GNSS, the measurement parameters are contained in the RRC UE POSITIONING GANSS MEASURED RESULTS IE (clause 10.3.7.93a in 3GPP TS 25.331 [30]). In case the UE provides also measurements on the GPS L1 C/A signal, the measurement parameters are contained in the RRC UE POSITIONING GPS MEASURED RESULTS IE (clause 10.3.7.93 in 3GPP TS 25.331 [30]). The measurement parameters required for calculating the UE position are:

1) Reference Time: The UE has two choices for the Reference Time:

a) "UE GANSS Timing of Cell Frames" and/or "UE GPS Timing of Cell Frames";

b) "GANSS TOD msec" and/or "GPS TOW msec" if GPS L1 C/A signal measurements are also provided.

NOTE: It is not expected that a UE will ever report both a GANSS TOD and a GPS TOW. However, if two time stamps are provided and they derive from different user times, be aware that no compensation is made for this difference and this could affect the location accuracy.

2) Measurement Parameters for each GANSS and GANSS Signal: 1 to <maxGANSSSat>:

a) "Satellite ID"; mapping according to table 10.3.7.88b in 3GPP TS 25.331 [30];

b) "GANSS Code Phase";

c) "GANSS Integer Code Phase";

d) "GANSS Integer Code Phase Extension";

e) "Code Phase RMS Error";

3) Additional Measurement Parameters in case of GPS L1 C/A signal measurements are also provided: 1 to <maxSat>:

a) "Satellite ID (SV PRN)";

b) "Whole GPS chips";

c) "Fractional GPS Chips";

d) "Pseudorange RMS Error".

Additional information required at the system simulator:

1) "UE Positioning GANSS Reference UE Position" or "UE Positioning GPS Reference UE Position" (clause 10.3.8.4c in 3GPP TS 25.331 [30]):
Used for initial approximate receiver coordinates.

2) "UE Positioning GANSS Navigation Model" and "UE Positioning GANSS Additional Navigation Models" (clauses 10.3.7.94a and 10.3.7.94b in 3GPP TS 25.331 [30]):
Contains the ephemeris and clock correction parameters as specified in the relevant ICD of each supported GANSS; used for calculating the satellite positions and clock corrections.

3) "UE Positioning GANSS Ionospheric Model" (clause 10.3.7.92a in 3GPP TS 25.331 [30]):
Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in [15] for computation of the ionospheric delay.

4) "UE Positioning GANSS Additional Ionospheric Model" (clause 10.3.7.92b in 3GPP TS 25.331 [30]):
Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in the relevant ICD of each supported GANSS [14], [37] for computation of the ionospheric delay.

5) "UE Positioning GANSS Time Model" (clause 10.3.7.97a in 3GPP TS 25.331 [30]):
Contains the GNSS-GNSS Time Offset for each supported GANSS. Note, that "UE Positioning GANSS Time Model" IE contains only the sub-ms part of the offset. Any potential integer seconds offset may be obtained from "UE Positioning GPS UTC Model" (clause 10.3.7.97 in 3GPP TS 25.331 [30]), "UE Positioning GANSS UTC Model" (clause 10.3.7.97c in 3GPP TS 25.331 [30]), or "UE Positioning GANSS Additional UTC Models" (clause 10.3.7.97d in 3GPP TS 25.331 [30]).

6) "UE Positioning GPS Navigation Model" (clause 10.3.7.94 in 3GPP TS 25.331 [30]):
Contains the GPS ephemeris and clock correction parameters as specified in [8]; used for calculating the GPS satellite positions and clock corrections in case of GPS L1 C/A signal measurements are the only GPS measurements provided in addition to GANSS measurements.

7) "UE Positioning GPS Ionospheric Model" (clause 10.3.7.92 in 3GPP TS 25.331 [30]):
Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in [8] for computation of the ionospheric delay.

B.4 E-UTRAN and NR UE measurement reports

In case of E-UTRAN and NR UE-assisted A-GNSS, the measurement parameters are contained in the LPP GNSS-SignalMeasurementInformation IE (clause 6.5.2.6 in 3GPP TS 36.355 [4] and 3GPP TS 37.355 [49]). The measurement parameters required for calculating the UE position are:

1) Reference Time: The UE has two choices for the Reference Time:
   a) "networkTime";
   b) "gnss-TOD-msec".
2) Measurement Parameters for each GNSS and GNSS signal: 1 to 64:
   a) " svID";
   b) "codePhase";
   c) "integerCodePhase";
   d) "codePhaseRMSError".

Additional information required at the system simulator:

1) "GNSS-ReferenceLocation" (clause 6.5.2.2 in 3GPP TS 36.355 [4] and 3GPP TS 37.355 [49]):
   Used for initial approximate receiver coordinates.
2) "GNSS-NavigationModel" (clause 6.5.2.2 in 3GPP TS 36.355 [4] and 3GPP TS 37.355 [49]):
   Contains the GNSS ephemeris and clock correction parameters as specified in the relevant ICD of each supported GNSS; used for calculating the satellite positions and clock corrections.
3) "GNSS-IonosphericModel" (clause 6.5.2.2 in 3GPP TS 36.355 [4] and 3GPP TS 37.355 [49]):
   Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in the relevant ICD of each supported GNSS [8], [14], [15] and [37] for computation of the ionospheric delay.

B.5 WLS position solution

The WLS position solution problem is concerned with the task of solving for four unknowns; x_u, y_u, z_u the receiver coordinates in a suitable frame of reference (usually ECEF) and b_u the receiver clock bias. It typically requires the following steps:

Step 1: Formation of pseudo-ranges

The observation of code phase reported by the UE for each satellite SV_i is related to the pseudo-range/c modulo the "GNSS Code Phase Ambiguity" (UTRAN), or "gnss-CodePhaseAmbiguity" (E-UTRAN and NR), or modulo 1 ms (the length of the C/A code period) in case of GPS L1 C/A signal measurements. For the formation of pseudo-ranges, the integer number of milliseconds to be added to each code-phase measurement has to be determined first. Since 1 ms corresponds to a travelled distance of 300 km, the number of integer ms can be found with the help of reference location and satellite ephemeris. The distance between the reference location and each satellite SV_i is calculated and the integer number of milliseconds to be added to the UE code phase measurements is obtained.

Step 2: Correction of pseudo-ranges for the GNSS-GNSS time offsets

In the case that the UE reports measurements for more than a single GNSS, the pseudo-ranges are corrected for the time offsets between the GNSSs relative to the selected reference time using the GNSS-GNSS time offsets available at the system simulator:

$$\rho_{GNSS_m,i} \equiv \rho_{GNSS_m,i} - c \cdot (t_{GNSS_k} - t_{GNSS_m}),$$

where $\rho_{GNSS_m,i}$ is the measured pseudo-range of satellite *i* of $GNSS_m$. The system time t_{GNSS_k} of $GNSS_k$ is the reference time frame, and is the available GNSS-GNSS time offset, and *c* is the speed of light.

Step 3: Formation of weighting matrix

The UE reported "codePhaseRMSError" (E-UTRAN and NR) or "Code Phase RMS Error" and/or "Pseudorange RMS Error" (UTRAN) values are used to calculate the weighting matrix for the WLS algorithm [9]. According to 3GPP TS 25.331 [30] and 3GPP TS 36.355 [4] and 3GPP TS 37.355 [49], the encoding for this field is a 6 bit value that consists of a 3 bit mantissa, X_i and a 3 bit exponent, Y_i for each SV_i:

$$w_i = RMSError = 0.5 \times \left(1 + \frac{X_i}{8}\right) \times 2^{Y_i}$$

The weighting Matrix **W** is defined as a diagonal matrix containing the estimated variances calculated from the "codePhaseRMSError" (E-UTRAN and NR) or "Code Phase RMS Error" and/or "Pseudorange RMS Error" (UTRAN) values:

Step 4: WLS position solution

The WLS position solution is described in reference [9] and usually requires the following steps:

1) Computation of satellite locations at time of transmission using the ephemeris parameters and user algorithms defined in the relevant ICD of the particular GNSS. The satellite locations are transformed into WGS-84 reference frame, if needed.

2) Computation of clock correction parameters using the parameters and algorithms as defined in the relevant ICD of the particular GNSS.

3) Computation of atmospheric delay corrections using the parameters and algorithms defined in the relevant ICD of the particular GNSS for the ionospheric delay, and using the Gupta model in reference [10] p.121 equation (2) for the tropospheric delay. For GNSSs which do not natively provide ionospheric correction models (e.g., GLONASS), the ionospheric delay is determined using the available ionospheric model adapted to the particular GNSS frequency.

4) The WLS position solution starts with an initial estimate of the user state (position and clock offset). The Reference Location is used as initial position estimate. The following steps are required:

   a) Calculate geometric range (corrected for Earth rotation) between initial location estimate and each satellite included in the UE measurement report.

   b) Predict pseudo-ranges for each measurement including clock and atmospheric biases as calculated in 1) to 3) above and defined in the relevant ICD of the particular GNSS and [9].

   c) Calculate difference between predicted and measured pseudo-ranges $\Delta\boldsymbol{\rho}$

   d) Calculate the "Geometry Matrix" **G** as defined in [9]:

$$\mathbf{G} \equiv \begin{bmatrix} -\hat{\mathbf{1}}^T_{GNSS_1,1} & 1 \\ -\hat{\mathbf{1}}^T_{GNSS_1,2} & 1 \\ \vdots & \vdots \\ -\hat{\mathbf{1}}^T_{GNSS_1,n} & 1 \\ \vdots & \vdots \\ -\hat{\mathbf{1}}^T_{GNSS_m,1} & 1 \\ -\hat{\mathbf{1}}^T_{GNSS_m,2} & 1 \\ \vdots & \vdots \\ -\hat{\mathbf{1}}^T_{GNSS_m,l} & 1 \end{bmatrix} \text{ with } \hat{\mathbf{1}}_{GNSS_m,i} \equiv \frac{\mathbf{r}_{s_{GNSS_m,i}} - \hat{\mathbf{r}}_u}{\left|\mathbf{r}_{s_{GNSS_m,i}} - \hat{\mathbf{r}}_u\right|}$$ where $\mathbf{r}_{s_{GNSSm,i}}$ is the satellite position vector for SV_i of $GNSS_m$ (calculated in 1) above), and $\hat{\mathbf{r}}_u$ is the estimate of the user location.

e) Calculate the WLS solution according to [9]:

$$\Delta\hat{\mathbf{x}} = \left(\mathbf{G}^T\mathbf{W}\mathbf{G}\right)^{-1}\mathbf{G}^T\mathbf{W}\Delta\boldsymbol{\rho}$$

f) Adding the $\Delta\hat{\mathbf{x}}$ to the initial state estimate gives an improved estimate of the state vector:

$$\hat{\mathbf{x}} \rightarrow \hat{\mathbf{x}} + \Delta\hat{\mathbf{x}}\,.$$

5) This new state vector $\hat{\mathbf{x}}$ can be used as new initial estimate and the procedure is repeated until the change in $\hat{\mathbf{x}}$ is sufficiently small.

Step 5: Transformation from Cartesian coordinate system to Geodetic coordinate system

The state vector $\hat{\mathbf{x}}$ calculated in Step 4 contains the UE position in ECEF Cartesian coordinates together with the UE receiver clock bias relative to the selected GNSS system time. Only the user position is of further interest. It is usually desirable to convert from ECEF coordinates x_u, y_u, z_u to geodetic latitude φ, longitude λ and altitude h on the WGS84 reference ellipsoid.

Step 6: Calculation of "2-D Position Errors"

The latitude φ / longitude λ obtained after Step 5 is used to calculate the 2-D position error.

Annex C (normative): General test conditions and declarations

The requirements of this clause apply to all applicable tests in the present document.

In all the relevant clauses in this clause all 2D position error measurements shall be carried out according to the general rules for statistical testing in Annex D.

In this clause, the terms GNSS and A-GNSS also include the cases where the only satellite system used is GPS unless otherwise stated.

The test tolerances may not be valid for operating bands above 4200 MHz since some test system uncertainties are changed for frequencies above 4200 MHz. The test tolerances for bands above 4200 MHz are For Further Study [FFS].

C.1 Acceptable uncertainty of Test System

The maximum acceptable uncertainty of the Test System is specified below for each test, where appropriate. The Test System shall enable the stimulus signals in the test case to be adjusted to within the specified range, and the equipment under test to be measured with an uncertainty not exceeding the specified values. All ranges and uncertainties are absolute values, and are valid for a confidence level of 95 %, unless otherwise stated.

A confidence level of 95 % is the measurement uncertainty tolerance interval for a specific measurement that contains 95 % of the performance of a population of test equipment.

It should be noted that the uncertainties in clause C.1 apply to the Test System operating into a nominal 50 ohm load and do not include system effects due to mismatch between the DUT and the Test System.

C.1.1 Measurement of test environments

The measurement accuracy of the UE environmental test conditions, defined in Annex G or TS 36.508 [18] clause 4.1, shall be:

Pressure	±5 kPa
Temperature	±2 degrees
Relative Humidity	±5 %
DC Voltage	±1.0 %
AC Voltage	±1.5 %
Vibration	10 %
Vibration frequency	0.1 Hz

The above values shall apply unless the test environment is otherwise controlled and the specification for the control of the test environment specifies the uncertainty for the parameter.

C.1.2 A-GNSS Minimum Performance requirements

Table C.1.1: Maximum Test System Uncertainty for A-GNSS Minimum Performance tests

Clause	Maximum Test System Uncertainty		Derivation of Test System Uncertainty
5.2.1, 6.2.1, 7.1.1, 13.2.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Position error	±0.05 m	Position error consists of ±0.05 m system uncertainty. The effect of position reporting resolution of approximately ±1.2 m (see note) is not included in the allowable test system uncertainty but is included in the Test Parameter Relaxations since this resolution limitation limits the reporting capability of the UE. For simplicity the combined Test Parameter Relaxation is given as ±1.3 m

Clause	Maximum Test System Uncertainty		Derivation of Test System Uncertainty
	Response time	± 300 ms	
5.2.2, 6.2.2, 7.1.2, 13.2.2 Sensitivity Fine Time Assistance	Coarse Time Assistance	±200 ms	
	Fine Time Assistance	±1 us	
	Absolute GNSS signal level	±1 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
5.3, 6.3, 7.2, 13.3 Nominal Accuracy	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
5.4, 6.4, 7.3, 13.4 Dynamic Range	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Relative GNSS signal level	±0.2 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
5.5, 6.5, 7.4, 13.5 Multi-path scenario	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Relative GNSS signal level	±0.2 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
5.6, 6.6, 7.5, 7.5A, 13.6, 13.7 Moving scenario and periodic update	Absolute GNSS signal level	±1 dB	
	Position error	±0.05 m	Position error as above
	Differential response time ± 100 ms	± 100 ms	

NOTE: For UE based mode the effect of position reporting resolution is given by:

$\sqrt{\left(\frac{90\times 2\times\pi\times R}{2E23\times 360}\right)^2+\left(\frac{360\times 2\times\pi\times R\times\cos\phi}{2E24\times 360}\right)^2}$ meters, where R is the radius of the earth and φ is the latitude of the location. For the GNSS scenarios defined in TS 37.571-5 [20] this equates to approximately.

Editor's note: this needs checking once the GNSS scenarios are agreed [TBD] m. For simplicity this is given as ±1.2 m.

For UE assisted mode it is assumed that the output from the WLS position solution calculation in Annex B is coded using the same position coding method as for UE based mode before being used to calculate position error. Therefore, the effect of reporting resolution will be the same as for UE based mode.

C.1.3 ECID and OTDOA Measurement requirements

Table C.1.3-1: Maximum Test System Uncertainty for ECID and OTDOA Measurement Requirements

Clause	Maximum Test System Uncertainty	Derivation of Test System Uncertainty
8.1.1 E-UTRAN FDD UE Rx – Tx time difference case (Rel-9 to Rel-11)	N_{oc} ±1.0 dB averaged over BW_{Config} $\hat{E}s / N_{oc}$ ±0.3 dB ±3Ts Uplink signal transmit timing relative to downlink	Note: $\hat{E}s / N_{oc}$ is the ratio of cell 1 signal / AWGN T_S = 1/(15000 x 2048) seconds, the basic timing unit defined in TS 36.211 [26]

8.1.1A E-UTRAN FDD UE Rx – Tx time difference case (Rel-12 onwards)	Same as 8.1.1	Same as 8.1.1
8.1.1B E-UTRAN FDD UE Rx – Tx time difference case for UE Category 1bis	Same as 8.1.1	Same as 8.1.1
8.1.2 E-UTRAN TDD UE Rx – Tx time difference case (Rel-9 to Rel-11)	Same as 8.1.1	Same as 8.1.1
8.1.2A E-UTRAN TDD UE Rx – Tx time difference case (Rel-12 onwards)	Same as 8.1.1	Same as 8.1.1

10.8 TDD RSTD Measurement Accuracy for 3DL Carrier Aggregation	Same as 10.7	Same as 10.7
In addition, the following Test System uncertainties and related constraints apply. Any additional constraints are defined in the specific tests.		
AWGN Bandwidth		≥ 1.08 MHz, 2.7 MHz, 4.5 MHz, 9 MHz, 13.5 MHz, 18 MHz; N_{RB} x 180kHz according to BW_{Config}
AWGN absolute power uncertainty		Test-specific
AWGN flatness and signal flatness, max deviation for any Resource Block, relative to average over BW_{Config}		±2 dB
AWGN peak to average ratio		≥10 dB @0.001%

Signal-to noise ratio uncertainty	Test-specific
Fading profile power uncertainty	±0.5 dB
Fading profile delay uncertainty, relative to frame timing	±5 ns (excludes absolute errors related to baseband timing)

C.1.4 MBS Minimum Performance requirements

Table C.1.4-1: Maximum Test System Uncertainty for MBS Minimum Performance tests

Clause	Maximum Test System Uncertainty		Derivation of Test System Uncertainty
11.1, 11.1A MBS Measurement Reporting Delay	Beacon power level	±2 dB	
	Response time	±300 ms	
11.2, 11.2A MBS Sensitivity Measurement Accuracy	Beacon power level	±2 dB	
	Code phase delay difference	±5 ns	Code phase delay difference error value of +/- 5ns, being derived from 10% of the most stringent code phase delay measurement accuracy requirement
11.3, 11.3A MBS Nominal Measurement Accuracy	Beacon power level	±2 dB	
	Code phase delay	±5 ns	Code phase delay error as above
11.4, 11.4A MBS Dynamic Range Measurement Accuracy	Beacon power level	±2 dB	
	Code phase delay	±5 ns	Code phase delay error as above
11.5, 11.5A MBS Measurement Accuracy in Multipath	Beacon power level	±2 dB	
	Code phase delay	±5 ns	Code phase delay error as above
Note: Code phase delay is equal to the propagation delay from the (simulated) beacon transmitter to the UE receive antenna based on the propagation distance in the test case.			

C.1.5 WLAN and BLE measurement requirements

Table C.1.5-1: Maximum Test System Uncertainty for WLAN and BLE measurement tests

Clause	Maximum Test System Uncertainty		Derivation of Test System Uncertainty
12.1.1 WLAN AP Identification and reporting delay under nominal conditions	Response time	±300 ms	
12.1.2 WLAN AP Identification and reporting delay under dynamic range conditions	Response time	±300 ms	
	AP Power Level Difference	±1 dB	
12.2.1 Bluetooth identification	Response time	±300 ms	

Note: AP Power Level Difference is the difference between the WLAN Received Power Level from the high power WLAN AP with respect to the low power WLAN APs.

