8. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the reducedDL-PRS-ProcessingSamples-r17 in the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
9. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 14.2.5.5-3.
10. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3). The UE shall perform and report the RSTD measurements for both Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-TDOA-ProvideLocationInformation* IE including the nr-RSTD field for both Cell 2 and Cell 3 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-TDOA-ProvideLocationInformation* IE with both the nr-RSTD fields included within the response time then the number of failure tests is increased by one.
11. If the UE message at step 10 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
12. Repeat steps 2-11 in Table 14.2.5.4-1 until the confidence level according to Annex D is achieved.

14.2.5.5 Test requirement

Table 14.2.5.5-1, Table 14.2.5.5-2 and Table 14.2.5.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.5.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [4] and TS 37.355 [34]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
SSB configuration	Config 1		SSB.1 FR1	
	Config 2		SSB.1 FR1	
	Config 3		SSB.2 FR1	
SMTC configuration	Config 1		SMTC.2	
	Config 2		SMTC.1	
	Config 3		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
	Config 2		SR.1.1 TDD	
	Config 3		SR.2.1 TDD	
RMSI CORESET RMC configuration	Config 1		CR.1.1 FDD	As specified in clause A.3.1.2.1
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	

Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
Initial BWP configuration	Config 1,2,3		DLBWP.0.1 ULBWP.0.1	
Active DL BWP configuration	Config 1,2,3		DLBWP.1.1	
Active UL BWP configuration	Config 1,2,3		ULBWP.1.1	
PRS Configuration	Config 1		PRS.1.2 FR1	As specified in clause A.3.31
	Config 2		PRS.1.2 FR1	
	Config 3		PRS.2.2 FR1	
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX			OFF	
Measurement gap			GP#24 or GP#0	GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [34] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance ta specified in TS 37.355 [34] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			4	Including the reference cell
PRS muting info			Cell 1: ‘10’ Cell 2: ‘01’ Cell 3: ‘10’	Corresponds to prs-MutingInfo defined in TS 37.355 [34]
PRS resource RE offset			Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1		s	3	The length of the time interval from the beginning of each test
T2		s	1.28	The length of the time interval that follows immediately after time interval T1

Table 14.2.5.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

	Config 2	dBm/SCS	-88	-Infinity	-Infinity
	Config 3	dBm/SCS	-88	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.

Table 14.2.5.5-3: Cell-specific test parameters for RSTD measurement reporting delay during T2

Parameter		Unit	Cell 1	Cell 2	Cell 3
			T2	T2	T2
NR RF Channel Number			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low

	Config 3	dBm/ 47.88MHz	-56.25	-56.25	-56.25
PRS $\hat{E}_s/I_{ot}$		dB	-3	-6	-6
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cells (all, except Cell 3 in T3) are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

The RSTD measurement time fulfils the requirements specified in clause 14.2.5.3.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration X1 specified in section 9.9.2.5 starting from the beginning of time interval T2, where X1 is 320ms.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in Clause 10.1.23.3, i.e., between RSTD_0000000 and RSTD1970049.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period plus ΔT, where ΔT = 50 ms. The RSTD measurement period follows the equation:

$$T_{RSTD,i} = \left(k_{multiTEG,i} * CSSF_{PRS,i} * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

,

Since the test case is for single positioning frequency layer, i = 1 and L = 1, so $T_{RSTD,Total} = T_{RSTD,1}$.

Analysing the equation for $T_{RSTD,i}$:

$k_{multiTEG,i}$=1 ,$CSSF_{PRS,i} = 1$ $N_{RxBeam,i} = 1$ $N_{PRS,i}^{slot} = 3$ N_{sample}= 1(for reduced sample number).

For SCS 15KHz:

$$L_{available_{PRS},i} = \frac{10}{10 * 1 * 14} * 4 * 1 * 3 = 0.857ms$$

For SCS=30KHz

$$L_{available_{PRS},i} = \frac{10}{20 * 1 * 14} * 4 * 1 * 3 = 0.428ms$$

$T_{last,i} = T_i + T_{available_PRS,i}$

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$

Therefore, the first part of the equation:

$$\left(1 * 1 * 1 * 1 * \left\lceil \frac{3}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS},i}}{N} \right\rceil * 1 - 1\right)$$

Where the remaining parameters depend on the UE capabilities. For SCS 15KHz The LPP time IE ranges between 0.168s and 27.04s. For SCS 30KHz The LPP time IE ranges between 0.168s and 15.5s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.5.4.3-3. The LPP time IE ranges between 1s and 28s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 28.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 14.2.5.5-4, Table 14.2.5.5-5 , Table 14.2.5.5-6 and Table 14.2.5.5-7 for reference.

The test tolerances are defined in clauses C.1.6, C 2.5 and C4.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.2.6 NR RSTD measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA

14.2.6.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the gapless RSTD measurement period requirement specified in TS 38.133[50] Clause 9.9.2.7 in an environment with AWGN propagation conditions in FR1 in standalone scenario when single positioning frequency layer is configured.

14.2.6.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning and prs-Processing Window.

14.2.6.3 Minimum conformance requirements

When physical layer receives last of *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in TS 38.133[50] Clause 9.9.2.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined as:

$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the positioning frequency layers are in Case 1, or

$T_{RSTD,Total} = \max(T_{RSTD_wo_gap,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2,

Where,

i is the index of positioning frequency layer, and

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{RSTD,Total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{RSTD_wo_gap,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer *i* as specified below.

$$T_{RSTD_wo_gap,i} = \left(k_{multiTEG,i} * N_{RxBeam,i} * \left\lfloor \frac{N_{PRS,i}^{slot}}{N'} \right\rfloor \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i},$$

where:

$N_{RxBeam,i}$ is the UE Rx beam sweeping factor. In FR1, $N_{RxBeam,i}$ = 1; and in FR2,$N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not supported *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*;

otherwise,

$k_{multiTEG,i}$ =$N_{TEG,i}$, if the UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG,i}$ =$\left\lfloor \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rfloor$ if the UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.

$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$,

only the PRS resources unmuted and fully or partially overlapped with PPW are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

N_{sample} is the number of PRS RSTD measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} =2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
- Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

$T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time.

If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where,

T_i corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw*-durationOfPRS-*ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$, the least common multiple between $T_{PRS,i}$ and $PPWRP_i$.

$PPWRP_i$ is the repetition periodicity of the PRS processing window applicable for measurements in the positioning frequency layer *i*.

$T_{PRS,i}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,i}$, where,

$T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*,

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

Note: For the purpose of calculating $T_{PRS,\mathrm{i}}$, only the PRS resources that meet the conditions for PRS measurement outside measurement gaps as defined in clause TS 38.133[50] 9.9.1.2 are considered.

N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer i is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer i is in Case 2.

N' is UE capability for number of DL PRS resources that it can process in a slot as indicated by *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* specified in TS 37.355 [34].

14.2.6.4 Test description

14.2.6.4.1 Initial conditions

The supported test configurations in listed in Table 14.2.6.4-1.

Table 14.2.6.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.6.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.12.
2. The general test parameter settings are set up according to Table 14.2.6.5-1, Table 14.2.6.5-2 and Table 14.2.6.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.2.6.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All cells are on the same RF channel distributed in single positioning frequency layer.

14.2.6.4.2 Test procedure

The test consists of two sub-tests; Sub-test 1 is for Nsample = 4 and sub-test 2 is for Nsample = 1. Sub-test 2 is only conducted when UE also supporting supported DL-PRS-ProcessingSamples-RRC-CONNECTED. The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2 and Cell 3. All three cells transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first PRS processing window instance containing the PRS resources.

The *NR-DL-TDOA-ProvideAssistanceData* and *nr-DL-TDOA-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.12.1, shall be provided to the UE during T1. The last TTI containing the two messages shall be provided

to the UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the *DL-TDOA assistance* data and location information request.

2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

3. Set the parameters according to Table 14.2.6.5-1, Table 14.2.6.5-2 and Table 14.2.6.5-3. Propagation conditions are set according to clause 4.15.2.

4. T1 starts.

5. The SS shall transmit an LPP REQUEST CAPABILITIES message.

6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.

7. The SS shall transmit an RRCReconfiguration message with the PPW configuration.

8. The UE shall transmit RRCReconfigurationComplete message.

9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. The position of neighbour Cell 2 and the position of neighbour Cell 3 are described in 3GPP TS 37.571-5 [20]. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.

11. The SS sends a Positioning Measurement Gap Activation command containing an ID to activate the associated measurement gap

12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 14.2.6.5-2 and Table 14.2.6.5-3.

13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3). The UE shall perform and report the RSTD measurements for both Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-TDOA-ProvideLocationInformation* IE including the nr-RSTD field for both Cell 2 and Cell 3 within the response time, then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-TDOA-ProvideLocationInformation* IE with the nr-RSTD fields included within the response time then the number of failure tests is increased by one.

14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

15. Repeat steps 2-14 in Table 14.2.6.4-1 until the confidence level according to Annex D is achieved.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

14.2.6.5 Test requirement

Table 14.2.6.5-1, Table 14.2.6.5-2 and Table 14.2.6.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.6.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [4] and TS 37.355 [34]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
$BW_{channel}$	Config 1	MHz	20: $N_{RB,c}$ = 106	
	Config 2		20: $N_{RB,c}$ = 106	
	Config 3		50: $N_{RB,c}$ = 133	
SSB configuration	Config 1		SSB.1 FR1	
	Config 2		SSB.1 FR1	
	Config 3		SSB.2 FR1	
SMTC configuration	Config 1		SMTC.2	
	Config 2		SMTC.1	
	Config 3		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
	Config 2		SR.1.1 TDD	

	Config 3		SR.2.1 TDD	
RMSI CORESET RMC configuration	Config 1		CR.1.1 FDD	As specified in clause A.3.1.2.1
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
Initial BWP configuration	Config 1,2,3		DLBWP.0.1 ULBWP.0.1	
Active DL BWP configuration	Config 1,2,3		DLBWP.1.1	Cell 2 and cell 3 also transmit PRS on active DL BWP configured to the UE
Active UL BWP configuration	Config 1,2,3		ULBWP.1.1	
PRS Configuration	Config 1		PRS.1.4 FR1	As specified in clause A.3.31
	Config 2		PRS.1.4 FR1	
	Config 3		PRS.2.4 FR1	
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX			OFF	
PPW configuration			PPW.1	As defined in A.3.33
Time offset between serving and neighbour cells	µs	– set to the UE reported capability for receive time difference threshold if the UE reported value is < 3µs – 3µs otherwise		PRS are transmitted from synchronous cells
Expected RSTD	µs	0		The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [34] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells	µs	Same as time offset		The corresponding parameter in the DL-TDOA assistance ta specified in TS 37.355 [34] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data		4		Including the reference cell
PRS muting info		Cell 1: ‘10’ Cell 2: ‘01’ Cell 3: ‘10’		Corresponds to prs-MutingInfo defined in TS 37.355 [34]
PRS resource RE offset		Cell 1: 0 Cell 2: 0 Cell 3: 1		Cell 1 and Cell 3 are configured with different resource offsets
T1	s	3		The length of the time interval from the beginning of each test
T2	ms	10		The length of the time interval that follows after time interval T1 and processing time of assistance data. In this test UE is configured to measure single PFL within the configured PPW.

Table 14.2.6.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

	Config 3	dBm/SCS	-88	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.

Table 14.2.6.5-3: Cell-specific test parameters for RSTD measurement reporting delay during T2

Parameter		Unit	Cell 1		Cell 2		Cell 3	
			Sub-test 1	Sub-test 2	Sub-test 1	Sub-test 2	Sub-test 1	Sub-test 2

	Config 3		-85	-94	-85	-96.2	-85	-96.2
Propagation Condition			AWGN					

Note 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The RSTD measurement time fulfils the requirements specified in clause 14.2.6.3.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in section 9.9.2.7 starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in Clause 10.1.23.3, i.e., between RSTD_0000000 and RSTD1970049.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period plus ΔT, where ΔT = 50ms. The LPP response time calculation procedure could be divided into two situations based on whether the UE support ppw-durationOfPRS-Processing1-r17 or ppw-durationOfPRSProcessing2-r17.The RSTD measurement period follows the equation:

$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the positioning frequency layers are in Case 1, or

$T_{RSTD,Total} = \max(T_{RSTD_wo_gap,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2,

$$T_{RSTD_wo_gap,i} = \left(k_{multiTEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i},$$

Since the test case is for single positioning frequency layer, i = 1 and L = 1, so $T_{RSTD,\,Total} = T_{RSTD_wo_gap,\,1}$.

Analysing the equation for $T_{RSTD_wo_gap,\,1}$: $N_{RxBeam,i} = 1$ $k_{multiTEG,i}=1$ $N_{PRS,i}^{slot} = 3$ $N_{sample} = 4$.

For SCS 15KHz:

$$L_{available_{PRS,i}} = \frac{10}{10 * 1 * 14} * 4 * 1 * 3 = 0.857ms$$

For SCS=30KHz

$$L_{available_{PRS,i}} = \frac{10}{20 * 1 * 14} * 4 * 1 * 3 = 0.428ms$$

Therefore, the first part of the equation:

$$\left(1 * 1 * \left\lceil \frac{3}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * 4 - 1\right)$$

$T_{last,i} = T_i$ +PPWL

$$T_{effect,i} = \left\lceil \frac{T_j}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

$T_{available_PRS,\mathrm{i}} = LCM\left(T_{PRS,\mathrm{i}}, PPWRP_{\mathrm{i}}\right)$; where Tprs = 160 ms, and the repetition periodicity $\mathrm{PPWRP_i}$ =160ms. Therefore, $T_{available_PRS,i} = 160$

For case 1:

$$\left(1 * \left\lceil \frac{3}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

Where the remaining parameters depend on the UE capabilities. For SCS 15KHz The LPP time IE ranges between 0.49s and 108s.

For SCS 30KHz The LPP time IE ranges between 0.49s and 61.4s.

The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.5.4.3-3. The LPP time IE ranges between 1s and 108s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 108.3s.

Case 2:

$\mathrm{T_{last,i}} = \mathrm{PPWL}$

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$

$T_{available_PRS,\mathrm{i}} = LCM\left(T_{PRS,\mathrm{i}}, PPWRP_{\mathrm{i}}\right)$; where Tprs = 160 ms, and the repetition periodicity $\mathrm{PPWRP_i}$=160ms. Therefore, $T_{available_PRS,i} = 160$

Therefore, $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ and $\mathrm{T_{last,i}}$ = PPWL take following values depending on Ti

$$\left(1 * \left\lceil \frac{3}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,\mathrm{i}}}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

Where the remaining parameters depend on the UE capabilities. For SCS 15KHz The LPP time IE ranges between 0.49s and 13.29s.

For SCS 30KHz The LPP time IE ranges between 0.49s and 7.53s.

The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.5.4.3-3. The LPP time IE ranges between 1s and 14s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 14.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 14.2.6.5-4, Table 14.2.9.6-5, Table 14.2.6.5-6, Table 14.2.6.5-7 and Table 14.2.6.5-8 for reference.

20ms	160	10

The test tolerances are defined in clauses C.1.6, C 2.5 and C4.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.2.7 NR RSTD measurement reporting delay test case for single positioning frequency layer with Rx TEG in FR1 SA

14.2.7.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the Rx TEG based measurement period requirements specified in TS 38.133 [50] Clause 9.9.2.5 in an environment with AWGN propagation conditions in FR1 in standalone scenario when single positioning frequency layer is configured.

14.2.7.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports UE assisted DL-TDOA positioning and nr-UE-RxTEG-ID-MaxSupport.

14.2.7.3 Minimum conformance requirements

Same as defined in clause 14.2.5.3.

14.2.7.4 Test description

14.2.7.4.1 Initial conditions

The supported test configurations in listed in Table 14.2.7.4-1.

Table 14.2.7.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.7.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.12.
2. The general test parameter settings are set up according to Table 14.2.7.5-1, Table 14.2.7.5-2 and Table 14.2.7.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.2.7.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All cells are on the same RF channel distributed in single positioning frequency layer.

14.2.7.4.2 Test procedure

Same as defined in clause 14.2.5.4.2.

14.2.7.4.3 Message contents

14.2.7.5 Test requirement

Table 14.2.7.5-1, Table 14.2.7.5-2 and Table 14.2.7.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.7.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [4] and TS 37.355 [34]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
$BW_{channel}$	Config 1	MHz	20: $N_{RB,c}$ = 106	
	Config 2		20: $N_{RB,c}$ = 106	
	Config 3		50: $N_{RB,c}$ = 133	
SSB configuration	Config 1		SSB.1 FR1	
	Config 2		SSB.1 FR1	
	Config 3		SSB.2 FR1	
SMTC configuration	Config 1		SMTC.2	
	Config 2		SMTC.1	
	Config 3		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
	Config 2		SR.1.1 TDD	
	Config 3		SR.2.1 TDD	
RMSI CORESET RMC configuration	Config 1		CR.1.1 FDD	As specified in clause A.3.1.2.1
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
Initial BWP configuration	Config 1,2,3		DLBWP.0.1 ULBWP.0.1	
Active DL BWP configuration	Config 1,2,3		DLBWP.1.1	
Active UL BWP configuration	Config 1,2,3		ULBWP.1.1	
PRS Configuration	Config 1		PRS.1.4 FR1	As specified in clause A.3.31
	Config 2		PRS.1.4 FR1	
	Config 3		PRS.2.4 FR1	

Physical cell ID PCI		(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length		Normal	
DRX		OFF	
Measurement gap		GP#24 or GP#0	GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured
Radio frame receive time offset between the cells at the UE antenna connector	µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD	µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [34] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells	µs	5	The corresponding parameter in the DL-TDOA assistance ta specified in TS 37.355 [34] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data		4	Including the reference cell
PRS muting info		Cell 1: '10' Cell 2: '01' Cell 3: '10'	Corresponds to prs-MutingInfo defined in TS 37.355 [34]
PRS resource RE offset		Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1	s	3	The length of the time interval from the beginning of each test
T2	s	[1.28*$k_{multiTEG}$]Note 1	The length of the time interval that follows immediately after time interval T1

Note 1:

o $k_{multiTEG}=\left\lceil \frac{N_{TEG}}{k_{TEG,simul}} \right\rceil$ if UE is capable of receiving the same DL PRS resource from the same TRP simultaneously from multiple Rx TEGs, where N_{TEG} is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource, and $k_{TEG,simul}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

Table 14.2.7.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter		Unit	Cell 1	Cell 2	Cell 3
NR RF Channel Number			1	1	1
Positioning frequency layer			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low

	Config 3	dBm/ 47.88MHz	-52.56	-52.56	-52.56
SSB RP Note4	Config 1	dBm/SCS	-88	-Infinity	-Infinity
	Config 2	dBm/SCS	-88	-Infinity	-Infinity
	Config 3	dBm/SCS	-88	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.

Table 14.2.7.5-3: Cell-specific test parameters for RSTD measurement reporting delay during T2

Parameter		Unit	Cell 1	Cell 2	Cell 3
			T2	T2	T2

	Config 3	dBm/ 47.88MHz	-61.32	-61.32	-61.32
PRS $\hat{E}_s/I_{ot}$		dB	-6	-13	-13
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

The RSTD measurement time fulfils the requirements specified in clause 14.2.7.3.

The UE shall perform and report the Rx TEG based RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in section 9.9.2.5 starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in Clause 10.1.23.3, i.e., between RSTD_0000000 and RSTD1970049.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period plus ΔT, where ΔT = 50 ms. The RSTD measurement period follows the equation:

$$T_{RSTD,i} = \left(k_{multiTEG,i} * CSSF_{PRS,i} * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Since the test case is for single positioning frequency layer, i = 1 and L = 1, so $T_{RSTD,Total} = T_{RSTD,1}$.

Analysing the equation for $T_{RSTD,i}$:

$CSSF_{PRS,i} = 1$ $N_{RxBeam,i} = 1$ $N_{PRS,i}^{slot} = 4$ $N_{sample} = 4$

For SCS 15KHz:

$$L_{available_{PRS,i}} = \frac{10}{10 * 1 * 14} * 4 * 1 * 4 = 1.14ms$$

For SCS=30KHz

$$L_{available_{PRS,i}} = \frac{10}{20 * 1 * 14} * 4 * 1 * 4 = 0.571ms$$

Case 1: $k_{multiTEG,i} = N_{TEG,i}$

Case 2: $k_{multiTEG,i} = \left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$

For case 1: $k_{multiTEG,i}$ can take a maximum value of n8 and minimum value of n2

For case2: $k_{multiTEG,i}$ can take a maximum value of 4 and minimum value would be 1.

Therefore, the first part of the equation:

$$\left(k_{multiTEG} * 1 * \left\lceil \frac{4}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * 4 - 1\right)$$

$T_{last,i} = T_i + T_{available_PRS,i}$

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$

Case 1:

Where the remaining parameters depend on the UE capabilities. For SCS 15KHz The LPP time IE ranges between 1.28s and 1638.5s. For SCS 30KHz The LPP time IE ranges between 1.28s and 819.6s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.7.4.3-3. The LPP time IE ranges between 2s and 1640s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and (1638.3sec)164ten-s.

Case 2:

Where the remaining parameters depend on the UE capabilities. For SCS 15KHz The LPP time IE ranges between 0.648s and 1638.5s. For SCS 30KHz The LPP time IE ranges between 0.64s and 819.6s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.7.4.3-3. The LPP time IE ranges between 1s and 1640s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and (1638.3sec)164ten-s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 14.2.7.5-4, Table 14.2.7.5-5 , Table 14.2.7.5-6 and Table 14.2.7.5-7 for reference.

Table 14.2.7.5-4: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

n1280	1280	1440

The test tolerances are defined in clauses C.1.6, C 2.5 and C4.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.2.8 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

14.2.8.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the requirements specified in TS 38.133 [50] Clause 9.9.2 in an environment with AWGN propagation conditions in FR2 in standalone scenario when single positioning frequency layer is configured. In this test PRS is transmitted within the active BWP of the UE.

14.2.8.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

14.2.8.3 Minimum conformance requirements

When physical layer receives last of *NR-TDOA-ProvideAssistanceData* message and *NR-TDOA-RequestLocationInformation* message from LMF via LPP [49], the UE shall be able to measure multiple DL RSTD measurements, defined in TS 38.215 [57], during the measurement period $T_{RSTD,Total}$ defined as:

$$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD,i} + (L-1) * \max(T_{effect,i})$$

Where ,

i is the index of positioning frequency layer,

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i

$T_{RSTD,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer i as specified below:

$$T_{RSTD,i} = \left(k_{multiTEG,i} * CSSF_{PRS,i} * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

,

where:

$N_{RxBeam,i}$ is the UE Rx beam sweeping factor. In FR1, $N_{RxBeam,i}$ = 1;

and in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$CSSF_{PRS,i}$ is the carrier-specific scaling factor for NR PRS-based positioning measurements in positioning frequency layer i as defined in TS 38.133[50] clause 9.1.5.2.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49] in *NR-DL-TDOA-RequestLocationInformation*;

otherwise,

$k_{multiTEG}$=$N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG}$=$\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49] in *NR-DL-TDOA-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

- For a window W of duration max($T_{PRS,i,}$ MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:
  - N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including those overlapped with other MG occasions within the window, and
  - $N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule
  - Requirements do not apply if $N_{available}$ =0.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.

$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

N_{sample} is the number of PRS RSTD measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

- N_{sample} = 4 otherwise.

$T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time. If all of the PRS resources to be measured are available in the same MG occasion during $T_{availabe}$, $T_{last,i} = T_i$ +MGL. Otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$,

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where,

T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [49],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$, the least common multiple between $T_{PRS,i}$ and $MGRP_i$.

$MGRP_i$ is the repetition periodicity of the measurement gap applicable for measurement in the PRS frequency layer i.

$T_{PRS,i}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,i}$, where,

$T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where

T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

- Note: For the purpose of calculating $T_{PRS,i}$, only the PRS resources fully or partially covered by the MG are considered.

$\{N, T\}$ is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [49] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [49] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [49].

N' is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* specified in TS 37.355 [49].

14.2.8.4 Test description

14.2.8.4.1 Initial conditions

The supported test configuration is listed in Table 14.2.8.4-1.

Table 14.2.8.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.8.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.2.8.5-1, Table 14.2.8.5-2 and Table 14.2.8.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.2.8.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All cells are on the same RF channel distributed in single positioning frequency layer.

14.2.8.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2 and Cell 3. All three cells transmit PRS during T2.The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources.

The *NR-DL-TDOA-ProvideAssistanceData* and *nr-DL-TDOA-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.12.1, shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the *DL-TDOA assistance* data and location information request.

The UE is configured with measurement gap pattern ID # 24 or #13 before T2.

2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.2.8.5-1, Table 14.2.8.5-2 and Table 14.2.8.5-3. Propagation conditions are set according to clause 4.15.2.
4. T1 starts.
5. The SS shall transmit an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* in the *NR-DL-PRS-ProcessingCapability* IE and DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
7. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. The position of neighbour Cell 2 and the position of neighbour Cell 3 are described in 3GPP TS 37.571-5 [20]. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
8. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the reducedDL-PRS-ProcessingSamples-r17 in the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
9. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 14.2.8.5-3.
10. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3). The UE shall perform and report the RSTD measurements for both Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-TDOA-ProvideLocationInformation* IE including the nr-RSTD field for both Cell 2 and Cell 3 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-TDOA-ProvideLocationInformation* IE with both the nr-RSTD fields included within the response time then the number of failure tests is increased by one.

11. If the UE message at step 10 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

12. Repeat steps 2-11 in Table 14.2.8.4-1 until the confidence level according to Annex D is achieved.

14.2.8.5 Test requirement

Table 14.2.8.5-1, Table 14.2.8.5-2 and Table 14.2.8.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.8.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [57] and TS 37.355 [49]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
SSB configuration	Config 1		SSB.3 FR2	
$BW_{channel}$	Config 1	MHz	200: $N_{RB,c}$ = 132	
SMTC configuration	Config 1		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	

RMSI CORESET RMC configuration	Config 1		CR.3.1 TDD	As specified in TS 38.133 [50] clause A.3.1.2.1
Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
PRS Configuration	Config 1		PRS.1.2 FR2	As specified in TS 38.133 [50] clause A.3. 31
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX			OFF	
Measurement gap			GP#24 or GP#13	GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			4	Including the reference cell
PRS muting info			Cell 1: ‘10’ Cell 2: ‘01’ Cell 3: ‘10’	Corresponds to prs-MutingInfo defined in TS 37.355 [49]
PRS resource RE offset			Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1		s	3	The length of the time interval from the beginning of each test
T2		s	1.28	The length of the time interval that follows immediately after time interval T1
AoA setup			Setup 1	As defined in TS 38.133 [50] A.3.15.1
Beam assumption			Rough	Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

Table 14.2.8.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter	Unit	Cell 1	Cell 2	Cell 3
NR RF Channel Number		1	1	1
Positioning frequency layer		1	1	1

Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.5 FDD	N/A	N/A
N_{oc} Note 3	Config 1	dBm/SCS	-89		
PRS $\hat{E}_s/N_{oc}$		dB	-Infinity	-Infinity	-Infinity
Io Note 4	Config 1	dBm/ 190.08MHz	-57.00	-57.00	-57.00
SSB RP Note4	Config 1	dBm/SCS	-89	-Infinity	-Infinity
SSB $\hat{E}_s/N_{oc}$		dB	0	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.