C.1.6 NR PRS-based measurement requirements

Table C.1.6-1: Maximum Test System Uncertainty for NR PRS-based Measurement Requirements

Clause	Maximum Test System Uncertainty	Derivation of Test System Uncertainty

14.2.1 NR RSTD measurement period test case for single positioning frequency layer in FR1 SA	N_{oc} ±1.5 dB averaged over BW_{Config} PRS $\hat{E}s_1 / N_{oc}$ ±0.3 dB averaged over BW_{Config} $\hat{E}s_1 / N_{oc}$ ±0.3 dB averaged over BW_{Config} PRS $\hat{E}s_2 / N_{oc}$ ±0.3 dB averaged over BW_{Config} $\hat{E}s_2 / N_{oc}$ ±0.3 dB averaged over BW_{Config} PRS $\hat{E}s_3 / N_{oc}$ ±0.3 dB averaged over BW_{Config} $\hat{E}s_3 / N_{oc}$ ±0.3 dB averaged over BW_{Config} Response Time = 300ms	Note: PRS $\hat{E}s_1 / N_{oc}$ and $\hat{E}s_1 / N_{oc}$ are the ratios of cell 1 signal / AWGN PRS $\hat{E}s_2 / N_{oc}$ and $\hat{E}s_2 / N_{oc}$ are the ratios of cell 2 signal / AWGN PRS $\hat{E}s_3 / N_{oc}$ and $\hat{E}s_3 / N_{oc}$ are the ratios of cell 3 signal / AWGN Signal-to-noise ratio uncertainty ±0.3 dB
14.2.2 NR RSTD measurement period test case for dual positioning frequency layers in FR1 SA	Same as 14.2.1	
14.2.3 NR RSTD measurement period test case for single positioning frequency layer in FR2 SA	N_{oc} ±5.65 dB averaged over BW_{Config} PRS $\hat{E}s_1 / N_{oc}$ ±0.3 dB averaged over BW_{Config} $\hat{E}s_1 / N_{oc}$ ±0.3 dB averaged over BW_{Config} PRS $\hat{E}s_2 / N_{oc}$ ±0.3 dB averaged over BW_{Config} $\hat{E}s_2 / N_{oc}$ ±0.3 dB averaged over BW_{Config} PRS $\hat{E}s_3 / N_{oc}$ ±0.3 dB averaged over BW_{Config} $\hat{E}s_3 / N_{oc}$ ±0.3 dB averaged over BW_{Config} Response Time = 300ms	Note: PRS $\hat{E}s_1 / N_{oc}$ and $\hat{E}s_1 / N_{oc}$ are the ratios of cell 1 signal / AWGN PRS $\hat{E}s_2 / N_{oc}$ and $\hat{E}s_2 / N_{oc}$ are the ratios of cell 2 signal / AWGN PRS $\hat{E}s_3 / N_{oc}$ and $\hat{E}s_3 / N_{oc}$ are the ratios of cell 3 signal / AWGN Signal-to-noise ratio uncertainty ±0.3 dB
14.2.4 NR RSTD measurement period test case for dual positioning frequency layers in FR2 SA	Same as 14.2.3	
14.2.5 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 14.2.1	
14.2.6 NR RSTD measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA	Same as 14.2.1	
14.2.7 NR RSTD measurement reporting delay test case for single positioning frequency layer with Rx TEG in FR1 SA	Same as 14.2.1	
14.2.8 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 14.2.3	
14.2.9 NR RSTD measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA	Same as 14.2.3	
14.2.10 NR RSTD measurement reporting delay test case for single positioning frequency layer with Rx TEG in FR2 SA	Same as 14.2.3	
14.2.11 NR RSTD measurement reporting delay test case for PRS aggregation in FR1	Same as 14.2.1	Same as 14.2.1

14.3.1 NR RSTD measurement accuracy test case for single positioning frequency layer in FR1 SA	N_{oc} ±1.5 dB averaged over BW_{Config} PRS $\hat{E}s_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} $\hat{E}s_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} PRS $\hat{E}s_2$ / N_{oc} ±0.3 dB averaged over BW_{Config} $\hat{E}s_2$ / N_{oc} ±0.3 dB averaged over BW_{Config} Cell Timing Difference = 32 Tc	Note: PRS $\hat{E}s_1$ / N_{oc} and $\hat{E}s_1$ / N_{oc} are the ratios of cell 1 signal / AWGN PRS $\hat{E}s_2$ / N_{oc} and $\hat{E}s_2$ / N_{oc} are the ratios of cell 2 signal / AWGN
14.3.2 NR RSTD measurement accuracy test case for dual positioning frequency layers in FR1 SA	Same as 14.3.1	
14.3.3 NR RSTD measurement accuracy test case for single positioning frequency layer in FR2 SA	N_{oc} ±5.65 dB averaged over BW_{Config} PRS $\hat{E}s_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} $\hat{E}s_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} PRS $\hat{E}s_2$ / N_{oc} ±0.3 dB averaged over BW_{Config} $\hat{E}s_2$ / N_{oc} ±0.3 dB averaged over BW_{Config} Cell Timing Difference = 32 Tc	Note: PRS $\hat{E}s_1$ / N_{oc} and $\hat{E}s_1$ / N_{oc} are the ratios of cell 1 signal / AWGN PRS $\hat{E}s_2$ / N_{oc} and $\hat{E}s_2$ / N_{oc} are the ratios of cell 2 signal / AWGN
14.3.4 NR RSTD measurement accuracy test case for dual positioning frequency layer in FR2 SA	Same as 14.3.3	
14.3.5 NR RSTD measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 14.3.3	
14.3.6 NR RSTD measurement accuracy test case for single positioning frequency layer with Rx TEG in FR1 SA	Same as 14.3.3	
14.3.7 NR RSTD measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 14.3.3	
14.3.8 NR RSTD measurement accuracy test case for single positioning frequency layer with Rx TEG in FR2 SA	Same as 14.3.3	
14.3.9 NR RSTD measurement accuracy test case for PRS aggregation in FR1 SA	Same as 14.3.1	Same as 14.3.1
14.4.1 NR RSTD measurement reporting delay test case for single positioning frequency layer in FR1 SA	Same as 14.3.3	
14.4.2 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 14.3.3	
14.4.3 NR RSTD measurement reporting delay test case for single positioning frequency layer in FR2 SA	Same as 14.3.3	
14.4.4 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 14.3.3	

14.5.1 NR RSTD measurement accuracy test case for single positioning frequency layer in FR1 SA	Same as 14.3.3	
14.5.2 NR RSTD measurement accuracy for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 14.3.3	
14.5.3 NR RSTD measurement accuracy test case for single positioning frequency layer in FR2 SA	Same as 14.3.3	
14.5.4 NR RSTD measurement accuracy for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 14.3.3	
15.2.1 UE Rx-Tx time difference measurement period for single positioning frequency layer in FR1 SA	Noc ±1.5 dB averaged over BWConfig PRS Ês1 / Noc ±0.3 dB averaged over BWConfig Ês1 / Noc ±0.3 dB averaged over BWConfig PRS Ês2 / Noc ±0.3 dB averaged over BWConfig Ês2 / Noc ±0.3 dB averaged over BWConfig Response Time = ± 300 ms	Note: PRS Ês1 / Noc and Ês1 / Noc are the ratios of cell 1 signal / AWGN PRS Ês2 / Noc and Ês2 / Noc are the ratios of cell 2 signal / AWGN Tc = 1/(480000 x 4096), the basic timing unit defined in TS 38.211 [53]
15.2.2 UE Rx-Tx time difference measurement period for dual positioning frequency layers in FR1 SA	Same as 15.2.1	Same as 15.2.1
15.2.3 UE Rx-Tx time difference measurement period for single positioning frequency layer in FR2 SA	Noc ±5.65 dB averaged over BWConfig PRS Ês1 / Noc ±0.3 dB averaged over BWConfig Ês1 / Noc ±0.3 dB averaged over BWConfig PRS Ês2 / Noc ±0.3 dB averaged over BWConfig Ês2 / Noc ±0.3 dB averaged over BWConfig Response Time = ± 300 ms	PRS Ês1 / Noc and Ês1 / Noc are the ratios of cell 1 signal / AWGN PRS Ês2 / Noc and Ês2 / Noc are the ratios of cell 2 signal / AWGN Tc = 1/(480000 x 4096), the basic timing unit defined in TS 38.211 [53]

15.2.16 UE Rx-Tx time difference measurement reporting delay test case in FR2 for Redcap UE with Rx FH	Same as 15.2.3	Same as 15.2.3
15.3.1 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR1 SA	N_{oc} ±1.5 dB averaged over BW_{Config} PRS $\hat{E}s_1 / N_{oc}$ ±0.3 dB averaged over BW_{Config} $\hat{E}s_1 / N_{oc}$ ±0.3 dB averaged over BW_{Config} PRS $\hat{E}s_2 / N_{oc}$ ±0.3 dB averaged over BW_{Config} $\hat{E}s_2 / N_{oc}$ ±0.3 dB averaged over BW_{Config} Cell Timing Difference = 32 Tc	Note: PRS $\hat{E}s_1 / N_{oc}$ and $\hat{E}s_1 / N_{oc}$ are the ratios of cell 1 signal / AWGN PRS $\hat{E}s_2 / N_{oc}$ and $\hat{E}s_2 / N_{oc}$ are the ratios of cell 2 signal / AWGN
15.3.2 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR2 SA	N_{oc} ±5.65 dB averaged over BW_{Config} PRS $\hat{E}s_1 / N_{oc}$ ±0.3 dB averaged over BW_{Config} $\hat{E}s_1 / N_{oc}$ ±0.3 dB averaged over BW_{Config} PRS $\hat{E}s_2 / N_{oc}$ ±0.3 dB averaged over BW_{Config} $\hat{E}s_2 / N_{oc}$ ±0.3 dB averaged over BW_{Config} Cell Timing Difference = 32 Tc	Note: PRS $\hat{E}s_1 / N_{oc}$ and $\hat{E}s_1 / N_{oc}$ are the ratios of cell 1 signal / AWGN PRS $\hat{E}s_2 / N_{oc}$ and $\hat{E}s_2 / N_{oc}$ are the ratios of cell 2 signal / AWGN
15.3.3 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 15.3.1	Same as 15.3.1
15.3.5 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 15.3.2	Same as 15.3.2
15.3.6 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with RxTx TEG in FR2 SA	Same as 15.3.2	Same as 15.3.2

15.3.7 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR1 SA	Same as 15.3.1	Same as 15.3.1
15.3.8 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR2 SA	Same as 15.3.2	Same as 15.3.2
15.3.9 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE without Rx FH	Same as 15.3.1	Same as 15.3.1
15.3.10 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE without Rx FH	Same as 15.3.2	Same as 15.3.2
15.3.11 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE with Rx FH	Same as 15.3.1	Same as 15.3.1
15.3.12 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE with Rx FH	Same as 15.3.2	Same as 15.3.2
15.4.1 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer in FR1 SA	Same as 15.2.1	Same as 15.2.1
15.4.2 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 15.2.1	Same as 15.2.1
15.4.3 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer in FR2 SA	Same as 15.2.3	Same as 15.2.3
15.4.4 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 15.2.3	Same as 15.2.3
15.4.5 UE Rx-Tx time difference measurement reporting delay for PRS aggregation in FR1 SA	Same as 15.2.1	Same as 15.2.1
15.4.6 UE Rx-Tx time difference measurement reporting delay for PRS aggregation in FR2 SA	Same as 15.2.3	Same as 15.2.3
15.4.7 UE Rx-Tx time difference measurement reporting delay in FR1 for Redcap UE without Rx FH	Same as 15.2.1	Same as 15.2.1
15.4.8 UE Rx-Tx time difference measurement reporting delay in FR2 for Redcap UE without Rx FH	Same as 15.2.3	Same as 15.2.3
15.4.9 UE Rx-Tx time difference measurement reporting delay in FR1 for Redcap UE with Rx FH	Same as 15.2.1	Same as 15.2.1
15.4.10 UE Rx-Tx time difference measurement reporting delay in FR2 for Redcap UE with Rx FH	Same as 15.2.3	Same as 15.2.3
15.4.11 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for normal UE in FR1 SA	Same as 15.2.1	Same as 15.2.1
15.4.12 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for RedCap UE in FR1 SA	Same as 15.2.1	Same as 15.2.1
15.4.13 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for normal UE in FR2 SA	Same as 15.2.3	Same as 15.2.3

15.4.14 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for RedCap UE in FR2 SA	Same as 15.2.3	Same as 15.2.3
15.5.1 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR1 SA	Same as 15.3.1	Same as 15.3.1
15.5.2 UE Rx-Tx time difference measurement accuracy with reduced number of samples in FR1 SA	Same as 15.3.1	Same as 15.3.1
15.5.3 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR2 SA	N_{oc} ±5.65 dB averaged over BW_{Config} PRS $\hat{E}s_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} $\hat{E}s_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} PRS $\hat{E}s_2$ / N_{oc} ±0.3 dB averaged over BW_{Config} $\hat{E}s_2$ / N_{oc} ±0.3 dB averaged over BW_{Config} Cell Timing Difference = 33 Tc	Same as 15.3.2
15.5.4 UE Rx-Tx time difference measurement accuracy with reduced number of samples in FR2 SA	N_{oc} ±5.65 dB averaged over BW_{Config} PRS $\hat{E}s_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} $\hat{E}s_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} PRS $\hat{E}s_2$ / N_{oc} ±0.3 dB averaged over BW_{Config} $\hat{E}s_2$ / N_{oc} ±0.3 dB averaged over BW_{Config} Cell Timing Difference = 33 Tc	Same as 15.3.2
15.5.5 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR1 SA	Same as 15.3.1	Same as 15.3.1
15.5.6 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR2 SA	Same as 15.3.2	Same as 15.3.2
15.5.7 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE without Rx FH	Same as 15.3.1	Same as 15.3.1
15.5.8 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE without Rx FH	Same as 15.3.2	Same as 15.3.2
15.5.9 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE with Rx FH	Same as 15.3.1	Same as 15.3.1
15.5.10 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE with Rx FH	Same as 15.3.2	Same as 15.3.2
16.2.1 PRS-RSRP measurement period test case for single positioning frequency layer in FR1 SA	Noc ±1.5 dB averaged over BWConfig PRS Ês1 / Noc ±0.3 dB averaged over BWConfig Ês1 / Noc ±0.3 dB averaged over BWConfig PRS Ês2 / Noc ±0.3 dB averaged over BWConfig Ês2 / Noc ±0.3 dB averaged over BWConfig	Note: PRS Ês1 / Noc and Ês1 / Noc are the ratios of cell 1 signal / AWGN PRS Ês2 / Noc and Ês2 / Noc are the ratios of cell 2 signal / AWGN Signal-to-noise ratio uncertainty ±0.3 dB
16.2.2 PRS-RSRP measurement period test case for dual positioning frequency layer in FR1 SA	Noc ±1.5 dB averaged over BWConfig PRS Ês1 / Noc ±0.3 dB averaged over BWConfig Ês1 / Noc ±0.3 dB averaged over BWConfig PRS Ês2 / Noc2 ±0.3 dB averaged over BWConfig Ês2 / Noc2 ±0.3 dB averaged over BWConfig	Note: PRS Ês1 / Noc and Ês1 / Noc are the ratios of cell 1 signal / AWGN PRS Ês2 / Noc2 and Ês2 / Noc2 are the ratios of cell 2 signal / AWGN Signal-to-noise ratio uncertainty ±0.3 dB

16.2.3 PRS-RSRP measurement period test case for single positioning frequency layer in FR2 SA	Noc ±5.65 dB averaged over BWConfig PRS Ês1 / Noc ±0.3 dB averaged over BWConfig Ês1 / Noc ±0.3 dB averaged over BWConfig PRS Ês2 / Noc ±0.3 dB averaged over BWConfig Ês2 / Noc ±0.3 dB averaged over BWConfig Response Time = ± 300 ms	PRS Ês1 / Noc and Ês1 / Noc are the ratios of cell 1 signal / AWGN PRS Ês2 / Noc and Ês2 / Noc are the ratios of cell 2 signal / AWGN Tc = 1/(480000 x 4096), the basic timing unit defined in TS 38.211 [53]
16.2.4 PRS-RSRP measurement period test case for dual positioning frequency layer in FR2 SA	Same as 16.2.3	Same as 16.2.3
16.2.5 PRS-RSRP measurement reporting delay test case for single positioning frequency with reduced number of samples in FR1 SA	Same as 16.2.1	Same as 16.2.1
16.2.6 PRS-RSRP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA	Same as 16.2.1	Same as 16.2.1
16.2.7 PRS-RSRP measurement reporting delay test case for single positioning frequency with reduced number of samples in FR2 SA	Same as 16.2.3	Same as 16.2.3
16.2.8 PRS-RSRP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA	Same as 16.2.3	Same as 16.2.3
16.3.1 PRS-RSRP measurement accuracy with PRS in FR1	Noc ±1.5 dB averaged over BWConfig PRS Ês1 / Noc ±0.3 dB averaged over BWConfig Ês1 / Noc ±0.3 dB averaged over BWConfig PRS Ês2 / Noc ±0.3 dB averaged over BWConfig Ês2 / Noc ±0.3 dB averaged over BWConfig	Note: PRS Ês1 / Noc and Ês1 / Noc are the ratios of cell 1 signal / AWGN PRS Ês2 / Noc and Ês2 / Noc are the ratios of cell 2 signal / AWGN Signal-to-noise ratio uncertainty ±0.3 dB
16.3.2 PRS-RSRP measurement accuracy with PRS in FR2	N_{oc} ±5.65 dB averaged over BW_{Config} PRS $Ês_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} $Ês_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} PRS $Ês_2$ / N_{oc} ±0.3 dB averaged over BW_{Config} $Ês_2$ / N_{oc} ±0.3 dB averaged over BW_{Config}	Note: PRS $Ês_1$ / N_{oc} and $Ês_1$ / N_{oc} are the ratios of cell 1 signal / AWGN PRS $Ês_2$ / N_{oc} and $Ês_2$ / N_{oc} are the ratios of cell 2 signal / AWGN
16.3.3 PRS-RSRP measurement accuracy with PRS in FR1 with reduced sample number	Same as 16.3.1	Same as 16.3.1
16.3.4 PRS-RSRP measurement accuracy with PRS in FR2 with reduced sample number	Same as 16.3.2	Same as 16.3.2
16.4.1 PRS-RSRP measurement reporting delay test case for single positioning frequency layer in FR1 SA	Same as 16.2.1	Same as 16.2.1
16.4.2 PRS-RSRP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 16.2.1	Same as 16.2.1
16.4.3 PRS-RSRP measurement reporting delay test case for single positioning frequency layer in FR2 SA	Same as 16.2.3	Same as 16.2.3

16.4.4 PRS-RSRP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 16.2.3	Same as 16.2.3
16.5.1 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR1 SA	Same as 16.3.1	Same as 16.3.1
16.5.2 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR1 with reduced sample number	Same as 16.3.1	Same as 16.3.1
16.5.3 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR2 SA	Same as 16.3.2	Same as 16.3.2
16.5.4 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR2 with reduced sample number	Same as 16.3.2	Same as 16.3.2
17.2.1 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR1 SA	Noc ±1.5 dB averaged over BWConfig PRS Ês1 / Noc ±0.3 dB averaged over BWConfig Ês1 / Noc ±0.3 dB averaged over BWConfig PRS Ês2 / Noc ±0.3 dB averaged over BWConfig Ês2 / Noc ±0.3 dB averaged over BWConfig	Note: PRS Ês1 / Noc and Ês1 / Noc are the ratios of cell 1 signal / AWGN PRS Ês2 / Noc and Ês2 / Noc are the ratios of cell 2 signal / AWGN Signal-to-noise ratio uncertainty ±0.3 dB
17.2.2 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 17.2.1	Same as 17.2.1
17.2.3 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA	Same as 17.2.1	Same as 17.2.1
17.2.4 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR2 SA	N_{oc} ±5.65 dB averaged over BW_{Config} PRS $\hat{E}s_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} $\hat{E}s_1$ / N_{oc} ±0.3 dB averaged over BW_{Config} PRS $\hat{E}s_2$ / N_{oc} ±0.3 dB averaged over BW_{Config} $\hat{E}s_2$ / N_{oc} ±0.3 dB averaged over BW_{Config}	Note: PRS $\hat{E}s_1$ / N_{oc} and $\hat{E}s_1$ / N_{oc} are the ratios of cell 1 signal / AWGN PRS $\hat{E}s_2$ / N_{oc} and $\hat{E}s_2$ / N_{oc} are the ratios of cell 2 signal / AWGN
17.2.5 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 17.2.4	Same as 17.2.4
17.2.6 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA	Same as 17.2.4	Same as 17.2.4
17.3.1 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR1 SA	Same as 17.2.1	Same as 17.2.1
17.3.2 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 17.2.1	Same as 17.2.1

17.3.3 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR2 SA	Same as 17.2.4	Same as 17.2.4
17.3.4 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 17.2.4	Same as 17.2.4
17.4.1 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR1 SA	Same as 17.2.1	Same as 17.2.1
17.4.2 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 17.2.1	Same as 17.2.1
17.4.3 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR2 SA	Same as 17.2.4	Same as 17.2.4
17.4.4 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 17.2.4	Same as 17.2.4
17.5.1 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR1 SA	Same as 17.2.1	Same as 17.2.1
17.5.2 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 17.2.1	Same as 17.2.1
17.5.3 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR2 SA	Same as 17.2.4	Same as 17.2.4
17.5.4 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 17.2.4	Same as 17.2.4

C.2 Test Parameter Relaxations (This clause is informative)

The Test Parameter Relaxations defined in this clause have been used to relax the Conformance requirement to derive the Test Requirements.

The Test Parameter Relaxations are derived from Test System uncertainties, regulatory requirements and criticality to system performance. As a result, the Test Parameter Relaxations may sometimes be set to zero.

The Test Parameter Relaxations should not be modified for any reason e.g. to take account of commonly known test system errors (such as mismatch, cable loss, etc.).

C.2.1 A-GNSS Minimum Performance requirements

Table C.2.1: Test Parameter Relaxations for A-GNSS Minimum Performance tests

Clause	Test Parameter Relaxation	
5.2.1, 6.2.1, 7.1.1, 13.2.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	200 ms
	Absolute GNSS signal level	1 dB

	Position error	1.3 m
	Response time	300 ms
5.2.2, 6.2.2, 7.1.2, 13.2.2 Sensitivity Fine Time Assistance	Coarse Time Assistance	200 ms
	Fine Time Assistance	1 us
	Absolute GNSS signal level	1 dB
	Position error	1.3 m
	Response time	300 ms
5.3, 6.3, 7.2, 13.3 Nominal Accuracy	Coarse Time Assistance	200 ms
	Absolute GNSS signal level	0 dB
	Position error	1.3 m
	Response time	300 ms
5.4, 6.4, 7.3, 13.4 Dynamic Range	Coarse Time Assistance	200 ms
	Absolute GNSS signal level	1 dB
	Relative GNSS signal level	0.2 dB
	Position error	1.3 m
	Response time	300 ms
5.5, 6.5, 7.4, 13.5 Multi-path scenario	Coarse Time Assistance	200 ms
	Absolute GNSS signal level	0 dB
	Relative GNSS signal level	0.2 dB
	Position error	1.3 m
	Response time	300 ms
5.6, 6.6, 7.5, 7.5A, 13.6, 13.7 Moving scenario and periodic update	Absolute GNSS signal level	0 dB
	Position error	1.3 m
	Differential Response Time	100 ms

C.2.2 ECID and OTDOA Measurement requirements

Table C.2.2: Test Parameter Relaxations for ECID and OTDOA Measurement requirements

Clause	Test Parameter Relaxation	
8.1.1 E-UTRAN FDD UE Rx – Tx time difference case (Rel-9 to Rel-11)	Parameters N_{oc}: -98dBm/15kHz $\hat{E}s$ / N_{oc}: -3.00dB RxTx time difference value:	Test Tolerance 0dB +0.3dB ±3Ts
8.1.1A E-UTRAN FDD UE Rx – Tx time difference case (Rel-12 onwards)	Same as 8.1.1	Same as 8.1.1
8.1.1B E-UTRAN FDD UE Rx – Tx time difference case for UE Category 1bis	Same as 8.1.1	Same as 8.1.1
8.1.2 E-UTRAN TDD UE Rx – Tx time difference case (Rel-9 to Rel-11)	Same as 8.1.1	Same as 8.1.1
8.1.2A E-UTRAN TDD UE Rx – Tx time difference case (Rel-12 onwards)	Same as 8.1.1	Same as 8.1.1
8.1.2B E-UTRAN TDD UE Rx – Tx time difference case for UE Category 1bis	Same as 8.1.1	Same as 8.1.1
8.1.3 E-UTRAN FDD UE Rx-Tx time difference under Time Domain Measurement Resource Restriction with Non-MBSFN ABS (eICIC)	Parameters N_{oc}: -98dBm/15kHz $\hat{E}s_1$ / N_{oc}: -3.00dB $\hat{E}s_2$ / N_{oc}: +1.00dB	Test Tolerance 0dB +0.3dB 0dB
8.1.4 E-UTRAN TDD UE Rx-Tx time difference under Time Domain Measurement Resource Restriction with Non-MBSFN ABS (eICIC)	Same as 8.1.3	Same as 8.1.3
8.1.5 E-UTRAN FDD UE Rx–Tx time difference under Time Domain Measurement Resource Restriction with CRS Assistance Information and Non-MBSFN ABS (feICIC)	Parameters N_{oc}: -98dBm/15kHz $\hat{E}s_1$ / N_{oc}: -3.00dB $\hat{E}s_2$ / N_{oc}: +3.00dB $\hat{E}s_3$ / N_{oc}: +1.00dB	Test Tolerance 0dB +0.4dB 0dB 0dB
8.1.6 E-UTRAN TDD UE Rx–Tx time difference under Time Domain Measurement Resource Restriction	Same as 8.1.5	Same as 8.1.5

with CRS Assistance Information and Non-MBSFN ABS (feICIC)		
8.1.7 E-UTRAN FDD UE Rx-Tx time difference case for Category M1/M2 UE in CEModeA	Same as 8.1.1	Same as 8.1.1
8.1.8 E-UTRAN HD-FDD UE Rx-Tx time difference case for Category M1/M2 UE in CEModeA	Same as 8.1.1	Same as 8.1.1
8.1.9 E-UTRAN TDD UE Rx-Tx time difference case for Category M1/M2 UE in CEModeA	Same as 8.1.1	Same as 8.1.1
9.1.1 FDD RSTD Measurement Reporting Delay	Response time	300 ms
9.1.1A FDD RSTD Measurement Reporting Delay for UE Category 1bis	Response time	300 ms
9.1.2 TDD RSTD Measurement Reporting Delay	Response time	300 ms
9.1.2A TDD RSTD Measurement Reporting Delay for UE Category 1bis	Response time	300 ms
9.1.3 FDD RSTD Measurement Accuracy	For Test 2 and Test 4: PRS $\hat{E}s_1$ / N_{oc} averaged over BW_{Config} PRS $\hat{E}s_2$ / N_{oc} averaged over BW_{Config} For all tests: Cell Timing Difference	 +0.3 dB +0.3 dB ± 1 Ts
9.1.3A FDD RSTD Measurement Accuracy for UE Category 1bis	Same as 9.1.3	Same as 9.1.3
9.1.4 TDD RSTD Measurement Accuracy	Same as 9.1.3	Same as 9.1.3
9.1.4A TDD RSTD Measurement Accuracy for UE Category 1bis	Same as 9.1.3	Same as 9.1.3
9.2.1 FDD-FDD inter-frequency RSTD measurement reporting delay	Response time	300 ms
9.2.1A FDD-FDD inter-frequency RSTD measurement reporting delay for UE Category 1bis	Response time	300 ms
9.2.2 TDD-TDD inter-frequency RSTD measurement reporting delay	Response time	300 ms
9.2.2A TDD-TDD inter-frequency RSTD measurement reporting delay for UE Category 1bis	Response time	300 ms
9.2.4 FDD-FDD inter frequency RSTD Accuracy	PRS $\hat{E}s_1$ / N_{oc1} averaged over BW_{Config} PRS $\hat{E}s_2$ / N_{oc2} averaged over BW_{Config} Cell Timing Difference	+0.3 dB +0.3 dB ± 2 Ts
9.2.4A FDD-FDD inter frequency RSTD Accuracy for UE Category 1bis	Same as 9.2.4	Same as 9.2.4
9.2.5 TDD-TDD inter frequency RSTD Accuracy	Same as 9.2.4	Same as 9.2.4
9.2.5A TDD-TDD inter frequency RSTD Accuracy for UE Category 1bis	Same as 9.2.4	Same as 9.2.4
9.3.1.1 FDD intra-frequency RSTD Measurement Reporting Delay in CE Mode A for Category M1	Same as 9.1.1	Same as 9.1.1
9.3.1.2 FDD intra-frequency RSTD Measurement Reporting Delay in CE Mode A for Category M2	Same as 9.1.1	Same as 9.1.1
9.3.2.1 HD-FDD intra-frequency RSTD Measurement Reporting	Same as 9.1.1	Same as 9.1.1

Delay in CE Mode A for Category M1		
9.3.2.2 HD-FDD intra-frequency RSTD Measurement Reporting Delay in CE Mode A for Category M2	Same as 9.1.1	Same as 9.1.1
9.3.3.1 TDD intra-frequency RSTD Measurement Reporting Delay in CE Mode A for Category M1	Same as 9.1.1	Same as 9.1.1
9.3.3.2 TDD intra-frequency RSTD Measurement Reporting Delay in CE Mode A for Category M2	Same as 9.1.1	Same as 9.1.1
9.3.4.1 FDD intra-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M1	Same as 9.1.1	Same as 9.1.1
9.3.4.2 FDD intra-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M2	Same as 9.1.1	Same as 9.1.1
9.3.5.1 HD-FDD intra-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M1	Same as 9.1.1	Same as 9.1.1
9.3.5.2 HD-FDD intra-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M2	Same as 9.1.1	Same as 9.1.1
9.3.6.1 TDD intra-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M1	Same as 9.1.1	Same as 9.1.1
9.3.6.2 TDD intra-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M2	Same as 9.1.1	Same as 9.1.1
9.3.7.1 FDD intra-frequency RSTD Measurement Accuracy in CE Mode A for Category M1	Same as 9.1.3	Same as 9.1.3
9.3.7.2 FDD intra-frequency RSTD Measurement Accuracy in CE Mode A for Category M2	Same as 9.1.3	Same as 9.1.3
9.3.8.1 HD-FDD intra-frequency RSTD Measurement Accuracy in CE Mode A for Category M1	Same as 9.1.3	Same as 9.1.3
9.3.8.2 HD-FDD intra-frequency RSTD Measurement Accuracy in CE Mode A for Category M2	Same as 9.1.3	Same as 9.1.3
9.3.9.1 TDD intra-frequency RSTD Measurement Accuracy in CE Mode A for Category M1	Same as 9.1.3	Same as 9.1.3
9.3.9.2 TDD intra-frequency RSTD Measurement Accuracy in CE Mode A for Category M2	Same as 9.1.3	Same as 9.1.3
9.3.10.1 FDD intra-frequency RSTD Measurement Accuracy in CE Mode B for Category M1	Same as 9.1.3	Same as 9.1.3
9.3.10.2 FDD intra-frequency RSTD Measurement Accuracy in CE Mode B for Category M2	Same as 9.1.3	Same as 9.1.3
9.3.11.1 HD-FDD intra-frequency RSTD Measurement Accuracy in CE Mode B for Category M1	Same as 9.1.3	Same as 9.1.3
9.3.11.2 HD-FDD intra-frequency RSTD Measurement Accuracy in CE Mode B for Category M2	Same as 9.1.3	Same as 9.1.3
9.3.12.1 TDD intra-frequency RSTD Measurement Accuracy in CE Mode B for Category M1	Same as 9.1.3	Same as 9.1.3

9.3.12.2 TDD intra-frequency RSTD Measurement Accuracy in CE Mode B for Category M2	Same as 9.1.3	Same as 9.1.3
9.3.13 E-UTRAN FDD intra-frequency RSTD measurement period test case in CE Mode A with longer PRS occasions	Same as 9.1.3	Same as 9.1.3
9.3.14 E-UTRAN HD-FDD intra-frequency RSTD measurement period test case in CE Mode A with longer PRS occasions	Same as 9.1.3	Same as 9.1.3
9.3.15 E-UTRAN TDD intra-frequency RSTD measurement period test case in CE Mode A with longer PRS occasions	Same as 9.1.3	Same as 9.1.3
9.3.16 E-UTRAN FDD intra-frequency RSTD measurement period test case in CE Mode B with longer PRS occasions	Same as 9.1.3	Same as 9.1.3
9.3.17 E-UTRAN HD-FDD intra-frequency RSTD measurement period test case in CE Mode B with longer PRS occasions	Same as 9.1.3	Same as 9.1.3
9.3.18 E-UTRAN TDD intra-frequency RSTD measurement period test case in CE Mode B with longer PRS occasions	Same as 9.1.3	Same as 9.1.3
9.4.1.1 FDD inter-frequency RSTD Measurement Reporting Delay in CE Mode A for Category M1	Same as 9.2.1	Same as 9.2.1
9.4.1.2 FDD inter-frequency RSTD Measurement Reporting Delay in CE Mode A for Category M2	Same as 9.2.1	Same as 9.2.1
9.4.2.1 HD-FDD inter-frequency RSTD Measurement Reporting Delay in CE Mode A for Category M1	Same as 9.2.1	Same as 9.2.1
9.4.2.2 HD-FDD inter-frequency RSTD Measurement Reporting Delay in CE Mode A for Category M2	Same as 9.2.1	Same as 9.2.1
9.4.3.1 TDD inter-frequency RSTD Measurement Reporting Delay in CE Mode A for Category M1	Same as 9.2.1	Same as 9.2.1
9.4.3.2 TDD inter-frequency RSTD Measurement Reporting Delay in CE Mode A for Category M2	Same as 9.2.1	Same as 9.2.1
9.4.4.1 FDD inter-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M1	Same as 9.2.1	Same as 9.2.1
9.4.4.2 FDD inter-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M2	Same as 9.2.1	Same as 9.2.1
9.4.5.1 HD-FDD inter-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M1	Same as 9.2.1	Same as 9.2.1
9.4.5.2 HD-FDD inter-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M2	Same as 9.2.1	Same as 9.2.1
9.4.6.1 TDD inter-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M1	Same as 9.2.1	Same as 9.2.1
9.4.6.2 TDD inter-frequency RSTD Measurement Reporting Delay in CE Mode B for Category M2	Same as 9.2.1	Same as 9.2.1

9.4.7.1 FDD inter-frequency RSTD Measurement Accuracy in CE Mode A for Category M1	Same as 9.2.4	Same as 9.2.4
9.4.7.2 FDD inter-frequency RSTD Measurement Accuracy in CE Mode A for Category M2	Same as 9.2.4	Same as 9.2.4
9.4.8.1 HD-FDD inter-frequency RSTD Measurement Accuracy in CE Mode A for Category M1	Same as 9.2.4	Same as 9.2.4
9.4.8.2 HD-FDD inter-frequency RSTD Measurement Accuracy in CE Mode A for Category M2	Same as 9.2.4	Same as 9.2.4
9.4.9.1 TDD inter-frequency RSTD Measurement Accuracy in CE Mode A for Category M1	Same as 9.2.4	Same as 9.2.4
9.4.9.2 TDD inter-frequency RSTD Measurement Accuracy in CE Mode A for Category M2	Same as 9.2.4	Same as 9.2.4
9.4.10.1 FDD inter-frequency RSTD Measurement Accuracy in CE Mode B for Category M1	Same as 9.2.4	Same as 9.2.4
9.4.10.2 FDD inter-frequency RSTD Measurement Accuracy in CE Mode B for Category M2	Same as 9.2.4	Same as 9.2.4
9.4.11.1 HD-FDD inter-frequency RSTD Measurement Accuracy in CE Mode B for Category M1	Same as 9.2.4	Same as 9.2.4
9.4.11.2 HD-FDD inter-frequency RSTD Measurement Accuracy in CE Mode B for Category M2	Same as 9.2.4	Same as 9.2.4
9.4.12.1 TDD inter-frequency RSTD Measurement Accuracy in CE Mode B for Category M1	Same as 9.2.4	Same as 9.2.4
9.4.12.2 TDD inter-frequency RSTD Measurement Accuracy in CE Mode B for Category M2	Same as 9.2.4	Same as 9.2.4
9.4.13 E-UTRAN FDD inter-frequency RSTD measurement period test case in CE Mode A with longer PRS occasions	Same as 9.2.4	Same as 9.2.4
9.4.14 E-UTRAN HD-FDD inter-frequency RSTD measurement period test case in CE Mode A with longer PRS occasions	Same as 9.2.4	Same as 9.2.4
9.4.15 E-UTRAN TDD inter-frequency RSTD measurement period test case in CE Mode A with longer PRS occasions	Same as 9.2.4	Same as 9.2.4
9.4.16 E-UTRAN FDD inter-frequency RSTD measurement period test case in CE Mode B with longer PRS occasions	Same as 9.2.4	Same as 9.2.4
9.4.17 E-UTRAN HD-FDD inter-frequency RSTD measurement period test case in CE Mode B with longer PRS occasions	Same as 9.2.4	Same as 9.2.4
9.4.18 E-UTRAN TDD inter-frequency RSTD measurement period test case in CE Mode B with longer PRS occasions	Same as 9.2.4	Same as 9.2.4
9.5.1 HD-FDD Intra frequency RSTD Measurement Accuracy for NB-IOT Inband Mode in normal coverage	PRS $\hat{E}s_1$ / N_{oc} averaged over BW_{Config} PRS $\hat{E}s_2$ / N_{oc} averaged over BW_{Config} Cell Timing Difference	+0.3 dB +0.3 dB ± 1 Ts
9.5.2 HD-FDD Intra frequency RSTD Measurement Accuracy for	Same as 9.5.1	Same as 9.5.1

NB-IOT Inband Mode in enhanced coverage		
9.5.3 HD-FDD Intra frequency RSTD Measurement Reporting Delay for NB-IOT Inband Mode in enhanced coverage	Response time	300 ms
9.6.1 HD-FDD Inter-Frequency RSTD Measurement Accuracy for NB-IOT Inband Mode in normal coverage	PRS $\hat{E}s_1$ / N_{oc1} averaged over BW_{Config} PRS $\hat{E}s_2$ / N_{oc2} averaged over BW_{Config} Cell Timing Difference	+0.3 dB +0.3 dB ± 2 Ts
9.6.2 HD-FDD Inter-Frequency RSTD Measurement Accuracy for NB-IOT Inband Mode in enhanced coverage	Same as 9.6.1	Same as 9.6.1
9.6.3 HD-FDD Inter frequency RSTD Measurement Reporting Delay for NB-IOT Inband Mode in enhanced coverage	Response time	300 ms
9.7.1 TDD Intra frequency RSTD Measurement Accuracy for NB-IOT Inband Mode in normal coverage	PRS $\hat{E}s_1$ / N_{oc} averaged over BW_{Config} PRS $\hat{E}s_2$ / N_{oc} averaged over BW_{Config} Cell Timing Difference	+0.3 dB +0.3 dB ± 1 Ts
9.7.2 TDD Intra frequency RSTD Measurement Accuracy for NB-IOT Inband Mode in enhanced coverage	Same as 9.7.1	Same as 9.7.1
9.7.3 TDD Intra frequency RSTD Measurement Reporting Delay for NB-IOT Inband Mode in enhanced coverage	Response time	300 ms
9.8.1 TDD Inter-frequency RSTD Measurement Accuracy for NB-IOT Inband Mode in normal coverage	PRS $\hat{E}s_1$ / N_{oc1} averaged over BW_{Config} PRS $\hat{E}s_2$ / N_{oc2} averaged over BW_{Config} Cell Timing Difference	+0.3 dB +0.3 dB ± 2 Ts
9.8.2 TDD Inter-frequency RSTD Measurement Accuracy for NB-IOT Inband Mode in enhanced coverage	Same as 9.8.1	Same as 9.8.1
9.8.3 TDD Inter frequency RSTD Measurement Reporting Delay for NB-IOT Inband Mode in enhanced coverage	Response time	300 ms
10.1 FDD RSTD Measurement Reporting Delay for Carrier Aggregation	Response time	300 ms
10.1A FDD RSTD Measurement Reporting Delay for Carrier Aggregation for 20 MHz	Response time	300 ms
10.1B FDD RSTD Measurement Reporting Delay Carrier Aggregation for 5 MHz +5 MHz Bandwidth	Response time	300 ms
10.1C FDD RSTD Measurement Reporting Delay for Carrier Aggregation for 10 MHz+5 MHz Bandwidth	Response time	300 ms
10.2 TDD RSTD Measurement Reporting Delay for Carrier Aggregation	Response time	300 ms
10.2A TDD RSTD Measurement Reporting Delay for Carrier Aggregation for 20 MHz	Response time	300 ms

10.2B TDD RSTD Measurement Reporting Delay Carrier Aggregation for 5 MHz +5 MHz Bandwidth	Response time	300 ms
10.2C TDD RSTD Measurement Reporting Delay for Carrier Aggregation for 10 MHz+5 MHz Bandwidth	Response time	300 ms
10.2D TDD RSTD Measurement Reporting Delay for Carrier Aggregation for 20 MHz +10 MHz Bandwidth	Response time	300 ms
10.3 FDD RSTD Measurement Accuracy for Carrier Aggregation	PRS $\hat{E}_{s2}$ / N_{oc2} averaged over BW_{Config} PRS $\hat{E}_{s3}$ / N_{oc2} averaged over BW_{Config} Cell Timing Difference	+0.3 dB +0.3 dB ± 1 Ts
10.3A FDD RSTD Measurement Accuracy for Carrier Aggregation for 20 MHz (Rel-10 and Rel-11)	Same as 10.3	Same as 10.3
10.3A_1 FDD RSTD Measurement Accuracy for Carrier Aggregation for 20 MHz (Rel-12 onwards)	Same as 10.3	Same as 10.3
10.3B FDD RSTD Measurement Accuracy for Carrier Aggregation for 5MHz+5MHz Bandwidth	Same as 10.3	Same as 10.3
10.3C FDD RSTD Measurement Accuracy for Carrier Aggregation for 10MHz+5MHz Bandwidth	Same as 10.3	Same as 10.3
10.4 TDD RSTD Measurement Accuracy for Carrier Aggregation	Same as 10.3	Same as 10.3
10.4A TDD RSTD Measurement Accuracy for Carrier Aggregation for 20 MHz (Rel-10 and Rel-11)	Same as 10.3	Same as 10.3
10.4A_1 TDD RSTD Measurement Accuracy for Carrier Aggregation for 20 MHz (Rel-12 onwards)	Same as 10.3	Same as 10.3
10.4B TDD RSTD Measurement Accuracy for Carrier Aggregation for 5MHz+5MHz Bandwidth	Same as 10.3	Same as 10.3
10.4C TDD RSTD Measurement Accuracy for Carrier Aggregation for 10MHz+5MHz Bandwidth	Same as 10.3	Same as 10.3
10.4D TDD RSTD Measurement Accuracy for Carrier Aggregation for 20 MHz+10 MHz Bandwidth	Same as 10.3	Same as 10.3
10.5 FDD 3 DL CA RSTD Measurement Reporting Delay	Response time	300 ms
10.6 TDD 3 DL CA RSTD Measurement Reporting Delay	Response time	300 ms
10.7 FDD RSTD Measurement Accuracy for 3DL Carrier Aggregation	PRS $\hat{E}_{s3}$ / N_{oc3} averaged over BW_{Config} PRS $\hat{E}_{s4}$ / N_{oc3} averaged over BW_{Config} Cell Timing Difference (Intra-band) Cell Timing Difference (Inter-band)	+0.3 dB +0.3 dB ± 1 Ts ± 2 Ts
10.8 TDD RSTD Measurement Accuracy for 3DL Carrier Aggregation	Same as 10.7	Same as 10.7

C.2.3 MBS Minimum Performance requirements

Table C.2.3-1: Test Parameter Relaxations for MBS Minimum Performance tests

Clause	Test Parameter Relaxation	
11.1,11.1A MBS Measurement Reporting Delay	Beacon power level	0 dB (no relaxation)
	Response time	300 ms
11.2,11.2A MBS Sensitivity Measurement Accuracy	Beacon power level	2 dB
	Code phase difference	5 ns
11.3,11.3A MBS Nominal Measurement Accuracy	Beacon power level	0 dB (no relaxation)
	Code phase difference	5 ns
11.4,11.4A MBS Dynamic Range Measurement Accuracy	Beacon power level	2 dB
	Code phase difference	5 ns
11.5,11.5A MBS Measurement Accuracy in Multipath	Beacon power level	0 dB (no relaxation)
	Code phase difference	5 ns