Table 14.2.8.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T2

Parameter		Unit	Cell 1	Cell 2	Cell 3
			T2	T2	T2
RF Channel Number			1	1	1
Positioning frequency layer			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.1	OP.1	OP.1
PRACH configuration			FR2 PRACH configuration 1	FR2 PRACH configuration 1	FR2 PRACH configuration 1
N_{oc} Note 3	Config 1	dBm/SCS	-95	-95	-95
PRS $\hat{E}_s/N_{oc}$	Config 1	dB	2.9	0.75	0.75
Io	Config 1	dBm/ 190.08MHz	-55.71	-55.71	-55.71
PRS $\hat{E}_s/I_{ot}$		dB	-2.7	-5.6	-5.6
PRP Note 4		dBm/SCS	-92.1	-94.2	-94.2
Propagation Condition			AWGN		

Note 1:	OCNG shall be used such that active cells (all, except Cell 3 in T3) are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
Note 2:	The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3:	Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4:	PRP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters. The Io is calculated based only on the symbols in which PRS is transmitted.
Note 5:	Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

The RSTD measurement time fulfils the requirements specified in clause 14.2.8.3.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 14.2.8.3 starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in TS 38.133[50] Clause 10.1.23.3, i.e., between RSTD_0000000 and RSTD_1970049.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period plus ΔT, where ΔT = 50ms. The RSTD measurement period follows the equation:

$$T_{RSTD,i} = \left(CSSF_{PRS,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $CSSF_{PRS,i} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 3$, $L_{available_PRS,i} = 1$, $N_{sample} = 1$. N is the parameter *durationOfPRS-ProcessingSysmbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_j}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 8 * \left\lceil \frac{3}{N'} \right\rceil \left\lceil \frac{0.107}{N} \right\rceil * 1 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 1.288s and 30.88s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.8.4.3-3. The LPP time IE ranges between 2s and 31s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 31.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 14.2.8.5-4, Table 14.2.8.5-5 and Table 14.2.8.5-6 for reference.

Table 14.2.8.5-4: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

maxNumOfDL-PRS-ResProcessedPerSlot	$\left\lceil \frac{3}{N'} \right\rceil$
n1	3
n2	3
>=n4	1

Table 14.2.8.5-5: value of N based on *durationOfPRS-ProcessingSysmbols*

durationOfPRS-ProcessingSysmbols	$\lceil \frac{0.107}{N} \rceil$
>=nDot125	1

Table 14.2.8.5-6: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	T_{effect}	T_{last}
n8	160	168
n16	160	176
n20	160	180
n30	160	190
n40	160	200
n80	160	240
n160	160	320
n320	320	480
n640	640	800
n1280	1280	1440

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.2.9 NR RSTD measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

14.2.9.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the gapless RSTD measurement requirements specified in TS 38.133 [50] Clause 9.9.2.7 in an environment with AWGN propagation conditions in FR2 in standalone scenario when single positioning frequency layer is configured.

14.2.9.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning and prs-Processing Window.

14.2.9.3 Minimum conformance requirements

When physical layer receives last of *NR-TDOA-ProvideAssistanceData* message and *NR-TDOA-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in Clause 9.9.2.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined as:

$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the positioning frequency layers are in Case 1, or

$T_{RSTD,Total} = \max(T_{RSTD_wo_gap,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2,

Where,

i is the index of positioning frequency layer, and

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{RSTD,Total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{RSTD_wo_gap,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer *i* as specified below.

$$T_{RSTD_wo_gap,i} = \left(k_{multiTEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i} ,$$

where:

$N_{RxBeam,i}$ is the UE Rx beam sweeping factor. In FR1, $N_{RxBeam,i}$ = 1; and in FR2,$N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not supported *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*;

otherwise,

$k_{multiTEG}$=$N_{TEG,i}$, if the UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG}$=$\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if the UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.

$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$,

only the PRS resources unmuted and fully or partially overlapped with PPW are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

N_{sample} is the number of PRS RSTD measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} =2 if the UE supports *supportedDL-PRS-ProcessingSamples* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
- Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

$T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time.

If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where,

T_i corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw*-durationOfPRS-*ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$, the least common multiple between $T_{PRS,i}$ and $PPWRP_i$.

$PPWRP_i$ is the repetition periodicity of the PRS processing window applicable for measurements in the positioning frequency layer *i*.

$T_{PRS,i}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,i}$, where,

$T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*,

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

Note: For the purpose of calculating $T_{PRS,i}$, only the PRS resources that meet the conditions for PRS measurement outside measurement gaps as defined in clause 9.9.1.2 are considered.

N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer i is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer i is in Case 2.

N' is UE capability for number of DL PRS resources that it can process in a slot as indicated by *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* specified in TS 37.355 [34].

14.2.9.4 Test description

14.2.9.4.1 Initial conditions

The supported test configurations in listed in Table 14.2.9.4-1.

Table 14.2.9.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.9.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.2.9.5-1, Table 14.2.9.5-2 and Table 14.2.9.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.2.9.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All cells are on the same RF channel distributed in single positioning frequency layer.

14.2.9.4.2 Test procedure

The test consists of two sub-tests; Sub-test 1 is for Nsample = 4 and sub-test 2 is for Nsample = 1. Sub-test 2 is only conducted when UE also supporting supportedDL-PRS-ProcessingSamples-RRC-CONNECTED. The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2 and Cell 3. All three cells transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first PRS processing window instance containing the PRS resources.

The *NR-DL-TDOA-ProvideAssistanceData* and *nr-DL-TDOA-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.12.1, shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the *DL-TDOA assistance* data and location information request.

3. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.2.9.5-1, Table 14.2.9.5-2 and Table 14.2.9.5-3. Propagation conditions are set according to clause 4.15.2.
4. T1 starts.
5. The SS shall transmit an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
7. The SS shall transmit an RRCReconfiguration message with the PPW configuration.

8. The UE shall transmit RRCReconfigurationComplete message.

9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. The position of neighbour Cell 2 and the position of neighbour Cell 3 are described in 3GPP TS 37.571-5 [20]. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.

11. The SS sends a Positioning Measurement Gap Activation command containing an ID to activate the associated measurement gap

12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 14.2.9.5-2 and Table 14.2.9.5-3.

13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3). The UE shall perform and report the RSTD measurements for both Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-TDOA-ProvideLocationInformation* IE including the nr-RSTD field for both Cell 2 and Cell 3 within the response time, then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-TDOA-ProvideLocationInformation* IE with the nr-RSTD fields included within the response time then the number of failure tests is increased by one.

14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

15. Repeat steps 2-14 in Table 14.2.9.4-1 until the confidence level according to Annex D is achieved.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

14.2.9.5 Test requirement

Table 14.2.9.5-1, Table 14.2.9.5-2 and Table 14.2.9.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.9.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [57] and TS 37.355 [49]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
$BW_{channel}$	Config 1	MHz	200: $N_{RB,c}$ = 132	
SSB configuration	Config 1		SSB.3 FR2	
SMTC configuration	Config 1		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
RMSI CORESET RMC configuration	Config 1		CR.3.1 TDD	As specified in TS 38.133 [50] clause A.3.1.2.1
Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
PRS Configuration	Config 1		PRS.1.4. FR2	As specified in TS 38.133 [50] clause A.3. 31
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX			OFF	
PPW configuration			Table A.3.X33-1: Reference PPW configuration	As defined in TS 38.133 [50] A.3.33
Time offset between serving and neighbour cells		µs	set to the UE reported capability for receive time difference threshold if the UE reported value is < 3µs 3µs otherwise	PRS are transmitted from synchronous cells
Expected RSTD		µs	0	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	Same as time offset between serving and neighbour cells	The corresponding parameter in the DL-TDOA assistance ta specified in TS

			37.355 [49] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data		4	Including the reference cell
PRS muting info		Cell 1: '10' Cell 2: '01' Cell 3: '10'	Corresponds to prs-MutingInfo defined in TS 37.355 [49]
PRS resource RE offset		Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1	s	3	The length of the time interval from the beginning of each test
T2	ms	10	The length of the time interval that follows after time interval T1 and processing time of assistance data. In this test UE is configured to measure single PFL within the configured PPW.
AoA setup		Setup 1	As defined in TS 38.133 [50] A.3.15.1
Beam assumption		Rough	Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

Table 14.2.9.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter		Unit	Cell 1	Cell 2	Cell 3
NR RF Channel Number			1	1	1
Positioning frequency layer			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.5 FDD	N/A	N/A
N_{oc} Note 3	Config 1	dBm/SCS	-89		
PRS $\hat{E}_s/N_{oc}$		dB	-Infinity	-Infinity	-Infinity
Io Note 4	Config 1	dBm/ 190.08MHz	-57.00	-57.00	-57.00
SSB RP Note4	Config 1	dBm/SCS	-89	-Infinity	-Infinity
SSB $\hat{E}_s/N_{oc}$		dB	0	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.

Table 14.2.9.5-3: Cell-specific test parameters for RSTD measurement reporting delay during T2

Parameter		Unit	Cell 1		Cell 2		Cell 3	
			Sub-test 1	Sub-test 2	Sub-test 1	Sub-test 2	Sub-test 1	Sub-test 2
RF Channel Number			1		1		1	
Positioning frequency layer			1		1		1	
Correlation Matrix and Antenna Configuration			1x2 Low		1x2 Low		1x2 Low	
OCNG patterns defined in A.3.2.1			OP.1		OP.1		OP.1	
PRACH configuration			FR2 PRACH configuration 1		FR2 PRACH configuration 1		FR2 PRACH configuration 1	
N_{oc} Note 3	Config 1	dBm/SCS	-89.41	-95	-89.41	-95	-84.41	-95
PRS $\hat{E}_s/N_{oc}$	Config 1	dB	-4.84	42.9	-11.02	0.75	-11.02	0.75
Io	Config 1	dBm/ 190.08MHz	-55.66	-55.71	-55.66	-55.71	-55.66	-55.71
PRS $\hat{E}_s/I_{ot}$		dB	-5.7	-276	-12.7	-5.6	-12.7	-5.6
PRS-RSRP Note 4		dBm/SCS	-94.2	-92.1	-100.4	-94.2	-100.4	-94.2
Propagation Condition			AWGN					

Note 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: PRP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters. The Io is calculated based only on the symbols in which PRS is transmitted.
Note 5: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

The RSTD measurement time fulfils the requirements specified in clause 14.2.9.3.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 14.2.9.3 starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in TS 38.133[50] Clause 10.1.23.3, i.e., between RSTD_0000000 and RSTD_1970049.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period plus ΔT, where ΔT = 50ms. The LPP response time calculation procedure could be divided into two situations based on whether the UE support ppw-durationOfPRS-Processing1-r17 or ppw-durationOfPRS-Processing2-r17.The RSTD measurement period follows the equation:

$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the positioning frequency layers are in Case 1, or

$T_{RSTD,Total} = \max(T_{RSTD_wo_gap,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2,

Where $N_{RxBeam,i}$ = 8, $k_{multiTEG,i}$=1, $N_{PRS,i}^{slot}$ = 3, $L_{available_PRS,i}$ = 0.214, N_{sample}= 4, $T_{uncertainty,i}$ = 0. N is the parameter *ppw-durationOfPRS-ProcessingSymbolsN* from TS 37.355 [49], N' is the parameter *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $T_{last,i}$ = T_i +PPWL and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$; where Tprs = 160 ms, and the repetition periodicity $PPWRP_i$=160ms. Therefore, $T_{available_PRS,i} = 160$

T_i depends on the UE parameter *ppw-durationOfPRS-ProcessingSymbolsT* from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(8 * \left\lceil \frac{3}{N'} \right\rceil \left\lceil \frac{0.214}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 4.971s and 245.77s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.9.4.3-3. The LPP time IE ranges between 5s and 250s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 5.3s and 25.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 14.2.9.5-4, Table 14.2.9.5-5 and Table 14.2.9.5-6 for reference.

ms160	160	170
ms320	320	330
ms640	640	650
ms1280	1280	1290

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.2.10 NR RSTD measurement reporting delay test case for single positioning frequency layer with Rx TEG in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

14.2.10.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the Rx TEG based measurement period requirements specified in TS 38.133 [50] Clause 9.9.2.5 in an environment with AWGN propagation conditions in FR2 in standalone scenario when single positioning frequency layer is configured.

14.2.10.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports UE assisted DL-TDOA positioning and nr-UE-RxTEG-ID-MaxSupport.

14.2.10.3 Minimum conformance requirements

Same as defined in clause 14.2.8.3.

14.2.10.4 Test description

14.2.10.4.1 Initial conditions

The supported test configurations in listed in Table 14.2.10.4-1.

Table 14.2.10.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.10.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.2.10.5-1, Table 14.2.10.5-2 and Table 14.2.10.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.2.10.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All cells are on the same RF channel distributed in single positioning frequency layer.

14.2.10.4.2 Test procedure

Same as defined in clause 14.2.8.4.2.

14.2.10.4.3 Message contents

14.2.10.5 Test requirement

Table 14.2.10.5-1, Table 14.2.10.5-2 and Table 14.2.10.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.10.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [57] and TS 37.355 [49]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
$BW_{channel}$	Config 1	MHz	200: $N_{RB,c}$ = 132	
SSB configuration	Config 1		SSB.3 FR2	

SMTC configuration	Config 1		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
RMSI CORESET RMC configuration	Config 1		CR.3.1 TDD	As specified in TS 38.133 [50] clause A.3.1.2.1
Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
PRS Configuration	Config 1		PRS.1.4. FR2	As specified in TS 38.133 [50] clause A.3. 31
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX			OFF	
Measurement gap			GP#24 or GP#13	GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			4	Including the reference cell
PRS muting info			Cell 1: '10' Cell 2: '01' Cell 3: '10'	Corresponds to prs-MutingInfo defined in TS 37.355 [49]
PRS resource RE offset			Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1		s	3	The length of the time interval from the beginning of each test
T2		s	1.28*$k_{multiTEG}$ Note 1	The length of the time interval that follows immediately after time interval T1
AoA setup			Setup 1	As defined in TS 38.133 [50] A.3.15.1
Beam assumption			Rough	Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

Note 1: $k_{multiTEG}=\left\lceil \frac{N_{TEG}}{k_{TEG,simul}} \right\rceil$ if UE is capable of receiving the same DL PRS resource from the same TRP simultaneously from multiple Rx TEGs, where N_{TEG} is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource, and $k_{TEG,simul}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

Table 14.2.10.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter		Unit	Cell 1	Cell 2	Cell 3
NR RF Channel Number			1	1	1
Positioning frequency layer			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.5 FDD	N/A	N/A
N_{oc} Note 3	Config 1	dBm/SCS	-89		
PRS $\hat{E}_s/N_{oc}$		dB	-Infinity	-Infinity	-Infinity
Io Note 4	Config 1	dBm/ 190.08MHz	-57.00	-57.00	-57.00
SSB RP Note4	Config 1	dBm/SCS	-89	-Infinity	-Infinity
SSB $\hat{E}_s/N_{oc}$		dB	0	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.

Table 14.2.10.5-3: Cell-specific test parameters for RSTD measurement reporting delay during T2

Parameter		Unit	Cell 1	Cell 2	Cell 3
			T2	T2	T2
RF Channel Number			1	1	1
Positioning frequency layer			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.1	OP.1	OP.1
PRACH configuration			FR2 PRACH configuration 1	FR2 PRACH configuration 1	FR2 PRACH configuration 1
N_{oc} Note 3	Config 1	dBm/SCS	-89.41	-89.41	-89.41
PRS $\hat{E}_s/N_{oc}$	Config 1	dB	-4.84	-11.02	-11.02
Io	Config 1	dBm/ 190.08MHz	-55.66	-55.66	-55.66

PRS $\hat{E}_s/I_{ot}$	dB	-5.7	-12.7	-12.7
PRP Note 4	dBm/SCS	-93.8	-100	-100
Propagation Condition		AWGN		

Note 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: PRP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters. The Io is calculated based only on the symbols in which PRS is transmitted.
Note 5: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

The RSTD measurement time fulfils the requirements specified in clause 14.2.10.3.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 14.2.10.3 starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in TS 38.133[50] Clause 10.1.23.3, i.e., between RSTD_0000000 and RSTD_1970049.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period plus ΔT, where ΔT = 50ms. The RSTD measurement period follows the equation:

$$T_{RSTD,i} = \left(k_{multiTEG,i} * CSSF_{PRS,i} * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where $CSSF_{PRS,i} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 3$, $L_{available_PRS,i} = 0.214$, $N_{sample} = 4$ $k_{multiTEG} = 2$. N is the parameter *durationOfPRS-ProcessingSysmbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot* from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(2 * 1 * 8 * \left\lceil \frac{3}{N'} \right\rceil \left\lceil \frac{0.214}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 10.248s and 491.68s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.10.4.3-3. The LPP time IE ranges between 11s and 500s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 11.3s and 500.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 14.2.10.5-4, Table 14.2.10.5-5 and Table 14.2.10.5-6 for reference.

n160	160	320
n320	320	480
n640	640	800
n1280	1280	1440

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.2.11 NR RSTD measurement reporting delay test case for PRS aggregation in FR1

14.2.11.1 Test purpose

The purpose of the test is to verify that the RSTD measurement by aggregating PRS resources from multiple positioning frequency layers (PFLs) meets the measurement period requirements specified in TS 38.133 [50] clause 9.9.2.10 in an environment with AWGN propagation conditions in FR1.

14.2.11.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports DL-TDOA positioning and *supportOfDL-PRS-BWA-RRC-Connected-r18.*

14.2.11.3 Minimum conformance requirements

When UE physical layer receives last of *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP [49] with a request to perform measurement by aggregating PRS resources from multiple PFLs via *nr-DL-PRS-JointMeasurementRequestedPFL-List*, the UE shall be able to perform RSTD measurement by aggregating PRS resources from multiple PFLs (up to the UE capability specified in TS 38.133 clause 9.9.2.3) defined in TS 38.215 [57], during the measurement period $T_{RSTD_aggregate,\ Total}$ defined as:

$$T_{RSTD_aggregate,\ Total} = T_{non_aggregate_RSTD} + T_{aggregate_RSTD} + T_{margin},$$

where,

$T_{non_aggregate_RSTD}$ is the total measurement period for RSTD measurement on PFLs that do not contain PRS resources for aggregation.

Calculation of $T_{non_aggregate_RSTD}$ is based on TS 38.133 clause 9.9.2.5 with the following exceptions,

- only PFLs containing resource set(s) not linked to any other resource set(s) are considered in L
- on each PFL i, only resource set(s) not linked to any other resource set(s) are considered in $T_{available_PRS,i}$, $N_{PRS,i}^{slot}$ and $L_{available_PRS,i}$
- N_{sample} = 2 if the UE supports the capability of positioning measurements with reduced number of samples as indicated by *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* specified in TS 37.355 [49], and the LMF requests the UE to perform positioning measurements with reduced number of samples,
- $(L-1)*\max(T_{effect,i})$ is replace by $(L-1)*T'_{margin}$.

$T_{non_aggregate_RSTD}$ is equal to zero if UE is not configured to perform non-aggregated measurements by the LMF.

If UE is configured to perform positioning measurements on PFLs that contain PRS resources for aggregation and on PFLs that do not contain PRS resources for aggregation, $T_{margin} = T'_{margin}$ is delay margin to account for delay between RSTD measurement performed by UE on PFLs that contain PRS resources for aggregation and RSTD measurement performed by UE on PFLs that do not contain PRS resources for aggregation.

If UE is only configured to perform measurements on PFLs that contain PRS resources for aggregation or if UE is only configured to perform measurements on PFLs that do not contain PRS resources for aggregation, then $T_{margin} = 0$.

$T'_{margin} = \max(Teffect, i)$, when both aggregated PFLs and non-aggregated PFLs are configured for positioning measurement.

If UE is capable of performing latency reduced positioning measurements and is configured to perform latency reduced positioning measurement by LMF via *reducedDL-PRS-ProcessingSamples-r17* [49], then $N_{sample} = 2$ shall be considered in calculations of $T_{aggregate_RSTD}$ and $T_{non\text{-}aggregate_RSTD}$.

If UE is not capable to perform latency reduced positioning measurements or is not configured to perform latency reduced positioning measurement by LMF via *reducedDL-PRS-ProcessingSamples-r17* [49], then $N_{sample} = 4$ shall be considered in calculations of $T_{aggregate_RSTD}$ and $T_{non\text{-}aggregate_RSTD}$.

$T_{aggregate_RSTD}$, total measurement period for RSTD measurements performed by UE by aggregating PRS resources from multiple PFLs as defined in TS 38.214 [56], is defined as:

$$T_{aggregate_RSTD} = \sum_{i=1}^{G} T_{RSTD_aggregate,i} + (G-1)*T'_{margin},$$

where

i is the index of effective PFL, corresponding to the group of PFLs containing linked PRS resource sets to be aggregated for RSTD measurement,

G denotes the number of effective PFLs that UE is configured to perform aggregated measurements on. G is configured by LMF and is provisioned to UE via *nr-DL-PRS-AggregationInfo.*

$T_{RSTD_aggregate,i}$ is the measurement period for PRS RSTD measurement in the effective PFL *i* as specified below:

$$T_{RSTD_aggregate,i} = \left(k_{multiTEG_agg,i} \times CSSF_{PRS_agg,i} \times ceil(K_{p,PRS_agg,i}) \times N_{RxBeam,i} \times \left\lceil \frac{N_{PRS_agg,i}^{slot}}{N'_{agg}} \right\rceil \left\lceil \frac{L_{available_PRS_agg,i}}{N_{agg}} \right\rceil \times N_{sample_agg} - 1\right) \times T_{effect_agg,i} + T_{last_agg,i},$$

where:

$N_{RxBeam,i}$ is the UE Rx beam sweeping factor.

In FR1, $N_{RxBeam,i} = 1$.

In FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing effective PFL i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$CSSF_{PRS_agg,i}$ is the carrier-specific scaling factor for NR PRS-based positioning measurements in effective PFL i as defined in TS 38.133 clause 9.1.5.2.

$k_{multiTEG_agg,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG_agg,i}$ = 1 if UE is not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49] in *NR-DL-TDOA-RequestLocationInformation*;

Otherwise,

$k_{multiTEG_agg,i} = N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG_{agg},i}=\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure aggregated PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49] in *NR-DL-TDOA-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$K_{p,PRS_agg,i}$ is a scaling factor for effective PFL i to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS_agg,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS_agg,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS_agg,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the effective PFL, and starting at the beginning of any associated gap occasions covering the PRS occasion:

- N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and
- $N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule
- Requirements do not apply if $N_{available} = 0$.

$N^{slot}_{PRS_agg,i}$ is the maximum number of DL PRS resources in effective PFL i configured in a slot.

$L_{available_PRS_agg,i}$ is the time duration of available PRS in the effective PFL i to be measured during $T_{available_PRS_agg,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{available_PRS_agg,i}$, only the PRS resources unmuted and fully or partially overlapped with MG and satisfying the conditions for PRS BW aggregation are considered.

N_{sample_agg} is the number of PRS RSTD measurement samples.

$T_{last_agg,i}$ is the measurement duration for the last PRS RSTD sample in the effective PFL i, including the sampling time and processing time. If all of the PRS resources to be measured are available in the same MG occasion during $T_{availabe_agg}$, $T_{last_agg,i} = T_{agg,i}$ + MGL. Otherwise, $T_{last_agg,i} = T_{agg,i} + T_{available_PRS_agg,i}$,

$T_{effect_agg,i}$ is the periodicity of the PRS RSTD measurement in the effective PFL i defined as:

$$T_{effect_agg,i} = \left\lceil \frac{T_{agg,i}}{T_{available_PRS_agg,i}} \right\rceil \times T_{available_PRS_agg,i}$$

where,

$T_{available_PRS_agg,i} = LCM(T_{PRS_agg,i}, MGRP_i)$, the least common multiple between $T_{PRS_agg,i}$ and $MGRP_i$. $MGRP_i$ is the repetition periodicity of the measurement gap applicable for measurement in the effective PFL i.

$T_{PRS_agg,i}$ is the periodicity of DL PRS resources meeting the bandwidth aggregation conditions with muting on effective PFL i. If more than one PRS periodicities are configured in effective PFL i, the least common multiple of PRS periodicities $T_{per_agg}^{PRS\ with\ muting}$ among all DL PRS resource sets in the effective PFL is used to derive $T_{PRS_agg,i}$, where,

$T_{per_agg}^{PRS\ with\ muting} = N_{muting} \times T_{per_agg}^{PRS}$, is the PRS periodicity with muting per PRS resource configured for aggregation,

$T_{per_agg}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS_agg} \times L_{muting}$, where $T_{muting}^{PRS_agg}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

- Note: For the purpose of calculating $T_{PRS_agg,i}$, only the PRS resources fully or partially covered by the MG and PRS resources that satisfy the conditions for PRS BW aggregation are considered.

$\{N_{agg}, T_{agg,i}\}$ is UE capability combination per band to aggregate PRS resources from multiple PFLs within an effective PFL where N_{agg} is a duration of DL PRS symbols in ms corresponding to *prs-durationOfTwoPRS-BWA-ProcessingSymbolsN-r18* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsN-r18* in TS 37.355 [49] processed every $T_{agg,i}$ ms corresponding to *prs-durationOfTwoPRS-BWA-ProcessingSymbolsT-r18* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsT* in TS 37.355 [49] for a given maximum bandwidth supported by UE corresponding to *maximumOfTwoAggregatedDL-PRS-Bandwidth* or *maximumOfThreeAggregatedDL-PRS-Bandwidth* in TS 37.355 [49]

N'_{agg} is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfAggregatedDL-PRS-ResourcePerSlot-FR1-r18* for FR1 and *maxNumOfAggregatedDL-PRS-ResourcePerSlot-FR2-r18* for FR2 specified in TS 37.355 [49].

The requirements in this clause for aggregated measurements apply provided that the linked PRS resource sets on multiple PFLs for aggregated measurements satisfy all the conditions specified in clause 5.1.6.5.3 in TS 38.214 [56].

Except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273, the time $T_{RSTD_aggregate,Total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data for aggregation after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the physical layer of UE via LPP [49] including a request to perform measurement by aggregating PRS resources from multiple PFLs via *nr-DL-PRS-JointMeasurementRequestedPFL-List*.

For deferred MT-LR with other event than “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 , the time $T_{RSTD_aggregate,Total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event “Periodic Location” as defined in clause 4.1a.5.1 TS 23.27] , the UE shall perform the aggregated RSTD measurement in each reporting period and activate the location report at the time when the periodic timer expires.

When PRS-RSRP is also reported by UE together with RSTD measurement based on aggregated DL-PRS resources from multiple-PFLs, PRS-RSRP are performed over the measurement period defined in TS 38.133 clause 9.9.2.10.

When PRS-RSRPP is also reported by UE together with RSTD measurement based on aggregated DL-PRS resources from multiple-PFLs, PRS-RSRPP are performed over the measurement period defined in TS 38.133 clause 9.9.2.10.

If during the measurement period of one or more effective PFLs, the MG pattern is reconfigured, the measurement period can be longer.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{RSTD_aggregate,Total}$ within measurement gaps due to collisions with other signals; otherwise, the measurement period can be longer.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for aggregated PRS resources, if the PRS resources to be aggregated are across two sampling duration of N_{agg} within duration $L_{available_PRS_agg,i}$.

The measurement requirements do not apply, if time span of the instance of the PRS resources to be aggregated (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N_{agg}.

The requirements in TS 38.133 clause 9.9.2.10 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which aggregated PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while aggregated RSTD measurements are being performed, then the UE shall continue and complete the on-going aggregated RSTD measure, ments. The aggregated RSTD measurement period can be longer. The UE shall meet the RSTD measurement accuracy requirements in TS 38.133 clause 10.1.23A.2.

14.2.11.4 Test description

14.2.11.4.1 Initial conditions

Table 14.2.11.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth per PFL, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth per PFL, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth per PFL, TDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.11.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.12.
2. The general test parameter settings are set up according to Table 14.2.11.5-1, Table 14.2.11.5-2 and Table 14.2.11.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.2.11.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR1.

14.2.11.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2 and Cell 3. All three cells transmit PRS resources on multiple positioning frequency layers during T2.

The *NR-DL-TDOA-ProvideAssistanceData* and *nr-DL-TDOA-RequestLocationInformation* as defined in TS 37.355 [49] clause 6.5.10, shall be provided to the UE during T1. The UE is capable of performing RSTD measurements by aggregating PRS resources from multiple PFLs and is configured by the LMF to perform measurements by aggregating the PRS resources from multiple positioning frequency layers via *jointMeasurementsReq*. The resources to be aggregated for RSTD measurement are indicated by the LMF to the UE via *nr-DL-PRS-JointMeasurementRequestedPFL-List*.