C.2.4 WLAN and BLE measurement requirements

Table C.2.4-1: Test Parameter Relaxations for WLAN and BLE measurement tests

Clause	Test Parameter Relaxation	
12.1.1 WLAN AP Identification and reporting delay under nominal conditions	Response time	300 ms
12.1.2 WLAN AP Identification and reporting delay under dynamic range conditions	Response time	300 ms
	Low Power WLAN APs Received Power Level	1 dB
12.2.1 Bluetooth identification	Response time	300 ms

C.2.5 NR PRS-based Measurement requirements

Table C.2.5-1: Test Parameter Relaxations for NR PRS-based Measurement requirements

Clause	Test Parameter Relaxation	
14.2.1 NR RSTD measurement period test case for single positioning frequency layer in FR1 SA	Response time	300ms
14.2.2 NR RSTD measurement period test case for dual positioning frequency layers in FR1 SA	Response time	300ms
14.2.3 NR RSTD measurement period test case for single positioning frequency layer in FR2 SA	Response time	300ms
14.2.4 NR RSTD measurement period test case for dual positioning frequency layers in FR2 SA	Response time	300ms
14.2.5 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Response time	300ms
14.2.6 NR RSTD measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA	Response time	300ms
14.2.7 NR RSTD measurement reporting delay test case for single positioning frequency layer with Rx TEG in FR1 SA	Response time	300ms

14.2.8 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Response time	300ms
14.2.9 NR RSTD measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA	Response time	300ms
14.2.10 NR RSTD measurement reporting delay test case for single positioning frequency layer with Rx TEG in FR2 SA	Response time	300ms
14.2.11 NR RSTD measurement reporting delay test case for PRS aggregation in FR1	Response time	300ms
14.3.1 NR RSTD measurement accuracy test case for single positioning frequency layer in FR1 SA	Cell Timing Difference	32 Tc
14.3.2 NR RSTD measurement accuracy test case for dual positioning frequency layers in FR1 SA	Cell Timing Difference	32 Tc
14.3.3 NR RSTD measurement accuracy test case for single positioning frequency layer in FR2 SA	Same as 14.3.1	Same as 14.3.1
14.3.4 NR RSTD measurement accuracy test case for dual positioning frequency layer in FR2 SA	Same as 14.3.2	Same as 14.3.2
14.3.5 NR RSTD measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR1 SA	Cell Timing Difference	32 Tc
14.3.6 NR RSTD measurement accuracy test case for single positioning frequency layer with Rx TEG in FR1 SA	Cell Timing Difference	32 Tc
14.3.7 NR RSTD measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR2 SA	Cell Timing Difference	32 Tc
14.3.8 NR RSTD measurement accuracy test case for single positioning frequency layer with Rx TEG in FR2 SA	Cell Timing Difference	32 Tc
14.3.9 NR RSTD measurement accuracy test case for PRS aggregation in FR1 SA	Cell Timing Difference	32 Tc
14.4.1 NR RSTD measurement reporting delay test case for single positioning frequency layer in FR1 SA	Response time	300ms
14.4.2 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Response time	300ms
14.4.3 NR RSTD measurement reporting delay test case for single positioning frequency layer in FR2 SA	Response time	300ms
14.4.4 NR RSTD measurement reporting delay test case for single	Response time	300ms

positioning frequency layer with reduced number of samples in FR2 SA		
14.5.1 NR RSTD measurement accuracy test case for single positioning frequency layer in FR1 SA	Cell Timing Difference	32 Tc
14.5.2 NR RSTD measurement accuracy for single positioning frequency layer with reduced number of samples in FR1 SA	Cell Timing Difference	32 Tc
14.5.3 NR RSTD measurement accuracy test case for single positioning frequency layer in FR2 SA	Cell Timing Difference	32 Tc
14.5.4 NR RSTD measurement accuracy for single positioning frequency layer with reduced number of samples in FR2 SA	Cell Timing Difference	32 Tc
15.2.1 UE Rx-Tx time difference measurement period for single positioning frequency layer in FR1 SA	Response time	300ms
15.2.2 UE Rx-Tx time difference measurement period for dual positioning frequency layer in FR1 SA	Response time	300ms
15.2.3 UE Rx-Tx time difference measurement period for single positioning frequency layer in FR2 SA	Response time	300ms
15.2.4 UE Rx-Tx time difference measurement period for dual positioning frequency layer in FR2 SA	Response time	300ms
15.2.5 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Response time	300ms
15.2.6 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA	Response time	300ms
15.2.7 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with multiple RxTx TEGs in FR1 SA	Response time	300ms
15.2.8 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Response time	300ms
15.2.9 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA	Response time	300ms
15.2.10 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with RxTx TEG in FR2 SA	Response time	300ms
15.2.11 UE Rx-Tx time difference measurement reporting delay test	Response time	300ms

case for PRS aggregation in FR1 SA		
15.2.12 UE Rx-Tx time difference measurement reporting delay test case for PRS aggregation in FR2 SA	Response time	300ms
15.2.13 UE Rx-Tx time difference measurement reporting delay test case in FR1 for Redcap UE without Rx FH	Response time	300ms
15.2.14 UE Rx-Tx time difference measurement reporting delay test case in FR2 for Redcap UE without Rx FH	Response time	300ms
15.2.15 UE Rx-Tx time difference measurement reporting delay test case in FR1 for Redcap UE with Rx FH	Response time	300ms
15.2.16 UE Rx-Tx time difference measurement reporting delay test case in FR2 for Redcap UE with Rx FH	Response time	300ms
15.3.1 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR1 SA	Cell Timing Difference	32 Tc
15.3.2 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR2 SA	Cell Timing Difference	32 Tc
15.3.3 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with reduced number of samples in FR1 SA	Cell Timing Difference	32 Tc
15.3.4 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with RxTx TEG in FR1 SA	Cell Timing Difference	32 Tc
15.3.5 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with reduced number of samples in FR2 SA	Cell Timing Difference	32 Tc
15.3.6 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with RxTx TEG in FR2 SA	Cell Timing Difference	32 Tc
15.3.7 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR1 SA	Cell Timing Difference	32 Tc
15.3.8 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR2 SA	Cell Timing Difference	32 Tc
15.3.9 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE without Rx FH	Cell Timing Difference	32 Tc
15.3.10 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE without Rx FH	Cell Timing Difference	32 Tc
15.3.11 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE with Rx FH	Cell Timing Difference	32 Tc
15.3.12 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE with Rx FH	Cell Timing Difference	32 Tc
15.4.1 UE Rx-Tx time difference measurement reporting delay test	Response time	300ms

case for single positioning frequency layer in FR1 SA		
15.4.2 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Response time	300ms
15.4.3 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer in FR2 SA	Response time	300ms
15.4.4 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Response time	300ms
15.4.5 UE Rx-Tx time difference measurement reporting delay for PRS aggregation in FR1 SA	Response time	300ms
15.4.6 UE Rx-Tx time difference measurement reporting delay for PRS aggregation in FR2 SA	Response time	300ms
15.4.7 UE Rx-Tx time difference measurement reporting delay in FR1 for Redcap UE without Rx FH	Response time	300ms
15.4.8 UE Rx-Tx time difference measurement reporting delay in FR2 for Redcap UE without Rx FH	Response time	300ms
15.4.9 UE Rx-Tx time difference measurement reporting delay in FR1 for Redcap UE with Rx FH	Response time	300ms
15.4.10 UE Rx-Tx time difference measurement reporting delay in FR2 for Redcap UE with Rx FH	Response time	300ms
15.4.11 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for normal UE in FR1 SA	Response time	300ms
15.4.12 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for RedCap UE in FR1 SA	Response time	300ms
15.4.13 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for normal UE in FR2 SA	Response time	300ms
15.4.14 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for RedCap UE in FR2 SA	Response time	300ms
15.5.1 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR1 SA	Cell Timing Difference	32 Tc
15.5.2 UE Rx-Tx time difference measurement accuracy with reduced number of samples in FR1 SA	Cell Timing Difference	32 Tc
15.5.3 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR2 SA	Cell Timing Difference	33 Tc
15.5.4 UE Rx-Tx time difference measurement accuracy with reduced number of samples in FR2 SA	Cell Timing Difference	33 Tc

15.5.5 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR1 SA	Cell Timing Difference	33 Tc
15.5.6 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR2 SA	Cell Timing Difference	33 Tc
15.5.7 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE without Rx FH	Cell Timing Difference	33 Tc
15.5.8 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE without Rx FH	Cell Timing Difference	33 Tc
15.5.9 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE with Rx FH	Cell Timing Difference	32 Tc
15.5.10 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE with Rx FH	Cell Timing Difference	33 Tc
16.2.1 PRS-RSRP measurement period test case for single positioning frequency layer in FR1 SA	Response time	300ms
16.2.2 PRS-RSRP measurement period test case for dual positioning frequency layer in FR1 SA	Response time	300ms
16.2.3 PRS-RSRP measurement period test case for single positioning frequency layer in FR2 SA	Response time	300ms
16.2.4 PRS-RSRP measurement period test case for dual positioning frequency layer in FR2 SA	Response time	300ms
16.2.5 PRS-RSRP measurement reporting delay test case for single positioning frequency with reduced number of samples in FR1 SA	Response time	300ms
16.2.6 PRS-RSRP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA	Response time	300ms
16.3.1 PRS-RSRP measurement accuracy with PRS in FR1	All Test ConfigurationsTest 1: Reported absolute PRP values Reported relative PRP values Test 2: Reported absolute PRP values Reported relative PRP values	Test Configuration 1 and 2Test 1: Reported absolute PRP values: Cell 1 ±3.5, Cell 2: ±8.5. Reported relative PRP values: Cell 1 ±3.5, Cell 2: ±9.5. Test 2: Reported absolute PRP values: Cell 1 ±3.5, Cell 2: ±6. Reported relative PRP values: Cell 1 ±3.5, Cell 2: ±6.5. Test Configuration 3 Test 1: Reported absolute PRP values: Cell 1 ±3.5, Cell 2: ±8.5. Reported relative PRP values: Cell 1 ±3.5, Cell 2: ±9.5. Test 2: Reported absolute PRP values: Cell 1 ±3.5, Cell 2: ±4.5. Reported relative PRP values: Cell 1 ±3.5, Cell 2: ±5.

16.3.2 PRS-RSRP measurement accuracy with PRS in FR2	Test 1: Reported absolute PRP values Reported relative PRP values Test 2: Reported absolute PRP values Reported relative PRP values	Test 1: Reported absolute PRP values: ±8.5 Reported relative PRP values: ±10 Test 2: Reported absolute PRP values: ±6 Reported relative PRP values: ±7.5
16.3.3 PRS-RSRP measurement accuracy with PRS in FR1 with reduced sample number	Test 1: Reported absolute PRP values Reported relative PRP values Test 2: Reported absolute PRP values Reported relative PRP values	Test 1: Reported absolute PRP values: Cell 1 ±3.5, Cell 2: ±4.5. Reported relative PRP values: Cell 1 ±3.5, Cell 2: ±6.5. Test 2: Reported absolute PRP values: Cell 1 ±3.5, Cell 2: ±4.5. Reported relative PRP values: Cell 1 ±3.5, Cell 2: ±6.5
16.3.4 PRS-RSRP measurement accuracy with PRS in FR2 with reduced sample number	Test 1: Reported absolute PRP values Reported relative PRP values Reported absolute PRP values Reported relative PRP values	Test 1: Reported absolute PRP values: ±8.5 Reported relative PRP values: ±10 Reported absolute PRP values: ±6 Reported relative PRP values: ±7.5
16.4.1 PRS-RSRP measurement reporting delay test case for single positioning frequency layer in FR1 SA	Response time	300ms
16.4.2 PRS-RSRP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Response time	300ms
16.4.3 PRS-RSRP measurement reporting delay test case for single positioning frequency layer in FR2 SA	Response time	300ms
16.4.4 PRS-RSRP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Response time	300ms
16.5.1 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR1 SA	Test 1: Cell1 reported absolute PRP values Cell 1 reported relative PRP values Cell2 reported absolute PRP values Cell 2 reported relative PRP values Test 2: Cell1 reported absolute PRP values Cell 1 reported relative PRP values Cell2 reported absolute PRP values	Test 1: Cell 1 reported absolute PRP values: ±3.5 Cell 1 reported relative PRP values: ±3.5 Cell 2 reported absolute PRP values: ±8.5 Cell 2 reported relative PRP values: ±9.5 Test 2: Cell 1 reported absolute PRP values: ±3.5 Cell 1 reported relative PRP values: ±3.5 Cell 2 reported absolute PRP values: ±6

	Cell 2 reported relative PRP values	Cell 2 reported relative PRP values: ±6.5
16.5.2 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR1 with reduced sample number	Same as 16.5.1	Same as 16.5.1
16.5.3 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR2 SA	Test 1: Cell1 reported absolute PRP values Cell 1 reported relative PRP values Cell2 reported absolute PRP values Cell 2 reported relative PRP values Test 2: Cell1 reported absolute PRP values Cell 1 reported relative PRP values Cell2 reported absolute PRP values Cell 2 reported relative PRP values	Test 1: Cell 1 reported absolute PRP values: ±5 Cell 1 reported relative PRP values: ±5 Cell 2 reported absolute PRP values: ±8.5 Cell 2 reported relative PRP values: ±10 Test 2: Cell 1 reported absolute PRP values: ±5 Cell 1 reported relative PRP values: ±5 Cell 2 reported absolute PRP values: ±6 Cell 2 reported relative PRP values: ±7.5
16.5.4 PRS-RSRP measurement accuracy test case for single positioning frequency layer with PRS in FR2 with reduced sample number	Same as 16.5.3	Same as 16.5.3
17.2.1 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR1 SA	Response time	300ms
17.2.2 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Response time	300ms
17.2.3 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA	Response time	300ms
17.2.4 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR2 SA	Response time	300ms
17.2.5 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Response time	300ms
17.2.6 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA	Response time	300ms
17.3.1 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR1 SA	Test 1: Cell1 reported absolute PRS-RSRPP values Cell2 reported absolute PRS-RSRPP values Test 2: Cell1 reported absolute PRS-RSRPP values Cell2 reported absolute PRS-RSRPP values	Test 1: Cell 1 reported absolute PRS-RSRPP values: ±4.1 Cell 2 reported absolute PRS-RSRPP values: ±5.8 Test 2: Cell 1 reported absolute PRS-RSRPP values: ±4.1 Cell 2 reported absolute PRS-RSRPP values: ±4.9

17.3.2 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR1 SA	Cell1 reported absolute PRS-RSRPP values Cell2 reported absolute PRS-RSRPP values	Cell 1 reported absolute PRS-RSRPP values: ±3.9 Cell 2 reported absolute PRS-RSRPP values: ±4.2
17.3.3 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR2 SA	Test 1: Cell1 reported absolute PRS-RSRPP values Cell2 reported absolute PRS-RSRPP values Test 2: Cell1 reported absolute PRS-RSRPP values Cell2 reported absolute PRS-RSRPP values	Test 1: Cell 1 reported absolute PRS-RSRPP values: ±6 Cell 2 reported absolute PRS-RSRPP values: ±7.3 Test 2: Cell 1 reported absolute PRS-RSRPP values: ±6 Cell 2 reported absolute PRS-RSRPP values: ±6.2
17.3.4 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR2 SA	Cell1 reported absolute PRS-RSRPP values Cell2 reported absolute PRS-RSRPP values	Cell 1 reported absolute PRS-RSRPP values: ±5.9 Cell 2 reported absolute PRS-RSRPP values: ±5.6
17.4.1 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR1 SA	Response time	300ms
17.4.2 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Response time	300ms
17.4.3 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer in FR2 SA	Response time	300ms
17.4.4 PRS-RSRPP measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Response time	300ms
17.5.1 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR1 SA	Same as 17.3.1	Same as 17.3.1
17.5.2 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR1 SA	Same as 17.3.2	Same as 17.3.2
17.5.3 PRS-RSRPP measurement accuracy test case for single positioning frequency layer in FR2 SA	Same as 17.3.3	Same as 17.3.3
17.5.4 PRS-RSRPP measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR2 SA	Same as 17.3.4	Same as 17.3.4

C.3 Interpretation of measurement results

The measurement results returned by the Test System are compared - without any modification - against the Test Requirements as defined by the shared risk principle.

The Shared Risk principle is defined in TR 102 273-1-2 [7], clause 6.5.

The actual measurement uncertainty of the Test System for the measurement of each parameter shall be included in the test report.

The recorded value for the Test System uncertainty shall be, for each measurement, equal to or lower than the appropriate figure in clause C.1.

If the Test System for a test is known to have a measurement uncertainty greater than that specified in clause C.1, it is still permitted to use this apparatus provided that an adjustment is made value as follows.

Any additional uncertainty in the Test System over and above that specified in clause C.1 shall be used to tighten the Test Requirement - making the test harder to pass. (This may require modification of stimulus signals). This procedure will ensure that a Test System not compliant with clause C.1does not increase the chance of passing a device under test where that device would otherwise have failed the test if a Test System compliant with clause C.1 had been used.

C.4 Derivation of Test Requirements (This clause is informative)

The Test Requirements have been calculated by relaxing the Conformance requirement of the core specification using the Test Parameter Relaxations defined in clause C.2. When the Test Parameter Relaxation is zero, the Test Requirement will be the same as the Conformance requirement. When the Test Parameter Relaxation is non-zero, the Test Requirements will differ from the Conformance requirement, and the formula used for this relaxation is given in table C.4.1, C.4.2, C.4.3 and C.4.4.

Table C.4.1: Derivation of Test Requirements for A-GNSS Minimum Performance tests

Test	Conformance requirement in TS 25.171 [31] or TS 25.172 [19] or TS 36.171 [3] or 38.171 [43]		Test Parameter Relaxation (TPR)	Test Requirement
5.2.1, 6.2.1, 7.1.1, 13.2.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	±2 s	200 ms	Formulas: UL-TPR, LL+TPR: ±1.8 s
	Absolute GPS L1 C/A signal level (test 5.2.1, 7.1.1, 13.2.1, sub-test 1)	-142, -147 dBm	1 dB	Level + TPR: -141, -146 dBm
	Absolute GNSS signal level (Galileo)	-142, -147 dBm	1 dB	Level + TPR: -141, -146 dBm
	Absolute GNSS signal level (GPS) (test 6.2.1, 7.1.1, 13.2.1, sub-tests 4, 5, 8, and 10 to 13)	-142, -147 dBm	1 dB	Level + TPR: -141, -146 dBm
	Absolute GNSS signal level (GLONASS)	-142, -147 dBm	1 dB	Level + TPR: -141, -146 dBm
	Absolute GNSS signal level (BDS)	-136, -145 dBm	1 dB	Level + TPR: -135, -144 dBm
	Position error	100 m	1.3 m	Error +TPR: 101.3 m
	Response time	20 s	300 ms	Time + TPR: 20.3 s
5.2.2, 6.2.2, 7.1.2, 13.2.2 Sensitivity Fine Time Assistance	Coarse Time Assistance	±2 s	200 ms	Formulas: UL-TPR, LL+TPR: ±1.8 s
	Fine Time Assistance	±10 us	1 us	UL-TPR, LL+TPR: ±9 us
	Absolute GPS L1 C/A signal level (test 5.2.2, 7.1.2, 13.2.2, sub-test 1)	-147 dBm	1 dB	Level + TPR: -146 dBm
	Absolute GNSS signal level (Galileo)	-147 dBm	1 dB	Level + TPR: -146 dBm
	Absolute GNSS signal level (GPS) (test 6.2.2, 7.1.2, 13.2.2, sub-tests 4, 5, 8 and 10 to 13)	-147 dBm	1 dB	Level + TPR: -146 dBm
	Absolute GNSS signal level (GLONASS)	-147 dBm	1 dB	Level + TPR: -146 dBm
	Absolute GNSS signal level (BDS)	-147 dBm	1 dB	Level + TPR: -146 dBm
	Position error	100 m	1.3 m	Error +TPR: 101.3 m
	Response time	20 s	300 ms	Time + TPR: 20.3 s

Test	Conformance requirement in TS 25.171 [31] or TS 25.172 [19] or TS 36.171 [3] or 38.171 [43]		Test Parameter Relaxation (TPR)	Test Requirement
5.3, 6.3, 7.2, 13.3 Nominal Accuracy	Coarse Time Assistance	±2 s	200 ms	Formulas: UL-TPR, LL+TPR: ±1.8 s
	Absolute GPS L1 C/A signal level (test 5.3, 7.2, 13.3, sub-test 1)	-130 dBm	0 dB	Formulas: Level + TPR: -130 dBm
	Absolute GNSS signal level (Galileo)	-127 dBm	0 dB	Level + TPR: -127 dBm
	Absolute GNSS signal level (GPS) (test 6.3, 7.2, 13.3, sub-tests 4, 5, 8 and 10 to 13)	-128.5 dBm	0 dB	Level + TPR: -128.5 dBm
	Absolute GNSS signal level (GLONASS)	-131 dBm	0 dB	Level + TPR: -131 dBm
	Absolute GNSS signal level (QZSS)	-128.5 dBm	0 dB	Level + TPR: -128.5 dBm
	Absolute GNSS signal level (SBAS)	-131 dBm	0 dB	Level + TPR: -131 dBm
	Absolute GNSS signal level (BDS)	-133 dBm	0 dB	Level + TPR: -133 dBm
	Position error	30 m	1.3 m	Error +TPR: 31.3 m
	Response time	20 s	300 ms	Time + TPR: 20.3 s
5.4, 6.4, 7.3, 13.4 Dynamic Range	Coarse Time Assistance	±2 s	200 ms	Formulas: UL-TPR, LL+TPR: ±1.8 s
	Absolute GPS L1 C/A signal level (test 5.4, 7.3, 13.4, sub-test 1)	-129 to -147 dBm	1 dB	Level + TPR: each level +1 dBm
	Absolute GNSS signal level (Galileo)	-127.5 to -147 dBm	1 dB	Level + TPR: each level +1 dBm
	Absolute GNSS signal level (GPS) (test 6.4, 7.3, 13.4, sub-tests 4, 5, 8 and 10 to 13)	-129 to -147 dBm	1 dB	Level + TPR: each level +1 dBm
	Absolute GNSS signal level (GLONASS)	-131.5 to -147 dBm	1 dB	Level + TPR: each level +1 dBm
	Absolute GNSS signal level (BDS)	-133.5 to -145 dBm	1 dB	Level + TPR: each level +1 dBm
	Relative GPS L1 C/A signal level (test 5.4, 7.3, 13.4, sub-test 1)	18 dB	0.2 dB	Level - TPR: highest level -0.2 dB: -128.2 dBm
	Relative GNSS signal level (Galileo)	19.5 dB	0.2 dB	Level - TPR: highest level -0.2 dB: -126.7 dBm
	Relative GNSS signal level (GPS) (test 6.4, 7.3, 13.4, sub-tests 4, 5, 8 and 10 to 13)	18 dB	0.2 dB	Level - TPR: highest level -0.2 dB: -128.2 dBm
	Relative GNSS signal level (GLONASS)	15.5 dB	0.2 dB	Level - TPR: highest level -0.2 dB: -130.7 dBm
	Relative GNSS signal level (BDS)	11.5 dB	0.2 dB	Level - TPR: highest level -0.2 dB: -132.7 dBm
	Position error	100 m	1.3 m	Error +TPR: 101.3 m
	Response time	20 s	300 ms	Time + TPR: 20.3 s
5.5, 6.5, 7.4, 13.5 Multi-path scenario	Coarse Time Assistance	±2 s	200 ms	Formulas: UL-TPR, LL+TPR: ±1.8 s
	Absolute GPS L1 C/A signal level (test 5.5, 7.4, 13.5, sub-test 1)	-130 dBm	0 dB	Formulas: Level + TPR: -130 dBm
	Absolute GNSS signal level (Galileo)	-127 dBm	0 dB	Level + TPR: -127 dBm
	Absolute GNSS signal level (GPS) (test 6.5, 7.4, 13.5, sub-tests 4, 5, 8 and 10 to 13)	-128.5 dBm	0 dB	Level + TPR: -128.5 dBm

Test	Conformance requirement in TS 25.171 [31] or TS 25.172 [19] or TS 36.171 [3] or 38.171 [43]		Test Parameter Relaxation (TPR)	Test Requirement
	Absolute GNSS signal level (GLONASS)	-131 dBm	0 dB	Level + TPR: -131 dBm
	Absolute GNSS signal level (BDS)	-133 dBm	0 dB	Level + TPR: -133 dBm
	Relative GPS L1 C/A signal level (test 5.5, 7.4, 13.5, sub-test 1) -142, -147 dBm	6 dB	0.2 dB	Relative level + TPR: relative level + 0.2dB: 6.2 dB
	Relative GNSS signal level (all GNSSs) (test 6.5, 7.4, 13.5, sub-tests 4, 5, 8 and 10 to 13)	Y dB where "Y" is given in Table 4.2.2	0.2 dB	Relative level + TPR: relative level + 0.2dB: Y + 0.2 dB

Table C.4.3: Derivation of Test Requirements for MBS Minimum Performance tests

Test	Conformance requirements in 11.1.3, 11.2.3, 11.3.3, 11.4.3 and 11.5.3		Test Parameter Relaxation (TPR)	Test Requirement
11.1, 11.1A MBS Measurement Reporting Delay	Beacon power level	-30 dBm	0 dB	Level+TPR: -30 dBm
	Response time	12 seconds	300 ms	Time+TPR: 12.3 s
11.2 MBS Sensitivity Measurement Accuracy	Beacon power level	-130 dBm	2 dB	Level+TPR: -128 dBm
	Code phase difference	2.35×10^{-4} ms	5 ns	Error+TPR: 2.40×10^{-4} ms
11.2A MBS Sensitivity Measurement Accuracy	Beacon power level	-130 dBm	2 dB	Level+TPR: -128 dBm
	Code phase difference	2.35×10^{-4} ms	5 ns	Error+TPR: 2.40×10^{-4} ms
	Code phase difference	9.3×10^{-5} ms	5 ns	Error+TPR: 9.8×10^{-5} ms
11.3 MBS Nominal Measurement Accuracy	Beacon power level	-30 dBm	0 dB	Level+TPR: -30 dBm
	Code phase difference	7.1×10^{-5} ms	5 ns	Error+TPR: 7.6×10^{-5} ms
11.3A MBS Nominal Measurement Accuracy	Beacon power level	-30 dBm	0 dB	Level+TPR: -30 dBm
	TB1 Code phase difference	7.1×10^{-5} ms	5 ns	Error+TPR: 7.6×10^{-5} ms
	TB2 Code phase difference	2.8×10^{-5} ms	5 ns	Error+TPR: 3.3×10^{-5} ms
11.4 MBS Dynamic Range Measurement Accuracy	High Power Beacon power level	-30 dBm	0 dB	Level+TPR: -30 dBm
	Code phase difference	7.1×10^{-5} ms	5 ns	Error+TPR: 7.6×10^{-5} ms
	Low Power Beacon power level	-130 dBm	2 dB	Level+TPR: -128 dBm

Table C.4.4: Derivation of Test Requirements for WLAN and BLE measurement tests

Test	Conformance requirements in 12.1.1, 12.1.2 and 12.2.1	Test Parameter	Test Requirement

			Relaxation (TPR)	
12.1.1 WLAN AP Identification and reporting delay under nominal conditions	Response time	20.85 seconds	300 ms	Time+TPR: 21.15 s
12.1.2 WLAN AP Identification and reporting delay under dynamic range conditions	Response time	20.85 seconds	300 ms	Time+TPR: 21.15 s
	Low Power WLAN APs Received Power Level	WLAN 2.4 GHz band: -74 dBm WLAN 5 GHz band: -79 dBm	1 dB	Power+TPR: WLAN 2.4 GHz band: -73 dBm WLAN 5 GHz band: -78 dBm
12.2.1 Bluetooth identification	Response time	10.85 seconds	300 ms	Time+TPR: 11.15 s

Table C.4.5: Derivation of Test Requirements for NR RSTD Measurement tests

Test	Minimum Requirement in TS 38.133	Test Parameter Relaxation (TPR)	Test Requirement in TS 37.571-1
14.2.1 NR RSTD measurement period test case for single positioning frequency layer in FR1 SA	Response Time between 1 s and 210 s depending on UE capabilities	300 ms	Time + TPR: between 1.3 s and 210.3 s depending on UE capabilities
14.2.2 NR RSTD measurement period test case for dual positioning frequency layers in FR1 SA	Response Time between 2 s and 104 s depending on UE capabilities	300 ms	Time + TPR: between 2.3 s and 104.3 s depending on UE capabilities
14.2.3 NR RSTD measurement period test case for single positioning frequency layer in FR2 SA	Response Time between 6 s and 250 s depending on UE capabilities	300 ms	Time + TPR: between 6.3 s and 250.3 s depending on UE capabilities
14.2.4 NR RSTD measurement period test case for dual positioning frequency layers in FR2 SA	Response Time between 11 s and 210 s depending on UE capabilities	300 ms	Time + TPR: between 11.3 s and 210.3 s depending on UE capabilities
14.2.5 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Response Time between 1 s and 28 s depending on UE capabilities	300 ms	Time + TPR: between 1.3 s and 28.3 s depending on UE capabilities
14.2.6 NR RSTD measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA	Response Time between 1 s and 14 s depending on UE capabilities	300 ms	Time + TPR: between 1.3 s and 14.3 s depending on UE capabilities
14.2.7 NR RSTD measurement reporting delay test case for single positioning frequency layer with Rx TEG in FR1 SA	Response Time between 1 s and 870 s depending on UE capabilities	300 ms	Time + TPR: between 1.3 s and 870.3 s depending on UE capabilities
14.2.8 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Response Time between 2 s and 31 s depending on UE capabilities	300 ms	Time + TPR: between 2.3 s and 31.3 s depending on UE capabilities
14.2.9 NR RSTD measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA	Response Time between 5 s and 25 s depending on UE capabilities	300 ms	Time + TPR: between 5.3 s and 25.3 s depending on UE capabilities

14.2.10 NR RSTD measurement reporting delay test case for single positioning frequency layer with Rx TEG in FR2 SA	Response Time between 11 s and 500 s depending on UE capabilities	300 ms	Time + TPR: between 11.3 s and 500.3 s depending on UE capabilities
14.2.11 NR RSTD measurement reporting delay test case for PRS aggregation in FR1	Response Time between 3 s and 84 s depending on UE capabilities	300 ms	Time + TPR: between 3.3 s and 84.3 s depending on UE capabilities
14.3.1 NR RSTD measurement accuracy test case for single positioning frequency layer in FR1 SA	Cell Timing Difference = 3μs	32 Tc	Time + TPR: 3μs ± 32 Tc
14.3.2 NR RSTD measurement accuracy test case for dual positioning frequency layers in FR1 SA	Cell Timing Difference = 3μs	32 Tc	Time + TPR: 3μs ± 32 Tc
14.3.3 NR RSTD measurement accuracy test case for single positioning frequency layer in FR2 SA	Test 1: Cell Timing Difference = 3μs± 88 Tc Test 2: Cell Timing Difference = 3μs± 50 Tc	32 Tc	Test 1: Time + TPR: 3μs ± 120 Tc Test 2: Time + TPR: 3μs ± 82 Tc
14.3.4 NR RSTD measurement accuracy test case for dual positioning frequency layer in FR2 SA	Test 1: Cell Timing Difference = 3μs± 328 Tc Test 2: Cell Timing Difference = 3μs± 278 Tc	32 Tc	Test 1: Time + TPR: 3μs ± 360 Tc Test 2: Time + TPR: 3μs ± 310 Tc
14.3.5 NR RSTD measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR1 SA	Test Configuration 1 and 2 Test 1: Cell Timing Difference = 3μs±202 Tc Test 2: Cell Timing Difference = 3μs± 110 Tc Test Configuration 3 Test 1: Cell Timing Difference = 3μs±116 Tc Test 2: Cell Timing Difference = 3μs± 72 Tc	32 Tc	Test Configuration 1 and 2 Test 1: Time + TPR: 3μs ± 234 Tc Test 2: Time + TPR: 3μs ± 142 Tc Test Configuration 3 Test 1: Time + TPR: 3μs ± 148 Tc Test 2: Time + TPR: 3μs ± 104 Tc
14.3.6 NR RSTD measurement accuracy test case for single positioning frequency layer with Rx TEG in FR1 SA	Test Configuration 1 and 2 Test 1: Cell Timing Difference = 3μs±284 Tc Test 2: Cell Timing Difference = 3μs± 110 Tc Test Configuration 3 Test 1: Cell Timing Difference = 3μs±179 Tc Test 2: Cell Timing Difference = 3μs± 72 Tc	32 Tc	Test Configuration 1 and 2 Test 1: Time + TPR: 3μs ± 316 Tc Test 2: Time + TPR: 3μs ± 142 Tc Test Configuration 3 Test 1: Time + TPR: 3μs ± 211 Tc Test 2: Time + TPR: 3μs ± 104 Tc
14.3.7 NR RSTD measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR2 SA	Test 1: Cell Timing Difference = 3μs± 61 Tc Test 2: Cell Timing Difference = 3μs± 50 Tc	32 Tc	Test 1: Time + TPR: 3μs ± 93 Tc Test 2: Time + TPR: 3μs ± 82 Tc
14.3.8 NR RSTD measurement accuracy test case for single positioning	Test 1: Cell Timing Difference = 3μs±88 Tc	32 Tc	Test 1: Time + TPR: 3μs ± 120 Tc Test 2: Time + TPR: 3μs ± 82 Tc

frequency layer with Rx TEG in FR2 SA	Test 2: Cell Timing Difference = 3μs± 50 Tc		
14.3.9 NR RSTD measurement accuracy test case for PRS aggregation in FR1 SA	Test Configuration 1 and 2: Cell Timing Difference = 3μs ± 344Tc Test Configuration 3: Cell Timing Difference = 3μs ± 299Tc	32 Tc	Test Configuration 1 and 2: Time + TPR: 3μs ± 376Tc Test Configuration 3: Time + TPR: 3μs ± 331Tc
14.4.1 NR RSTD measurement reporting delay test case for single positioning frequency layer in FR1 SA	Response Time between 6 s and 109 s depending on UE capabilities	300 ms	Time + TPR: between 6.3 s and 109.3 s depending on UE capabilities
14.4.2 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Response Time between 2 s and 29 s depending on UE capabilities	300 ms	Time + TPR: between 2.3 s and 29.3 s depending on UE capabilities
14.4.3 NR RSTD measurement reporting delay test case for single positioning frequency layer in FR2 SA	Response Time between 21 s and 124 s depending on UE capabilities	300 ms	Time + TPR: between 21.3 s and 124.3 s depending on UE capabilities
14.4.4 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Response Time between 6 s and 32 s depending on UE capabilities	300 ms	Time + TPR: between 6.3 s and 32.3 s depending on UE capabilities
14.5.1 NR RSTD measurement accuracy test case for single positioning frequency layer in FR1 SA	Test Configuration 1 and 2 Test 1: Cell Timing Difference = 3μs±284 Tc Test 2: Cell Timing Difference = 3μs± 110 Tc Test Configuration 3 Test 1: Cell Timing Difference = 3μs±179 Tc Test 2: Cell Timing Difference = 3μs± 72 Tc	32 Tc	Test Configuration 1 and 2 Test 1: Time + TPR: 3μs ± 316 Tc Test 2: Time + TPR: 3μs ± 142 Tc Test Configuration 3 Test 1: Time + TPR: 3μs ± 211 Tc Test 2: Time + TPR: 3μs ± 104 Tc
14.5.2 NR RSTD measurement accuracy for single positioning frequency layer with reduced number of samples in FR1 SA	Test Configuration 1 and 2 Test 1: Cell Timing Difference = 3μs±202 Tc Test 2: Cell Timing Difference = 3μs± 110 Tc Test Configuration 3 Test 1: Cell Timing Difference = 3μs±116 Tc Test 2: Cell Timing Difference = 3μs± 72 Tc	32 Tc	Test Configuration 1 and 2 Test 1: Time + TPR: 3μs ± 234 Tc Test 2: Time + TPR: 3μs ± 142 Tc Test Configuration 3 Test 1: Time + TPR: 3μs ± 148 Tc Test 2: Time + TPR: 3μs ± 104 Tc
14.5.3 NR RSTD measurement accuracy test case for single positioning frequency layer in FR2 SA	Cell Timing Difference = 3μs	32 Tc	Time + TPR: 3μs ± 32 Tc

Table C.4.6: Derivation of Test Requirements for UE Rx–Tx time difference Measurement tests

Test	Minimum Requirement in TS 38.133	Test Parameter Relaxation (TPR)	Test Requirement in TS 37.571-1
15.2.1 UE Rx-Tx time difference measurement period for single positioning frequency layer in FR1 SA	Response Time between 1 s and 103 s depending on UE capabilities	300ms	Time + TPR: between 1.3 s and 103.3 s depending on UE capabilities
15.2.2 UE Rx-Tx time difference measurement period for dual positioning frequency layers in FR1 SA	Response Time between 2.3 s and 53.3 s depending on UE capabilities	300ms	Time + TPR: between 2.3 s and 53.3 s depending on UE capabilities
15.2.3 UE Rx-Tx time difference measurement period for single positioning frequency layer in FR2 SA	Response Time between 6 s and 170 s depending on UE capabilities	300ms	Time + TPR: between 6.3 s and 170.3 s depending on UE capabilities
15.2.4 UE Rx-Tx time difference measurement period for dual positioning frequency layers in FR2 SA	Response Time between 11 s and 84 s depending on UE capabilities	300ms	Time + TPR: between 11.3 s and 84.3 s depending on UE capabilities
15.2.5 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA	Response Time between 1 s and 52 s depending on UE capabilities	300ms	Time + TPR: between 1.3 s and 52.3 s depending on UE capabilities
15.2.6 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA	Response Time between 1 s and 205 s depending on UE capabilities	300ms	Time + TPR: between 1.3 s and 205.3 s depending on UE capabilities
15.2.7 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with multiple RxTx TEGs in FR1 SA	Response Time between 1 s and 164 s depending on UE capabilities	300ms	Time + TPR: between 1.3 s and 164.3 s depending on UE capabilities
15.2.8 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA	Response Time between 2 s and 21 s depending on UE capabilities	300ms	Time + TPR: between 2.3 s and 21.3 s depending on UE capabilities
15.2.9 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA	Response Time Sub-test 1: between 3 s and 21 s depending on UE capabilities Sub-test 2: between 6 s and 83 s depending on UE capabilities	300ms	Sub-test 1: Time + TPR: between 3.3 s and 21.3 s depending on UE capabilities Sub-test 2: Time + TPR: between 6.3 s and 83.3 s depending on UE capabilities

15.2.10 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with RxTx TEG in FR2 SA	Response Time between 11 s and 170 s depending on UE capabilities	300ms	Time + TPR: between 11.3 s and 170.3 s depending on UE capabilities
15.2.11 UE Rx-Tx time difference measurement reporting delay test case for PRS aggregation in FR1 SA	Response Time between 3 s and 42 s depending on UE capabilities	300ms	Time + TPR: between 3.3 s and 42.3 s depending on UE capabilities
15.2.12 UE Rx-Tx time difference measurement reporting delay test case for PRS aggregation in FR2 SA	Response Time between 42 s and 170 s depending on UE capabilities	300ms	Time + TPR: between 42.3 s and 170.3 s depending on UE capabilities
15.2.13 UE Rx-Tx time difference measurement reporting delay test case in FR1 for Redcap UE without Rx FH	Response Time between 2 s and 83 s depending on UE capabilities	300ms	Time + TPR: between 2.3 s and 83.3 s depending on UE capabilities
15.2.14 UE Rx-Tx time difference measurement reporting delay test case in FR2 for Redcap UE without Rx FH	Response Time between 11 s and 42 s depending on UE capabilities	300ms	Time + TPR: between 11.3 s and 42.3 s depending on UE capabilities
15.2.15 UE Rx-Tx time difference measurement reporting delay test case in FR1 for Redcap UE with Rx FH	Response Time between 2 s and 990 s depending on UE capabilities	300ms	Time + TPR: between 2.3 s and 990.3 s depending on UE capabilities
15.2.16 UE Rx-Tx time difference measurement reporting delay test case in FR2 for Redcap UE with Rx FH	Response Time between 11 s and 330 s depending on UE capabilities	300ms	Time + TPR: between 11.3 s and 330.3 s depending on UE capabilities
15.3.1 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR1 SA	Config 1 and Config 2: Sub-test 1: Cell Timing Difference = 3μs± 238 Tc Sub-test 2: Cell Timing Difference = 3μs± 86 Tc Config 3: Sub-test 1: Cell Timing Difference = 3μs± 137 Tc Sub-test 2: Cell Timing Difference = 3μs± 39 Tc	32 Tc	Config 1 and Config 2: Sub-test 1: Cell Timing Difference = 3μs± 270 Tc Sub-test 2: Cell Timing Difference = 3μs± 118 Tc Config 3: Sub-test 1: Cell Timing Difference = 3μs± 169 Tc Sub-test 2: Cell Timing Difference = 3μs± 71 Tc
15.3.2 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR2 SA	Sub-test 1: Cell Timing Difference = 3μs± 44 Tc Sub-test 2: Cell Timing Difference = 3μs± 24 Tc	32 Tc	Sub-test 1: Cell Timing Difference = 3μs± 76 Tc Sub-test 2: Cell Timing Difference = 3μs± 56 Tc
15.3.3 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with reduced number of samples in FR1 SA	Config 1 and Config 2: Sub-test 1: Cell Timing Difference = 3μs± 139 Tc Sub-test 2: Cell Timing Difference = 3μs± 155 Tc Config 3: Sub-test 1: Cell Timing Difference = 3μs± 86 Tc Sub-test 2: Cell Timing Difference = 3μs± 95 Tc	32 Tc	Config 1 and Config 2: Sub-test 1: Cell Timing Difference = 3μs± 171 Tc Sub-test 2: Cell Timing Difference = 3μs± 187 Tc Config 3: Sub-test 1: Cell Timing Difference = 3μs± 118 Tc Sub-test 2: Cell Timing Difference = 3μs± 127 Tc
15.3.4 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with RxTx TEG in FR1 SA	Config 1 and Config 2: Sub-test 1: Cell Timing Difference = 3μs± 292 Tc Sub-test 2: Cell Timing Difference = 3μs± 98 Tc Config 3: Sub-test 1: Cell Timing Difference = 3μs± 155 Tc	32 Tc	Config 1 and Config 2: Sub-test 1: Cell Timing Difference = 3μs± 324 Tc Sub-test 2: Cell Timing Difference = 3μs± 130 Tc Config 3: Sub-test 1: Cell Timing Difference = 3μs± 187 Tc