The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the DL-TDOA assistance data and location information request.

The beginning of the time interval T2 shall be aligned with the beginning of the first measurement gap instance containing the PRS resources.

The UE is configured with measurement gap pattern ID # 24 or measurement gap pattern ID # 0 before T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.2.11.5-1, Table 14.2.11.5-2 and Table 14.2.11.5-3. Propagation conditions are set according to clause 4.15.2.
4. T1 starts.
5. The SS shall transmit an LPP REQUEST CAPABILITIES message.
6. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
7. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms. If the UE message at step 6 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
8. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *nr-DL-PRS-JointMeasurementRequestedPFL-List* in the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
9. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 14.2.11.5-3.
10. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.4.4). The UE shall perform and report the RSTD measurements by aggregating PRS resources from multiple PFLs for both Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1.

    If the UE transmits an *NR-DL-TDOA-ProvideLocationInformation* IE including the nr-RSTD field for both Cell 2 and Cell 3 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-TDOA-ProvideLocationInformation* IE with both the nr-RSTD fields included within the response time then the number of failure tests is increased by one.
11. If the UE message at step 10 includes the ackRequested IE set to TRUE, the SS shall send a LPP acknowledgement message.
12. Repeat steps 2-11 in Tables 14.2.11.4-1 until the confidence level according to Annex D is achieved.

14.2.11.4.3 Message contents

14.2.11.5 Test requirement

Table 14.2.11.5-1 to Table 14.2.11.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.11.5-1: General test parameters for RSTD measurement reporting delay

Parameter	Unit	Value	Comment

Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [57] and TS 37.355 [49]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first place in the respective neighbour cell list in the DL-TDOA assistance data.
$BW_{channel}$ per carrier	Config 1	MHz	20: $N_{RB,c}$ = 106	
	Config 2		20: $N_{RB,c}$ = 106	
	Config 3		50: $N_{RB,c}$ = 133	
SSB configuration	Config 1		SSB.1 FR1	
	Config 2		SSB.1 FR1	
	Config 3		SSB.2 FR1	
SMTC configuration	Config 1		SMTC.2	
	Config 2		SMTC.1	
	Config 3		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
	Config 2		SR.1.1 TDD	
	Config 3		SR.2.1 TDD	
RMSI CORESET RMC configuration	Config 1		CR.1.1 FDD	As specified in TS 38.133 [50] clause A.3.1.2.1
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
Dedicated CORESET RMC configuration	Config 1		CCR.1.1 FDD	
	Config 2		CCR.1.1 TDD	
	Config 3		CCR.2.1 TDD	
Initial BWP configuration	Config 1,2,3		DLBWP.0.1 ULBWP.0.1	
Active DL BWP configuration	Config 1,2,3		DLBWP.1.1	
Active UL BWP configuration	Config 1,2,3		ULBWP.1.1	
PRS Configuration per PFL	Config 1		PRS.1.2 FR1	As specified in TS 38.133 [50] clause A.3.31.
	Config 2		PRS.1.2 FR1	
	Config 3		PRS.2.2 FR1	
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2) mod 6=0 and (PCI of Cell 1 – PCI of Cell 3) mod 6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX			OFF	
Measurement gap			GP#24 or GP#0	GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured
Radio frame receive time offset between the cells at the UE antenna connector		μs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells

Expected RSTD	μs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expected RSTD indicator
Expected RSTD uncertainty for all neighbour cells	μs	5	The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the *expectedRSTD-Uncertainty* index
Number of cells provided in DL-TDOA assistance data		3	Including the reference cell
PRS muting info		Cell 1: '10' Cell 2: '01' Cell 3: '10'	Correponds to *NR-MutingPattern* defined in TS 37.355 [49]
PRS resource RE offset		Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1	s	3	The length of the time interval from the beginning of each test
T2	s	1.28	The length of the time interval that follows immediately after time interval T1

Table 14.2.11.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter		Unit	Cell 1	Cell 2	Cell 3
NR RF Channel Number			1	1	1
Correlation Matrix and Antenna Configuration			1×2 Low	1×2 Low	1×2 Low

Io Note 4	Config 1	dBm/ 19.08MHz	-56.54	-56.54	-66.96
	Config 2	dBm/ 19.08MHz	-56.54	-56.54	--66.96
	Config 3	dBm/ 47.88MHz	-52.56	-52.56	-62.97
SSB RP Note4	Config 1	dBm/SCS	-88	-Infinity	-Infinity

	Config 2	dBm/SCS	-88	-Infinity	-Infinity
	Config 3	dBm/SCS	-85	-Infinity	-Infinity
Propagation Condition			AWGN		
NOTE 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS. NOTE 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2. NOTE 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled. NOTE 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.					

Table 14.2.11.5-3: Cell-specific test parameters for RSTD measurement reporting delay during T2

Propagation Condition		AWGN		

Note 1: OCNG shall be used such that active cells are fully allocated, and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters. The Io is calculated based only on the symbols in which PRS is transmitted.
Note 5: Carriers are intra-band and contiguous.

The RSTD measurement time fulfils the requirements specified in clause 14.2.11.3.

The UE shall perform and report the RSTD measurements by aggregating PRS resources from multiple positioning frequency layers for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in TS 38.133 [50] section 9.9.2.10 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in TS 38.133 [50] clause 10.1.23A.3, i.e., between RSTD_000000000 and RSTD_126083073.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE is derived from the UE RSTD measurement period plus ΔT, where ΔT = 50 ms. The RSTD measurement period follows the equation:

$$T_{RSTD_aggregate,i} = \left(k_{multiTEG_agg,i} \times CSSF_{PRS_agg,i} \times ceil(K_{p,PRS_agg,i}) \times N_{RxBeam,i} \times \left\lceil \frac{N^{slot}_{PRS_agg,i}}{N'_{agg}} \right\rceil \left\lceil \frac{L_{available_PRS_agg,i}}{N_{agg}} \right\rceil \times N_{sample_agg} - 1 \right) \times T_{effect_agg,i} + T_{last_agg,i}$$

Where $k_{multiTEG_agg,i} = 1$, $CSSF_{PRS_agg,i} = 1$, $K_{p,PRS_agg,i} = 1$, $N_{RxBeam,i} = 1$, $N^{slot}_{PRS_agg,i} = 1$, $L_{avavailable_PRS_agg,,i} = 0.857$ for 15kHz and 0.429 for 30kHz, $N_{sample_agg} = 4$. N'_{agg} is the parameter maxNumOfAggregatedDL-PRS-ResourcePerSlot from TS 37.355 [49], Nagg is the parameter prs-durationOfTwoPRS-BWA-ProcessingSymbolsN or prs-durationOfThreePRS-BWA-ProcessingSymbolsN from TS 37.355 [49], $T_{last_agg,i} = Tagg,i + T_{available_PRS_agg,i}$ and $T_{effect_agg,i} = \left\lceil \frac{T_{agg,i}}{T_{available_PRS_agg,i}} \right\rceil \times T_{available_PRS_agg,i}$.

$T_{available_PRS_agg,i} = LCM(T_{PRS_agg,i}, MGRP_i)$; where $T_{PRS_agg,i}$ = 320 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $T_{available_PRS_agg,i} = 320$ ms.

Finally, it results in the following equation:

$$T_{RSTD_aggregate,i} = \left(1 \times 1 \times 1 \times 1 \times \left\lceil \frac{1}{N'_{agg}} \right\rceil \left\lceil \frac{L_{available_PRS_agg,i}}{N_{agg}} \right\rceil \times 4 - 1 \right) \times T_{effect_agg,i} + T_{last_agg,i}$$

where the remaining parameters depend on the UE capabilities.

Depending on the UE Buffering defined in clause 5.1.6.5 of TS 38.214 [26]:

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 15kHz the LPP time IE ranges between 2.896s and 73.6s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.11.4.3-3. The LPP time IE ranges between 3s and 74s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 3.3s and 74.3s.

Similarly for Type 2 Buffering, Best Case result of 2.896s is 3s and for the worst-case result of 83.84s is 84s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 3.3s and 84.3s.

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 30kHz the LPP time IE ranges between 2.896s and 42.88s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.11.4.3-3. The LPP time IE ranges between 3s and 43s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 3.3s and 43.3s.

Similarly for Type 2 Buffering, Best Case result of 2.896s is 3s and for the worst-case result of 42.88s is 43s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 3.3s and 43.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 14.2.11.5-4, Table 14.2.11.5-5 and Table 14.2.11.5-6 for reference.

ms640	640	960
ms1280	1280	1600

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.2.12 NR RSTD measurement reporting delay test case for PRS aggregation in FR2

Editor's Note: This test case is incomplete. Following aspects are either missing or FFS: Test requirement is incomplete and MU/TT analysis is missing

14.2.12.1 Test purpose

The purpose of the test is to verify that the RSTD measurement performed by UE by aggregating PRS resources from multiple positioning frequency layers (PFLs) meets the requirements specified in TS 38.133 [50] clause 9.9.2.10 in an environment with AWGN propagation conditions in FR2 in standalone scenario when multiple positioning frequency layer is configured.

14.2.12.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports DL-TDOA positioning and *supportOfDL-PRS-BWA-RRC-Connected-r18.*

14.2.12.3 Minimum conformance requirements

Same as in clause 14.2.11.3.

14.2.12.4 Test description

14.2.12.4.1 Initial conditions

Table 14.2.12.4-1: Test Configurations

Configuration	Description
1	120 kHz SSB SCS, 200 MHz bandwidth per PFL, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.12.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.2.12.5-1, Table 14.2.12.5-2 and Table 14.2.12.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.2.12.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR1.

14.2.12.4.2 Test procedure

Same test procedure as defined in clause 14.2.11.4.2 with following exceptions:

Table 14.2.12.4-1 replaces Table 14.2.11.4-1; Table 14.2.12.5-1 replaces 14.2.11.5-1; Table 14.2.12.5-2 repalces Table 14.2.11.5-2; Table 14.2.12.5-3 replaces Table 14.2.11.5-3;

14.2.12.4.3 Message contents

Same message contents as defined in clause 14.2.11.4.3, with the following exceptions:

Table 14.2.12.4.3-1 replaces Table 14.2.11.4.3-5; Table 14.2.12.4.3-2 replacesTable 14.2.11.4.3-6.

14.2.12.5 Test requirement

Table 14.2.12.5-1 to Table 14.2.12.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.12.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [57] and TS 37.355 [49]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
SSB configuration	Config 1		SSB.3 FR2	
SMTC configuration	Config 1		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
RMSI CORESET RMC configuration	Config 1		CR.3.1 TDD	As specified in clause A.3.1.2.1
Dedicated CORESET RMC configuration	Config 1		CCR.1.1 FDD	
PRS Configuration per PFL	Config 1		PRS.1.1 FR2	As specified in TS 38.133 [50] clause A.3.31
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX			OFF	

Measurement gap		GP#24 or GP#13	GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured
Radio frame receive time offset between the cells at the UE antenna connector	µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD	µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells	µs	5	The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data		3	Including the reference cell
PRS muting info		Cell 1: '10' Cell 2: '01' Cell 3: '10'	Correponds to prs-MutingInfo defined in TS 37.355 [49]
PRS resource RE offset		Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1	s	3	The length of the time interval from the beginning of each test
T2	s	1.28	The length of the time interval that follows immediately after time interval T1
AoA setup		Setup 1	As defined in TS 38.133 [50] A.3.15.1
Beam assumption		Rough	Information about types of UE beam is given in clause TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

Table 14.2.12.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter	Unit	Cell 1	Cell 2	Cell 3
NR RF Channel Number		1	1	1

Note 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: PRP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters. The Io is calculated based only on the symbols in which PRS is transmitted.
Note 5: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] table 6.2.1.3-4.
Note 6: Carriers are intra-band and contiguous to each other.

The RSTD measurement time fulfils the requirements specified in 14.2.12.3.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in TS 38.133 [50] clause 9.9.2.10 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2\times TTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in TS 38.133 [50] clause 10.1.23A.2, i.e., between RSTD_000000000 and RSTD_126083073.

14.2.13 NR RSTD measurement reporting delay test case in FR1 for Redcap UE without Rx FH

Editor's Note: This test case is incomplete in following aspects:

- Message content is missing;
- Apllicability is missing;
- Cell configuration is missing;
- Test procedure is missing;
- TT analysis is missing.

14.2.13.1 Test purpose

The purpose of the test is to verify that the RSTD measurement for RedCap UE without FH in RRC CONNECTED state meets the requirements specified in TS 38.133 clause 9.9A.2 in an environment with AWGN propagation conditions in FR1 in standalone scenario when single positioning frequency layer is configured.

14.2.13.2 Test applicability

This test applies to RedCap UE release 18 onwards that support DL-TDOA positioning.

14.2.13.3 Minimum conformance requirements

The requirements in this clause shall apply provided the RedCap UE has received *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP requesting the RedCap UE to measure and report DL RSTD measurements defined in TS 38.215 [57].

The requirements in this clause shall apply provided the RedCap UE does not support, or support but not configured, to measure PRS resources with Frequency Hopping (FH), subject to UE capability indicated via *NR-DL-AoD-ProvideCapabilities*.

The requirements in this clause apply for periodic and triggered RSTD measurements without FH, provided:

- PRS-RSTD related side conditions for 2 Rx RedCap UE given in TS 38.133 [50] clause 10.1.23.2 for FR1 and FR2 are fulfilled, for a corresponding band, or
- PRS-RSTD related side conditions for 1 Rx RedCap UE given in TS 38.133 [50] clause 10.1A.16.2.1 for FR1 are fulfilled, for a corresponding band.

RedCap UE PRS RSTD measurement capability is as indicated by the RedCap UE in *NR-DL-TDOA-ProvideCapabilities*, according to TS 37.355 [49].

The requirements in TS 38.133 [50] clause 9.9.2.4 shall apply except for RSTD measurement accuracy. The RSTD measurements performed and reported according to this clause shall meet the RSTD measurement accuracy requirements in TS 38.133 [50] clause 10.1A.16.2 for each measured DL PRS resource.

When physical layer receives last of *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP [34], the RedCap UE shall be able to measure multiple (up to the RedCap UE capability specified in clause TS 38.133 [50] 9.9A.2.3) DL RSTD measurements, defined in TS 38.215 [57], during the measurement period $T_{RSTD,Total}$ defined as:

$$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD,i} + (L-1) * \max(T_{effect,i}),$$

where

i is the index of positioning frequency layer,

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i

$T_{RSTD,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer i as specified below:

$T_{RSTD,i} = \left(k_{multiTEG,i} * CSSF_{PRS_RedCap,i} * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$,

where:

$N_{RxBeam,i}$ is the RedCap UE Rx beam sweeping factor. In FR1 (for 2 Rx or 1 Rx RedCap UE), $N_{RxBeam,i}$ = 1;

and in FR2 (for 2 Rx RedCap UE only), $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$CSSF_{PRS_RedCap,i}$ is the carrier-specific scaling factor for NR PRS-based positioning measurements in positioning frequency layer i as defined in TS 38.133 [50] clause 9.1A.5.2.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* in *NR-DL-TDOA-RequestLocationInformation*;

otherwise,

$k_{multiTEG}$=$N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG}$=$\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* in *NR-DL-TDOA-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

- For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:
  - N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and
  - $N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule
  - Requirements do not apply if $N_{available}$ =0.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.

$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

N_{sample} is the number of PRS RSTD measurement samples, where

- N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED*, and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED*, and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- N_{sample} = 4 otherwise.

$T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the

sampling time and processing time. If all of the PRS resources to be measured are available in the same MG occasion during $T_{availabe}$, $T_{last,i} = T_i$ +MGL. Otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$,

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where,

T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [49],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$, the least common multiple between $T_{PRS,i}$ and $MGRP_i$.

$MGRP_i$ is the repetition periodicity of the measurement gap applicable for measurement in the PRS frequency layer i.$T_{PRS,i}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,i}$, where,

$T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where

T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

- Note: For the purpose of calculating $T_{PRS,i}$, only the PRS resources fully or partially covered by the MG are considered.

$\{N, T\}$ is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [49] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [49] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [49].

N' is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* specified in TS 37.355 [49].

Except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{RSTD,Total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the physical layer of UE via LPP [34].

For deferred MT-LR with other event than "Periodic Location" as defined in clause 4.1a.5.1 TS 23.273 [61], the time $T_{RSTD,Total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event "Periodic Location" as defined in clause 4.1a.5.1 TS 23.273 [61], the UE shall perform the RSTD measurement in each reporting period and activate the location report at the time when the periodic timer expires.

Note: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When PRS-RSRP is configured for DL-TDOA, RSTD and RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA, RSTD and RSRPP are performed over the same measurement period.

If during the measurement period of one or more positioning frequency layers, the MG pattern is reconfigured, the measurement period can be longer.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{RSTD,Total}$ within measurement gaps due to collisions with other signals; otherwise, the measurement period can be longer.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 9.9A.2 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements. The RSTD measurement period can be longer. The UE shall meet the RSTD measurement accuracy requirements in clause 10.1A.16.2.

When physical layer receives last of *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP [34], the RedCap UE shall be able to measure multiple (up to the RedCap UE capability specified in clause 9.9A.2.3) DL RSTD measurements, defined in TS 38.215 [57], during the measurement period $T_{RSTD,Total}$ defined as:

$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the positioning frequency layers are in Case 1, or

$T_{RSTD,Total} = \max(T_{RSTD_wo_gap,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2,

Where,

i is the index of positioning frequency layer, and

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{RSTD,Total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{RSTD_wo_gap,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer *i* as specified below.

$$T_{RSTD_wo_gap,i} = \left(k_{multiTEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i},$$

where:

$N_{RxBeam,i}$ is the UE Rx beam sweeping factor. In FR1 (for 2 Rx or 1 Rx RedCap UE), $N_{RxBeam,i}$ = 1; and in FR2 (for 2 Rx RedCap UE only), $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not supported *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*;

otherwise,

$k_{multiTEG}$=$N_{TEG,i}$, if the UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG}$=$\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if the UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

Where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* in *NR-DL-TDOA-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.

$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{available_PRS,i}$,

only the PRS resources unmuted and fully or partially overlapped with PPW are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

N_{sample} is the number of PRS RSTD measurement samples, where

- N_{sample}= 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* , and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and

- Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

- N_{sample}=2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED*, and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:

  - PRS bandwidth is within the active BWP and

- Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

- N_{sample}= 4 otherwise.

$T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time.

If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where,

T_i corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw*-durationOfPRS-*ProcessingSymbolsN2* in TS 37.355 [49] if positioning frequency layer *i* is in Case 2,

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$, the least common multiple between $T_{PRS,i}$ and $PPWRP_i$.

$PPWRP_i$ is the repetition periodicity of the PRS processing window applicable for measurements in the positioning frequency layer *i*.

$T_{PRS,i}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,i}$, where,

$T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*,

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

Note: For the purpose of calculating $T_{PRS,i}$, only the PRS resources that meet the conditions for PRS measurement outside measurement gaps as defined in clause 9.9.1.2 are considered.

N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer i is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer i is in Case 2.

N' is UE capability for number of DL PRS resources that it can process in a slot as indicated by *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* specified in TS 37.355 [49].

The time $T_{RSTD_wo_gap,i}$ starts from the first instance of the activated PPW for measurement of positioning frequency layer *i* aligned with a DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the physical layer of UE via LPP [34].

When PRS-RSRP is configured for DL-TDOA, RSTD and RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA, RSTD and RSRPP are performed over the same measurement period.

If during the measurement period of one or more positioning frequency layers, the PPW is re-configured or reactivated, the measurement period can be longer.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{RSTD_wo_gap,i}$ within PPW due to collisions with other signals; otherwise, the measurement period can be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 9.9A.2 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements. The RSTD measurement period can be longer. The UE shall meet the RSTD measurement accuracy requirements in clause 10.1A.16.2.1.

If any positioning frequency layer is in Case 2, the requirements in this clause apply provided that the PPWL corresponding to the positioning frequency layer is larger than (T2+X) ms.

The requirements in this clause apply provided that a single positioning frequency layer is configured for measurement in each PPW.

If the RedCap UE is configured with both MG applicable to positioning measurement and PPW, the UE shall measure positioning frequency layer *i* within

- MG, if PRS resources on positioning frequency layer *i* are overlapped with MG, or
- PPW, if PRS resources on positioning frequency layer *i* are overlapped with PPW.

The measurement period $T_{RSTD,Total}$ is defined as:

$$T_{RSTD,Total} = T_{RSTD,Total,MG} + T_{RSTD,Total,PPW} + T_{guard},$$

Where

- $T_{RSTD,Total,MG}$ is defined in TS 38.133 [50] clause 9.9A.2.5.1 and includes all positioning frequency layers to be measured within MG,
- $T_{RSTD,Total,PPW}$ is defined in TS 38.133 [50] clause 9.9A.2.5.2 and includes all positioning frequency layers to be measured within PPW,
- T_{guard} is the maximum T_{effect} defined in TS 38.133 [50] clauses 9.9A.2.5.1 and 9.9A.2.5.2 among all PFLs.

The requirements apply provided the following conditions are satisfied:

- MGs and PPWs do not overlap in time;
- Each PFL in the assistance data can be measured completely (all PRS resources) either within MG or within activated PPW.

14.2.13.4 Test description

14.2.13.4.1 Initial conditions

The supported test configurations in listed in Table 14.2.13.4-1.

Table 14.2.13.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.13.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.2.13.5-1, Table 14.2.13.5-2 and Table 14.2.13.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.2.13.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR1.

14.2.13.4.2 Test procedure

TBD

14.2.13.4.3 Message contents

TBD

14.2.13.5 Test requirement

Table 14.2.13.5-1, Table 14.2.13.5-2 and Table 14.2.13.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.13.5-1: General test parameters for RSTD measurement reporting delay

Parameter	Unit	Value	Comment
Reference cell		Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [4] and TS 37.355 [34]. The reference cell is the PCell in this test case.

Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
SSB configuration	Config 1		SSB.1 FR1

Propagation Condition			AWGN		

NOTE 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
NOTE 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
NOTE 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters. The Io is calculated based only on the symbols in which PRS is transmitted.

The RSTD measurement time without FH for RedCap fulfils the requirements specified in clause 14.2.13.2.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 14.2.13.2 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90% with a confidence level of 95%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in TS 38.133 [50] clause 10.1A.16.3, i.e., between RSTD_0000000 and RSTD1970049.

14.2.14 RSTD measurement reporting delay test case in FR2 for Redcap UE without Rx FH

Editor's Note: This test case is incomplete in following aspects:

- Message content is missing;
- Apllicability is missing;
- Cell configuration is missing;
- Test procedure is missing;
- TT analysis is missing.

14.2.14.1 Test purpose

The purpose of the test is to verify that the RSTD measurement for RedCap UE without FH in RRC CONNECTED state meets the requirements specified in TS 38.133 [50] clause 9.9A.2 in an environment with AWGN propagation conditions in FR2 in standalone scenario when single positioning frequency layer is configured.

14.2.14.2 Test applicability

This test applies to RedCap UE release 18 onwards that support DL-TDOA positioning.

14.2.14.3 Minimum conformance requirements

Same as in clause 14.2.13.3.

14.2.14.4 Test description

14.2.14.4.1 Initial conditions

The supported test configurations in listed in Table 14.2.14.4-1.

Table 14.2.14.4-1: Test Configurations

Configuration	Description
1	120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.14.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.2.14.5-1, Table 14.2.14.5-2 and Table 14.2.14.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.2.14.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR2.

14.2.14.4.2 Test procedure

TBD

14.2.14.4.3 Message contents

TBD

14.2.14.5 Test requirement

Table 14.2.14.5-1, Table 14.2.14.5-2 and Table 14.2.14.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.14.5-1: General test parameters for RSTD measurement reporting delay

Parameter	Unit	Value	Comment

Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [4] and TS 37.355 [34]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
SSB configuration	Config 1		SSB.3 FR2	
SMTC configuration	Config 1		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
RMSI CORESET RMC configuration	Config 1		CR.3.1 TDD	As specified in clause A.3.1.2.1
Dedicated CORESET RMC configuration	Config 1		CCR.1.1 FDD	
PRS Configuration	Config 1		PRS.1.1 FR2	As specified in clause A.3.31
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX			OFF	
Measurement gap			GP#24 or GP#13	GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [34] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [34] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			3	Including the reference cell
PRS muting info			Cell 1: ‘10’ Cell 2: ‘01’ Cell 3: ‘10’	Correponds to prs-MutingInfo defined in TS 37.355 [34]
PRS resource RE offset			Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets

T1	s	3	The length of the time interval from the beginning of each test
T2	s	1.28	The length of the time interval that follows immediately after time interval T1
AoA setup		Setup 1	As defined in clause A.3.15.1
Beam assumption		Rough	Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation

Table 14.2.14.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

PRP Note 4	dBm/SCS	-94.45	-100.67	-100.67
Propagation Condition		AWGN		

NOTE 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
NOTE 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
NOTE 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 4: PRP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters. The Io is calculated based only on the symbols in which PRS is transmitted.
NOTE 5: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.

The RSTD measurement time without FH for RedCap fulfils the requirements specified in clause 9.9A.2.5.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 9.9.2A.5 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90% with the confidence level of 95%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in clause 10.1A.16.3, i.e., between RSTD_0000000 and RSTD_1970049.

14.2.15 NR RSTD measurement reporting delay test case in FR1 for Redcap UE with Rx FH

Editor's Note: This test case is incomplete in following aspects:

- Message content is missing;
- Apllicability is missing;
- Cell configuration is missing;
- Test procedure is missing;
- TT analysis is missing.

14.2.15.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the requirements specified in TS 38.133 [50] clause 9.9A.2.6 in an environment with AWGN propagation conditions in FR1 in standalone scenario when frequency hopping is configured.

14.2.15.2 Test applicability

This test applies to RedCap UE release 18 onwards that support DL-TDOA positioning.

14.2.15.3 Minimum conformance requirements

The requirements in this clause shall apply provided the RedCap UE has received *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP requesting the RedCap UE to measure and report DL RSTD measurements defined in TS 38.215 [57].

The requirements in TS 38.133 [50] clause 9.9A.2.5 shall apply provided the RedCap UE does not support, or support but not configured, to measure PRS resources with Frequency Hopping (FH), subject to UE capability indicated via *NR-DL-AoD-ProvideCapabilities*.

The requirements in TS 38.133 [50] clause 9.9A.2.6 shall apply provided the RedCap UE supports and is configured to measure PRS resources with Frequency Hopping (FH), subject to UE capability indicated via *NR-DL-AoD-ProvideCapabilities*.

The requirements in this clause apply for periodic and triggered RSTD measurements with FH, provided:

- PRS-RSTD related side conditions for 2 Rx RedCap UE given in TS 38.133 [50] clause 10.1A.16.2.2 for FR1 and FR2 are fulfilled, for a corresponding band. or
- PRS-RSTD related side conditions for 1 Rx RedCap UE given in TS 38.133 [50] clause 10.1A.16.2.2 for FR1 are fulfilled, for a corresponding band.

RedCap UE PRS RSTD measurement capability is as indicated by the RedCap UE in *NR-DL-TDOA-ProvideCapabilities*, according to TS 37.355[49].

The requirements in TS 38.133 [50] clause 9.9.2.4 shall apply except for RSTD measurement accuracy. The RSTD measurements performed and reported according to this clause shall meet the RSTD measurement accuracy requirements in clause 10.1A.16.2 for each measured DL PRS resource.

When UE physical layer receives last of *NR-TDOA-ProvideAssistanceData* message and *NR-TDOA-RequestLocationInformation* message from LMF via LPP, requesting RedCap UE to measure DL RSTD measurement with FH, the RedCap UE shall be able to measure multiple (up to the RedCap UE capability specified in clause 9.9A.2.3) DL RSTD measurements, defined in TS 38.215 [57], during the measurement period $T_{RSTD,Total}$ defined in TS 38.133 [50] clause 9.9A.2.5.1 with using the following definition for N_{sample} and $L_{available_PRS,\mathrm{i}}$:

- N_{sample} is the number of PRS RSTD measurement samples, where
  - N_{sample} = 2 if the RedCap UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED*, and the LMF requests the UE to perform positioning measurements with reduced number of samples.
  - N_{sample} = 4 otherwise.
- A measurement sample with FH is defined as a PRS measurement over multiple hops within a single measurement gap occasion.
- $L_{available_PRS,\mathrm{i}}$ is the time duration of available PRS in the positioning frequency layer i to be measured during a MG, and is calculated by:

$$L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$$

  where,

  - $N_{hop,i,j}$ is the number of hops that UE can do in an MG occasion *j* as defined in the following, and
  - $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in MG instance *j* during $T_{available_PRS,\mathrm{i}}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{per-hop,i,j}$, only the PRS resources unmuted and fully or partially overlapped with the sampling duration in each hop are considered;
  - *J* is the number of MG instance during $T_{available_PRS,\mathrm{i}}$.

The sampling window per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, T_{hop} is the applicable length per hop as defined in table 14.2.15.3-1, and RRT_{FH} is the retuning time between Rx hops as reported by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability*. The first hop

within a MG instance starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the MG instance taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

Table 14.2.15.3-1: Applicable number of hops per slot and applicable length of each hop

RRT_{FH}	(comb size, Number of PRS symbols)	Applicable number of hops per slot (N_{hops}^{slot})	Applicable length per hop (T_{hop}) in number of symbols
$RRT_{FH} \leq 2$ symbols	(2, 12) with SCS 15 kHz, 30 kHz, 60 kHz in FR2, 120 kHz	2	7
	All others	1	14
2 symbols $< RRT_{FH}$ ≤ 6 symbols	(≤ 6, any)	1	14
	(12, 12)	½	28
$RRT_{FH} > 6$ symbols	Any combination	½	28

The number of hops within a single MG occasion $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right)$$

where

- $N_{hop,max,i}$ is the maximum number of Rx hops signaled by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* as specified in for positioning frequency layer *i*
- $N3_i$ is indicated via UE capability *processingPRS-SymbolsDurationN3-r18* for positioning frequency layer *i*
- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a MG instance *j*,
- $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot} = 2$,
- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1$,
- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} > 1$,
- $N_{hops,effect,i,j} = \left\lfloor \frac{(N_{rep}^{PRS}-1)}{2} \right\rfloor + 1$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} = 1$,
  - where N_{rep}^{PRS} is the number of inter-slot PRS repetitions within the MG occasion, excluding the gap retuning times, which are unmuted and fully or partially overlapped with the sampling duration within each hop. M_{rep}^{PRS} is the PRS repetition interval configured by *dl-PRS-ResourceTimeGap*, N_{hops}^{slot} is the applicable number of hops per slot as defined in table 14.2.15.3-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions (N_{rep}^{PRS}) within an MG instance and the same PRS repetition interval (M_{rep}^{PRS}), otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of BW_{total} defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop} * BW_{per-hop} - \left(N_{hop} - 1\right) * BW_{overlap}\right)$$

where

BW_{PRS} is the minimum among

- configured PRS BW, and
- UE capability of maximum PRS BW across all hops indicated via *maximumPRS-BandwidthAcrossAllHopsFR1-r18* or *maximumPRS-BandwidthAcrossAllHopsFR2-r18*, and
- total BW of all hops requested by LMF via *nr-DL-PRS-RxHoppingTotalBandwidth-r18.*

$N_{hop,i,j}$ is number of hops within a single MG occasion as define above,

$BW_{per-hop}$ is the UE capability on PRS BW per hop indicated via *supportedBandwidthPRS-r16*,

$BW_{overlap}$ $BW_{overlap}$ is the UE capability on BW of the overlapping RB indicated via *numOfOverlappingPRB-r18*.

14.2.15.4 Test description

14.2.15.4.1 Initial conditions

The supported test configurations in listed in Table 14.2.15.4-1.

Table 14.2.15.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, cell bandwidth 50 MHz, FDD duplex mode
2	15 kHz SSB SCS, cell bandwidth 50 MHz, TDD duplex mode
3	30 kHz SSB SCS, cell bandwidth 100 MHz, TDD duplex mode
4	15 kHz SSB SCS, cell bandwidth 50 MHz, HD-FDD duplex mode
NOTE 1: The UE is only required to be tested in one of the supported test configurations. NOTE 2: UE with 1 Rx or 2 Rx is required to meet the same requirements specified in this clause. NOTE 3: This test case is applicable to the UE supporting per hop bandwidth ≥ 10 MHz for SCS 15 kHz. NOTE 4: This test case is applicable to the UE supporting per hop bandwidth = 20 MHz for SCS 30 kHz.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.15.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.2.15.5-1, Table 14.2.15.5-2 and Table 14.2.15.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.2.15.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR1.

14.2.15.4.2 Test procedure

TBD

14.2.15.4.3 Message contents

TBD

14.2.15.5 Test requirement

Table 14.2.15.5-1, Table 14.2.15.5-2 and Table 14.2.15.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.15.5-1: General test parameters for RSTD measurement reporting delay

Parameter	Unit	Value	Comment

Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [4] and TS 37.355 [34]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
CD-SSB configuration	Config 1, 2, 4		SSB.1 FR1	
	Config 3		SSB.1 RedCap FR1	
NCD-SSB configuration	Config 1, 2, 4		SSB.6 RedCap FR1	
	Config 3		SSB.7 RedCap FR1	
SMTC configuration	Config 1, 4		SMTC.4 RedCap	
	Config 2		SMTC.2 RedCap	
	Config 3		SMTC.2 RedCap	
PRS Configuration	Config 1, 4		PRS.1.5 FR1	PRS configured with frequency hopping as specified in clause A.3.31
	Config 2		PRS.1.5 FR1	
	Config 3		PRS.2.6 FR1	
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX			OFF	
Measurement gap			GP#24 or GP#0	GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [34] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance ta specified in TS 37.355 [34] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			3	Including the reference cell
PRS muting info			Cell 1: ‘10’ Cell 2: ‘01’ Cell 3: ‘10’	Correponds to prs-MutingInfo defined in TS 37.355 [34]
PRS resource RE offset			Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets

T1	s	3	The length of the time interval from the beginning of each test
T2	s	1.28	The length of the time interval that follows immediately after time interval T1

Table 14.2.15.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters. The Io is calculated based only on the symbols in which PRS is transmitted.

14.2.16 NR RSTD measurement reporting delay test case in FR2 for Redcap UE with Rx FH

Editor's Note: This test case is incomplete in following aspects:

- Message content is missing;
- Apllicability is missing;
- Cell configuration is missing;
- Test procedure is missing;
- TT analysis is missing.

14.2.16.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the TBD.

14.2.16.2 Test applicability

This test applies to all types of NR UE release 18 onwards that support TBD.

14.2.16.3 Minimum conformance requirements

Same as in 14.2.15.3.

14.2.16.4 Test description

14.2.16.4.1 Initial conditions

The supported test configurations in listed in Table 14.2.10.4-1.

Table 14.2.16.4-1: Test Configurations

Configuration	Description
1	120 kHz SSB SCS, cell bandwidth 400 MHz, TDD duplex mode
NOTE 1: This test case is applicable to the UE supporting per hop bandwidth = 100 MHz for SCS 120 kHz.	

14.2.16.4.2 Test procedure

TBD

14.2.16.4.3 Message contents

TBD

14.2.16.5 Test requirement

Table 14.2.16.5-1, Table 14.2.16.5-2 and Table 14.2.16.5-3 define the primary level settings including test tolerances for the test.

Table 14.2.16.5-1: General test parameters for RSTD measurement reporting delay

Parameter	Unit	Value	Comment

Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [4] and TS 37.355 [34]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.

PRS $\hat{E}_s/I_{ot}$		dB	dB	-6	-13
PRP Note 4		dBm/SCS	dBm/SCS	-94.44	-100.67
Propagation Condition			AWGN		

NOTE 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.

NOTE 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

NOTE 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

NOTE 4: PRP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters. The Io is calculated based only on the symbols in which PRS is transmitted.

NOTE 5: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.

The RSTD measurement time fulfils the requirements specified in clause 9.9A.2.6.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 9.9A.2.6 starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90% with the confidence level of 95%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in clause 10.1A.16.3, i.e., between RSTD_0000000 and RSTD_1970049.

14.3 NR RSTD measurement accuracy test case in RRC_CONNECTED

14.3.1 NR RSTD measurement accuracy test case for single positioning frequency layer in FR1 SA

14.3.1.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions.

14.3.1.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports DL-TDOA positioning.

14.3.1.3 Minimum conformance requirements

The RSTD measurement reported by the UE shall fulfil the accuracy requirements defined by ±(X+Y+Z) T_c.

X is defined in Table 14.3.1.3-1 for AWGN channel, provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [54] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to Annex I.2 for a corresponding Band for each relevant PRS resource configured for measurement.

The RSTD measurement reported by the UE shall fulfil the accuracy requirements defined in Table 14.3.1.3-2 for AWGN channel, provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-2 [55] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to Annex I.2 for a corresponding Band for each relevant PRS resource configured for measurement.

When UE measures RSTD on PRS resources belonging to different PFLs, then the RSTD accuracy is defined as the accuracy corresponding to the largest accuracy value among different PFLs.

When UE measures RSTD on PRS resources belonging to same PFL, Y=32 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 160 ms.

When UE measures RSTD on PRS resources belonging different PFLs, Y=256 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 1280 ms

Z is defined in Table 14.3.1.3-2 a for FR1.

Table 14.3.1.3-1: RSTD absolute accuracy in FR1 for AWGN channel

NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of the reference resource and the measured neighbour resource i.
NOTE 2: Minimum number of PRS resource repetitions among the reference resource and the measured neighbour resource i. $T_{\text{rep}}^{\text{PRS}}$, L_{PRS}, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: Δ= 0 for single PFL, Δ is defined in Table 14.3.1.3-3 for dual PFL.

14.3.1.4 Test description

14.3.1.4.1 Initial conditions

The test is defined with three possible Test Configurations. In the case that the UE supports more than one of these Test Configurations, then the UE is only required to be tested in one of the Test Configurations, chosen by the UE. The defined Test Configurations are specified in Table 14.3.1.4.1-1.

Table 14.3.1.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 14.3.1.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.1.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the RSTD reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR1. GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.3.1.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell.

The NR-DL-TDOA-RequestLocationInformation message and the DL-TDOA assistance data as defined in clause 14.3.1.4.3 shall be provided to the UE during the set-up period. The last TTI containing the NR-DL-TDOA-RequestLocationInformation message shall be provided to the UE ΔT ms before the start of the measurement period, where $\Delta T = 50$ ms is the maximum processing time of the NR-DL-TDOA-RequestLocationInformation message and the DL-TDOA assistance data in the UE.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.3.1.5-1 as appropriate. Propagation conditions are set according to clause 4.15.2.
4. The SS shall send an LPP REQUEST CAPABILITIES message.
5. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.

6. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the nr-DL-TDOA-ProvideAssistanceData-r16 IE. If the UE message at step 5 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
7. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-DL-TDOA-RequestLocationInformation-r16 IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.
8. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message, including the nr-DL-TDOA-ProvideLocationInformation-r16 IE.
9. If the UE message at step 8 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
10. The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 14.3.1.5-2.
11. Repeat step 2-10 until the confidence level according to Annex D is achieved.
12. Repeat step 1-11 for the other sub-test defined in Table 14.3.1.4-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

Propagation condition	1~3	-	AWGN		AWGN	
Antenna configuration	1~3		1x2		1x2	

Note 1:	OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. The Io is calculated based only on the symbols where PRS is transmitted.
Note 4:	RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5:	The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 14.2.1.5, with the following difference: $N_{PRS,i}^{slot} = 2$. Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(\left\lceil\frac{2}{N'}\right\rceil\left\lceil\frac{L_{available_{PRS,i}}}{N}\right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation (see Table 14.3.1.4.3-3).

Table 14.3.1.5-2: RSTD accuracy requirements for the reported values

Test Configuration	Subtest	Lowest reported value [T_c]	Highest reported value [T_c]
1 & 2	Test 1	5582	6214
	Test 2	5756	6040
3	Test 1	5687	6109
	Test 2	5794	6002

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

14.3.2 NR RSTD measurement accuracy test case for dual positioning frequency layer in FR1 SA

14.3.2.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions.

14.3.2.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports DL-TDOA positioning.

14.3.2.3 Minimum conformance requirements

Same as in clause 14.3.1.3.

14.3.2.4 Test description

14.3.2.4.1 Initial conditions

The test is defined with three possible Test Configurations. In the case that the UE supports more than one of these Test Configurations, then the UE is only required to be tested in one of the Test Configurations, chosen by the UE. The defined Test Configurations are specified in Table 14.3.2.4.1-1.

Table 14.3.2.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Low for RF channel #1 and High for RF channel #2 as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.2.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 14.3.2.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.2.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the RSTD reference as well as the PCell on NR RF channel #1 in FR1. Cell 2 is a neighbour cell on a different NR RF channel #2 in FR1. GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.3.2.4.2 Test procedure

Same as clause 14.3.1.4.2.

14.3.2.4.3 Message contents

Same as clause 14.3.1.4.3 except that Table 14.3.2.4.3-1 replaces Table 14.3.1.4.3-5.

	3		-100.7	-107.7	-100.7	-107.7
Io[Note3]	1,2	dBm/ 19.08MHz	-65.92	-66.73	-65.92	-66.73
	3	dBm/ 47.88MHz	-61.92	-62.73	-61.92	-62.73
PRS $\hat{E}_s / N_{oc}$	1~3	dB	-5.7	-12.7	-5.7	-12.7
Propagation condition	1~3	-	AWGN		AWGN	
Antenna configuration	1~3		1x2		1x2	

Note 1:	OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. The Io is calculated based only on the symbols where PRS is transmitted.
Note 4:	RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5:	The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 14.2.2.1.5, with the following difference: $N_{PRS,i}^{slot} = 1$. Therefore, the value of the LPP Time IE is given by the following equation:

$$T_{RSTD} = \left(\left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation (see Table 14.3.1.4.3-3).

Table 14.3.2.5-2: RSTD accuracy requirements for the reported values

Test Configuration	Subtest	Lowest reported value [T_c]	Highest reported value [T_c]
1 & 2	Test 1	5230	6566
	Test 2	5500	6296
3	Test 1	5399	6397
	Test 2	5554	6242

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

14.3.3 NR RSTD measurement accuracy test case for single positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

14.3.3.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when dsingle positioning frequency layers are configured.

14.3.3.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports DL-TDOA positioning.

14.3.3.3 Minimum conformance requirements

Same as in clause 14.3.1.3.

14.3.3.4 Test description

The supported test configurations in listed in Table 14.3.3.4-1.

Table 14.3.3.4-1: Test Configurations

Configuration	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

14.3.3.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.3.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.3.3.5-1 and Table 14.3.3.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.3.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR2. GP#13 is configured for the test.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.3.3.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration, PRS.1.1 FR2 and PRS.1.2 FR2. The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The NR-DL-TDOA-RequestLocationInformation message and the DL-TDOA assistance data as defined in clause 14.3.3.4.3 shall be provided to the UE during the set-up period. The last TTI containing the NR-DL-TDOA-RequestLocationInformation message shall be provided to the UE ΔT ms before the start of the measurement period, where $\Delta T = 50$ ms is the maximum processing time of the NR-DL-TDOA-RequestLocationInformation message and the DL-TDOA assistance data in the UE.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.3.3.5-1 and Table 14.3.3.5-2 as appropriate. Propagation conditions are set according to clause 4.15.2.
4. The SS shall send an LPP REQUEST CAPABILITIES message.
5. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
6. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the nr-DL-TDOA-ProvideAssistanceData-r16 IE. If the UE message at step 5 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

7. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-DL-TDOA-RequestLocationInformation-r16 IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.

8. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message, including the nr-DL-TDOA-ProvideLocationInformation-r16 IE.

9. If the UE message at step 8 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

10. The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 14.3.3.5-3.

11. Repeat step 2-10 until the confidence level according to Annex D is achieved.

12. Repeat step 1-11 for the other sub-test defined in Table 14.3.3.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

RMSI CORESET Reference Channel		CR.3.1 TDD	-	CR.3.1 TDD	-
Control channel RMC		CCR.3.1 TDD	-	CCR.3.1 TDD	-
OCNG Patterns		OP.1	OP.1	OP.1	OP.1
SSB configuration		SSB.3 FR2	SSB.3 FR2	SSB.3 FR2	SSB.3 FR2
SMTC configuration		SMTC.1	SMTC.1	SMTC.1	SMTC.1
PRS configuration		PRS.1.1 FR2	PRS.1.1 FR2	PRS.1.2 FR2	PRS.1.2 FR2
PRS Resource slot offset	slot	0	2	0	2
Expected RSTD	µs	N/A	3	N/A	3
Expected RSTD uncertainty	µs	N/A	5	N/A	5
Time offset with Cell 1	µs	-	3	-	3
PDSCH/PDCCH subcarrier spacing	kHz	120	120	120	120
EPRE ratio of PSS to SSS	dB	0	0	0	0

EPRE ratio of PBCH_DMRS to SSS					
EPRE ratio of PBCH to PBCH_DMRS					
EPRE ratio of PDCCH_DMRS to SSS					
EPRE ratio of PDCCH to PDCCH_DMRS					
EPRE ratio of PDSCH_DMRS to SSS					
EPRE ratio of PDSCH to PDSCH_DMRS					
EPRE ratio of OCNG DMRS to SSS Note 1					
EPRE ratio of OCNG to OCNG DMRS Note 1					
EPRE ratio of PRS to SSS	dB	0	0	0	0
Propagation conditions		AWGN	AWGN	AWGN	AWGN
Antenna configuration		1x2	1x2	1x2	1x2
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS..					

Table 14.3.3.5-2: RSTD accuracy OTA related test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to TS 38.133 [50] clause A.3.15.1			
Assumption for UE beams Note 5		Rough		Rough	
N_{oc} Note1	dBm/SCS Note3	-89.1		-89.1	
PRS $\hat{E}_s / N_{oc}$	dB	-5.17	-11.36	-5.17	-11.36
PRP Note2	dBm/SCS	-94.2	-100.4	-94.2	-100.4
PRS $\hat{E}_s / I_{ot}$	dB	-5.7	-12.7	-5.7	-12.7
Io Note2	dBm/190.08 MHz Note3	-55.68	-55.68	-55.68	-55.68
Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.					
Note 2: PRP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. The Io is calculated based only on the symbols in which PRS is transmitted.					
Note 3: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone					
Note 4: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [2], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.					
Note 5: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation					

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 14.2.3.5 with the following difference: $N_{PRS,i}^{slot} = 2$. Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.142}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation (see Table 14.3.3.4.3-3).

Table 14.3.3.5-3: RSTD accuracy requirements for the reported values

Test Configuration	Lowest reported value	Highest reported value
Sub-test 1	(5898 – 120) T_c converted to RSTD measurement according to clause 4.15.6	(5898 + 120) T_c converted to RSTD measurement according to clause 4.15.6
Sub-test 2	(5898 – 82) T_c converted to RSTD measurement according to clause 4.15.6	(5898 + 82) T_c converted to RSTD measurement according to clause 4.15.6

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.3.4 NR RSTD measurement accuracy test case for dual positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

14.3.4.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when dual positioning frequency layers are configured.

14.3.4.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports DL-TDOA positioning.

14.3.4.3 Minimum conformance requirements

Same as in clause 14.3.1.3.

14.3.4.4 Test description

The supported test configurations in listed in Table 14.3.4.4-1.

Table 14.3.4.4-1: Test Configurations

Configuration	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

14.3.4.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.4.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.

2. The general test parameter settings are set up according to Table 14.3.4.5-1 and Table 14.3.4.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.4.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell on NR RF channel #1 in FR2. Cell 2 is a neighbour cell on a different NR RF channel #2 in FR2. GP#13 is configured for the test.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.3.4.4.2 Test procedure

Same as clause 14.3.3.4.2.

14.3.4.5 Test requirement

The RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.3.4.3.

Table 14.3.4.5-1: RSTD accuracy test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
PRS ARFCN		freq1	freq2	freq1	freq2
Duplex mode		TDD		TDD	
TDD configuration		TDDConf.3.1		TDDConf.3.1	
$BW_{channel}$	MHz	200: $N_{RB,c}$ = 132		200: $N_{RB,c}$ = 132	
Measurement gap		GP#24 or GP#13			
Downlink initial BWP configuration		DLBWP.0.1	-	DLBWP.0.1	-

Downlink dedicated BWP configuration		DLBWP.1.1	-	DLBWP.1.1	-
Uplink initial BWP configuration		ULBWP.0.1	-	ULBWP.0.1	-
Uplink dedicated BWP configuration		ULBWP.1.1	-	ULBWP.1.1	-
DRX cycle configuration		Not applicable	-	Not applicable	-
TRS configuration		TRS.2.1 TDD	-	TRS.2.1 TDD	-
TCI state		TCI.State.0	-	TCI.State.0	-
PDSCH Reference measurement channel		SR.3.1 TDD	-	SR.3.1 TDD	-

EPRE ratio of PDSCH to PDSCH_DMRS					
EPRE ratio of OCNG DMRS to SSS Note 1					
EPRE ratio of OCNG to OCNG DMRS Note 1					
Propagation conditions		AWGN	AWGN	AWGN	AWGN
Antenna configuration		1x2	1x2	1x2	1x2
EPRE ratio of PRS to SSS	dB	0	0	0	0
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.					

Table 14.3.4.5-2: RSTD accuracy OTA related test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to clause A.3.15.1			
Assumption for UE beams Note 5		Rough		Rough	
N_{oc} Note1	dBm/SCS Note3	-89		-89	
PRS $\hat{E}_s / N_{oc}$	dB	-5.47	-12.47	-5.47	-12.47
PRP Note2	dBm/SCS	-94.4	-101.4	-94.4	-101.4
$\hat{E}_s / I_{ot}$ BB Note4	dB	-5.7	-12.7	-5.7	-12.7
Io Note2	dBm/190.08 MHz Note3	-55.89	-55.89	-55.89	-55.89

Note 1:	Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 2:	PRP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. The Io is calculated based only on the symbols in which PRS is transmitted.
Note 3:	Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 4:	Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] Table 6.2.1.3-4.
Note 5:	Information about types of UE beam is given in B.2.1.3, and does not limit UE implementation or test system implementation

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 14.2.4.5 with the following difference: $N_{PRS,i}^{slot} = 1$. Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(1 * 8 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation (see Table 14.3.4.4.3-3).

Table 14.3.4.5-3: RSTD accuracy requirements for the reported values

Test Configuration	Lowest reported value	Highest reported value
Sub-test 1	[5898 – 360] T_c converted to RSTD measurement according to clause 4.15.6	[5898 + 360] T_c converted to RSTD measurement according to clause 4.15.6
Sub-test 2	[5898 – 310] T_c converted to RSTD measurement according to clause 4.15.6	[5898 + 310] T_c converted to RSTD measurement according to clause 4.15.6

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.3.5 NR RSTD measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR1 SA

14.3.5.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions.

14.3.5.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning and supportedDL-PRS-ProcessingSamples.

14.3.5.3 Minimum conformance requirements

The accuracy requirements for RSTD measurement shall be within ±(X+Y+Z+Δ) T_c.

X is defined in TS 38.133 [50] Table 10.1.23.2-7 for AWGN channel in FR1 provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to Annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

Note: The requirements for fading channel in this clause are derived based on TDL-A (30 ns delay spread, 5Hz) and TDL-C (60 ns delay spread, 300 Hz) channel models for FR1 and FR2 respectively.

When UE measures RSTD on PRS resources belonging to different PFLs, then the RSTD accuracy is defined as the accuracy corresponding to the largest accuracy value among different PFLs.

If the UE doesn't support Rx TEG reporting for RSTD measurement or when the measurements of reference cell and neighbour cell belong to different Rx TEGs, Y, Z and Δ are defined as follows:

- When UE measures RSTD on PRS resources belonging to same PFL, Y=32 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 160 ms.
- When UE measures RSTD on PRS resources belonging different PFLs, Y=256 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 1280 ms.
- Z is defined in Table 14.3.5.3-1
- Δ is zero for single PFL, and is defined in Table 14.3.5.3-1, for dual PFL.

Table 14.3.5.3-1: Margin for RSTD measurement accuracy in FR1

24			≥ 132	≥ 1	Note 6	Note 6	Note 6
24		60	≥ 64	≥ 1	NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A	-121	-50
					NR_FDD_FR1_B	-120.5	-50
					NR_TDD_FR1_C	-120	-50
					NR_FDD_FR1_D, NR_TDD_FR1_D	-119.5	-50
					NR_FDD_FR1_E, NR_TDD_FR1_E	-119	-50
					NR_FDD_FR1_F	-118.5	-50
					NR_FDD_FR1_G, NR_TDD_FR1_G	-118	-50
					NR_FDD_FR1_H	-117.5	-50
10			≥ 132	≥ 1	Note 6	Note 6	Note 6

NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of the reference resource and the measured neighbour resource i.
NOTE 2: Minimum number of PRS resource repetitions among the reference resource and the measured neighbour resource i. $T_{\text{rep}}^{\text{PRS}}, L_{\text{PRS}}, K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [49], respectively.
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [53].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: Void

14.3.5.4 Test description

14.3.5.4.1 Initial conditions

The supported test configuration is listed in Table 14.3.5.4-1.

Table 14.3.5.4-1: Test Configuration

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.5.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 14.3.5.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.5.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR1. GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured for the test.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.3.5.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration. The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The NR-DL-TDOA-RequestLocationInformation message and the DL-TDOA assistance data as defined in clause 14.3.5.4.3 shall be provided to the UE during the set-up period.

The UE is configured with measurement gap pattern ID # 24 if UE supports MG#24, otherwise #0 before T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.3.5.5-1. Propagation conditions are set according to clause 4.15.2.
4. The SS shall transmit an LPP REQUEST CAPABILITIES message.
5. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* in the *NR-DL-PRS-ProcessingCapability* IE and DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
6. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. If the UE message at step 5 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
7. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the reducedDL-PRS-ProcessingSamples-r17 in the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.
8. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3).
9. If the UE message at step 8 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
10. The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 14.3.5.5-2.
11. Repeat steps 2-10 in Table 14.3.5.4-1 until the confidence level according to Annex D is achieved.
12. Repeat step 1-11 for the other sub-test defined in Table 14.3.5.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

$\hat{E}_s / N_{oc}$	1~3	dB	-0.95	-3.10	-0.95	-3.10
Propagation condition	1~3	-	AWGN		AWGN	
Antenna configuration	1~3		1x2		1x2	
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.						

The

Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4:	RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5:	The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.3.5.3.

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 14.3.1.5.

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation (see Table 14.3.3.4.3-3).

Table 14.3.5.5-2: RSTD accuracy requirements for the reported values

Test Configuration	Subtest	Lowest reported value [T_c]	Highest reported value [T_c]
1 & 2	Test 1	5664	6132
	Test 2	5756	6040
3	Test 1	5750	6046
	Test 2	5794	6002

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.3.6 NR RSTD measurement accuracy test case for single positioning frequency layer with Rx TEG in FR1 SA

14.3.6.1 Test purpose

The purpose of the test is to verify that the RSTD measurements when the measurements are within the same Rx TEG meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions.

14.3.6.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports UE assisted DL-TDOA positioning and nr-UE-RxTEG-ID-MaxSupport.

14.3.6.3 Minimum conformance requirements

Same as defined in clause 14.3.5.3.

14.3.6.4 Test description

14.3.6.4.1 Initial conditions

The supported test configuration is listed in Table 14.3.6-1.