	Sub-test 2: Cell Timing Difference = 3μs± 48 Tc		Sub-test 2: Cell Timing Difference = 3μs± 80 Tc
15.3.5 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with reduced number of samples in FR2 SA	Cell Timing Difference = 3μs± 33 Tc	32 Tc	Time + TPR: 3μs ± 65 Tc
15.3.6 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with RxTx TEG in FR2 SA	Sub-test 1: Cell Timing Difference = 3μs± 56 Tc Sub-test 2: Cell Timing Difference = 3μs± 26 Tc	32 Tc	Sub-test 1: Cell Timing Difference = 3μs± 88 Tc Sub-test 2: Cell Timing Difference = 3μs± 58 Tc
15.3.7 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR1 SA	Config 1 and Config 2: Cell 1: Cell Timing Difference = 3μs± 38 Tc Cell 2: Cell Timing Difference = 3μs± 40 Tc Config 3: Cell 1: Cell Timing Difference = 3μs± 30 Tc Cell 2: Cell Timing Difference = 3μs± 32 Tc	32 Tc	Config 1 and Config 2: Cell 1: Cell Timing Difference = 3μs± 70 Tc Cell 2: Cell Timing Difference = 3μs± 72 Tc Config 3: Cell 1: Cell Timing Difference = 3μs± 62 Tc Cell 2: Cell Timing Difference = 3μs± 64 Tc
15.3.8 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR2 SA	Config 1: Cell 1: Cell Timing Difference = 3μs± 22 Tc Cell 2: Cell Timing Difference = 3μs± 22 Tc	32 Tc	Config 1: Cell 1: Cell Timing Difference = 3μs± 54 Tc Cell 2: Cell Timing Difference = 3μs± 54 Tc
15.3.9 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE without Rx FH	Config 1&2&4: Cell 1 for 2RX redcap UE: Cell Timing Difference = 3μs± 238 Tc Cell 1 for 1RX redcap UE: Cell Timing Difference = 3μs± 249 Tc Cell 2 for 2RX redcap UE: Cell Timing Difference = 3μs± 262 Tc Cell 2 for 1RX redcap UE: Cell Timing Difference = 3μs± 258 Tc Config 3: Cell 1 for 2RX redcap UE: Cell Timing Difference = 3μs± 137 Tc Cell 1 for 1RX redcap UE: Cell Timing Difference = 3μs± 129 Tc Cell 2 for 2RX redcap UE: Cell Timing Difference = 3μs± 138 Tc Cell 2 for 1RX redcap UE: Cell Timing Difference = 3μs± 135 Tc	32 Tc	Config 1&2&4: Cell 1 for 2RX redcap UE: Cell Timing Difference = 3μs± 270 Tc Cell 1 for 1RX redcap UE: Cell Timing Difference = 3μs± 281 Tc Cell 2 for 2RX redcap UE: Cell Timing Difference = 3μs± 293 Tc Cell 2 for 1RX redcap UE: Cell Timing Difference = 3μs± 290 TcConfig 3: Config 3: Cell 1 for 2RX redcap UE: Cell Timing Difference = 3μs± 169 Tc Cell 1 for 1RX redcap UE: Cell Timing Difference = 3μs± 161 Tc Cell 2 for 2RX redcap UE: Cell Timing Difference = 3μs± 170 Tc Cell 2 for 1RX redcap UE: Cell Timing Difference = 3μs± 167 Tc
15.3.10 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE without Rx FH	Config 1: Cell 1: Cell Timing Difference = 3μs±31 Tc Cell 2: Cell Timing Difference = 3μs± 33 Tc	32 Tc	Config 1: Cell 1: Cell Timing Difference = 3μs± 63 Tc Cell 2: Cell Timing Difference = 3μs± 65 Tc

Table C.4.7: Derivation of Test Requirements for PRS-RSRP Measurement tests

Test	Minimum Requirement in TS 38.133	Test Parameter Relaxation (TPR)	Test Requirement in TS 37.571-1
16.2.1 PRS-RSRP measurement period test case for single positioning frequency layer in FR1 SA	Response Time between 1 s and 210 s depending on UE capabilities	300 ms	Time + TPR: between 1.3 s and 210.3 s depending on UE capabilities
16.2.2 PRS-RSRP measurement period test case for dual positioning frequency layer in FR1 SA	Response Time between 2 s and 104 s depending on UE capabilities	300 ms	Time + TPR: between 2.3 s and 104.3 s depending on UE capabilities
16.2.3 PRS-RSRP measurement period test case for single positioning frequency layer in FR2 SA	Response Time between 6 s and 170 s depending on UE capabilities	300ms	Time + TPR: between 6.3 s and 170.3 s depending on UE capabilities
16.2.4 PRS-RSRP measurement period test case for dual positioning frequency layer in FR2 SA	Response Time between 11 s and 84 s depending on UE capabilities	300ms	Time + TPR: between 11.3 s and 84.3 s depending on UE capabilities
16.2.5 PRS-RSRP measurement reporting delay test case for single positioning frequency with reduced number of samples in FR1 SA	Response Time between 1 s and 52 s depending on UE capabilities	300ms	Time + TPR: between 1.3 s and 52.3 s depending on UE capabilities
16.2.6 PRS-RSRP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA	Response Time between 1 s and 7 s depending on UE capabilities	300ms	Time + TPR: between 1.3 s and 205.3 s depending on UE capabilities
16.2.7 PRS-RSRP measurement reporting delay test case for single positioning frequency with	Response Time between 2 s and 21 s depending on UE capabilities	300ms	Time + TPR: between 2.3 s and 21.3 s depending on UE capabilities

reduced number of samples in FR2 SA			
16.2.8 PRS-RSRP measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA	Response Time Sub-test 1: between 2 s and 21 s depending on UE capabilities Sub-test 2: between 6 s and 83 s depending on UE capabilities	300ms	Sub-test 1: Time + TPR: between 2.3 s and 21.3 s depending on UE capabilities Sub-test 2: Time + TPR: between 6.3 s and 83.3 s depending on UE capabilities
16.3.1 PRS-RSRP measurement accuracy with PRS in FR1	Absolute power, log: -98 dBm/15Hz PRS Es/Noc Cell#1: -2 PRS Es/Noc Cell#2: -10 Test Configuration 1 and 2 Test 1 Reported absolute PRP1 values: ±3.5 Reported relative PRP1 values: ±3.5 Reported absolute PRP2 values: ±8.5 Reported relative PRP2 values: ±9.5 Test2 Reported absolute PRP1 values: ±3.5 Reported relative PRP1 values: ±3.5 Reported absolute PRP2 values: ±6 Reported relative PRP2 values: ±6.5 Test Configuration 3 Test 1 Reported absolute PRP1 values: ±3.5 Reported relative PRP1 values: ±3.5 Reported absolute PRP2 values: ±8.5 Reported relative PRP2 values: ±9.5 Test2 Reported absolute PRP1 values: ±3.5 Reported relative PRP1 values: ±3.5 Reported absolute PRP2 values: ±4.5 Reported relative PRP2 values: ±5	0 0 0 Via mapping	Absolute power, log: -98 dBm/15Hz PRS Es/Noc Cell#1: -2 PRS Es/Noc Cell#2: -10 Test Configuration 1 and 2 Test 1 Reported absolute PRP1 : PRS_RSRP_51 to PRS_RSRP_62 Reported relative PRP1 : DIFFRSRP_27 to DIFFRSRP_30 Reported absolute PRP2 : PRS_RSRP_38 to PRS_RSRP_59 Reported relative PRP2 : DIFFRSRP_21 to DIFFRSRP_30 Test 2 Reported absolute PRP1 : PRS_RSRP_51 to PRS_RSRP_62 Reported relative PRP1 : DIFFRSRP_27 to DIFFRSRP_30 Reported absolute PRP2 : PRS_RSRP_41 to PRS_RSRP_56 Reported relative PRP2 : DIFFRSRP_24 to DIFFRSRP_30 Test Configuration 3 Test 1 Reported absolute PRP1 : PRS_RSRP_54 to PRS_RSRP_65 Reported relative PRP1 : DIFFRSRP_27 to DIFFRSRP_30 Reported absolute PRP2 : PRS_RSRP_41 to PRS_RSRP_62 Reported relative PRP2 : DIFFRSRP_21 to DIFFRSRP_30 Test 2 Reported absolute PRP1 : PRS_RSRP_54 to PRS_RSRP_65 Reported relative PRP1 : DIFFRSRP_27 to DIFFRSRP_30 Reported absolute PRP2 : PRS_RSRP_45 to PRS_RSRP_58 Reported relative PRP2 : DIFFRSRP_25 to DIFFRSRP_30
16.3.2 PRS-RSRP measurement accuracy with PRS in FR2	Test 1: Reported absolute PRP1 values: ±8.5 Reported relative PRP1 values: ±10 Reported absolute PRP2 values: ±8.5 Reported relative PRP2 values: ±10 Test 2: Reported absolute PRP1 values: ±6	Via mapping	Test 1: Reported absolute PRP1 : PRS_RSRP_54 to PRS_RSRP_85 Reported relative PRP1 : DIFFRSRP_22 to DIFFRSRP_30 Reported absolute PRP2 : PRS_RSRP_46 to PRS_RSRP_77 Reported relative PRP2 : DIFFRSRP_20 to DIFFRSRP_30 Test 2:

Annex D (normative): Rules for statistical testing

D.1 Test Method

In this clause the terms GNSS and A-GNSS also include the cases where the only satellite system used is GPS unless otherwise stated.

Each test is performed in the following manner:

a) Setup the required test conditions.

b) Start each repetition after having applied the message 'RESET UE POSITIONING STORED INFORMATION'. This ensures that each result is independent from the previous one.

c) Make the required measurement a repeated number of times. The results, measured, are simplified to:

good result, if the measured result is ≤ limit.

bad result, if the measured result is > limit

For the relevant A-GNSS test cases measure the 2D position and Time to First Fix (TTFF) a repeated number of times. Measure the 2D position and Time to First Fix (if applicable) repeated times. Start each repetition after having applied the message 'RESET UE POSITIONING STORED INFORMATION'. This ensures that each result is independent from the previous one. The results, measured, are simplified to:

good result, if the 2D position and TTFF are ≤ limit.

bad result, if the 2D position or TTFF or both are > limit

d) Record the number of results (ns) and the number of bad results (ne)

e) Stop the test at a pass or a fail event.

f) Once the test is stopped, decide according to the pass fail decision rules (D.4.2)

D.2 Error Ratio (ER)

The Error Ratio (ER) is defined as the ratio of bad results (ne) to all results (ns).

(1-ER is the success ratio)

D.3 Test Design

A statistical test is characterised by:

Test-time, Selectivity and Confidence level

D.3.1 Confidence level

The outcome of a statistical test is a decision. This decision may be correct or in-correct. The Confidence Level CL describes the probability that the decision is a correct one. The complement is the wrong decision probability (risk) D = 1-CL

D.3.2 Introduction: Supplier Risk versus Customer Risk

There are two targets of decision:

a) A measurement on the pass-limit shows, that the DUT has the specified quality or is better with probability CL (CL e.g.95%) This shall lead to a “pass decision”

The pass-limit is on the good side of the specified DUT-quality. A more stringent CL (CL e.g.99%) shifts the pass-limit further into the good direction. Given that the quality of the DUTs is distributed, a greater CL passes less and better DUTs.

A measurement on the bad side of the pass-limit is simply “not pass” (undecided)

aa) Complementary:

A measurement on the fail-limit shows, that the DUT is worse than the specified quality with probability CL.

The fail-limit is on the bad side of the specified DUT-quality. A more stringent CL shifts the fail-limit further into the bad direction. Given that the quality of the DUTs is distributed, a greater CL fails less and worse DUTs.

A measurement on the good side of the fail-limit is simply “not fail”.

b) A DUT, known to have the specified quality, shall be measured and decided pass with probability CL. This leads to the pass limit.

For CL e.g. 95%, the pass limit is on the bad side of the specified DUT-quality. CL e.g.99% shifts the pass-limit further into the bad direction. Given that the DUT-quality is distributed, a greater CL passes more and worse DUTs.

bb) A DUT, known to be an ($\varepsilon \rightarrow 0$) beyond the specified quality, shall be measured and decided fail with probability CL.

For CL e.g.95%, the fail limit is on the good side of the specified DUT-quality.

Note the different sense for CL in (a), (aa) versus (b), (bb).

NOTE: For constant CL in all 4 bullets, (a) is equivalent to (bb) and (aa) is equivalent to (b).

D.3.3 Supplier Risk versus Customer Risk

The table below summarizes the different targets of decision.

Table D.3.3: Equivalent statements

	Equivalent statements, using different cause-to-effect-directions, and assuming CL = constant >0.5	
cause-to-effect-directions	Known measurement result → estimation of the DUT’s quality	Known DUT’s quality → estimation of the measurement’s outcome
Supplier Risk	**A measurement on the pass-limit shows, that the DUT has the specified quality or is better (a)**	A DUT, known to have an ($\varepsilon \rightarrow 0$) beyond the specified DUT-quality, shall be measured and decided fail (bb)
Customer Risk	A measurement on the fail-limit shall shows, that the DUT is worse than the specified quality (aa)	**A DUT, known to have the specified quality, shall be measured and decided pass (b)**

NOTE: The bold text shows the obvious interpretation of Supplier Risk and Customer Risk. The same statements can be based on other DUT-quality-definitions.

D.3.4 Introduction: Standard test versus early decision concept

In standard statistical tests, a certain number of results (ns) is predefined in advance of the test. After ns results the number of bad results (ne) is counted and the error ratio (ER) is calculated as ne/ns.

Applying statistical theory, a decision limit can be designed, against which the calculated ER is compared to derive the decision. Such a limit is one decision point and is characterised by:

- D: the wrong decision probability (a predefined parameter)
- ns: the number of results (a fixed predefined parameter)
- ne: the number of bad results (the limit based on just ns)

In the formula for the limit, D and ns are parameters and ne is the variable. In the standard test ns and D are constant. The property of such a test is: It discriminates between two states only, depending on the test design:

- pass (with CL) / undecided (undecided in the sense: finally undecided)
- fail (with CL) / undecided (undecided in the sense: finally undecided)
- pass (with CL) / fail (with CL) (however against two limits).

In contrast to the standard statistical tests, the early decision concept predefines a set of (ne, ns) co-ordinates, representing the limit-curve for decision. After each result a preliminary ER is calculated and compared against the limit-curve. After each result one may make the decision or not (undecided for later decision). The parameters and variables in the limit-curve for the early decision concept have a similar but not equal meaning:

- D: the wrong decision probability (a predefined parameter)
- ns: the number of results (a variable parameter)
- ne: the number of bad results (the limit. It varies together with ns)

To avoid a “final undecided” in the standard test, a second limit must be introduced and the single decision co-ordinate (ne, ns) needs a high ne, leading to a fixed (high) test time. In the early decision concept, having the same selectivity and the same confidence level an “undecided” does not need to be avoided, as it can be decided later. A perfect DUT will hit the decision coordinate (ne, ns) with ne=0. This test time is short.

D.3.5 Standard test versus early decision concept

For Supplier Risk:
The wrong decision probability D in the standard test is the probability, to decide a DUT in-correctly in the single decision point. In the early decision concept there is a probability of in-correct decisions d at each point of the limit-curve. The sum of all those wrong decision probabilities accumulate to D. Hence $d<D$

For Customer Risk:
The correct decision probability CL in the standard test is the probability, to decide a DUT correctly in the single decision point. In the early decision concept there is a probability of correct decisions cl at each point of the limit-curve. The sum of all those correct decision probabilities accumulate to CL. Hence $cl<CL$ or $d>D$

D.3.6 Selectivity

There is no statistical test which can discriminate between a limit-DUT-quality and a DUT-quality which is an ($\varepsilon \rightarrow 0$) apart from the limit in finite time and confidence level $CL>1/2$. Either the test discriminates against one limit with the results pass (with CL)/undecided or fail (with CL)/undecided, or the test ends in a result pass (with CL)/fail (with CL) but this requires a second limit.

For $CL>0.5$, a (measurement-result = specified-DUT-quality), generates undecided in test “supplier risk against pass limit” (a in clause D.3.2) and also in the equivalent test against the fail limit (aa in clause D.3.2)

For $CL>0.5$, a DUT, known to be on the limit, will be decided pass for the test “customer risk against pass limit” (b in clause D.3.2) and also in the equivalent test against fail limit (bb in clause D.3.2).

This overlap or undecided area is not a fault or a contradiction, however it can be avoided by introducing a Bad or a Good DUT quality according to:

- Bad DUT quality: specified DUT-quality * M ($M>1$)
- Good DUT quality: specified DUT-quality * m ($m<1$)

Using e.g. $M>1$ and CL=95% the test for different DUT qualities yield different pass probabilities:

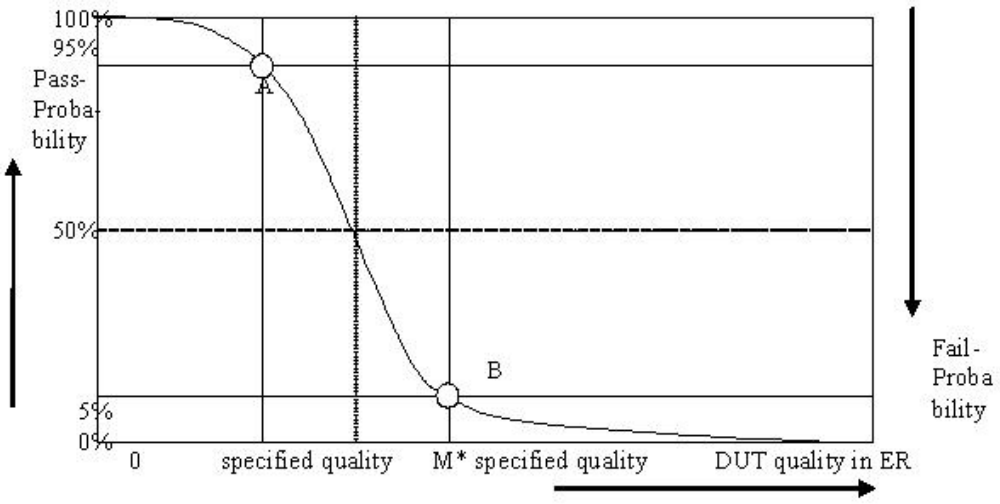

Figure D.3.6: Pass probability versus DUT quality

D.3.7 Design of the test

The test is defined according to the following design principles:

1. The early decision concept is applied.
2. A second limit is introduced: Bad DUT factor M>1
3. To decide the test pass:

   Supplier risk is applied based on the Bad DUT quality

To decide the test fail

   Customer Risk is applied based on the specified DUT quality

The A-GNSS test cases are defined using the following parameters:

1. Specified DUT quality: ER = 0.05
2. Bad DUT quality: M=1.5 (selectivity)
3. Confidence level CL = 95% (for specified DUT and Bad DUT-quality)

The ECID and OTDOA test cases are defined using the following parameters:

1. Specified DUT quality: ER = 0.1
2. Bad DUT quality: M=1.5 (selectivity)
3. Confidence level CL = 95% (for specified DUT and Bad DUT-quality)

This has the following consequences:

a) A measurement on the fail limit is connected with 2 equivalent statements:

A measurement on the fail-limit shows, that the DUT is worse than the specified DUT-quality	A DUT, known to have the specified quality, shall be measured and decided pass

A measurement on the pass limit is connected with the complementary statements:

A measurement on the pass limit shows, that the DUT is better than the Bad DUT-quality.	A DUT, known to have the Bad DUT quality, shall be measured and decided fail

The left column is used to decide the measurement.

The right column is used to verify the design of the test by simulation.

The simulation is based on the two fulcrums A and B only in Figure D.3.6. There is freedom to shape the remainder of the function.

b) Test time

1. The minimum and maximum test time is fixed.
2. The average test time is a function of the DUT's quality.
3. The individual test time is not predictable (except ideal DUT).

c) The number of decision co-ordinates (ne, ns) in the early decision concept is responsible for the selectivity of the test and the maximum test time. Having fixed the number of decision co-ordinates there is still freedom to select the individual decision co-ordinates in many combinations, all leading to the same confidence level.

D.4 Pass fail decisions

D.4.1 Numerical definition of the pass fail limits for A-GNSS test cases

Table D.4.1: Pass/fail limits for A-GNSS test cases

The third column is the number of results for the fail limit (ns_f)

D.4.2 Pass fail decision rules for A-GNSS test cases

Having observed 0 bad results, pass the test at ≥77 results, otherwise continue

Having observed 1 bad result, pass the test at ≥106 results, otherwise continue

Having observed 2 bad results, pass the test at ≥131 results, otherwise continue

etc. until

Having observed 6 bad results, pass the test at ≥218 results, fail the test at ≤ 42 results, otherwise continue

Having observed 7 bad results, pass the test at ≥238 results, fail the test at ≤ 52 results, otherwise continue

etc. until

Having observed 168 bad results, pass the test at ≥2751 results, fail the test at ≤2747 results, otherwise continue

Having observed 169 bad results, pass the test at ≥2765 results, otherwise fail

NOTE: an ideal DUT passes after 77 results. The maximum test time is 2765 results.

The first column is the number of errors (ne = number of exceeded delays or number of wrong reports)

The second column is the number of samples for the pass limit (ns_p , ns=Number of samples= number of successes + number of exceedings or number of reports)

The third column is the number of samples for the fail limit (ns_f)

D.4.4 Pass fail decision rules for ECID, OTDOA, MBS, WLAN and BLE test cases

Having observed 0 errors, pass the test at 33+ samples, otherwise continue

Having observed 1 error, pass the test at 46+ samples, otherwise continue

Having observed 2 errors, pass the test at 58+ samples, fail the test at 2 samples, otherwise continue

Having observed 146 errors, pass the test at 1181+ samples, fail the test at 1173- samples, otherwise continue

Having observed 147 errors, fail the test at 1182- samples,

Where x+ means: x or more, x- means x or less

NOTE: an ideal DUT passes after 33 samples. The maximum test time is 1181 samples.