Table 14.3.6.4-1: Test Configuration

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode

3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.6.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 14.3.6.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.6.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR2. GP#24 is configured if UE supports GP#24. otherwise, GP#0 is configured for the test.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.3.6.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration. The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The NR-DL-TDOA-RequestLocationInformation message and the DL-TDOA assistance data as defined in clause 14.3.6.4.3 shall be provided to the UE during the set-up period.

The UE is configured with measurement gap pattern ID # 24 if UE supports MG#24, otherwise #0 before T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On, to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.3.6.5-1 as appropriate. Propagation conditions are set according to clause 4.15.2.
4. The SS shall transmit an LPP REQUEST CAPABILITIES message.
5. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports nr-UE-RxTEG-ID-MaxSupport in the *NR-UE-TEG-Capability* IE and DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
6. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. If the UE message at step 5 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
7. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-UE-RxTEG-Request-r17 in the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.
8. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3).
9. If the UE message at step 8 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
10. The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 14.3.6.5-3.

11. Repeat steps 2-10 in Table 14.3.6.4-1 until the confidence level according to Annex D is achieved.

12. Repeat step 1-11 for the other sub-test defined in Table 14.3.6.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

Propagation condition	1~3	-	AWGN		AWGN	
Antenna configuration	1~3		1x2		1x2	
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.						

Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	RRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4:	RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5:	The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

The RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.3.6.3.

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 14.3.1.5.

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation (see Table 14.3.6.4.3-3).

Table 14.3.6.5-2: RSTD accuracy requirements for the reported values

Test Configuration	Subtest	Lowest reported value [T_c]	Highest reported value [T_c]
1 & 2	Test 1	5582	6214
	Test 2	5756	6040
3	Test 1	5687	6109
	Test 2	5794	6002

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.3.7 NR RSTD measurement accuracy test case for single positioning frequency layer with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

14.3.7.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions.

14.3.7.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

14.3.7.3 Minimum conformance requirements

The accuracy requirements for RSTD measurement shall be within ±(X+Y+Z+Δ) T_c.

…

X is defined in Table 10.1.23.2-8 for AWGN channel in FR2 provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to Annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

Note: The requirements for fading channel in this clause are derived based on TDL-A (30 ns delay spread, 5Hz) and TDL-C (60 ns delay spread, 300 Hz) channel models for FR1 and FR2 respectively.

When UE measures RSTD on PRS resources belonging to different PFLs, then the RSTD accuracy is defined as the accuracy corresponding to the largest accuracy value among different PFLs.

If the UE doesn't support Rx TEG reporting for RSTD measurement or when the measurements of reference cell and neighbour cell belong to different Rx TEGs, Y, Z and Δ are defined as follows:

- When UE measures RSTD on PRS resources belonging to same PFL, Y=32 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 160 ms.
- When UE measures RSTD on PRS resources belonging different PFLs, Y=256 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 1280 ms.
- Z is defined in Table 10.1.23.2-5 for FR1 and Table 10.1.23.2-6 for FR2, respectively.
- Δ is zero for single PFL, and is defined in Table 10.1.23.2-5a for FR1 and Table 10.1.23.2-6a for FR2, respectively, for dual PFL.

…

Table 10.1.23.2-6: Margin for RSTD measurement accuracy in FR2

PRS BW (PRB number)		Margin (Tc)
SCS=60kHz	SCS=120kHz	
≥ 24	N/A	72
≥ 64	≥ 32	32
≥ 132	≥ 64	16
N/A	≥ 128	12

Table 10.1.23.2-6a: Margin Δ for RSTD measurement accuracy in FR2

PRS BW (PRB number)		Margin (Tc)
SCS=60kHz	SCS=120kHz	
≥ 24	N/A	32
≥ 64	≥ 32	16
≥ 132	≥ 64	8
N/A	≥ 128	4

…

Table 10.1.23.2-8: RSTD absolute accuracy in FR2 for AWGN channel with reduced number of samples

Accuracy	Conditions					
	PRS Ês/Iot	PRS SCS	PRS bandwidth Note 1	PRS resource repetition ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$) Note 2	Io Note 3 range	
					Minimum Io	Maximum Io
Tc Note 4	dB	kHz	PRB		dBm/SCS	dBm/$BW_{Channel}$
24		60	≥ 64	≥ 1	Same value as PRS_RP in Table B.2.14-2, according to	Note 5

	(PRS Ês/Iot)$_{ref}$ ≥ -3dB (PRS Ês/Iot)$_i$ ≥ -6dB				UE Power class, operating band and angle of arrival	
11			≥ 132	≥ 1	Note 5	Note 5
13		120	≥ 64	≥ 1	Same value as PRS_RP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	Note 5
6			≥ 128	≥ 1	Note 5	Note 5
NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of the reference resource and the measured neighbour resource i.						
NOTE 2: Minimum number of PRS resource repetitions among the reference resource and the measured neighbour resource i. $T_{\text{rep}}^{\text{PRS}}$, L_{PRS} , $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.						
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.						
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].						
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.						
NOTE 6: Void						

14.3.7.4 Test description

14.3.7.4.1 Initial conditions

The supported test configuration is listed in Table 14.3.7.4-1.

Table 14.3.7.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.7.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.3.7.5-1 and Table 14.3.7.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.7.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR2. GP#24 is configured if UE supports GP#24, otherwise, GP#13 is configured for the test.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.3.7.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration, PRS.1.1 FR2 and PRS.1.2 FR2. The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The NR-DL-TDOA-RequestLocationInformation message and the DL-TDOA assistance data as defined in clause 14.3.7.4.3 shall be provided to the UE during the set-up period.

The UE is configured with measurement gap pattern ID # 24 or #13 before T2.

2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On, according to TS 38.508-1 [45] clause 4.5.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

3. Set the parameters according to Table 14.3.7.5-1 and Table 14.3.7.5-2 as appropriate. Propagation conditions are set according to clause 4.15.2.

4. The SS shall transmit an LPP REQUEST CAPABILITIES message.

5. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* in the *NR-DL-PRS-ProcessingCapability* IE and DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.

6. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. If the UE message at step 5 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

7. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the reducedDL-PRS-ProcessingSamples-r17 in the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.

8. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3).

9. If the UE message at step 8 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

10. The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 14.3.7.5-3.

11. Repeat steps 2-11 in Table 14.3.7.4-1 until the confidence level according to Annex D is achieved.

12. Repeat step 1-11 for the other sub-test defined in Table 14.3.7.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

14.3.7.5 Test requirement

Table 14.3.7.5-1 and Table 14.3.7.5-2 define the primary level settings including test tolerances for the test.

Table 14.3.7.5-1: RSTD accuracy test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
PRS ARFCN		freq1		freq1	
Duplex mode		TDD		TDD	
TDD configuration		TDDConf.3.1		TDDConf.3.1	
$BW_{channel}$	MHz	200: $N_{RB,c}$ = 132		200: $N_{RB,c}$ = 132	
Downlink initial BWP configuration		DLBWP.0.1	-	DLBWP.0.1	-
Downlink dedicated BWP configuration		DLBWP.1.1	-	DLBWP.1.1	-
Uplink initial BWP configuration		ULBWP.0.1	-	ULBWP.0.1	-
Uplink dedicated BWP configuration		ULBWP.1.1	-	ULBWP.1.1	-
DRX cycle configuration		Not applicable	-	Not applicable	-
TRS configuration		TRS.2.1 TDD	-	TRS.2.1 TDD	-
TCI state		TCI.State.0	-	TCI.State.0	-
PDSCH Reference measurement channel		SR.3.1 TDD	-	SR.3.1 TDD	-
RMSI CORESET Reference Channel		CR.3.1 TDD	-	CR.3.1 TDD	-
Control channel RMC		CCR.3.1 TDD	-	CCR.3.1 TDD	-
OCNG Patterns		OP.3	OP.3	OP.3	OP.3
SSB configuration		SSB.3 FR2	SSB.3 FR2	SSB.3 FR2	SSB.3 FR2
SMTC configuration		SMTC.1	SMTC.1	SMTC.1	SMTC.1
PRS configuration		PRS.1.2 FR2	PRS.1.2 FR2	PRS.1.2 FR2	PRS.1.2 FR2
PRS BW		64 PRBs	64 PRBs	128 PRBs	128 PRBs
PRS Resource slot offset	slot	0	2	0	2
Expected RSTD	µs	N/A	3	N/A	3
Expected RSTD uncertainty	µs	N/A	5	N/A	5
Time offset with Cell 1	µs	-	3	-	3
PDSCH/PDCCH subcarrier spacing	kHz	120	120	120	120
EPRE ratio of PSS to SSS	dB	0	0	0	0
EPRE ratio of PBCH_DMRS to SSS					
EPRE ratio of PBCH to PBCH_DMRS					
EPRE ratio of PDCCH_DMRS to SSS					
EPRE ratio of PDCCH to PDCCH_DMRS					
EPRE ratio of PDSCH_DMRS to SSS					
EPRE ratio of PDSCH to PDSCH_DMRS					

EPRE ratio of OCNG DMRS to SSS Note 1					
EPRE ratio of OCNG to OCNG DMRS Note 1					
Propagation conditions		AWGN	AWGN	AWGN	AWGN
Antenna configuration		1x2	1x2	1x2	1x2
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.					

Table 14.3.7.5-2: RSTD accuracy OTA related test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to clause A.3.15.1			
Assumption for UE beams Note 5		Rough		Rough	
N_{oc} Note1	dBm/15kHz Note3	-91.6		-91.6	
PRS $\hat{E}_s / N_{oc}$	dB	-0.56	-2.72	-0.56	-2.72
PRS-RSRP Note2	dBm/SCS	-92.1	-94.3	-92.1	-94.3
SS-RSRP Note2	dBm/SCS	-89.7	N/A	-89.7	N/A
PRS $\hat{E}_s / I_{ot}$ BB Note4	dB	-2.96	-5.68	-2.69	-5.68
Io Note2	dBm/190.08 MHz Note3	-55.74	-55.74	-55.74	-55.74
Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.					
Note 2: SSB_RP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.					
Note 3: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone					
Note 4: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [2], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] Table 6.2.1.3-4.					
Note 5: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation					

The RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.3.7.3.

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 14.2.8.5 with the following difference: $N_{PRS,i}^{slot} = 2$. Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.107}{N} \right\rceil * 1 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation (see Table 14.3.3.4.3-3).

Table 14.3.7.5-3: RSTD accuracy requirements for the reported values

Test Configuration	Lowest reported value	Highest reported value
Sub-test 1	(5898 – 93) T_c converted to RSTD measurement according to clause 4.15.6	(5898 + 93) T_c converted to RSTD measurement according to clause 4.15.6
Sub-test 2	(5898 – 82) T_c converted to RSTD measurement according to clause 4.15.6	(5898 + 82) T_c converted to RSTD measurement according to clause 4.15.6

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.3.8 NR RSTD measurement accuracy test case for single positioning frequency layer with Rx TEG in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

14.3.8.1 Test purpose

The purpose of the test is to verify that the RSTD measurements when the measurements are within the same Rx TEG meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions.

14.3.8.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports UE assisted DL-TDOA positioning and nr-UE-RxTEG-ID-MaxSupport.

14.3.8.3 Minimum conformance requirements

Same as defined in clause 14.3.7.3.

14.3.8.4 Test description

14.3.8.4.1 Initial conditions

The supported test configuration is listed in Table 14.3.8-1.

Table 14.3.8.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.8.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.3.8.5-1 and Table 14.3.8.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.8.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR2. GP#24 is configured if UE supports GP#24. otherwise, GP#13 is configured for the test.

6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.3.8.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration, PRS.1.1 FR2 and PRS.1.2 FR2. The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The NR-DL-TDOA-RequestLocationInformation message and the DL-TDOA assistance data as defined in clause 14.3.8.4.3 shall be provided to the UE during the set-up period.

The UE is configured with measurement gap pattern ID # 24 or #13 before T2.

2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On, to TS 38.508-1 [45] clause 4.5.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

3. Set the parameters according to Table 14.3.8.5-1 and Table 14.3.8.5-2 as appropriate. Propagation conditions are set according to clause 4.15.2.

4. The SS shall transmit an LPP REQUEST CAPABILITIES message.

5. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports nr-UE-RxTEG-ID-MaxSupport in the *NR-UE-TEG-Capability* IE and DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.

6. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. If the UE message at step 5 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

7. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-UE-RxTEG-Request-r17 in the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.

8. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3).

9. If the UE message at step 8 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

10. The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 14.3.8.5-3.

11. Repeat steps 2-11 in Table 14.3.8.4-1 until the confidence level according to Annex D is achieved.

12. Repeat step 1-11 for the other sub-test defined in Table 14.3.8.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

EPRE ratio of PRS to SSS					
Propagation conditions		AWGN	AWGN	AWGN	AWGN
Antenna configuration		1x2	1x2	1x2	1x2
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.					

Table 14.3.8.5-2: RSTD accuracy OTA related test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to clause A.3.15.1			
Assumption for UE beams Note 5		Rough		Rough	
N_{oc} Note1	dBm/SCS Note3	-89.1		-89.1	
PRS $\hat{E}_s / N_{oc}$	dB	-5.17	-11.36	-5.17	-11.36
PRP Note2	dBm/SCS	-94.2	-100.4	-94.28	-100.4
PRS $\hat{E}_s / I_{ot}$ Note4	dB	-5.7	-12.7	-5.7	-12.7
Io Note2	dBm/190.08 MHz Note3	-55.68	-55.68	-55.68	-55.68
Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.					
Note 2: PRP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.					
Note 3: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone					
Note 4: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.					
Note 5: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation					

The RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.3.8.3.

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 14.2.10.5 with the following difference: $N_{PRS,i}^{slot} = 2$. Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(k_{multiTEG} * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 4 - 1\right)$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 10.248s and 164s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.3.8.4.3-3. The LPP time IE ranges between 11s and 170s.

Table 14.3.8.5-3: RSTD accuracy requirements for the reported values

Test Configuration	Lowest reported value	Highest reported value
Sub-test 1	(5898 – 120) T_c converted to RSTD measurement according to clause 4.15.6	(5898 + 120) T_c converted to RSTD measurement according to clause 4.15.6
Sub-test 2	(5898 – 86) T_c converted to RSTD measurement according to clause 4.15.6	(5898 + 86) T_c converted to RSTD measurement according to clause 4.15.6

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.3.9 NR RSTD measurement accuracy test case for PRS aggregation in FR1 SA

14.3.9.1 Test purpose

The purpose of the test is to verify that the RSTD measurement by aggregating PRS resoureces from multiple positioning frequency layers (PFLs) meets the measurement accuracy requirements specified in TS 38.133 [50] clause 10.1.23A.2 in an environment with AWGN propagation conditions.

14.3.9.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports DL-TDOA positioning and *supportOfDL-PRS-BWA-RRC-Connected-r18*.

14.3.9.3 Minimum conformance requirements

When UE measures RSTD on PRS resources belonging to different PFLs or different PFL combinations, then the RSTD accuracy is defined as the accuracy corresponding to the largest accuracy value among different PFLs or different PFL combinations.

The requirements in this clause for 3-PFL and 2-PFL apply provided that:

- PRS resources linked for aggregation saftisfy all the conditions specified in TS 38.214 [56] clause 5.1.6.5.3.
- The spacing between the center frequencies of adjacent PFLs containing PRS resources linked for aggregation does not exceed the nominal channel spacing for intra-band contiguous CA defined in TS 38.101-1 [18], clause 5.4A.1 for FR1, and in TS 38.101-2, [19] clause 5.4A.1 for FR2-1.

The accuracy requirements for RSTD measurement based on PRS Aggregation shall be within $\pm(X+Y+Z+\Delta)$ T_c.

X is defined in table 14.3.9.3-1 for AWGN channel and table 14.3.9.3-3 for fading channel for FR1, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to TS 38.133[50] annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE does not perform positioning measurement with reduced number of samples.

X is defined in table 14.3.9.3-2 for AWGN channel and table 14.3.9.3-4 for fading channel for FR2, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.

- UE does not perform positioning measurement with reduced number of samples.

X is defined in table 14.3.9.3-5 for AWGN channel in FR1, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.

- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

X is defined in table 14.3.9.3-6 for AWGN channel in FR2, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.

- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

NOTE: The requriements for fading channel in this clause are derived based on TDL-A (30 ns delay spread, 5Hz) and TDL-C (60 ns delay spread, 300 Hz) channel models for FR1 and FR2 respectively.

If the UE doesn't support Rx TEG reporting for RSTD measurement or when the measurements of reference cell and neighbour cell belong to different Rx TEGs, Y, Z and Δ are defined as follows:

- When UE measures RSTD on PRS resources belonging to same PFL or same PFL combination, Y=32 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbor cell, which are used for a single RSTD estimate, is no greater than 160 ms.

- When UE measures RSTD on PRS resources belonging different PFLs or different PFL combinations, Y=256 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbor cell, which are used for a single RSTD estimate, is no greater than 1280 ms.

- Z is defined in table 14.3.9.3-7 for FR1 and table 14.3.9.3-9 for FR2, respectively, where the PRS BW refers to the sum of the PRS PRB numbers across the aggregated PFLs.

- Δ is zero when UE measures RSTD on PRS resources belonging to same PFL or same PFL combination and is defined in table 14.3.9.3-8 for FR1 and table 14.3.9.3-10 for FR2, respectively, when UE measures RSTD on PRS resources belonging different PFLs or different PFL combinations, where the PRS BW refers to the sum of the PRS PRB numbers across the aggregated PFLs.

If the measurements of reference cell and neighbour cell belong to the same Rx TEG, i.e. associated and reported with a common Rx TEG ID, then the sum of Y+Z+Δ is equal to the timing error margin of the Rx TEG reported in *nr-UE-RxTEG-TimingErrorMargin*. The timing error margin reported via *nr-UE-RxTEG-TimingErrorMargin* cannot be larger than the value of (Y+Z+Δ) defined when the UE does not associate the measurements with the same Rx TEG.

Table 14.3.9.3-1: RSTD absolute accuracy in FR1 for AWGN channel

NOTE 1: Minimum PRS bandwidth per PFL, which is minimum of the PRS bandwidths of the reference resource and the measured neighbour resource i among all the aggregated PFLs.
NOTE 2: Minimum number of PRS resource repetitions among the reference resource and the measured neighbour resource i. $T_{\text{rep}}^{\text{PRS}}$, L_{PRS}, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.

Table 14.3.9.3-2: RSTD absolute accuracy in FR2 for AWGN channel

Accuracy for 2 PFLs	Accuracy for 3 PFLs	Conditions					
		PRS Ês/Iot	PRS SCS	PRS bandwidth per PFL Note 1	PRS resource repetition (T_{rep}^{PRS} * L_{PRS}/ K_{comb}^{PRS}) Note 2	Io Note 3 range

The normative reference for this requirement is TS 38.133 [50] clause 10.1.23A.2.

14.3.9.4 Test description

14.3.9.4.1 Initial conditions

The test is defined with three possible Test Configurations. In the case that the UE supports more than one of these Test Configurations, then the UE is only required to be tested in one of the Test Configurations, chosen by the UE. The defined Test Configurations are specified in Table 14.3.9.4.1-1.

Table 14.3.9.4.1-1: Supported test configurations for PRS aggregation

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth per PFL, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth per PFL, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth per PFL, TDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.9.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 14.3.9.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 14.3.9.4.3.1
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

14.3.9.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The *NR-TDOA-ProvideAssistanceData* and *NR-TDOA-RequestLocationInformation* message as defined in TS 37.355 [49], shall be provided to the UE before the start of the test. The test duration should be larger than the UE measurement period as defined in TS 38.133[50] clause 9.9.2.

The last TTI containing the NR-DL-TDOA-RequestLocationInformation message shall be provided to the UE ΔT ms before the start of the measurement period, where $\Delta T = 50$ ms is the maximum processing time of the NR-DL-TDOA-RequestLocationInformation message and the DL-TDOA assistance data in the UE.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.3.9.5-1 as appropriate. Propagation conditions are set according to clause 4.15.2.
4. The SS shall send an LPP REQUEST CAPABILITIES message.
5. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
6. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. If the UE message at step 5 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

7. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *nr-DL-PRS-JointMeasurementRequestedPFL-List* in the *NR-DL-TDOA-RequestLocationInformation* such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.

8. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message, including the *NR-DL-TDOA-ProvideLocationInformation* IE.

9. If the UE message at step 8 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

10. The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 14.3.9.5-2.

11. Repeat step 2-10 until the confidence level according to Annex D is achieved.

14.3.9.5 Test requirement

The RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.3.9.3.

Table 14.3.9.5-1: RSTD accuracy test parameters for PRS aggregation

Parameter	Config	Unit	Cell 1	Cell 2
PRS ARFCN	1,2,3		freq1, freq2	freq1, freq2
$BW_{channel}$ per carrier	1	MHz	20: $N_{RB,c}$ = 106	
	2		20: $N_{RB,c}$ = 106	
	3		50: $N_{RB,c}$ = 133	
Duplex mode	1		FDD	
	2		TDD	
	3		TDD	
TDD configuration	1		N/A	
	2		TDDConf.1.1	
	3		TDDConf.2.1	
Measurement gap	1, 2, 3		GP#24 or GP#0	
PDSCH Reference measurement channel	1		SR.1.1 FDD	-
	2		SR.1.1 TDD	
	3		SR.2.1 FDD	
RMSI CORESET Reference Channel	1		CR.1.1 FDD	-
	2		CR.1.1 TDD	-
	3		CR.2.1 FDD	-
Dedicated CORESET Reference Channel	1		CCR.1.1 FDD	-
	2		CCR.1.1 TDD	-
	3		CCR.2.1 TDD	-
SSB configuration	1		SSB.1 FR1	
	2		SSB.1 FR1	
	3		SSB.2 FR1	
OCNG Patterns	1,2,3		OP.1	
TRS configuration	1		TRS.1.1 FDD	-
	2		TRS.1.1 TDD	
	3		TRS.1.2 TDD	
Initial BWP Configuration	1,2,3		DLBWP.0.1 ULBWP.0.1	

Dedicated BWP configuration	1,2,3		DLBWP.1.1 ULBWP.1.1	
Time offset with Cell 1	1	µs	-	3
	2,3		-	3
SMTC configuration	1		SMTC.2	
	2,3		SMTC.1	
PRS configuration	1		PRS.1.2 FR1	
	2		PRS.1.2 FR1	
	3		PRS.2.2 FR1	
PRS Resource slot offset	1, 2, 3	slot	0	4
Expected RSTD	1, 2, 3	µs	N/A	3
Expected RSTD uncertainty	1, 2, 3	µs	N/A	5
EPRE ratio of PSS to SSS	1,2,3	dB	0	0
EPRE ratio of PBCH DMRS to SSS				
EPRE ratio of PBCH to PBCH DMRS				
EPRE ratio of PDCCH DMRS to SSS				
EPRE ratio of PDCCH to PDCCH DMRS				
EPRE ratio of PDSCH DMRS to SSS				
EPRE ratio of PDSCH to PDSCH DMRS				
EPRE ratio of OCNG DMRS to SSS				
EPRE ratio of OCNG to OCNG DMRS				
EPRE ratio of PRS to SSS	1,2,3	dB	0	0
N_{oc} Note2	1,2	dBm/ SCS	-98	
	3		-95	
PRS $\hat{E}_s/I_{ot}$	1,2,3	dB	-5.64	-12.65
PRP	1,2	dBm/SCS	-103.4	-109.5
	3		-100.4	-106.5
Io	1,2	dBm/ 19.08MHz per PFL	-62.61	-62.61
	3	dBm/ 47.88MHz per PFL	-58.62	-58.62
PRS $\hat{E}_s/N_{oc}$	1,2,3	dB	-5.35	-11.54
SSB $\hat{E}_s/N_{oc}$	1,2,3	dB	-5.7	
Propagation condition	1,2,3	-	AWGN	

The RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.3.9.3.

Table 14.3.9.5-2: RSTD accuracy requirements for the reported values

Test Configuration	Lowest reported value	Highest reported value
Config1, Config2	(5898 – 376) T_c	(5898 + 376) T_c
Config 3	(5898 – 331) T_c	(5898 + 331) T_c

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.3.10 NR RSTD measurement accuracy test case for PRS aggregation in FR2 SA

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test requirements and test tolerance analysis is incomplete

14.3.10.1 Test purpose

The purpose of the test is to verify that the RSTD measurement by aggregating PRS resoureces from multiple positioning frequency layers (PFLs) meets the measurement accuracy requirements specified in TS 38.133 [50] clause 10.1.23A.2 in an environment with AWGN propagation conditions.

14.3.10.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports DL-TDOA positioning and *supportOfDL-PRS-BWA-RRC-Connected-r18*.

14.3.10.3 Minimum conformance requirements

Same minimum requirements as in clause 14.3.9.3

14.3.10.4 Test description

14.3.10.4.1 Initial conditions

Table 14.3.10.4.1-1: Supported test configurations

Configuration	Description
1	120 kHz SSB SCS, 200 MHz bandwidth per PFL, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.10.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.3.10.5-1 and Table 14.3.10.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.10.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cells. GP#24 is configured if UE supports GP#24, otherwise, GP#13 is configured for the test.

14.3.10.4.2 Test procedure

Same test procedure as defined in clause 14.3.9.4.2 with following exceptions:

3. Set the parameters according to Table 14.3.10.5-1 and Table 14.3.10.5-2 as appropriate. Propagation conditions are set according to clause 4.15.2.

10. The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 4.3.10.5-3.

14.3.10.4.3 Message contents

Same message contents as defined in clause 14.3.9.4.3 with following exceptions:

Table 14.3.10.4.3-1 replaces Table 14.3.9.4.3-5; Table 14.3.10.4.3-2 replaces Table 14.3.9.4.3-6.

14.3.10.5 Test requirements

The RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.3.10.3.

Table 14.3.10.5-1: RSTD accuracy test parameters for PRS aggregation

Parameter	Unit	Cell 1	Cell 2
PRS ARFCN		freq1, freq2	
Duplex mode		TDD	
TDD configuration		TDDConf.3.1	
$BW_{channel}$ per carrier	MHz	200: $N_{RB,c}$ = 132	
Measurement gap		GP#24 or GP#13	
Downlink initial BWP configuration		DLBWP.0.1	-
Downlink dedicated BWP configuration		DLBWP.1.1	-
Uplink initial BWP configuration		ULBWP.0.1	-
Uplink dedicated BWP configuration		ULBWP.1.1	-
DRX cycle configuration		Not applicable	-
TRS configuration		TRS.2.1 TDD	-
TCI state		TCI.State.0	-
PDSCH Reference measurement channel		SR.3.1 TDD	-
RMSI CORESET Reference Channel		CR.3.1 TDD	-
Control channel RMC		CCR.3.1 TDD	-
OCNG Patterns		OP.1	OP.1
SSB configuration		SSB.3 FR2	SSB.3 FR2
SMTC configuration		SMTC.1	SMTC.1
PRS configuration		PRS.1.1 FR2	PRS.1.1 FR2
PRS Resource slot offset	slot	0	4
Expected RSTD	µs	N/A	3
Expected RSTD uncertainty	µs	N/A	5
Time offset with Cell 1	µs	-	3
PDSCH/PDCCH subcarrier spacing	kHz	120	120
EPRE ratio of PSS to SSS	dB	0	0
EPRE ratio of PBCH_DMRS to SSS			
EPRE ratio of PBCH to PBCH_DMRS			
EPRE ratio of PDCCH_DMRS to SSS			
EPRE ratio of PDCCH to PDCCH_DMRS			
EPRE ratio of PDSCH_DMRS to SSS			
EPRE ratio of PDSCH to PDSCH DMRS			
EPRE ratio of OCNG DMRS to SSS Note 1			
EPRE ratio of OCNG to OCNG DMRS Note 1			
EPRE ratio of PRS to SSS	dB	0	0
Propagation conditions		AWGN	AWGN
Antenna configuration		1x2	1x2
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS. Note 2: Carriers with PRS resources for aggregation are intra-band and contiguous to each other.			

Table 14.3.10.5-2: RSTD accuracy OTA related test parameters

Parameter	Unit	Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to TS 38.133 [50] clause A.3.15.1	
Assumption for UE beams Note 5		Rough	
N_{oc} Note1	dBm/SCS Note3	-89	
PRS $\hat{E}_s/N_{oc}$	dB	-5.7 + TT	-11.9 + TT
PRP Note2	dBm/SCS	-94.7 + TT	-100.9 + TT
PRS $\hat{E}_s/I_{ot}$	dB	-6 + TT	-13 + TT
Io Note2 per PFL	dBm/190.08 MHz Note3	-55.75 + TT	-55.75 + TT

Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over sub-carriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 2: PRP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. The Io is calculated based only on the symbols in which PRS is transmitted.
Note 3: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
Note 4: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.
Note 5: Information about types of UE beam is given in clause B.2.1.3, and does not limit UE implementation or test system implementation.

The value of the LPP Time IE depends on the UE capabilities. The calculation is FFS

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation (see Table 14.3.9.4.3-3).

The RSTD accuracy requirements for the reported values is FFS.

14.3.11 NR RSTD measurement accuracy test case in FR1 for Redcap UE without Rx FH

Editor's Note: This test case is incomplete in following aspects:

- Message content is missing;
- Apllicability is missing;
- Cell configuration is missing;
- Test procedure is missing;
- TT analysis is missing.

14.3.11.1 Test purpose

The purpose of the test is to verify that the RSTD measurement for RedCap UE without FH in RRC CONNECTED state meets the accuracy requirements specified in TS 38.133 [50] clause 10.1A.16.2 in an environment with AWGN propagation conditions.

14.3.11.2 Test applicability

This test applies to RedCap UE release 18 onwards that support DL-TDOA positioning.

14.3.11.3 Minimum conformance requirements

The accuracy requirements for RSTD measurement shall be within ±(X+Y+Z+Δ) T_c. The values of Y, Z and Δ and Rx TEG based requirement are as defined in TS 38.133 [50] clause 10.1.23.2. The requirements for fading channel in this clause are derived based on TDL-A (30 ns delay spread, 5Hz) and TDL-C (60 ns delay spread, 300 Hz) channel models for FR1 and FR2, respectively.

14.3.11.4 Test description

14.3.11.4.1 Initial conditions

The supported test configurations in listed in Table 14.3.11.4-1.

Table 14.3.11.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.11.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.3.11.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.11.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR1. GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.3.11.4.2 Test procedure

TBD

14.3.11.4.3 Message contents

TBD

14.3.11.5 Test requirement

Table 14.3.11.5-1 define the primary level settings including test tolerances for the test.

Table 14.3.11.5-1: RSTD accuracy test parameters

N_{oc} Note2	1,2,4	dBm/ SCS	-98	
	3		-95	
PRS $\hat{E}_s/I_{ot}$	1,2,3,4	dB	-6	-13
PRP Note3	1,2,4	dBm/SCS	-103.7	-109.9
	3		-100.7	-106.9
Io Note3	1,2,4	dBm/ 9.36MHz	-68.8	-68.8
	3	dBm/ 18.36MHz	-65.88	-65.88
PRS $\hat{E}_s/N_{oc}$	1,2,3,4	dB	-5.7	-11.9
Propagation condition	1,2,3,4	-	AWGN	
Antenna configuration	1,2,3,4		1x2	

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. The Io is calculated based only on the symbols in which PRS is transmitted.
NOTE 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

The RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.4.11.3.

TBD

14.3.12 NR RSTD measurement accuracy test case in FR2 for Redcap UE without Rx FH

Editor's Note: This test case is incomplete in following aspects:

- Message content is missing;
- Apllicability is missing;
- Cell configuration is missing;
- Test procedure is missing;
- TT analysis is missing.

14.3.12.1 Test purpose

The purpose of the test is to verify that the RSTD measurement for RedCap UE without FH in RRC CONNECTED state meets the accuracy requirements specified in TS 38.133 [50] clause 10.1A.16.2 in an environment with AWGN propagation conditions.

14.3.12.2 Test applicability

This test applies to RedCap UE release 18 onwards that support DL-TDOA positioning.

14.3.12.3 Minimum conformance requirements

Same as in 14.3.11.3.

14.3.12.4 Test description

14.3.12.4.1 Initial conditions

The supported test configurations in listed in Table 14.3.12.4-1.

Table 14.3.12.4-1: Test Configurations

Configuration	Description
1	120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.12.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.3.12.5-1 and Table 14.3.12.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.12.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR2. GP#24 is configured if UE supports GP#24, otherwise, GP#13 is configured for the test.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.3.12.4.2 Test procedure

TBD

14.3.12.4.3 Message contents

TBD

14.3.12.5 Test requirement

Table 14.3.12.5-1 and Table 14.3.12.5-2: define the primary level settings including test tolerances for the test.

Io Note2	dBm/95.04 MHz Note3	-58.76	-58.76

NOTE 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 2: PRP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. The Io is calculated based only on the symbols in which PRS is transmitted.
NOTE 3: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
NOTE 4: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.
NOTE 5: Information about types of UE beam is given in annex B.2.1.3 and does not limit UE implementation or test system implementation.

The RSTD measurement accuracy shall fulfil the absolute requirement in clause 14.3.12.3.

TBD

14.3.13 NR RSTD measurement accuracy test case in FR1 for Redcap UE with Rx FH

Editor's Note: This test case is incomplete in following aspects:

- Message content is missing;
- Apllicability is missing;
- Cell configuration is missing;
- Test procedure is missing;
- TT analysis is missing.

14.3.13.1 Test purpose

The purpose of the test is to verify that the RSTD measurement for RedCap UE without FH in RRC CONNECTED state meets the accuracy requirements specified in TS 38.133 [50] clause 10.1A.16.2 in an environment with AWGN propagation conditions.

14.3.13.2 Test applicability

This test applies to RedCap UE release 18 onwards that support DL-TDOA positioning.

14.3.13.3 Minimum conformance requirements

The accuracy requirements for RSTD measurement shall be within ±(X+Y+Z+Δ) T_c. The values of Y, Z and Δ and Rx TEG based requirement are as defined in TS 38.133 [50] clause 10.1.23.2. For Rx FH, PRS BW in TS 38.133 [50] in

tables 10.1.23.2-5, 10.1.23.2-5a, 10.1.23.2-6, and 10.1.23.2-6a refer to per hop BW. The requirements for fading channel in this clause are derived based on TDL-A (30 ns delay spread, 5Hz) and TDL-C (60 ns delay spread, 300 Hz) channel models for FR1 and FR2, respectively.

14.3.13.4 Test description

14.3.13.4.1 Initial conditions

The supported test configurations in listed in Table 14.3.13.4-1.

Table 14.3.14.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, cell bandwidth 50 Hz, FDD duplex mode
2	15 kHz SSB SCS, cell bandwidth 50 Hz, TDD duplex mode
3	30 kHz SSB SCS, cell bandwidth 100 Hz, TDD duplex mode
4	15 kHz SSB SCS, cell bandwidth 50 Hz, HD-FDD duplex mode
NOTE 1: The UE is only required to be tested in one of the supported test configurations. NOTE 2: UE with 1 Rx or 2 Rx is required to meet the same requirements specified in this clause. NOTE 3: This test case is applicable to the UE supporting per hop bandwidth ≥ 10 MHz for SCS 15 kHz. NOTE 4: This test case is applicable to the UE supporting per hop bandwidth = 20 MHz for SCS 30 kHz.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.13.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.3.13.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.13.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR1. GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.3.13.4.2 Test procedure

TBD

14.3.13.4.3 Message contents

TBD

14.3.13.5 Test requirement

Table 14.3.13.5-1 define the primary level settings including test tolerances for the test.

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. The Io is calculated based only on the symbols in which PRS is transmitted.
NOTE 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

The RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.4.13.3.

TBD

14.3.14 NR RSTD measurement accuracy test case in FR2 for Redcap UE with Rx FH

Editor's Note: This test case is incomplete in following aspects:

- Message content is missing;
- Apllicability is missing;
- Cell configuration is missing;
- Test procedure is missing;
- TT analysis is missing.

14.3.14.1 Test purpose

The purpose of the test is to verify that the RSTD measurement for RedCap UE without FH in RRC CONNECTED state meets the accuracy requirements specified in TS 38.133 [50] clause 10.1A.16.2 in an environment with AWGN propagation conditions.

14.3.14.2 Test applicability

This test applies to RedCap UE release 18 onwards that support DL-TDOA positioning.

14.3.14.3 Minimum conformance requirements

Same as in 14.3.13.3.

14.3.14.4 Test description

14.3.14.4.1 Initial conditions

The supported test configurations in listed in Table 14.2.10.4-1.

Table 14.3.14.4-1: Test Configurations

Configuration	Description
1	120 kHz SSB SCS, cell bandwidth 400 MHz, TDD duplex mode
NOTE 1: This test case is applicable to the UE supporting per hop bandwidth = 100 MHz for SCS 120 kHz.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.3.14.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.3.14.5-1 and Table 14.3.14.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.3.14.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR2. GP#24 is configured if UE supports GP#24, otherwise, GP#13 is configured for the test.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

NOTE 3: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.			
NOTE 4: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.			
NOTE 5: Information about types of UE beam is given in annex B.2.1.3 and does not limit UE implementation or test system implementation.			

The RSTD measurement accuracy shall fulfil the absolute requirement in clause 14.3.14.3.

TBD

14.4 NR RSTD measurement period test cases in RRC_INACTIVE

14.4.1 NR RSTD measurement reporting delay test case for single positioning frequency layer in FR1 SA

14.4.1.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the requirements specified in TS 38.133 [50] clause 5.6.2.5 in an environment with AWGN propagation conditions in FR1 in standalone scenario when single positioning frequency layer is configured.

14.4.1.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning and DL-PRS measurement in RRC_INACTIVE.

14.4.1.3 Minimum conformance requirements

After receiving both *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in Clause 5.6.2.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined as:

$$\mathrm{T_{RSTD,Total}} = \sum_{i=1}^{L} \mathrm{T_{RSTD,i}} + (\mathrm{L}-1) * \max\left(\mathrm{T_{effect,i}}\right)$$

Where:

- i is the index of positioning frequency layer,
- L is total number of positioning frequency layers, and
- $\mathrm{T_{effect},i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i

$\mathrm{T_{RSTD,i}}$ is the measurement period for PRS RSTD measurement in positioning frequency layer *i* as specified below:

$$\mathrm{T_{RSTD,i}} = \left(K_{\mathrm{carrier_PRS}} * N_{Rx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil * \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * \mathrm{T_{effect,i}} + \mathrm{T_{last,i}} ,$$

Where:

- $N_{RxBeam,i}$ is the UE Rx beam sweeping factor:
  - $N_{RxBeam,i}$ = 1 if positioning frequency layer *i* is in FR1, and if positioning frequency layer *i* is in FR2
    - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*.
  - $N_{RxBeam,i}$ equals to 8, otherwise.
- $K_{\mathrm{carrier_PRS}}$ is a scaling factor for PRS-based NR positioning measurements in RRC_INACTIVE. If the UE supports *parallelPRS-MeasRRC-Inactive-r17*, $\mathrm{K_{carrier_PRS}}$ = 1; otherwise,
- If Srxlev ≤ $\mathrm{S_{nonIntraSearchP}}$ or Squal ≤ $\mathrm{S_{nonIntraSearchQ}}$, $K_{\mathrm{carrier_PRS}} = K_{\mathrm{carrier}} + 1$, where K_{carrier} is defined in clause 4.2.2.4
- If Srxlev > $\mathrm{S_{nonIntraSearchP}}$ and Squal > $\mathrm{S_{nonIntraSearchQ}}$, $K_{\mathrm{carrier_PRS}} = N_{\mathrm{layers}} + 1$, where N_{layers} is defined in clause 4.2.2.7.
- $N_{Rx,TEG,i}$ is the Rx TEG specific scaling factor:

- $N_{Rx,TEG,i}$ =1 if the UE is not configured by the LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34].
- $N_{Rx,TEG,i}$ is defined as follows if the UE is configured by the LMF with *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] to perform measurement on same DL PRS resource of a TRP using different Rx TEGs in *NR-DL-TDOA-RequestLocationInformation* [34]:
  - $N_{Rx,TEG,i} = P$, if the UE is not capable of measuring same DL PRS resource simultaneously from multiple Rx TEGs, where P is the number of UE Rx TEGs that the UE is requested by LMF to measure the same DL-PRS Resource of a TRP indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* in [34], and in case 'n0' is indicated, P is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*.
  - $N_{Rx,TEG,i} = \left\lfloor \frac{P}{Q} \right\rfloor$, if the UE is capable of measuring the same DL PRS resource simultaneously from multiple Rx TEGs, where Q is the number of UE Rx TEGs for measuring the same DL-PRS Resource simultaneously indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul-r17* in [34].

- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.
- $L_{available_PRS,\mathrm{i}}$ is the time duration of available PRS in positioning frequency layer *i* to be measured within $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,\mathrm{i}}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- N_{sample} is the number of PRS RSTD samples, where
  - N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
    - PRS bandwidth is within the initial BWP and
    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
  - N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
    - PRS bandwidth is within the initial BWP and
    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
  - N_{sample} = 4 otherwise.
- $T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time, $\mathrm{T_{last,i}} = T_{\mathrm{i}} + T_{available_PRS,\mathrm{i}}$,
- $\mathrm{T_{effect,}}_i$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{\mathrm{effect,i}} = \left\lceil \frac{T_{\mathrm{i}}}{T_{available_PRS,\mathrm{i}}} \right\rceil * T_{available_PRS,\mathrm{i}}$$

Where:

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34],
- $T_{available_PRS,\mathrm{i}} = LCM\left(T_{PRS,\mathrm{i}}, T_{DRX}\right)$, the least common multiple between $T_{PRS,\mathrm{i}}$ and the DRX cycle length T_{DRX}
- $T_{PRS,\mathrm{i}}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,\mathrm{i}}$, where,

- $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,
- T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.
- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where
- T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.
- $\{N, T\}$ is the UE capability combination per band for RRC_INACTIVE state where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [34], T (ms) corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34], [and T-N (>0) is the time required to process duration N of DL PRS symbols already buffered in memory], for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],
- N' is UE capability for number of DL PRS resources that it can process in a slot [in RRC_INACTIVE state as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* specified in TS 37.355 [34].

The time $T_{RSTD,Total}$ starts from the first DRX cycle containing the DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

14.4.1.4 Test description

The supported test configurations in listed in Table 14.4.1.4-1

Table 14.4.1.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

14.4.1.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.4.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.12.
2. The general test parameter settings are set up according to Table 14.4.1.5-1, Table 14.4.1.5-2 and Table 14.4.1.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.4.1.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the RSTD reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR1.

14.4.1.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2 and Cell3. During T2 UE shall be in RRC_INACTIVE state and all cells transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The *NR-DL-TDOA-ProvideAssistanceData* as defined in TS 37.355 [49] clause 6.5.10.1 shall be provided to the UE during T1. The last TTI containing the *NR-DL-TDOA-ProvideAssistanceData* and *NR-DL-TDOA-RequestLocationInformation* shall be provided to the UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the *DL-TDOA assistance* data and location information request.

The beginning of the time interval T2 shall be aligned with the first DRX cycle containing a DL PRS resource(s).

0. Configure the Cell for RA-SDT with SIB1 configured according to TS 38.508-1 [45], clause 4.6.1 with condition SDT.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.4.1.5-1, Table 14.4.1.5-2 and Table 14.4.1.5-3. Propagation conditions are set according to clause 4.15.2.
4. T1 starts.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. The position of neighbour Cell 2 and the position of neighbour Cell 3 are described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
12. When T1 expires, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and switch the power setting from T1 to T2 as specified in Table 14.4.1.5-2 and Table 14.4.1.5-3.
13. Wait for the UE monitors for occurrence of the periodic event requested.
14. The UE shall transmit the UE transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the RRCResumeRequest message and then go to step 18.
15. The SS transmits an *RRCResume* message.
16. The UE transmits an *RRCResumeComplete* message.
17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3).

18. The UE shall perform and report the RSTD measurements for both Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-TDOA-ProvideLocationInformation* IE including the nr-RSTD field for both Cell 2 and Cell 3 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-TDOA-ProvideLocationInformation* IE with both the nr-RSTD fields included within the response time then the number of failure tests is increased by one.

19. Repeat steps 2-17 in Tables 14.4.1.4-1 until the confidence level according to Annex D is achieved.

14.4.1.5 Test requirement

Table 14.4.1.5-1, Table 14.4.1.5-2 and Table 14.4.1.5-3 define the primary level settings including test tolerances for the test.

Table.14.4.1.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [4] and TS 37.355 [34]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
SSB configuration	Config 1		SSB.1 FR1	
	Config 2		SSB.1 FR1	
	Config 3		SSB.2 FR1	
SMTC configuration	Config 1		SMTC.2	
	Config 2		SMTC.1	
	Config 3		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
	Config 2		SR.1.1 TDD	
	Config 3		SR.2.1 TDD	
RMSI CORESET RMC configuration	Config 1		CR.1.1 FDD	As specified in clause A.3.1.2.1
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
Initial BWP configuration	Config 1,2,3		DLBWP.0.1 ULBWP.0.1	

Active UL BWP configuration	Config 1,2,3		ULBWP.1.1	
PRS Configuration	Config 1		PRS.1.1 FR1	As specified in clause A.3.31
	Config 2		PRS.1.1 FR1	
	Config 3		PRS.2.1 FR1	
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX		s	1.28	
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [34] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance ta specified in TS 37.355 [34] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			4	Including the reference cell
PRS muting info			Cell 1: '10' Cell 2: '01' Cell 3: '10'	Corresponds to prs-MutingInfo defined in TS 37.355 [34]
PRS resource RE offset			Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1		s	3	The length of the time interval from the beginning of each test
T2		s	5	The length of the time interval that follows immediately after time interval T1.

Table Table.14.4.1.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter		Unit	Cell 1	Cell 2	Cell 3
NR RF Channel Number			1	1	1
Positioning frequency layer			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.1	N/A	N/A
N_{oc} Note 3	Config 1	dBm/SCS	-98		
	Config 2	dBm/SCS	-98		
	Config 3	dBm/SCS	-95		
PRS $\hat{E}_s/N_{oc}$		dB	-Infinity	-Infinity	-Infinity
SSB $\hat{E}_s/N_{oc}$		dB	10	-Infinity	-Infinity
Io Note 4	Config 1	dBm/ 19.08MHz	-56.54	-56.54	-56.54
	Config 2	dBm/ 19.08MHz	-56.54	-56.54	-56.54
	Config 3	dBm/ 47.88MHz	-52.56	-52.56	-52.56
SSB RP Note4	Config 1	dBm/SCS	-88	-Infinity	-Infinity

	Config 2	dBm/SCS	-88	-Infinity	-Infinity
	Config 3	dBm/SCS	-85	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.

Table 14.4.1.5-3: Cell-specific test parameters for RSTD measurement reporting delay during T2

Parameter		Unit	Cell 1	Cell 2	Cell 3
			T2	T2	T2
NR RF Channel Number			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.1	OP.1	OP.1
PRACH configuration			FR1 PRACH configuration 1	FR1 PRACH configuration 1	FR1 PRACH configuration 1
N_{oc} Note 3	Config 1	dBm/SCS	-98	-98	-98
	Config 2	dBm/SCS	-98	-98	-98
	Config 3	dBm/SCS	-95	-95	-95
PRS $\hat{E}_s/N_{oc}$	Config 1	dB	-5.08	-11.27	-11.27
	Config 2	dB	-5.08	-11.27	-11.27
	Config 3	dB	-5.08	-11.27	-11.27
Io Note 4	Config 1	dBm/ 19.08MHz	-65.31	-65.31	-65.31
	Config 2	dBm/ 19.08MHz	-65.31	-65.31	-65.31
	Config 3	dBm/ 47.88MHz	-61.32	-61.32	-61.32
PRS $\hat{E}_s/I_{ot}$		dB	-6	-13	-13
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cells (all, except Cell 3 in T2) are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
Note 2: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

The RSTD measurement time fulfils the requirements specified in Clause 5.6.2.5.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in section 5.6.2.5 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be higher than the time duration above because of the uncertainty in acquiring the first available PRACH occasion to transition to RRC_CONNECTED state to report the measurements.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in Clause 10.1.23.3, i.e., between RSTD_0000000 and RSTD1970049.

$T_{RSTD,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer *i* as specified below:

$$T_{RSTD,i} = \left(K_{carrier_PRS} * N_{Rx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil * \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i},$$

Since the test case is for single positioning frequency layer, i = 1 and L = 1, so $T_{RSTD,Total} = T_{RSTD,1}$.

Analysing the equation for $T_{RSTD,i}$:

, $K_{carrier_PRS} = 1$;

$N_{RxBeam,i} = 1$

$N_{Rx,TEG,i} = 1$

$N_{PRS,i}^{slot} = 4$

For SCS 15KHz:

$$L_{available_{PRS},i} = \frac{10}{10 * 1 * 14} * 4 * 1 * 4 = 1.14ms$$

For SCS=30KHz

$$L_{available_{PRS},i} = \frac{10}{20 * 1 * 14} * 4 * 1 * 4 = 0.571ms$$

$N_{sample} = 4$.

$T_{last,i} = T_i + T_{available_PRS,i}$

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$; where Tprs = 160 ms, and , $T_{DRX} = 1.28sec = 1280msec$ Therefore, $T_{available_PRS,i}$ =1280

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 5.12s and 206.08s.

For SCS 30KHz The LPP time IE ranges between 5.12s and 103.6s.

The LPP time IE ranges between 6s and 207s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 207.3

The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation.

The values of N', N and Ti and the effect in the response time equation are defined in Table 14.4.1.5-4, Table 14.4.1.5-5 , Table 14.4.1.5-6 and Table 14.4.1.5-7 for reference.

Table 14.4.1.5-4: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17*

N'	$\lceil 4/N' \rceil$
n1	4

N	$\lceil \frac{0.571}{N} \rceil$
nDot125	5
nDot25	2
>=nDot1	1

Table 14.4.1.5-7: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	Teffect	Tlast
n8	1280	1288
n16	1280	1296
n20	1280	1300
n30	1280	1310
n40	1280	1320
n80	1280	1360
n160	1280	1440
n320	1280	1600
n640	1280	1920
n1280	1280	2560

The test tolerances are defined in clauses C.1.6, C 2.5 and C4.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.4.2 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA

14.4.2.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the requirements specified in TS 38.133 [50] Clause 5.6.2 in an environment with AWGN propagation conditions in FR1 in standalone scenario when single positioning frequency layer is configured.

14.4.2.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning, DL-PRS measurement in RRC_INACTIVE and reduced number of samples for PRS measurement in RRC_INACTIVE state.

14.4.2.3 Minimum conformance requirements

Same as in clause 14.4.1.3.

14.4.2.4 Test description

The supported test configurations in listed in Table 14.4.2.4-1

Table 14.4.2.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS,50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

14.4.2.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.4.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.12.
2. The general test parameter settings are set up according to Table 14.4.2.5-1, Table 14.4.2.5-2 and Table 14.4.2.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.4.2.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the RSTD reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR1.

14.4.2.4.2 Test procedure

Same as in clause 14.4.3.4.2.

14.4.2.4.3 Message contents

As defined in clause 14.4.1.4.3, with the following exceptions:

Table 14.4.2.4.3-1 replaces Table 14.4.1.4.3-6 and Table 14.4.2.4.3-2 replaces Table 14.4.1.4.3-7 and Table 14.4.2.4.3-3 replaces Table 14.4.1.4.3-9..

14.4.2.5 Test requirement

Table 14.4.2.5-1, Table 14.4.2.5-2 and Table 14.4.2.5-3 define the primary level settings including test tolerances for the test.

Table 14.4.2.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [4] and TS 37.355 [34]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
SSB configuration	Config 1		SSB.1 FR1	
	Config 2		SSB.1 FR1	
	Config 3		SSB.2 FR1	
SMTC configuration	Config 1		SMTC.2	
	Config 2		SMTC.1	
	Config 3		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
	Config 2		SR.1.1 TDD	
	Config 3		SR.2.1 TDD	
RMSI CORESET	Config 1		CR.1.1 FDD	As specified in clause A.3.1.2.1
	Config 2		CR.1.1 TDD	

RMC configuration	Config 3		CR.2.1 TDD	
Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
Initial BWP configuration	Config 1,2,3		DLBWP.0.1 ULBWP.0.1	
PRS Configuration	Config 1		PRS.1.2 FR1	As specified in clause A.3.31.
	Config 2		PRS.1.2 FR1	
	Config 3		PRS.2.2 FR1	
PRS Resource slot offset	Config 1, 2, 3	slots	Cell 1, 2, 3: 0	
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX cycle length		s	1.28	
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [34] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance ta specified in TS 37.355 [34] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			4	Including the reference cell
PRS muting info			Cell 1: ‘10’ Cell 2: ‘01’ Cell 3: ‘10’	Corresponds to prs-MutingInfo defined in TS 37.355 [34]
PRS resource RE offset			Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1		s	3	The length of the time interval from the beginning of each test
T2		s	5	The length of the time interval that follows immediately after time interval T1

Table 14.4.2.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter		Unit	Cell 1	Cell 2	Cell 3
NR RF Channel Number			1	1	1
Positioning frequency layer			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.1	N/A	N/A
N_{oc} Note 3	Config 1	dBm/SCS	-98		
	Config 2	dBm/SCS	-98		
	Config 3	dBm/SCS	-95		
PRS $\hat{E}_s/N_{oc}$		dB	-Infinity	-Infinity	-Infinity

SSB $\hat{E}_s/N_{oc}$		dB	0	-Infinity	-Infinity
Io Note 4	Config 1	dBm/ 19.08MHz	-63.94	-63.94	-63.94
	Config 2	dBm/ 19.08MHz	-63.94	-63.94	-63.94
	Config 3	dBm/ 47.88MHz	-59.96	-59.96	-59.96
SSB RP Note4	Config 1	dBm/SCS	-98	-Infinity	-Infinity
	Config 2	dBm/SCS	-98	-Infinity	-Infinity
	Config 3	dBm/SCS	-95	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.

Table 14.4.2.5-3: Cell-specific test parameters for RSTD measurement reporting delay during T2

Parameter		Unit	Cell 1	Cell 2	Cell 3
			T2	T2	T2
NR RF Channel Number			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.1	OP.1	OP.1
PRACH configuration			FR1 PRACH configuration 1	FR1 PRACH configuration 1	FR1 PRACH configuration 1
N_{oc} Note 3	Config 1	dBm/SCS	-98	-98	-98
	Config 2	dBm/SCS	-98	-98	-98
	Config 3	dBm/SCS	-95	-95	-95
PRS $\hat{E}_s/N_{oc}$	Config 1	dB	2.20	0.10	0.10
	Config 2	dB	2.20	0.10	0.10
	Config 3	dB	2.20	0.10	0.10
Io Note 4	Config 1	dBm/ 19.08MHz	-60.23	-60.23	-60.23
	Config 2	dBm/ 19.08MHz	-60.23	-60.23	-60.23
	Config 3	dBm/ 47.88MHz	-56.23	-56.23	-56.23

The RSTD measurement time fulfils the requirements specified in Clause 5.6.2.5.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in section 5.6.2.5 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be higher than the time duration above because of the uncertainty in acquiring the first available PRACH occasion to transition to RRC_CONNECTED state to report the measurements.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in Clause 10.1.23.3, i.e., between RSTD_0000000 and RSTD_1970049.

Since the test case is for single positioning frequency layer, i = 1 and L = 1, so $T_{RSTD,Total} = T_{RSTD,1}$.

Analysing the equation for $T_{RSTD,i}$:

, $K_{carrier_PRS} = 1$;

$N_{RxBeam,i} = 1$

$N_{Rx,TEG,i} = 1$

$N_{PRS,i}^{slot} = 4$

$N_{sample} = 1$.