D.4.5 Background information to the pass fail limits

There is freedom to design the decision co-ordinates (ne, ns).

The binomial distribution and its inverse is used to design the pass and fail limits. Note that this method is not unique and that other methods exist.

$$fail(ne, d_f) := \frac{ne}{(ne + qnbinom(d_f, ne, ER))}$$

$$pass(ne, cl_p, M) := \frac{ne}{(ne + qnbinom(cl_p, ne, ER \cdot M))}$$

Where

fail(..) is the error ratio for the fail limit

pass(..) is the error ratio for the pass limit

ER is the specified error ratio e.g. 0.05

ne is the number of bad results. This is the variable in both equations

M is the Bad DUT factor M=1.5

d_f is the wrong decision probability of a single (ne, ns) co-ordinate for the fail limit.
It is found by simulation to be $d_f = 0.004$

cl_p is the confidence level of a single (ne, ns) co-ordinate for the pass limit.
It is found by simulation to be $cl_p = 0.9975$

qnbinom(..): The inverse cumulative function of the negative binomial distribution

The simulation works as follows:

A large population of limit DUTs with true ER = 0.05 is decided against the pass and fail limits.

cl_p and d_f are tuned such that CL (95%) of the population passes and D (5%) of the population fails.

A population of Bad DUTs with true ER = M*0.05 is decided against the same pass and fail limits.

cl_p and d_f are tuned such that CL (95%) of the population fails and D (5%) of the population passes.

This procedure and the relationship to the measurement is justified in clause D.3.7. The number of DUTs decreases during the simulation, as the decided DUTs leave the population. That number decreases with an approximately exponential characteristic. After 169 bad results all DUTs of the population are decided.

NOTE: The exponential decrease of the population is an optimal design goal for the decision co-ordinates (ne, ns), which can be achieved with other formulas or methods as well.

Annex E (normative): Conditions for ECID and OTDOA requirements

E.1 Conditions for E-CID UE Rx – Tx time difference Measurements

This clause defines the E-UTRAN RSRP applicable for ECID UE Rx-Tx time difference Measurements for a corresponding operating band

The conditions for E-UTRAN ECID UE Rx-Tx time difference measurements are as defined in Table E.1-1.

Table E.1-1: Conditions for ECID UE Rx-Tx time difference measurements

Parameter	E-UTRA operating band groups Note 3	Minimum RSRP Note 1
		dBm/15kHz
Conditions	FDD_A, TDD_A	-127
	FDD_B	-126.5
	FDD_C, TDD_C	-126
	FDD_D	-125.5
	FDD_E, TDD_E	-125
	FDD_F	-124.5 Note 2
	FDD_G	-124
	FDD_H	-123.5
	FDD_N	-120.5
NOTE 1: This condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3 of TS 36.133 [23].		
NOTE 2: The condition is -125 dBm/15kHz when the carrier frequency of the assigned E-UTRA channel bandwidth is within 865-894 MHz.		
NOTE 3: E-UTRA operating band groups are as defined in clause 4.4.2.		

E.1.1 Conditions for E-CID UE Rx – Tx time difference by UE Category M1/M2

This clause defines the E-UTRAN RSRP applicable for ECID UE Rx-Tx time difference Measurements for a corresponding operating band for UE Category M1 and M2.

The conditions for CE mode A intra-frequency E-UTRAN FDD, HD-FDD and TDD measurements are defined in Table E.1.1-1.

Table B.2.14-1: E-UTRAN ECID UE Rx-Tx time difference measurements for FDD, HD-FDD and TDD for CE mode A

Parameter	E-UTRA operating band groups Note 3	Minimum RSRP Note 1
		dBm/15kHz
Conditions	FDD-M1_A, TDD-M1_A	-127
	FDD-M1_D	-125.5
	FDD-M1_E, TDD-M1_E	-125
	FDD-M1_F	-124.5 Note 2
	FDD-M1_G	-124
	FDD-M1_N	-120.5
NOTE 1: This condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3 of TS 36.133 [23].		
NOTE 2: The condition is -125 dBm/15kHz when the carrier frequency of the assigned E-UTRA channel bandwidth is within 865-894 MHz.		
NOTE 3: E-UTRA operating band groups are as defined in clause 4.4.2.		

E.2 Conditions for OTDOA intra-frequency RSTD Measurements

This clause defines the E-UTRAN intra-frequency PRP_1,2 applicable for OTDOA intra-frequency RSTD measurements for a corresponding operating band.

The conditions for E-UTRAN OTDOA intra-frequency RSTD measurements are as defined in Table E.2-1

Table E.2-1: Conditions for OTDOA intra-frequency RSTD measurements

Parameter	E-UTRA operating band groups Note 3	Minimum PRP1,2 Note 1
		dBm/15kHz
Conditions	FDD_A, TDD_A	-127
	FDD_B	-126.5
	FDD_C, TDD_C	-126
	FDD_D	-125.5
	FDD_E, TDD_E	-125
	FDD_F	-124.5 Note 2
	FDD_G	-124
	FDD_H	-123.5
	FDD_N	-120.5
NOTE 1: This condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3 of TS 36.133[23].		
NOTE 2: The condition is -125 dBm/15kHz when the carrier frequency of the assigned E-UTRA channel bandwidth is within 865-894 MHz.		
NOTE 3: E-UTRA operating band groups are as defined in clause 4.4.2.		

E.2.1 Conditions for OTDOA intra-frequency RSTD Measurements by UE Category M1 and M2

This clause defines the E-UTRAN intra-frequency PRP1,2 applicable for a corresponding operating band.

The conditions for CE mode A intra-frequency E-UTRAN HD-FDD, FDD and TDD measurements are defined in Table E.2.1-1.

The conditions for CE mode B for intra-frequency E-UTRAN HD-FDD, FDD and TDD measurements are defined in Table E.2.1-2.

Table E.2.1-1: E-UTRAN intra-frequency measurements for HD-FDD, FDD and TDD for CE mode A

Parameter	E-UTRA operating band groups Note 2	Minimum PRP1,2
		dBm/15kHz
Conditions	FDD_A, TDD_A	-127
	FDD_D	-125.5
	FDD_E, TDD_E	-125
	FDD_F	-124.5 Note 1
	FDD_G	-124
	FDD_N	-120.5
NOTE 1: The condition is -125 dBm/15kHz when the carrier frequency of the assigned E-UTRA channel bandwidth is within 865-894 MHz.		
NOTE 2: E-UTRA operating band groups are as defined in Section 4.4.2.		

Table E.2.1-2: E-UTRAN intra-frequency measurements for HD-FDD, FDD and TDD for CE mode B

Parameter	E-UTRA operating band groups Note 2	Minimum PRP1,2
		dBm/15kHz
Conditions	FDD_A, TDD_A	-136
	FDD_D	-134.5
	FDD_E, TDD_E	-134
	FDD_F	-133.5 Note 1

	FDD_G	-133
	FDD_N	-129.5
NOTE 1: The condition is -125 dBm/15kHz when the carrier frequency of the assigned E-UTRA channel bandwidth is within 865-894 MHz.		
NOTE 2: E-UTRA operating band groups are as defined in Section 4.4.2.		

E.3 Conditions for OTDOA inter-frequency RSTD Measurements

This clause defines the E-UTRAN inter-frequency PRP_1,2 applicable for OTDOA Inter-frequency RSTD measurements for a corresponding operating band.

The conditions for E-UTRAN OTDOA inter-frequency RSTD measurements are as defined in Table E.2-1.

E.3.1 Conditions for OTDOA inter-frequency RSTD Measurements by UE Category M1 and M2

This clause defines the E-UTRAN inter-frequency PRP1,2 applicable for a corresponding operating band.

The conditions for CE mode A inter-frequency E-UTRAN HD-FDD, FDD and TDD measurements are defined in Table E.3.1-1.

The conditions for CE mode B for inter-frequency E-UTRAN HD-FDD, FDD and TDD measurements are defined in Table E.3.1-2.

Table E.3.1-1: E-UTRAN inter-frequency measurements for HD-FDD, FDD and TDD for CE mode A

Parameter	E-UTRA operating band groups Note 2	Minimum PRP1,2
		dBm/15kHz
Conditions	FDD_A, TDD_A	-127
	FDD_D	-125.5
	FDD_E, TDD_E	-125
	FDD_F	-124.5 Note 1
	FDD_G	-124
	FDD_N	-120.5
NOTE 1: The condition is -125 dBm/15kHz when the carrier frequency of the assigned E-UTRA channel bandwidth is within 865-894 MHz.		
NOTE 2: E-UTRA operating band groups are as defined in Section 4.4.2.		

Table E.3.1-2: E-UTRAN inter-frequency measurements for HD-FDD, FDD and TDD for CE mode B

Parameter	E-UTRA operating band groups Note 2	Minimum PRP1,2
		dBm/15kHz
Conditions	FDD_A, TDD_A	-136
	FDD_D	-134.5
	FDD_E, TDD_E	-134
	FDD_F	-133.5 Note 1
	FDD_G	-133
	FDD_N	-129.5
NOTE 1: The condition is -125 dBm/15kHz when the carrier frequency of the assigned E-UTRA channel bandwidth is within 865-894 MHz.		
NOTE 2: E-UTRA operating band groups are as defined in Section 4.4.2.		

E.4 Conditions for UE Rx-Tx Time Difference Measurement under Time Domain Measurement Resource Restriction with CRS Assistance Information

This clause defines the E-UTRAN RSRP applicable for UE Rx-Tx Time Difference Measurement under Time Domain Measurement Resource Restriction with CRS Assistance Information for a corresponding operating band.

The conditions for UE Rx-Tx time difference measurements, when time domain measurement resource restriction pattern and CRS assistance information are provided, are as defined in Table E.1-1.

E.5 Conditions for NB-IOT OTDOA intra-frequency RSTD Measurements

This clause defines the NB-IoT intra-frequency PRP1,2 applicable for a corresponding operating band.

The conditions for intra-frequency RSTD measurements in normal coverage are defined in Table E.5-1.

The conditions for intra-frequency RSTD measurements in enhanced coverage are defined in Table E.5-2.

Table E.5-1: NB-IoT intra-frequency RSTD measurements for HD-FDD in normal coverage

Parameter	E-UTRA operating band groups Note 1	Minimum PRP1,2 Note 1
		dBm/15kHz
Conditions	NFDD_G	-129
NOTE 1: E-UTRA operating band groups for NB-IoT are as defined in Section 4.11.1		

Table E.5-2: NB-IoT intra-frequency RSTD measurements for HD-FDD in enhanced coverage

Parameter	E-UTRA operating band groups Note 1	Minimum PRP1,2 Note 1
		dBm/15kHz
Conditions	NFDD_G	-135
NOTE 1: E-UTRA operating band groups for NB-IoT are as defined in Section 4.11.1		

E.6 Conditions for NB-IOT OTDOA inter-frequency RSTD Measurements

This clause defines the NB-IoT intra-frequency PRP1,2 applicable for a corresponding operating band.

The conditions for inter-frequency RSTD measurements in normal coverage are defined in Table E.5-1.

The conditions for inter-frequency RSTD measurements in enhanced coverage are defined in Table E.5-2.

Annex F (normative): UTRAN Generic procedures

F.1 General

This normative annex specifies the set up and release procedure that shall be used for each UTRAN test case.

In this clause the terms GNSS and A-GNSS also include the cases where the only satellite system used is GPS unless otherwise stated.

F.2 UTRAN connection set up

F.2.1 Initial conditions

System Simulator:

- 1 cell, default parameters. The default system information, as specified in clause 6.1 of TS 34.108 [28], is broadcast with the exceptions of SIB15, SIB15.1, SIB15.2 and SIB15.3 which are not broadcast.

User Equipment:

- The UE shall be operated in Normal Propagation Conditions as specified in clause 5.2.1 of TS 34.108 [28].
- The UE is in state "MM idle" state with valid TMSI and CKSN.
- The UE is in state "PMM idle" with valid P-TMSI.

F.2.2 Procedures

CS Domain

Step	Direction		Message	Comments
	UE	SS		
1	<--		SYSTEM INFORMATION (BCCH)	Broadcast
2	<--		PAGING TYPE1 (PCCH)	Paging (CS domain, TMSI)
3	-->		RRC CONNECTION REQUEST (CCCH)	RRC
4	<--		RRC CONNECTION SETUP (CCCH)	RRC
5	-->		RRC CONNECTION SETUP COMPLETE (DCCH)	RRC
6	-->		PAGING RESPONSE	RR
7	<--		AUTHENTICATION REQUEST	MM
8	-->		AUTHENTICATION RESPONSE	MM
9	<--		SECURITY MODE COMMAND	RRC
10	-->		SECURITY MODE COMPLETE	RRC

PS Domain

Step	Direction		Message	Comments
	UE	SS		
1	<--		PAGING TYPE1 (PCCH)	Paging (PS domain, PMSI or IMSI)
2	-->		RRC CONNECTION REQUEST (CCCH)	RRC
3	<--		RRC CONNECTION SETUP (CCCH)	RRC
4	-->		RRC CONNECTION SETUP COMPLETE (DCCH)	RRC (Transport Channel: DCH or FACH)
5	-->		SERVICE REQUEST	GMM
6	<--		AUTHENTICATION REQUEST	GMM
7	-->		AUTHENTICATION RESPONSE	GMM
8	<--		SECURITY MODE COMMAND	RRC

9	-->	SECURITY MODE COMPLETE	RRC

F.2.3 Specific message contents

The default message contents specified in clause 9.1 of TS 34.108 [28] will be used for the Moving Scenario and Periodic Update test. For all Minimum Performance TTFF Tests the default message contents specified in clause 9.1 of TS 34.108 [28] will be used with the following exception.

Contents of PAGING TYPE1:

Information Element	Value/remark
Paging Cause	Terminating High Priority Signalling

Contents of RRC CONNECTION SETUP:

For A-GNSS performance testing in CELL_DCH state: The RRC Connection Setup is defined in clause 9.1.1 of TS 34.108 [28] "Contents of RRC CONNECTION SETUP message: UM (Transition to CELL_DCH)".

For A-GNSS performance testing in CELL_FACH state: The RRC Connection Setup is defined in clause 9.1.1 of TS 34.108 [28] "Contents of RRC CONNECTION SETUP message: UM (Transition to CELL_FACH)".

Contents of RRC CONNECTION SETUP COMPLETE:

Information Element	Value/remark
UE radio access capability - UE positioning capability	Defines the A-GNSS mode the UE supports (UE-based, UE-assisted, or both). UE shall be tested for all modes it supports.

F.3 UTRAN connection release

F.3.1 Procedure

Table F.3.1: UTRAN connection release procedure

Step	Direction		Message	Comments
	UE	SS		
1	<--		RRC CONNECTION RELEASE	RRC
2	-->		RRC CONNECTION RELEASE COMPLETE	RRC

F.3.2 Specific message contents

The default message contents specified in clause 9.1 of TS 34.108 [28] are used.

Annex G (normative): Environmental conditions

G.1 General

This normative annex specifies the environmental requirements of the UE. Within these limits the requirements of the present documents shall be fulfilled.

G.2 Environmental requirements

The requirements in this clause apply to all types of UE(s).

G.2.1 Temperature

The UE shall fulfil all the requirements in the full temperature range of:

Table G.2.1.1

+15°C to +35°C	for normal conditions (with relative humidity up to 75 %)

G.2.2 Voltage

The UE shall fulfil all the requirements in the full voltage range, i.e. the voltage range between the extreme voltages.

The manufacturer shall declare the lower and higher extreme voltages and the approximate shutdown voltage. For the equipment that can be operated from one or more of the power sources listed below, the lower extreme voltage shall not be higher, and the higher extreme voltage shall not be lower than that specified below.

Table G.2.2.1

Power source	Normal conditions voltage
AC mains	nominal
Regulated lead acid battery	1.1 × nominal
Non regulated batteries: - Leclanché / lithium - Mercury/nickel and cadmium	 Nominal Nominal

Annex H (informative): MBS Beacon parameters

H.1 General

This informative annex consolidates a description of the MBS beacon parameters that are specified in the MBS ICD [38]. They are provided here for reference.

H.2 Beacon parameters

This is a summary of the MBS beacon parameters to be used for MBS testing:

Beacon PN Code: 1023 chip length for TB1. Actual PN codes are listed it the MBS ICD [38]

MBS Beacon Configuration: TB1 (2.046 MHz, contains data) [38]

MBS Packet Type: Type 2 [38]

MBS Transmitter ID (TxID): Field used to signal a unique ID that identifies each transmitter within one major deployment area, such as within North America. Range: [0, 2^{15}-1] [38]

Slot Index: This is the physical time slot within a MBS transmission period, in which a transmitter is transmitting. Each slot is 100 ms in duration and a MBS transmission period is 1 sec long. [38]

All other fields: Set to the min value (bit value equal to 0) for testing [38]

Annex I (normative): Conditions for NR PRS-based measurements

I.1 General

This clause defines the following conditions for NR PRS-based measurements and corresponding procedures performed based on PRS: PRP and PRS Ês/Iot, applicable for a corresponding operating band.

I.2 General

The conditions are defined in Table I.2-1 for FR1 NR cells.

The conditions are defined in Table I.2-2 for FR2 NR cells.

Editor's notes for Table I.2-1and Table I.2-2:

- The Table is not complete, FFS for PRS-RSRP and UE Rx-Tx.

Table I.2-1: Conditions for NR PRS-based measurements in FR1

Parameter	NR operating band groups Note1	Minimum PRP1,2			PRS Ês/Iot for RSTD measurement reference cell PRS resource
		dBm / SCS_{PRS}			dB
		SCS_{PRS} = 15 kHz	SCS_{PRS} = 30 kHz	SCS_{PRS} = 60 kHz	
Conditions	NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A	-127	-124	-121	≥ -6 ≥ -13
	NR_FDD_FR1_B	-126.5	-123.5	-120.5	
	NR_TDD_FR1_C	-126	-123	-120	
	NR_FDD_FR1_D, NR_TDD_FR1_D	-125.5	-122.5	-119.5	
	NR_FDD_FR1_E, NR_TDD_FR1_E	-125	-122	-119	
	NR_FDD_FR1_F	-124.5	-121.5	-118.5	
	NR_FDD_FR1_G	-124	-121	-118	
	NR_FDD_FR1_H	-123.5	-120.5	-117.5	
NOTE 1: NR operating band groups are defined in TS 38.101-1 [54] clause 3.5.2.					

Table I.2-2: Conditions for NR PRS-based measurements in FR2

Parameter	Angle of arrival	NR operating bands	Minimum PRP1,2 Note 2, Note 3					PRS Ês/Iot for RSTD measurement reference cell PRS resource
			dBm / SCS_{PRS}					dB
			SCS_{PRS} = 120 kHz				SCS_{PRS} = 60 kHz	
			UE power class				UE power class	
			1	2	3	4	1, 2, 3, 4	
Conditions	Rx Beam Peak	n257	$-128.3+Y_1$	-113.8	-112.1	$-127.8+Y_4$	(Value for SCS_{PRS} = 120 kHz) - 3dB	≥ -6 ≥ -13
		n258	$-128.3+Y_1$	-113.8	-112.1	$-127.8+Y_4$		
		n259			-108.5			

		n260	$-125.3+Y_1$		-109.5	$-125.8+Y_4$		
		n261	$-128.3+Y_1$	-113.8	-112.1	$-127.8+Y_4$		
	Spherical coverage Note 1	n257	$-120.3+Z_1$	-102.8	-101.2	$-118.8+Z_4$	(Value for SCS_{PRS} = 120 kHz) - 3dB	≥ -6 ≥ -13
		n258	$-120.3+Z_1$	-102.8	-101.2	$-118.8+Z_4$		
		n259			-95.7			
		n260	$-117.3+Z_1$		-96.9	$-113.8+Z_4$		
		n261	$-120.3+Z_1$	-102.8	-101.2	$-118.8+Z_4$		

NOTE 1: Values based on EIS spherical coverage as defined in clause 7.3.4 of TS 38.101-2 [55]. Side condition applies for directions in which EIS spherical coverage requirement is met.
NOTE 2: Values specified at the Reference point to give minimum PRS Ês/Iot, with no applied noise.
NOTE 3: For UEs that support multiple FR2 bands, Rx Beam Peak values are increased by $\Delta MB_{P,n}$ and spherical coverage values are increased by $\Delta MB_{S,n}$, the UE multi-band relaxation factor in dB specified in clause 6.2.1 of TS 38.101-2 [55].