$T_{last,i} = T_i + T_{available_PRS,i}$

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$; where Tprs = 160 ms, and, $T_{DRX} = 1.28sec = 1280msec$ Therefore, $T_{available_PRS,i} = 1280$

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 1.28s and 52.48s.

For SCS 30KHz The LPP time IE ranges between 1.28s and 26.88s.

The LPP time IE ranges between 2s and 53s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 53.3

The values of N', N and Ti and the effect in the response time equation are defined in Table 14.4.2.5-4, Table 14.4.2.5-5 , Table 14.4.2.5-6 and Table 14.4.2.5-7 for reference.

Table 14.4.2.5-4: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17*

n80	1280	1360
n160	1280	1440
n320	1280	1600
n640	1280	1920
n1280	1280	2560

The test tolerances are defined in clauses C.1.6, C 2.5 and C4.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.4.3 NR RSTD measurement reporting delay test case for single positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

14.4.3.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the requirements specified in TS 38.133 [50] clause 5.6.2.5 in an environment with AWGN propagation conditions in FR2 in standalone scenario when single positioning frequency layer is configured.

14.4.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning and DL-PRS measurement in RRC_INACTIVE.

14.4.3.3 Minimum conformance requirements

After receiving both *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [49], the UE shall be able to measure multiple (up to the UE capability specified in Clause 5.6.2.3) DL RSTD measurements, defined in TS 38.215 [57], during the measurement period $T_{RSTD,Total}$ defined as:

$$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD,i} + (L-1) * \max(T_{effect,i})$$

Where:

- i is the index of positioning frequency layer,

- L is total number of positioning frequency layers, and

- $T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i

$T_{RSTD,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer *i* as specified below:

$$T_{RSTD,i} = \left(K_{carrier_PRS} * N_{Rx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil * \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i},$$

Where:

- $N_{RxBeam,i}$ is the UE Rx beam sweeping factor:
  - $N_{RxBeam,i}$ = 1 if positioning frequency layer *i* is in FR1, and if positioning frequency layer *i* is in FR2
    - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*.
  - $N_{RxBeam,i}$ equals to 8, otherwise.
- $K_{carrier_PRS}$ is a scaling factor for PRS-based NR positioning measurements in RRC_INACTIVE. If the UE supports *parallelPRS-MeasRRC-Inactive-r17*, $K_{carrier_PRS}$ = 1; otherwise,
- If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, $K_{carrier_PRS} = K_{carrier} + 1$, where $K_{carrier}$ is defined in clause 4.2.2.4
- If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, $K_{carrier_PRS} = N_{layers} + 1$, where N_{layers} is defined in clause 4.2.2.7.
- $N_{Rx,TEG,i}$ is the Rx TEG specific scaling factor:
  - $N_{Rx,TEG,i}$ =1 if the UE is not configured by the LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49].
  - $N_{Rx,TEG,i}$ is defined as follows if the UE is configured by the LMF with *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49] to perform measurement on same DL PRS resource of a TRP using different Rx TEGs in *NR-DL-TDOA-RequestLocationInformation* [49]:
    - $N_{Rx,TEG,i} = P$, if the UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, where P is the number of UE Rx TEGs that the UE is requested by LMF to measure the same DL-PRS Resource of a TRP indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* in [49], and in case 'n0' is indicated, P is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*.
    - $N_{Rx,TEG,i} = \left\lceil \frac{P}{Q} \right\rceil$, if the UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs, where Q is the number of UE Rx TEGs for measuring the same DL-PRS Resource simultaneously indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul-r17* in [49].
- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.
- $L_{available_PRS,i}$ is the time duration of available PRS in positioning frequency layer *i* to be measured $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{available_PRS,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- N_{sample} is the number of PRS RSTD samples, where
  - N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [49], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
    - PRS bandwidth is within the initial BWP and
    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

- N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [49], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the initial BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 4 otherwise.

- $T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time, $T_{\text{last,i}} = T_{\text{i}} + T_{available_PRS,\text{i}}$,
- $T_{\text{effect},i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{\text{effect,i}} = \left\lceil \frac{T_{\text{i}}}{T_{available_PRS,\text{i}}} \right\rceil * T_{available_PRS,\text{i}}$$

Where:

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [49],
- $T_{available_PRS,\text{i}} = LCM\left(T_{PRS,\text{i}}, T_{DRX}\right)$, the least common multiple between $T_{PRS,\text{i}}$ and the DRX cycle length T_{DRX}
- $T_{PRS,\text{i}}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,\text{i}}$, where,

- $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,
- T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.
- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where
- T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.
- $\{N, T\}$ is the UE capability combination per band for RRC_INACTIVE state where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [49], T (ms) corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [49], [and T-N (>0) is the time required to process duration N of DL PRS symbols already buffered in memory], for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [49],
- N' is UE capability for number of DL PRS resources that it can process in a slot [in RRC_INACTIVE state as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* specified in TS 37.355 [49].

14.4.3.4 Test description

The supported test configurations in listed in Table 14.4.3.4-1

Table 14.4.3.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

14.4.3.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.4.3.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.4.3.5-1, Table 14.4.3.5-2 and Table 14.4.3.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.4.3.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the RSTD reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR2.

14.4.3.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2 and Cell3. During T2 UE shall be in RRC_INACTIVE state and all cells transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The *NR-DL-TDOA-ProvideAssistanceData* as defined in TS 37.355 [49] clause 6.5.10.1 shall be provided to the UE during T1. The last TTI containing the *NR-DL-TDOA-ProvideAssistanceData* and *NR-DL-TDOA-RequestLocationInformation* shall be provided to the UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the *DL-TDOA assistance* data and location information request.

The beginning of the time interval T2 shall be aligned with the first DRX cycle containing a DL PRS resource(s).

0 Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 14.4.3.4.3-0.

1 Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.4.3.5-1, Table 14.4.3.5-2 and Table 14.4.3.5-3. Propagation conditions are set according to clause 4.15.2.
4. T1 starts.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. The position of neighbour Cell 2 and the position of neighbour Cell 3 are described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.

12. When T1 expires, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and switch the power setting from T1 to T2 as specified in Table 14.4.3.5-2 and Table 14.4.3.5-3.

13. Wait for the UE monitors for occurrence of the periodic event requested.

14. The UE shall transmit the UE transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 17.

15. The SS transmits an *RRCResume* message.

16. The UE transmits an *RRCResumeComplete* message.

17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3). The UE shall perform and report the RSTD measurements for both Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1. If the UE transmits an *NR-DL-TDOA-ProvideLocationInformation* IE including the nr-RSTD field for both Cell 2 and Cell 3 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-TDOA-ProvideLocationInformation* IE with both the nr-RSTD fields included within the response time then the number of failure tests is increased by one.

18. Repeat steps 2-17 in Tables 14.4.3.4-1 until the confidence level according to Annex D is achieved.

14.4.3.5 Test requirement

Table 14.4.3.5-1, Table 14.4.3.5-2 and Table 14.4.3.5-3 define the primary level settings including test tolerances for the test.

Table 14.4.3.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [57] and TS 37.355 [49]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
$BW_{channel}$		MHz	200: $N_{RB,c}$ = 132	
SSB configuration	Config 1		SSB.2 FR2	
SMTC configuration	Config 1		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
RMSI CORESET RMC configuration	Config 1		CR.3.1 TDD	As specified in TS 38.133 [50] clause A.3.1.2.1

Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
PRS Configuration	Config 1		PRS.1.4. FR2	As specified in TS 38.133 [50] clause A.3. 31
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX		s	0.64	
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			4	Including the reference cell
PRS muting info			Cell 1: ‘10’ Cell 2: ‘01’ Cell 3: ‘10’	Correponds to prs-MutingInfo defined in TS 37.355 [49]
PRS resource RE offset			Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1		s	3	The length of the time interval from the beginning of each test
T2		s	125	The length of the time interval that follows immediately after time interval T1
AoA setup			Setup 1	As defined in TS 38.133 [50] A.3.15.1
Beam assumption			Rough	Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

Table 14.4.3.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter	Unit	Cell 1	Cell 2	Cell 3
NR RF Channel Number		1	1	1
Positiong frequency layer		1	1	1
Correlation Matrix and Antenna Configuration		1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1		OP.5 FDD	N/A	N/A

N_{oc} Note 3	Config 1	dBm/SCS	-89		
PRS $\hat{E}_s/N_{oc}$		dB	-Infinity	-Infinity	-Infinity
Io Note 4	Config 1	dBm/ 190.08MHz	-54.00	-54.00	-54.00
SSB RP Note4	Config 1	dBm/SCS	-89	-Infinity	-Infinity
$\hat{E}_s/N_{oc}$		dB	0	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.

Table 14.4.3.5-3: Cell-specific test parameters for RSTD measurement reporting delay during T2

Parameter		Unit	Cell 1	Cell 2	Cell 3
			T2	T2	T2
RF Channel Number			1	1	1
Positiong frequency layer			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.1	OP.1	OP.1
PRACH configuration			FR2 PRACH configuration 1	FR2 PRACH configuration 1	FR2 PRACH configuration 1
N_{oc} Note 3	Config 1	dBm/SCS	-89.41	-89.41	-89.41
PRS $\hat{E}_s/N_{oc}$	Config 1	dB	-4.84	-11.02	-11.02
Io	Config 1	dBm/ 19.08MHz	-55.66	-55.66	-55.66
PRS $\hat{E}_s/I_{ot}$		dB	-5.7	-12.7	-12.7
PRS-RSRP		dBm/SCS	-94.2	-100.4	-100.4
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cells (all, except Cell 3 in T3) are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
Note 2: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

The RSTD measurement time fulfils the requirements specified in clause 14.4.3.3.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 14.4.3.3 starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in TS 38.133[50] Clause 10.1.23.3, i.e., between RSTD_0000000 and RSTD_1970049.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period. The RSTD measurement period follows the equation:

$$T_{RSTD,i} = \left(K_{carrier_{PRS}} * N_{Rx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil * \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{Rx,TEG,i} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 3$, $L_{available_PRS,i} = 0.035$, $N_{sample} = 4$. N is the parameter *durationOfPRS-ProcessingSymbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive* from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$, where Tprs = 160 ms, and T_{DRX}= 640ms depending on UE capabilities. Therefore, $T_{available_PRS,i} = 640$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{3}{N'} \right\rceil \left\lceil \frac{0.035}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 20.488s and 123.52s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.4.3.4.3-9. The LPP time IE ranges between 21s and 124s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 21.3s and 124.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 14.4.3.5-4, Table 14.4.3.5-5 and Table 14.4.3.5-6 for reference.

Table 14.4.3.5-4: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive*

maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive	$\left\lceil \frac{3}{N'} \right\rceil$
n1	3
n2	2
>=n4	1

Table 14.4.3.5-5: value of N based on *durationOfPRS-ProcessingSymbols*

durationOfPRS-ProcessingSymbols	$\left\lceil \frac{0.035}{N} \right\rceil$
>= nDot025	1

Table 14.4.3.5-6: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	**T_{effect}**	**T_{last}**
n8	640	648
n16	640	656
n20	640	660
n30	640	670
n40	640	680
n80	640	720

n160	640	800
n320	640	960
n640	640	1280
n1280	1280	1920

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.e

14.4.4 NR RSTD measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

14.4.4.1 Test purpose

The purpose of the test is to verify that the RSTD measurement meets the requirements specified in TS 38.133 [50] Clause 5.6.2 in an environment with AWGN propagation conditions in FR2 in standalone scenario when single positioning frequency layer is configured.

14.4.4.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning, DL-PRS measurement in RRC_INACTIVE and reduced number of samples for PRS measurement in RRC_INACTIVE state.

14.4.4.3 Minimum conformance requirements

Same as in clause 14.4.3.3.

14.4.4.4 Test description

The supported test configurations in listed in Table 14.4.4.4-1

Table 14.4.4.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

14.4.4.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.4.4.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.

2. The general test parameter settings are set up according to Table 14.4.4.5-1, Table 14.4.4.5-2 and Table 14.4.4.5-3.

3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.4.4.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the RSTD reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR2.

14.4.4.4.2 Test procedure

Same as in clause 14.4.3.4.2.

14.4.4.4.3 Message contents

As defined in clause 14.4.3.4.3, with the following exceptions:

Table 14.4.4.4.3-1 replaces Table 14.4.3.4.3-7 and Table 14.4.4.4.3-2 replaces Table 14.4.3.4.3-9.

14.4.4.5 Test requirement

Table 14.4.4.5-1, Table 14.4.4.5-2 and Table 14.4.4.5-3 define the primary level settings including test tolerances for the test.Table 14.4.4.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [57] and TS 37.355 [49]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
SSB configuration	Config 1		SSB.2 FR2	
SMTC configuration	Config 1		SMTC.1	
Initial BWP configuration	Config 1		DLBWP.0.1 ULBWP.0.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	

RMSI CORESET RMC configuration	Config 1		CR.3.1 TDD	As specified in TS 38.133 [50] clause A.3.1.2.1
Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
PRS Configuration	Config 1		PRS.1.2 FR2	As specified in TS 38.133 [50] clause A.3. 31.
PRS Resource slot offset	Config 1	slots	Cell 1, 2, 3: 0	
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX cycle length		s	0.64	
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			4	Including the reference cell
PRS muting info			Cell 1: ‘10’ Cell 2: ‘01’ Cell 3: ‘10’	Correponds to prs-MutingInfo defined in TS 37.355 [49]
PRS resource RE offset			Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1		s	3	The length of the time interval from the beginning of each test
T2		s	32	The length of the time interval that follows immediately after time interval T1
AoA setup			Setup 1	As defined in TS 38.133 [50] A.3.15.1
Beam assumption			Rough	Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

Table 14.4.4.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter	Unit	Cell 1	Cell 2	Cell 3
NR RF Channel Number		1	1	1
Positiong frequency layer		1	1	1

Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.1	N/A	N/A
N_{oc} Note 3	Config 1	dBm/SCS	-89		
PRS $\hat{E}_s/N_{oc}$		dB	-Infinity	-Infinity	-Infinity
Io Note 4	Config 1	dBm/ 190.08MHz	-54.00	-54.00	-54.00
SSB RP Note4	Config 1	dBm/SCS	-89	-Infinity	-Infinity
$\hat{E}_s/N_{oc}$		dB	0	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.

Table 14.4.4.5-3: Cell-specific test parameters for RSTD measurement reporting delay during T2

Parameter		Unit	Cell 1	Cell 2	Cell 3
			T2	T2	T2
RF Channel Number			1	1	1
Positiong frequency layer			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1			OP.1	OP.1	OP.1
PRACH configuration			FR2 PRACH configuration 1	FR2 PRACH configuration 1	FR2 PRACH configuration 1
N_{oc} Note 3	Config 1	dBm/SCS	-95	-95	-95
PRS $\hat{E}_s/N_{oc}$	Config 1	dB	2.9	0.75	0.75
Io Note 4	Config 1	dBm/ 190.08MHz	-55.71	-55.71	-55.71
PRS $\hat{E}_s/I_{ot}$		dB	-2.7	-5.6	-5.6
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that all active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols, except for slots where PRS is transmitted by any of the cells.
Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: Io levels apply only for symbols where PRS is transmitted.

The RSTD measurement time fulfils the requirements specified in clause 14.4.4.3.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 14.4.4.3 starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in TS 38.133[50] Clause 10.1.23.3, i.e., between RSTD_0000000 and RSTD_1970049.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the RSTD measurement period. The RSTD measurement period follows the equation:

$$T_{RSTD,i} = \left(K_{carrier_{PRS}} * N_{Rx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil * \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{Rx,TEG,i} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 3$, $L_{available_PRS,i} = 0.035$, $N_{sample} = 1$. N is the parameter *durationOfPRS-ProcessingSymbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive* from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$, where Tprs = 160 ms, and T_{DRX}= 640ms depending on UE capabilities. Therefore, $T_{available_PRS,i} = 640$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{3}{N'} \right\rceil \left\lceil \frac{0.035}{N} \right\rceil * 1 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 5.128s and 31.36s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 32s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 32.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 14.4.4.5-4, Table 14.4.4.5-5 and Table 14.4.4.5-6 for reference.

Table 14.4.4.5-4: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive*

maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive	$\left\lceil \frac{3}{N'} \right\rceil$
n1	3
n2	2

durationOfPRS-ProcessingSymbols	$\left\lceil \frac{0.035}{N} \right\rceil$
>= nDot125	1

Table 14.4.4.5-6: value of T_{effect} and T_{last} based on *durationOfPRS-ProcessingSymbolsInEveryTms*

durationOfPRS-ProcessingSymbolsInEveryTms	T_{effect}	T_{last}
n8	640	648
n16	640	656
n20	640	660
n30	640	670

n40	640	680
n80	640	720
n160	640	800
n320	640	960
n640	640	1280
n1280	1280	1920

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.4.5 NR RSTD measurement reporting delay test case for PRS aggregation in FR1 SA in RRC_INACTIVE state

Editor's Note: This test case has been completed for the following aspects:

- Test requirement and MU/TT are not complete

14.4.5.1 Test purpose

The purpose of the test is to verify that the RSTD measurement with PRS aggregation in RRC_INACTIVE state meets the requirements specified in TS 38.133[50] clause 5.6.2.6 in AWGN propagation condition in FR1 in standalone scenario when two intra-band contiguous positioning frequency layers (PFL) are configured.

14.4.5.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports DL-TDOA positioning and *supportOfDL-PRS-BWA-RRC-Inactive-r18*.

14.4.5.3 Minimum conformance requirements

The requirements in this clause apply provided that UE receives requests from LMF to perform PRS measurement on aggregated positioning frequency layers (PFLs) via *nr-DL-PRS-JointMeasurementRequestedPFL-List [49]*.

After receiving both *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [49], the UE shall be able to measure multiple (up to the UE capability specified in TS 38.133[50] clause 5.6.2.3) DL RSTD measurements, defined in TS 38.215 [57], during the measurement period $T_{RSTD,Total}$ defined as:

$$T_{RSTD,total} = T_{RSTD,aggr} + T_{RSTD,non-aggr} + T_{margin}$$

Where:

- $T_{RSTD,aggr}$ is the total measurement period for aggregated measurements as defined in this clause, and
- $T_{RSTD,non-aggr}$ is the total measurement period for non-aggregated measurements as defined in this clause, and
- When both $T_{RSTD,aggr}$ and $T_{RSTD,non-aggr}$ are non-zero, then $T_{margin} = T'_{margin}$; otherwise $T_{margin} = 0$, where $T'_{margin} = \max(T_{effect,j})$, andthe maximum $T_{effect,j}$ is across all the PFL combination(s) and non-aggregated PFL(s) configured for positioning measurements.

$T_{RSTD,non-aggr}$ is zero if every resource set on every PFL is linked for aggregation to at least one other resource set on another PFL. Otherwise, $T_{RSTD,non-aggr}$ is as defined in clause 5.6.2.5 with the following exceptions,

- only PFLs containing resource set(s) not linked to any other resource set(s) are considered in L,
- on each PFL i, only resource set(s) not linked to any other resource set(s) are considered in $T_{available_PRS,i}$, $N^{slot}_{PRS,i}$ and $L_{available_PRS,i}$,

- N_{sample} = 2 if the UE supports the capability of positioning measurements with reduced number of samples as indicated by *supportedDL-PRS-ProcessingSamples-RRC-Inactive* specified in TS 37.355 [49], and the LMF requests the UE to perform positioning measurements with reduced number of samples,

- $(\mathrm{L}-1)*\max(\mathrm{T}_{\mathrm{effect,i}})$ is replace by $(\mathrm{L}-1)*\mathrm{T}'_{\mathrm{margin}}$.

$\mathrm{T}_{\mathrm{RSTD,aggr}}$ is zero if no resource sets on any PFL are linked for aggregation with other resource sets on other PFLs. Otherwise, $\mathrm{T}_{\mathrm{RSTD,aggr}}$ is defined as

$$\mathrm{T}_{\mathrm{RSTD,aggr}} = \sum_{m=1}^{M} \mathrm{T}_{\mathrm{RSTD,aggr,m}} + (\mathrm{M}-1)*\mathrm{T}'_{\mathrm{margin}} \quad ,$$

where:

- m is the index of PFL combination,

- M is total number of PFL combinations,

- $\mathrm{T}_{\mathrm{effect,aggr,m}}$ is the periodicity of the PRS measurement in PFL combination m as defined in this clause,

- $\mathrm{T}_{\mathrm{RSTD,aggr,m}}$ is the measurement period for PRS RSTD measurement in PFL combination m as specified below.

$$\mathrm{T}_{\mathrm{RSTD,aggr,m}} = \left(\mathrm{K}_{\mathrm{carrier,aggr}} * \mathrm{N}_{\mathrm{Rx,TEG,aggr,m}} * \mathrm{N}_{\mathrm{RxBeam,aggr,m}} * \left\lceil \frac{\mathrm{N}^{\mathrm{slot}}_{\mathrm{PRS,aggr,m}}}{\mathrm{N}'_{\mathrm{aggr,m}}} \right\rceil * \left\lceil \frac{\mathrm{L}_{\mathrm{available_{PRS},aggr,m}}}{\mathrm{N}_{\mathrm{aggr,m}}} \right\rceil * \mathrm{N}_{\mathrm{sample}} - 1\right) * \mathrm{T}_{\mathrm{effect,aggr,m}} + \mathrm{T}_{\mathrm{last,aggr,m}} \ ,$$

where:

- $\mathrm{K}_{\mathrm{carrier,aggr}}$ is a scaling factor for PRS measurements in RRC_INACTIVE,

  - $\mathrm{K}_{\mathrm{carrier,aggr}} = 1$ if the UE supports *parallelPRS-MeasRRC-Inactive-r17*,

  - Otherwise,

    - If Srxlev $\leq \mathrm{S}_{\mathrm{nonIntraSearchP}}$ or Squal $\leq \mathrm{S}_{\mathrm{nonIntraSearchQ}}$, $\mathrm{K}_{\mathrm{carrier,aggr}} = K_{\mathrm{carrier}} + 1$, where K_{carrier} is defined in clause 4.2.2.4

    - If Srxlev > $\mathrm{S}_{\mathrm{nonIntraSearchP}}$ and Squal > $\mathrm{S}_{\mathrm{nonIntraSearchQ}}$, $\mathrm{K}_{\mathrm{carrier,aggr}} = N_{\mathrm{layers}} + 1$, where N_{layers} is defined in clause 4.2.2.7.

  - $\mathrm{N}_{\mathrm{Rx,TEG,aggr,m}}$ is a scaling factor for PRS measurements with multiple Rx TEGs

    - $\mathrm{N}_{\mathrm{Rx,TEG,aggr,m}}$ =1 if the UE is not configured by the LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49].

    - $\mathrm{N}_{\mathrm{Rx,TEG,aggr,m}}$ is defined as follows if the UE is configured by the LMF with *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] to perform measurement on same DL PRS resource of a TRP using different Rx TEGs in *NR-DL-TDOA-RequestLocationInformation* [49]:

      - $N_{Rx,TEG,i} = P$, if the UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, where P is the number of UE Rx TEGs that the UE is requested by LMF to measure the same DL-PRS Resource of a TRP indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* in [34], and in case 'n0' is indicated, P is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*.

      - $N_{Rx,TEG,i} = \left\lceil \frac{P}{Q} \right\rceil$, if the UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs, where Q is the number of UE Rx TEGs for measuring the same DL-PRS Resource simultaneously indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul-r17* in [34].

  - $\mathrm{N}_{\mathrm{RxBeam,aggr,m}}$ is a scaling factor for PRS measurements with multiple Rx beams, and is defined as

    - $\mathrm{N}_{\mathrm{RxBeam,aggr,m}}$ = 1 if PFL combination m is in FR1,

- $N_{RxBeam,aggr,m}$ is defined as follows if PFL combination *m* is in FR2
  - $N_{RxBeam,aggr,m}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing PFL combination *m*, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*,
  - $N_{RxBeam,aggr,m}$ equals to 8 otherwise

- $N^{slot}_{PRS,aggr,m}$ is the maximum number of DL PRS resources in PFL combination *m* configured in a slot, and only the PRS resources in resource set(s) linked to other resource set in PFL combination *m* are counted

- $N'_{aggr,m}$ is the UE capability on maximum number of DL PRS resources that can be processed in a slot for PFL combination *m* as indicated by *maxNumOfAggregatedDL-PRS-ResourcePerSlot-FR1-r18* for FR1 and *maxNumOfAggregatedDL-PRS-ResourcePerSlot-FR2-r18* for FR2 specified in TS 37.355 [34].

- $L_{available_{PRS},aggr,m}$ is the time duration of available PRS resources in PFL combination *m* to be measured during $T_{PRS,aggr,m}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{available_{PRS},aggr,m}$, only unmuted PRS resources in resource set(s) linked to other resource set in PFL combination *m* and that are not fully overlapped with other higher-priority DL signals/channels are considered.

- $N_{aggr,m}$ is the UE capability on duration of DL PRS resources in ms for PFL combination *m* as indicated by *prs-durationOfTwoPRS-BWA-ProcessingSymbolsN-r18* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsN-r18* specified in TS 37.355 [49].

- N_{sample} is number of PRS measurement samples,
  - N_{sample} = 2 if the UE supports the capability of positioning measurements with reduced number of samples as indicated by *reducedNumOfSampleInMeasurementWithPRS-BWA-RRC-IdleAndInactive* specified in TS 37.355 [49], and the LMF requests the UE to perform positioning measurements with reduced number of samples,
  - N_{sample} = 4 otherwise.

- $T_{effect,aggr,m}$ is the periodicity of the PRS measurement in PFL combination m,

$$T_{effect,aggr,m} = \left\lceil \frac{T_{aggr,m}}{T_{available,PRS,aggr,m}} \right\rceil * T_{available,PRS,aggr,m}$$

  - $T_{aggr,m}$ is the UE capability on time for processing of DL PRS resources in ms for PFL combination *m* as indicated by *prs-durationOfTwoPRS-BWA-ProcessingSymbolsT-r18* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsT* specified in TS 37.355 [49].
  - $T_{available,PRS,aggr,m} = LCM(T_{PRS,aggr,m}, T_{DRX})$, the least common multiple between $T_{PRS,aggr,m}$ and the DRX cycle length T_{DRX}, where $T_{PRS,aggr,m}$ is the periodicity of DL PRS resource with muting on PFL combination m.
    - If more than one PRS periodicities are configured in PFL combination m, the least common multiple of PRS periodicities $T_{per}^{\text{PRS with muting}}$ among all DL PRS resource sets that are linked to other resource set in PFL combination m, is used to derive $T_{PRS,aggr,m}$, and for each applicable PRS resource set,
      - $T_{per}^{\text{PRS with muting}} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource, and
      - T_{per}^{PRS} is the periodicity of PRS resource set given by the higher-layer parameter *DL-PRS-Periodicity*, and
      - N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

- $T_{last,aggr,m}$ is the measurement duration for the last PRS sample in PFL combination m, including the sampling time and processing time, $T_{last,aggr,m} = T_{aggr,m} + T_{available,PRS,aggr,m}$.

The requirements in this clause for aggregated measurements apply provided that the linked PRS resource sets on multiple PFLs for aggregated measurements are transmitted by the TRP using single Tx chain as defined in clause 5.1.6.5.3 in TS 38.214 [26].

If PRS resources in one or more of the aggregated PFLs in PFL combination m are dropped because of collision with other signals, $T_{RSTD,aggr,m}$ can be longer than specified above.

The time $T_{RSTD,Total}$ starts from the first DRX cycle containing the DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

NOTE: No separate requirement on non-aggregated measurement based on $T_{RSTD,non-aggr}$ or on aggregated measurement based on $T_{RSTD,aggr}$ is applied when both $T_{RSTD,aggr}$ and $T_{RSTD,non-aggr}$ are non-zero.

If the DRX cycle is reconfigured during the RSTD measurement period, then the measurement period can be longer.

When PRS-RSRP is configured for DL-TDOA, RSTD and PRS-RSRP are performed over the same measurement period. When PRS-RSRPP is configured for DL-TDOA, RSTD and PRS-RSRPP are performed over the same measurement period.