2015-09	RAN#69	R5-153865	0142	1	Update of eICIC Test case 8.1.4	12.3.0	12.4.0
2015-09	RAN#69	-	-	-	update of the "non-specific references" in section 2 according to the approved R5-153582 and an action point on ETSI MCC	12.3.0	12.4.0
2015-12	RAN#70	R5-155018	0145	-	Uncertainties and Test Tolerances for RSTD Test Cases 10.3A_1 and 10.4A_1	12.4.0	12.5.0
2015-12	RAN#70	R5-155035	0146	-	Incorrect Table Note referenced in LPP Request Table	12.4.0	12.5.0
2015-12	RAN#70	R5-155063	0149	-	Incorrect references in TDD test cases	12.4.0	12.5.0
2015-12	RAN#70	R5-155064	0150	-	Reference [2] has no explanation	12.4.0	12.5.0
2015-12	RAN#70	R5-155065	0151	-	Remove square brackets from RSTD tests	12.4.0	12.5.0
2015-12	RAN#70	R5-155066	0152	-	Incorrect Section number referenced	12.4.0	12.5.0
2015-12	RAN#70	R5-155081	0153	-	Editorial changes to correct Section and Table references	12.4.0	12.5.0
2015-12	RAN#70	R5-155875	0154	1	Two new 3 DL CA RSTD Measurement Reporting Delay test cases	12.4.0	12.5.0
2015-12	RAN#70	R5-156111	0155	1	Two new 3 DL CA RSTD Measurement Accuracy test cases	12.4.0	12.5.0
2016-03	RAN#71	R5-160041	0156	-	Correction to Cells in OTDOA 3DL RSTD Measurement	12.5.0	12.6.0
2016-03	RAN#71	R5-160900	0164	-	Add Cell values in RSTD Table for 3DL RSTD	12.5.0	12.6.0
2016-03	RAN#71	R5-160909	0157	1	Correction of Cell Time offset in RSTD CA	12.5.0	12.6.0
2016-03	RAN#71	R5-161016	0161	1	Add Cell values in OTDOA table for 3DL RSTD Measurement Reporting Delay	12.5.0	12.6.0
2016-03	RAN#71	R5-161053	0158	1	Correction to Trstd values in 3DL RSTD Measurement Accuracy test cases	12.5.0	12.6.0
2016-03	RAN#71	R5-161054	0160	1	Addition of antenna diagram Figure for 3DL CA test cases	12.5.0	12.6.0
2016-06	RAN#72	R5-162114	0165	-	Uncertainties and Test Tolerances for RSTD Test Cases 10.5 and 10.6	12.6.0	12.7.0
2016-06	RAN#72	R5-162116	0166	-	Uncertainties and Test Tolerances for RSTD Test Cases 10.7 and 10.8	12.6.0	12.7.0
2016-06	RAN#72	R5-163116	0167	1	Uncertainties and Test tolerances for TS 37.571-1 Test cases 8.1.3 and 8.1.4	12.6.0	12.7.0
2016-06	RAN#72	R5-162970	0168	1	Add missing LTE FDD TDD bands to E-UTRA Band Groups	12.7.0	13.0.0
2016-06	RAN#72	R5-162971	0169	1	Add missing LTE FDD band to Annex E	12.7.0	13.0.0
2016-09	RAN#73	R5-165350	0179	-	Incorrect FDD Band reference noted for Band 32	13.0.0	13.1.0
2016-09	RAN#73	R5-165360	0181	-	Correct editorial changes in Annex C of 37.571-1	13.0.0	13.1.0
2016-09	RAN#73	R5-166125	0173	1	Updates to the UE Rx – Tx Time Difference tests for Rel-12 onwards	13.0.0	13.1.0
2016-09	RAN#73	R5-166126	0178	1	Add missing references to GPS and Galileo and A-GPS and A-Galileo	13.0.0	13.1.0

Change history							
Date	**TSG #**	**TSG Doc.**	**CR**	**Rev**	**Subject/Comment TS 36.571-1**	**Old**	**New**
2016-09	RAN#73	R5-166127	0180	1	Add Derivation of Test Requirements for test cases 8.1.5 and 8.1.6	13.0.0	13.1.0
2016-09	RAN#73	R5-166168	0182	1	Addition of performance test specification for Indoor Positioning Enhancements (MBS)	13.0.0	13.1.0
2016-09	RAN#73	R5-166179	0171	1	Addition of editor's notes for TDD UE Rx-TX tests	13.0.0	13.1.0
2016-09	RAN#73	R5-166181	0174	1	Unification of Channel BW testing requirements for OTDOA 3 DL CA test cases	13.0.0	13.1.0
2016-09	RAN#73	R5-166283	0183	-	Change of Reference Channel for 1.4 MHz RSTD tests	13.0.0	13.1.0
2016-12	RAN#74	R5-168060	0185	-	Change references to Reference Channel for RSTD tests	13.1.0	13.2.0
2016-12	RAN#74	R5-168063	0186	-	Change of applicability of UE Rx-Tx tests for TDD	13.1.0	13.2.0
2016-12	RAN#74	R5-168147	0187	-	Corrections for errors in 37.571-1	13.1.0	13.2.0
2016-12	RAN#74	R5-169602	0184	1	Addition of test tolerances to the performance test specification for Indoor Positioning Enhancements (MBS)	13.1.0	13.2.0
2016-12	RAN#74	R5-169611	0190	1	Clarification of MBS beacon code phase delay	13.1.0	13.2.0
2016-12	RAN#74	R5-169663	0188	1	Editorial correction on OTDOA TC10.6	13.1.0	13.2.0
2016-12	RAN#74	R5-168396	0189	-	Band 70 addition to band groups in 37.571-1	13.2.0	14.0.0
2017-01	RAN#74	-	-	-	correction of floating point of R5-169602 in Table 11.4.5-3	14.0.0	14.0.1
2017-03	RAN#75	R5-171304	0195	-	Removal of square brackets in the performance test specification for Indoor Positioning Enhancements (MBS)	14.0.1	14.1.0
2017-03	RAN#75	R5-171902	0191	1	Update TS 37.571-1 with Addition of LTE Band 48	14.0.1	14.1.0
2017-03	RAN#75	R5-171904	0192	1	Clarification on DRX for Single Mode OTDOA Measurement Reporting Delay Test Cases	14.0.1	14.1.0
2017-03	RAN#75	R5-171905	0193	1	Clarification on DRX for 2CC OTDOA Measurement Reporting Delay Test Cases	14.0.1	14.1.0
2017-03	RAN#75	R5-171906	0194	1	Clarification on DRX for 3CC OTDOA Measurement Reporting Delay Test Cases	14.0.1	14.1.0
2017-06	RAN#76	R5-172179	0197	-	Add Minimum Performance Sub-tests for 3 GNSS	14.1.0	14.2.0
2017-06	RAN#76	R5-172623	0198	-	Introduction of periodical reporting capability for GNSS	14.1.0	14.2.0
2017-06	RAN#76	R5-173364	0200	1	Introduction of MBS Assistance Data Measurement Test Cases	14.1.0	14.2.0
2017-06	RAN#76	R5-173414	0201	1	Addition of ACKs in step 5 of test procedures	14.1.0	14.2.0
2017-09	RAN#77	R5-173569	0202	-	Correction of PRS Subframe Offset for TC 10.5 and 10.6	14.2.0	14.3.0
2017-09	RAN#77	R5-173570	0203	-	Correction of SRS-Bandwidth for ECID TC 8.1.3 and 8.1.4	14.2.0	14.3.0
2017-09	RAN#77	R5-173571	0204	-	Correction of SRS-Bandwidth for ECID TC 8.1.5 and 8.1.6	14.2.0	14.3.0
2017-09	RAN#77	R5-173572	0205	-	Correction of message contents for ECID (Editorial Change)	14.2.0	14.3.0
2017-09	RAN#77	R5-173576	0209	-	WLAN and BLE Annex D updates (Editorial Change)	14.2.0	14.3.0
2017-09	RAN#77	R5-173863	0214	-	Editorial change to clarify the MBS test cases applicability	14.2.0	14.3.0
2017-09	RAN#77	R5-174053	0215	-	Update Statement Concerning Test System Uncertainties for Operating Bands Above 3 GHz	14.2.0	14.3.0
2017-09	RAN#77	R5-175116	0206	1	New Abbreviations and References for WLAN and BLE (Editorial Change)	14.2.0	14.3.0
2017-09	RAN#77	R5-175117	0207	1	WLAN test conditions	14.2.0	14.3.0

Change history							
Date	**TSG #**	**TSG Doc.**	**CR**	**Rev**	**Subject/Comment TS 36.571-1**	**Old**	**New**

2019-06	RAN#84	R5-195009	0286	1	MBS Tests for NR	16.0.0	16.1.0
2019-06	RAN#84	R5-195450	0287	2	Alignment 9.5.3 and 9.6.3 with core spec	16.0.0	16.1.0
2019-09	RAN#85	R5-196604	0292	-	Alignment of 9.5.3 and 9.6.3 to core spec	16.1.0	16.2.0
2019-09	RAN#85	R5-197356	0294	-	Missing Bands in Tables	16.1.0	16.2.0
2019-09	RAN#85	R5-197357	0295	-	Corrections to GNSS Multi-path Tests	16.1.0	16.2.0
2019-09	RAN#85	R5-197358	0296	-	Correct RSTD Test Parameter Values	16.1.0	16.2.0
2019-09	RAN#85	R5-197381	0288	1	Corrections to RSTD tests for NB-IoT	16.1.0	16.2.0
2019-09	RAN#85	R5-197471	0289	1	Alignment of NR terminology	16.1.0	16.2.0
2019-09	RAN#85	R5-197473	0290	2	Add default conditions for FR2 positioning tests for performance	16.1.0	16.2.0
2019-09	RAN#85	R5-197477	0291	1	Clarify LPP transport for min perf positioning	16.1.0	16.2.0
2019-09	RAN#85	R5-197478	0293	1	Correct MBS Applicability Table and Editorial Updates	16.1.0	16.2.0
2019-12	RAN#86	R5-198063	0297	-	Addition of User Plane testing of A-GNSS to clause 7 for LTE	16.2.0	16.3.0
2019-12	RAN#86	R5-198817	0302	-	Editorial Correction to Multi-Path Scenario Test Parameter Table	16.2.0	16.3.0
2019-12	RAN#86	R5-198821	0303	-	Add Reference to RRM Specifications for Frequency Band Groups	16.2.0	16.3.0
2019-12	RAN#86	R5-198822	0304	-	Editorial Corrections for RSTD Test Cases	16.2.0	16.3.0
2019-12	RAN#86	R5-199090	0300	1	Update to min perf positioning tests	16.2.0	16.3.0
2020-03	RAN#87	R5-201013	0305	1	Editorial changes to TS 37.571-X titles to remove references to individual RATs	16.3.0	16.4.0
2020-06	RAN#88	R5-202803	0308	1	Update of the Note 1 in the Power level and satellite allocation tables for the Sensitivity Coarse time assistance requirements and tests for E-UTRA and NR.	16.4.0	16.5.0
2020-09	RAN#89	R5-204979	0309	1	Clarification on frequency band test conditions for A-GNSS	16.5.0	16.6.0
2020-12	RAN#90	R5-206774	0311	1	Addition of BDS B1C Signal test contents in TS 37.571-1	16.6.0	16.7.0
2020-12	RAN#90	R5-206783	0310	1	Definition of A-GNSS Sensitivity testing conditions for EN-DC	16.6.0	16.7.0
2021-03	RAN#91	R5-210757	0318	-	Update to Annex C for TDD NB-IOT RSTD measurement test cases	16.7.0	16.8.0
2021-03	RAN#91	R5-211796	0312	1	Addition of TDD NB-IOT RSTD measurement test case 9.7.1	16.7.0	16.8.0
2021-03	RAN#91	R5-211797	0313	1	Addition of TDD NB-IOT RSTD measurement test case 9.7.2	16.7.0	16.8.0
2021-03	RAN#91	R5-211798	0314	1	Addition of TDD NB-IOT RSTD measurement test case 9.7.3	16.7.0	16.8.0
2021-03	RAN#91	R5-211799	0315	1	Addition of TDD NB-IOT RSTD measurement test case 9.8.1	16.7.0	16.8.0

Change history							
Date	**TSG #**	**TSG Doc.**	**CR**	**Rev**	**Subject/Comment TS 36.571-1**	**Old**	**New**
2021-03	RAN#91	R5-211800	0316	1	Addition of TDD NB-IOT RSTD measurement test case 9.8.2	16.7.0	16.8.0
2021-03	RAN#91	R5-211801	0317	1	Addition of TDD NB-IOT RSTD measurement test case 9.8.3	16.7.0	16.8.0
2021-06	RAN#92	R5-212200	0320	-	Addition of Derivation of Test Requirements for NB-IOT and CA RSTD tests	16.8.0	16.9.0
2021-06	RAN#92	R5-212201	0321	-	Corrections to RSTD accuracy requirements values for UE Category M1 and M2 test cases	16.8.0	16.9.0
2021-06	RAN#92	R5-212202	0322	-	Corrections to RSTD accuracy requirements values for NB-IOT test cases	16.8.0	16.9.0
2021-06	RAN#92	R5-212234	0323	-	Addition of Derivation of Test Requirements for RSTD and Category M1 and M2 RSTD tests	16.8.0	16.9.0
2021-06	RAN#92	R5-212235	0324	-	Correction to Derivation of Test Requirements for UE Rx-Tx tests for Category M1 and M2 UEs	16.8.0	16.9.0
2021-06	RAN#92	R5-212237	0325	-	Updates to Correction to Derivation of Test Requirements for UE Rx-Tx tests for Category M1 and M2 UEs	16.8.0	16.9.0
2021-06	RAN#92	R5-212238	0326	-	Addition of Test Parameter Relaxations for UE Rx - Tx time difference cases	16.8.0	16.9.0
2021-06	RAN#92	R5-212242	0327	-	Clarifications to FDD NB-IoT RSTD test case applicabilities and other corrections	16.8.0	16.9.0
2021-06	RAN#92	R5-212244	0328	-	Corrections to RSTD test cases for Category M1 and M2 UEs	16.8.0	16.9.0
2021-06	RAN#92	R5-212247	0329	-	Updates to requirements for RSTD test cases for Category M1 and M2 UEs	16.8.0	16.9.0
2021-06	RAN#92	R5-212397	0330	-	Update Release 15 and onwards references for TS 36.355 to TS 37.355	16.8.0	16.9.0
2021-06	RAN#92	R5-213134	0332	-	Add OTDOA feMTC test case 9.3.14	16.8.0	16.9.0
2021-06	RAN#92	R5-213135	0333	-	Add OTDOA feMTC test case 9.3.15	16.8.0	16.9.0
2021-06	RAN#92	R5-213138	0336	-	Add OTDOA feMTC test case 9.3.18	16.8.0	16.9.0
2021-06	RAN#92	R5-213139	0337	-	OTDOA feMTC test cases - Annexes	16.8.0	16.9.0
2021-06	RAN#92	R5-213992	0331	1	Add OTDOA feMTC test case 9.3.13	16.8.0	16.9.0
2021-06	RAN#92	R5-213993	0334	1	Add OTDOA feMTC test case 9.3.16	16.8.0	16.9.0
2021-06	RAN#92	R5-213994	0335	1	Add OTDOA feMTC test case 9.3.17	16.8.0	16.9.0
2021-09	RAN#93	R5-215973	0338	1	Addition of Multi-RTT, DI-AoD and DL-TDOA positioning method test conditions	16.9.0	16.10.0
2021-09	RAN#93	R5-215974	0340	1	Addition of conditions for NR PRS-based measurements and connection diagrams	16.9.0	16.10.0
2021-12	RAN#94	R5-217133	0346	-	Update number of satellites for multi-GNSS for LTE tests	16.10.0	16.11.0
2021-12	RAN#94	R5-217134	0347	-	Update number of satellites for multi-GNSS for NR tests	16.10.0	16.11.0
2021-12	RAN#94	R5-217183	0355	-	EN-DC frequency bands for testing of A-GNSS sensitivity requirements	16.10.0	16.11.0
2021-12	RAN#94	R5-218283	0348	1	Add OTDOA feMTC test case 9.4.13	16.10.0	16.11.0
2021-12	RAN#94	R5-218284	0349	1	Add OTDOA feMTC test case 9.4.14	16.10.0	16.11.0
2021-12	RAN#94	R5-218285	0350	1	Add OTDOA feMTC test case 9.4.15	16.10.0	16.11.0
2021-12	RAN#94	R5-218286	0351	1	Add OTDOA feMTC test case 9.4.16	16.10.0	16.11.0

Change history

2025-09	RAN#109	R5-254444	0655	-	Adding new NR RSTD measurement accuracy test case for PRS aggregation in FR1	18.2.0	18.3.0
2025-09	RAN#109	R5-255333	0656	1	Introducing new NR RSTD measurement accuracy test case for PRS aggregation in FR2	18.2.0	18.3.0
2025-09	RAN#109	R5-254446	0657	-	Introduce RSTD measurement requirements based on PRS aggregation	18.2.0	18.3.0
2025-09	RAN#109	R5-254715	0658	-	Addition of new NR RSTD measurement reporting delay test cases for RedCap UE	18.2.0	18.3.0
2025-09	RAN#109	R5-254715	0659	1	Addition of new NR RSTD measurement accuracy test cases for RedCap UE	18.2.0	18.3.0
2025-12	RAN#110	R5-255704	0660	-	Addition of new UE Rx-Tx time difference measurement test cases in RRC_INACTIVE state	18.3.0	18.4.0
2025-12	RAN#110	R5-255713	0661	-	Correction of UE Rx-Tx time difference measurement period test case 15.2.1 including TT	18.3.0	18.4.0
2025-12	RAN#110	R5-255714	0662	-	Correction of UE Rx-Tx time difference measurement period test case 15.2.2 including TT	18.3.0	18.4.0
2025-12	RAN#110	R5-255715	0663	-	Correction of UE Rx-Tx time difference measurement period test case 15.4.1 including TT	18.3.0	18.4.0
2025-12	RAN#110	R5-255717	0664	-	Correction to assistance data for measurement period test cases	18.3.0	18.4.0
2025-12	RAN#110	R5-255827	0665	-	Introducing new connection diagrams for 4 or 6 cells testing in FR1 and FR2	18.3.0	18.4.0
2025-12	RAN#110	R5-255828	0666	-	Adding new FR1 RSTD measurement reporting delay test case for PRS aggregation	18.3.0	18.4.0
2025-12	RAN#110	R5-255829	0667	-	Adding new FR2 RSTD measurement reporting delay test case for PRS aggregation	18.3.0	18.4.0
2025-12	RAN#110	R5-255830	0668	-	Adding new FR1 RSTD measurement accuracy test case for PRS aggregation	18.3.0	18.4.0
2025-12	RAN#110	R5-255831	0669	-	Adding new FR2 RSTD measurement accuracy test case for PRS aggregation	18.3.0	18.4.0
2025-12	RAN#110	R5-256423	0670	-	Correction of NR RSTD measurement accuracy in FR1 for Redcap UE without Rx FH test case 14.3.11	18.3.0	18.4.0
2025-12	RAN#110	R5-256424	0671	-	Correction of NR RSTD measurement accuracy in FR2 for Redcap UE without Rx FH test case 14.3.12	18.3.0	18.4.0
2025-12	RAN#110	R5-256425	0672	-	Correction of NR RSTD measurement accuracy in FR1 for Redcap UE with Rx FH test case 14.3.13	18.3.0	18.4.0
2025-12	RAN#110	R5-256426	0673	-	Correction of NR RSTD measurement accuracy in FR2 for Redcap UE with Rx FH test case 14.3.14	18.3.0	18.4.0
2025-12	RAN#110	R5-256427	0674	-	Correction of NR RSTD measurement reporting delay test case in FR1 for Redcap UE without Rx FH test case 14.2.13	18.3.0	18.4.0
2025-12	RAN#110	R5-256428	0675	-	Correction of NR RSTD measurement reporting delay test case in FR2 for Redcap UE without Rx FH test case 14.2.14	18.3.0	18.4.0
2025-12	RAN#110	R5-256429	0676	-	Correction of NR RSTD measurement reporting delay test case in FR1 for Redcap UE with Rx FH test case 14.2.15	18.3.0	18.4.0
2025-12	RAN#110	R5-256430	0677	-	Correction of NR RSTD measurement reporting delay test case in FR2 for Redcap UE with Rx FH test case 14.2.16	18.3.0	18.4.0
2026-03	RAN#111	R5-260022	0681	-	Update TC 15.3.7 with TT analysis results	18.4.0	18.5.0
2026-03	RAN#111	R5-260023	0682	-	Update TC 15.3.8 with TT analysis results	18.4.0	18.5.0
2026-03	RAN#111	R5-260053	0685	-	Updating test requirement with TT analysis results for FR1 test case 14.3.9	18.4.0	18.5.0
2026-03	RAN#111	R5-260203	0687	-	Addition of UE Rx-Tx time difference reporting delay test case for normal UE and Redcap UE in RRC INACTIVE state	18.4.0	18.5.0
2026-03	RAN#111	R5-260204	0688	-	Addition of UE Rx-Tx time difference accuracy test case for normal UE and Redcap UE in RRC INACTIVE state	18.4.0	18.5.0
2026-03	RAN#111	R5-260795	0689	-	Adding new test cases for PRS-RSRP measurement delay for Redcap UE without Rx FH	18.4.0	18.5.0
2026-03	RAN#111	R5-260796	0690	-	Adding new test cases for PRS-RSRP measurement delay for Redcap UE with Rx FH	18.4.0	18.5.0
2026-03	RAN#111	R5-260797	0691	-	Adding new FR1 test case for NR RSTD measurement delay for Redcap UE without Rx FH in RRC INACTIVE state	18.4.0	18.5.0
2026-03	RAN#111	R5-260927	0693	-	Correction of test case 16.3.1 TT analysis	18.4.0	18.5.0
2026-03	RAN#111	R5-260930	0694	-	Corrections of UE Rx-Tx time difference measurement period FR1 test cases	18.4.0	18.5.0
2026-03	RAN#111	R5-260931	0695	-	Correction of LPP Time calculation for Rel 16 FR1 measurement accuracy test cases	18.4.0	18.5.0
2026-03	RAN#111	R5-261569	0692	1	Adding new FR2 test case for NR RSTD measurement delay for Redcap UE without Rx FH in RRC INACTIVE state	18.4.0	18.5.0
2026-03	RAN#111	R5-261659	0678	1	Update TC 15.2.11 with TT analysis results	18.4.0	18.5.0
2026-03	RAN#111	R5-261660	0679	1	Update TC 15.2.12 with TT analysis results	18.4.0	18.5.0
2026-03	RAN#111	R5-261661	0680	1	Update TC 15.2.13 with TT analysis results	18.4.0	18.5.0