The measurement requirements do not apply to any PRS resource that always collides with other higher-priority DL signals/channels, as specified in TS 38.133[50] clause 5.6.1.

Longer RSTD measurement period is expected when there are collisions between PRS resources and other higher-priority DL signals/channels.

If $K_{carrier_PRS}$ changes for any PFL or any PFL combination during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in TS 38.133[50] clause 5.6.2 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If cell re-selection occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements after the cell selection is completed. The RSTD measurement period can be longer.

If the RRC state transition occurs from RRC_INACTIVE to RRC_CONNECTED state during the RSTD measurement period, then the UE shall continue the RSTD measurement in the RRC_CONNECTED state. The RSTD measurement period can be longer.

The UE shall meet the RSTD measurement accuracy requirements in TS 38.133[50] clause 10.1.23A.2.

The normative reference for this requirement is TS 38.133 [50] clause 5.6.2.6.

14.4.5.4 Test description

14.4.5.4.1 Initial conditions

The supported test configuration is listed in Table 14.4.5.4.1-1.

Table 14.4.5.4.1-1: Supported test configurations

Configuration	Description

1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.4.5.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.16.
2. The general test parameter settings are set up according to Table 14.4.5.5-1, Table 14.4.5.5-2 and Table 14.4.5.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.4.5.4.3.
5. In the test there are 6 synchronous cells in the test: Cell 1, Cell 2, Cell 3 Cell 4, Cell 5 and Cell 6. Cell 1 is the PCell on NR RF channel 1 in FR1. Cell 2 and Cell 3 are neighbour cells on the same RF channel as Cell 1. Cell 4, Cell 5 and Cell 6 are the neighbour cells on a different NR RF channel, i.e., RF channel 2, in FR1.

14.4.5.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2, Cell 3, Cell 4, Cell 5 and Cell 6. During T2 UE shall be in RRC_INACTIVE state and all 6 cells transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The *NR-DL-TDOA-ProvideAssistanceData* and *nr-DL-TDOA-RequestLocationInformation* as defined in TS 37.355 [49], clause 6.5.12.1, shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE ΔT ms before the start of T2, where $\Delta T = 50$ ms is the maximum processing time of the *DL-TDOA assistance* data and location information request.

The beginning of the time interval T2 shall be aligned with the first DRX cycle containing a DL PRS resource(s).

The UE is configured with DRX cycle of 1.28s.

0. Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 14.4.5.4.3-0.
1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.4.5.5-1, Table 14.4.5.5-2 and Table 14.4.5.5-3. Propagation conditions are set according to clause 4.15.2.
4. T1 starts.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
6. The UE shall transmit RRCReconfigurationComplete message
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE such that the UE receives the message ΔT ms before the start of T2, where $\Delta T = 50$

ms. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *nr-DL-PRS-JointMeasurementRequestedPFL-List* in the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.

11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message

12. When T1 expires, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and switch the power setting from T1 to T2 as specified in Table 14.4.5.5-2 and Table 14.4.5.5-3.

13. Wait for the UE monitors for occurrence of the periodic event requested

14. The UE shall transmit an RRCResumeRequest message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the RRCResumeRequest message and then go to step 17

15. The SS transmits an RRCResume message.

16. The UE transmits an RRCResumeComplete message

17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3). The UE shall perform and report the RSTD measurements by aggregating PRS resources from multiple PFLs for Cell 2 and Cell 5, Cell 3 and Cell 6 respectively with respect to the Cell 1 and Cell 4 from which the transmitted PRS resources are also aggregated in the DL-TDOA assistance data.

If the UE transmits an *NR-DL-TDOA-ProvideLocationInformation* IE including the nr-RSTD field for Cell 2 and Cell 5, Cell 3 and Cell 6 respectively within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-TDOA-ProvideLocationInformation* IE with both the nr-RSTD fields included within the response time then the number of failure tests is increased by one.

18. If the UE message at step 17 includes the ackRequested IE set to TRUE, the SS shall send a LPP acknowledgement message.

19. Repeat steps 2-18 in Table 14.4.5.4.1-1 until the confidence level according to Annex D is achieved.

14.4.5.5 Test requirement

Table 14.4.5.5-1 to Table 14.4.5.5-3 defines the primary level settings including test tolerances for the test.

Table 14.4.5.5-1: General test parameters for RSTD measurement with PRS aggregation reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1, Cell 4	Reference cells are the cells in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [57] and TS 37.355 [49]. The reference cell 1 is the PCell in this test case.
Neighbor cells			Cell 2, Cell 3, Cell 4, Cell 5 and Cell 6	Cell 2, Cell 3, Cell 4, Cell 5 and Cell 6 appear at the first, second, third, fourth and fifth places in the neighbour cell list in the DL-TDOA assistance data.
SSB configuration	Config 1		SSB.1 FR1	
	Config 2		SSB.1 FR1	
	Config 3		SSB.2 FR1	
SMTC configuration	Config 1		SMTC.2	
	Config 2		SMTC.1	
	Config 3		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
	Config 2		SR.1.1 TDD	
	Config 3		SR.2.1 TDD	
RMSI CORESET RMC configuration	Config 1		CR.1.1 FDD	As specified in TS 38.133 [50] clause A.3.1.2.1
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
Initial BWP configuration	Config 1,2,3		DLBWP.0.1 ULBWP.0.1	
Active UL BWP configuration	Config 1,2,3		ULBWP.1.1	
PRS Configuration	Config 1		PRS.1.1 FR1	As specified in TS 38.133 [50] clause A.3.31
	Config 2		PRS.1.2 FR1	
	Config 3		PRS.2.1 FR1	
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0 and (PCI of Cell 1 – PCI of Cell 4)mod6=0 and (PCI of Cell 1 – PCI of Cell 5)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by then test parameters

		and (PCI of Cell 1 – PCI of Cell 6)mod6=0	
CP length		Normal	
DRX	s	1.28	
Radio frame receive time offset between the cells at the UE antenna connector	µs	Cell 2, Cell 4, Cell 5 to Cell 1: 0 Cell 3, Cell 6 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD	µs	Cell 2 to Cell 6: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells	µs	5	The corresponding parameter in the DL-TDOA assistance ta specified in TS 37.355 [49] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data		6	Including the reference cells
PRS muting info		Cell 1, Cell 4: ‘10’ Cell 2, Cell 5: ‘01’ Cell 3, Cell 6: ‘10’	Correponds to prs-MutingInfo defined in TS 37.355 [49]
PRS resource RE offset		Cell 1, Cell 4: 0 Cell 2, Cell 5: 0 Cell 3, Cell 6: 1	Cell 1, Cell 2, Cell 3, Cell 4, Cell 5 and Cell 6
T1	s	3	The length of the time interval from the beginning of each test
T2	s	5	The length of the time interval that follows immediately after time interval T1.

Table 14.4.5.5-2: Cell-specific test parameters for RSTD measurement with PRS aggregation reporting delay during T1

Parameter		Unit	Cell 1, Cell 4	Cell 2, Cell 5	Cell 3, Cell 6

	Config 2	dBm/SCS	-88	-Infinity	-Infinity
	Config 3	dBm/SCS	-85	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.
Note 5: The values are defined separately for the cells from which the transmitted PRS resources are aggregated.

Table 14.4.5.5-3: Cell-specific test parameters for RSTD measurement with PRS aggregation reporting delay during T2

Parameter		Unit	Cell 1, Cell 4	Cell 2, Cell 5	Cell 3, Cell 6
			T2	T2	T2

PRS $\hat{E}_s/I_{ot}$ Note 4		dB	-6 + TT	-13 + TT	-13 + TT
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
Note 2: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: The values are defined separately for the cells from which the transmitted PRS resources are aggregated.

The RSTD measurement time with PRS aggregation in RRC_INACTIVE state fulfils the requirements specified in clause 14.4.5.3.

The UE shall perform and report the RSTD measurements by aggregating PRS resources from Cell 2 and Cell 5, Cell 3 and Cell 6 respectively with respect to the Cell 1 and Cell 4 from which the transmitted PRS resources are also aggregated, within the time duration specified in section 5.6.2.6 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be higher than the time duration above because of the uncertainty in acquiring the first available PRACH occasion to transition to RRC_CONNECTED state to report the measurements.

The rate of the correct events observed during repeated tests shall be at least 90%, where the reported RSTD measurement with PRS aggregation for each correct event shall be within the RSTD reporting range specified in TS 38.133 [50] clause 10.1.23A.3.

14.4.6 NR RSTD measurement reporting delay test case for PRS aggregation in FR2 SA in RRC_INACTIVE state

Editor's Note: This test case has been completed for the following aspects:

- Test requirement and MU/TT are not complete

14.4.6.1 Test purpose

The purpose of the test is to verify that the RSTD measurement with PRS aggregation in RRC_INACTIVE state meets the requirements specified in TS 38.133 [50] clause 5.6.2.6 in AWGN propagation condition in FR2 in standalone scenario when two intra-band contiguous positioning frequency layers (PFL) are configured.

14.4.6.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports DL-TDOA positioning and *supportOfDL-PRS-BWA-RRC-Inactive-r18*.

14.4.6.3 Minimum conformance requirements

Same as in clause 14.4.5.3.

14.4.6.4 Test description

14.4.6.4.1 Initial conditions

The supported test configuration is listed in Table 14.4.6.4.1-1.

Table 14.4.6.4.1-1: Supported test configurations

Configuration	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.4.6.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.4.6.5-1, Table 14.4.6.5-2 and Table 14.4.6.5-3.
3. Propagation conditions are set according to clause 4.15.2.

4. Message contents are defined in clause 14.4.6.4.3.

5. In the test there are 6 synchronous cells in the test: Cell 1, Cell 2, Cell 3 Cell 4, Cell 5 and Cell 6. Cell 1 is the PCell on NR RF channel 1 in FR2. Cell 2 and Cell 3 are neighbour cells on the same RF channel as Cell 1. Cell 4, Cell 5 and Cell 6 are the neighbour cells on a different NR RF channel, i.e., RF channel 2, in FR2.

14.4.6.4.2 Test procedure

Same test procedure as defined in clause 14.4.5.4.2 with following exceptions:

Table 14.4.6.4.1-1 replaces Table 14.4.5.4.1-1; Table 14.4.6.5-1 replaces 14.4.5.5-1; Table 14.4.6.5-2 repalces Table 14.4.5.5-2; Table 14.4.6.5-3 replaces Table 14.4.5.5-3.

14.4.6.4.3 Message contents

Same message contents as defined in clause 14.4.5.4.3, with the following exceptions:

Table 14.4.6.4.3-0 replaces Table 14.4.5.4.3-4; Table 14.4.6.4.3-1 replaces Table 14.4.5.4.3-6; Table 14.4.6.4.3-2 replaces Table 14.4.5.4.3-7; Table 14.4.6.4.3-3 replacesTable 14.4.5.4.3-9.

14.4.6.5 Test requirement

Table 14.4.6.5-1 to Table 14.4.6.5-3 defines the primary level settings including test tolerances for the test.

Table 14.4.6.5-1: General test parameters for RSTD measurement with PRS aggregation reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1, Cell 4	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [57] and TS 37.355 [49]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2, Cell 3, Cell 4, Cell 5 and Cell 6	Cell 2, Cell 3, Cell 4, Cell 5 and Cell 6 appear at the first, second, third, fourth and fifth places in the neighbour cell list in the DL-TDOA assistance data.
$BW_{channel}$		MHz	200: $N_{RB,c}$ = 132	
SSB configuration	Config 1		SSB.2 FR2	
SMTC configuration	Config 1		SMTC.1	

PDSCH RMC configuration	Config 1		SR.1.1 FDD	
RMSI CORESET RMC configuration	Config 1		CR.3.1 TDD	As specified in TS 38.133 [50] clause A.3.1.2.1
Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
PRS Configuration	Config 1		PRS.1.4. FR2	As specified in TS 38.133 [50]clause A.3. 31
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0 and (PCI of Cell 1 – PCI of Cell 4)mod6=0 and (PCI of Cell 1 – PCI of Cell 5)mod6=0 and (PCI of Cell 1 – PCI of Cell 6)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX		s	0.64	
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2, Cell 4, Cell 5 to Cell 1: 0 Cell 3, Cell 6 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2 to 6: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			6	Including the reference cells
PRS muting info			Cell 1, Cell 4: ‘10’ Cell 2, Cell 5: ‘01’ Cell 3, Cell 6: ‘10’	Correponds to prs-MutingInfo defined in TS 37.355 [49]
PRS resource RE offset			Cell 1, Cell 4: 0 Cell 2, Cell 5: 0 Cell 3, Cell 6: 1	
T1		s	3	The length of the time interval from the beginning of each test
T2		s	1.28	The length of the time interval that follows immediately after time interval T1
AoA setup			Setup 1	As defined in TS 38.133 [50]A.3.15.1
Beam assumption			Rough	Information about types of UE beam is given in TS 38.133 [50]clause B.2.1.3, and does not limit UE implementation or test system implementation

Table 14.4.6.5-2: Cell-specific test parameters for RSTD measurement with PRS aggregation reporting delay during T1

Parameter		Unit	Cell 1, Cell 4	Cell 2, Cell 5	Cell 3, Cell 6
NR RF Channel Number			1, 2	1, 2	1, 2
Positiong frequency layer			PFL 1, 2	PFL 1, 2	PFL 1, 2
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in A.3.2.1 Note 1			OP.5 FDD	N/A	N/A
N_{oc} Note 3, 5	Config 1	dBm/SCS	-89		
PRS $\hat{E}_s/N_{oc}$ Note 5		dB	-Infinity	-Infinity	-Infinity
Io Note 4, 5	Config 1	dBm/ 190.08MHz	-54.00	-54.00	-54.00
SSB RP Note4, 5	Config 1	dBm/SCS	-89	-Infinity	-Infinity
$\hat{E}_s/N_{oc}$ Note 5		dB	0	-Infinity	-Infinity
Propagation Condition			AWGN		

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.
Note 5: The values are defined separately for the cells from which the transmitted PRS resources are aggregated.

Table 14.4.6.5-3: Cell-specific test parameters for RSTD measurement with PRS aggregation reporting delay during T2

Parameter		Unit	Cell 1, Cell 4	Cell 2, Cell 5	Cell 3, Cell 6
			T2	T2	T2
RF Channel Number			1, 2	1, 2	1, 2
Positiong frequency layer			PFL 1, 2	PFL 1, 2	PFL 1, 2
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low
OCNG patterns defined in TS 38.133 [50] A.3.2.1			OP.1	OP.1	OP.1
PRACH configuration			FR2 PRACH configuration 1	FR2 PRACH configuration 1	FR2 PRACH configuration 1
N_{oc} Note 3, 4	Config 1	dBm/SCS	-89 + TT	-89 + TT	-89 + TT
PRS $\hat{E}_s/N_{oc}$ Note 4	Config 1	dB	-5.44 + TT	-11.67 + TT	-11.67 + TT
Io Note 4	Config 1	dBm/ 19.08MHz	-55.48 + TT	-55.48 + TT	-55.48 + TT

PRS $\hat{E}_s/I_{ot}$ Note 4	dB	-6 + TT	-13 + TT	-13 + TT
Propagation Condition		AWGN		

Note 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
Note 2: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.
Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 4: The values are defined separately for the cells from which the transmitted PRS resources are aggregated.

14.4.7 NR RSTD measurement reporting delay test case in FR1 for Redcap UE without Rx FH

Editor's Note: This test case is incomplete in following aspects:

- TT analysis is missing.

14.4.7.1 Test purpose

The purpose of the test is to verify that the RSTD measurement for RedCap UE without FH in RRC INACTIVE state meets the requirements specified in TS 38.331 [50] clause 5.6A.4.5 in an environment with AWGN propagation conditions in FR1 in standalone scenario when single positioning frequency layer is configured.

14.4.7.2 Test applicability

This test applies to NR FR1 RedCap UEs release 18 onwards that support DL-TDOA positioning.

14.4.7.3 Minimum conformance requirements

After receiving both *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [34], and UE is not configured to perform measurement with RX FH, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6A.4.3) DL RSTD measurements, defined in TS 38.215 [57], during the measurement period $T_{RSTD,Total}$ defined as:

$$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD,i} + (L-1) \times \max(T_{effect,i})$$

Where:

- i is the index of positioning frequency layer,
- L is total number of positioning frequency layers, and
- $T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i

$T_{RSTD,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer i as specified below:

$$T_{RSTD,i} = \left(K_{carrier_PRS_RedCap} \times N_{Rx,TEG,i} \times N_{RxBeam,i} \times \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \times \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil \times N_{sample} - 1\right) \times T_{effect,i} + T_{last,i},$$

Where:

- $N_{RxBeam,i}$ is the UE Rx beam sweeping factor:
  - $N_{RxBeam,i}$ = 1 if positioning frequency layer i is in FR1 or UE has only 1Rx branch,

- $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2*, if positioning frequency layer *i* is in FR2 or the UE has 2Rx branches, and the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*.

- $N_{RxBeam,i}$ equals to 8, otherwise.

- $K_{\text{carrier_PRS_RedCap}}$ is a scaling factor for PRS-based NR positioning measurements in RRC_INACTIVE. If the UE supports *parallelPRS-MeasRRC-Inactive-r17*, $K_{\text{carrier_PRS_RedCap}}$ = 1; otherwise,

  - If Srxlev ≤ $S_{\text{nonIntraSearchP}}$ or Squal ≤ $S_{\text{nonIntraSearchQ}}$, $K_{\text{carrier_PRS_RedCap}} = K_{\text{carrier_RedCap}} + 1$, where $K_{\text{carrier_RedCap}}$ is defined in clause 4.2B.2.4

  - If Srxlev > $S_{\text{nonIntraSearchP}}$ and Squal > $S_{\text{nonIntraSearchQ}}$, $K_{\text{carrier_PRS_RedCap}} = N_{\text{layers}} + 1$, where N_{layers} is defined in TS 38.133 [50] clause 4.2.2.7.

- $N_{Rx,TEG,i}$ is the Rx TEG specific scaling factor:

  - $N_{Rx,TEG,i}$ =1 if the UE is not configured by the LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49].

  - $N_{Rx,TEG,i}$ is defined as follows if the UE is configured by the LMF with *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] to perform measurement on same DL PRS resource of a TRP using different Rx TEGs in *NR-DL-TDOA-RequestLocationInformation* [49]:

    - $N_{Rx,TEG,i} = P$, if the UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, where P is the number of UE Rx TEGs that the UE is requested by LMF to measure the same DL-PRS Resource of a TRP indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* in [34], and in case 'n0' is indicated, P is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*.

    - $N_{Rx,TEG,i} = \left\lfloor \frac{P}{Q} \right\rfloor$, if the UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs, where Q is the number of UE Rx TEGs for measuring the same DL-PRS Resource simultaneously indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul-r17* in [49].

- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.

- $L_{available_PRS,\text{i}}$ is the time duration of available PRS in positioning frequency layer *i* to be measured $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,\text{i}}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.

- N_{sample} is the number of PRS RSTD samples, where

  - N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [49], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 4 otherwise.

- $T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time, $T_{\mathrm{last,i}} = T_{\mathrm{i}} + T_{available_PRS,\mathrm{i}}$,

- $T_{\mathrm{effect},i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{\mathrm{effect,i}} = \left\lceil \frac{T_{\mathrm{i}}}{T_{available_PRS,\mathrm{i}}} \right\rceil \times T_{available_PRS,\mathrm{i}}$$

where:

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [49],

- $T_{available_PRS,\mathrm{i}} = LCM(T_{PRS,\mathrm{i}}, T_{DRX})$, the least common multiple between $T_{PRS,\mathrm{i}}$ and the DRX cycle length T_{DRX}

  - When UE is configured with RAN eDRX_INACTIVE ≤ 10.24 s:

    T_{DRX} is calculated as T defined in TS 38.304 [1] when CN eDRX_INACTIVE ≤ 10.24 s.

    T_{DRX} is calculated as max(T_{inside}, $T_{outside}$), where T_{inside} and $T_{outside}$ of the CN PTW as defined in TS 38.304 [1].

  - When UE is configured with RAN eDRX_INACTIVE > 10.24 s:

    T_{DRX} is calculated as max(T_{DRX_RAN}, T_{DRX_CN}), T_{DRX_RAN} and T_{DRX_CN} are DRX cycles with the RAN PTW and CN PTW defined in TS 38.304 .

  Otherwise, T_{DRX} is the DRX cycle of the UE in the serving cell.

- $T_{PRS,\mathrm{i}}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,\mathrm{i}}$, where,

- $T_{per}^{PRS\ with\ muting} = N_{muting} \times T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

- T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} \times L_{muting}$, where

- T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

- $\{N, T\}$ is the UE capability combination per band for RRC_INACTIVE state where N is the duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [34], T (ms) corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [49], and T-N (>0) is the time required to process duration N of DL PRS symbols already buffered in memory, for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [49] .

- N' is UE capability for number of DL PRS resources that it can process in a slot in RRC_INACTIVE state as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* specified in TS 37.355 [49].

If the following conditions are met, the time $T_{\mathrm{RSTD,Total}}$ starts from the first DL PRS resource(s) instances inside a PTW after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [49].

- UE is configured with RAN eDRX > 10.24 s, and

- periodic PRS measurement reporting is configured, and

- RAN eDRX cycle is smaller or equal to the PRS measurement reporting periodicity configured via higher layer parameter *reportingInterval* in TS 37.355 [49], and

- there is one or more PRS resources occurring in PTW.

Otherwise, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) after both the *NR-DL-TDOAProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [49].

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

If the DRX cycle is reconfigured during the RSTD measurement period, then the measurement period can be longer.

If eDRX_INACTIVE cycle is reconfigured during the RSTD measurement period, then the measurement period can be longer.

When PRS-RSRP is configured for DL-TDOA, RSTD and PRS-RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA, RSTD and PRS-RSRPP are performed over the same measurement period.

The measurement requirements do not apply to any PRS resource that always collides with other higher-priority DL signals/channels, as specified in TS 38.133 [50] clause 5.6A.1.

Longer RSTD measurement period is expected when there are collisions between PRS resources and other higher-priority DL signals/channels.

If $K_{\text{carrier_PRS_RedCap}}$ changes for any PFL during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in TS 38.133 [50] clause 5.6A.4.5 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If cell re-selection occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements after the cell selection is completed. The RSTD measurement period can be longer.

If the RRC state transition occurs from RRC_INACTIVE to RRC_CONNECTED state during the RSTD measurement period, then the UE shall continue the RSTD measurement in the RRC_CONNECTED state. The RSTD measurement period can be longer.

The normative reference for this requirement is TS 38.133 [50] clause 5.6A.4.5.

14.4.7.4 Test description

14.4.7.4.1 Initial conditions

The supported test configurations are listed in

Table 14.4.7.4.1-1

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.4.7.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.12.
2. The general test parameter settings are set up according to Table 14.4.7.5-1.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.4.7.4.3.
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR1.

14.4.7.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2 and Cell 3. During T2 UE shall be in RRC_INACTIVE state and all three cells transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The *NR-DL-TDOA-ProvideAssistanceData* and *nr-DL-TDOA-RequestLocationInformation* as defined in TS 37.355 [49], clause 6.5.12.1, shall be provided to the RedCap UE during T1

The beginning of the time interval T2 shall be aligned with the first DRX cycle containing a DL PRS resource(s).

The UE is configured with DRX cycle of 1.28s.

0. Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 14.4.5.4.3-0.
1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.4.7.5-1, Table 14.4.7.5-2 and Table 14.4.7.5-3. Propagation conditions are set according to clause 4.15.2.
4. T1 starts.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
6. The UE shall transmit RRCReconfigurationComplete message
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message
12. When T1 expires, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and switch the power setting from T1 to T2 as specified in Table 14.4.7.5-3.

13. Wait for the UE monitors for occurrence of the periodic event requested

14. The UE shall transmit an RRCResumeRequest message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the RRCResumeRequest message and then go to step 17

15. The SS transmits an RRCResume message.

16. The UE transmits an RRCResumeComplete message

17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3). The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 respectively with respect to the Cell 1 from which the transmitted PRS resources are also aggregated in the DL-TDOA assistance data.

If the UE transmits an *NR-DL-TDOA-ProvideLocationInformation* IE including the nr-RSTD field for Cell 2and Cell 3 respectively within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-DL-TDOA-ProvideLocationInformation* IE with both the nr-RSTD fields included within the response time then the number of failure tests is increased by one.

18. If the UE message at step 17 includes the ackRequested IE set to TRUE, the SS shall send a LPP acknowledgement message.

19. Repeat steps 2-18 until the confidence level according to Annex D is achieved.

14.4.7.5 Test requirement

Table 14.4.7.5-1 to Table 14.4.7.5-3 defines the primary level settings including test tolerances for the test.

Table 14.4.7.5-1: General test parameters for RSTD measurement reporting delay

Parameter	Unit	Value	Comment
Reference cell		Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [57] and TS 37.355 [49]. The reference cell is the PCell in this test case.
Neighbor cells		Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.

SSB configuration	Config 1		SSB.1 FR1	
	Config 2		SSB.1 FR1	
	Config 3		SSB.1 RedCap FR1	
	Config 4		SSB.1 FR1	
SMTC configuration	Config 1		SMTC.2	
	Config 2		SMTC.1	
	Config 3		SMTC.1	
	Config 4		SMTC.2	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
	Config 2		SR.1.1 TDD	
	Config 3		SR.2.1 TDD	
	Config 4		SR.1.1 FDD	
RMSI CORESET RMC configuration	Config 1		CR.1.1 FDD	As specified in TS 38.133 [50] clause A.3.1.2
	Config 2		CR.1.1 TDD	
	Config 3		CR.2.1 TDD	
	Config 4		CR.1.1 FDD	
Dedicated CORESET RMC configuration	Config 1		CCR.1.1 FDD	
	Config 2		CCR.1.1 TDD	
	Config 3		CCR.2.1 TDD	
	Config 4		CCR.1.1 FDD	
Initial BWP configuration	Config 1,2,3,4		DLBWP.0.1 ULBWP.0.1	
Active UL BWP configuration	Config 1,2,3,4		ULBWP.1.1	
PRS Configuration	Config 1		PRS.1.1 FR1	As specified in TS 38.133 [50] clause A.3.31
	Config 2		PRS.1.1 FR1	
	Config 3		PRS.2.1 FR1	
	Config 4		PRS.1.1 FR1	
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX		s	1.28	
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance ta specified in TS 37.355 [49] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			3	Including the reference cell
PRS muting info			Cell 1: ‘10’ Cell 2: ‘01’ Cell 3: ‘10’	Correponds to prs-MutingInfo defined in TS 37.355 [49]
PRS resource RE offset			Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1		s	3	The length of the time interval from the beginning of each test
T2		s	5	The length of the time interval that follows immediately after time interval T1.

Table 14.4.7.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter		Unit	Cell 1	Cell 2	Cell 3

	Config 2	dBm/SCS	-88	-Infinity	-Infinity
	Config 3	dBm/SCS	-85	-Infinity	-Infinity
	Config 4	dBm/SCS	-88	-Infinity	-Infinity
Propagation Condition			AWGN		

NOTE 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.
NOTE 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 4: SSB RP and Io levels have been derived from other parameters and are given for information purpose. These are not settable test parameters.

Table 14.4.7.5-3: Cell-specific test parameters for RSTD measurement reporting delay during T2

Parameter		Unit	Cell 1	Cell 2	Cell 3
			T2	T2	T2
NR RF Channel Number			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low

PRS $\hat{E}_s/N_{oc}$	Config 1	dB	-5.45 + TT	-11.67 + TT	-11.67 + TT
	Config 2	dB	-5.45 + TT	-11.67 + TT	-11.67 + TT
	Config 3	dB	-5.45 + TT	-11.67 + TT	-11.67 + TT
	Config 4	dB	-5.45 + TT	-11.67 + TT	-11.67 + TT
Io Note 4	Config 1	dBm/ 9.36MHz	-68.52 + TT	-68.52 + TT	-68.52 + TT
	Config 2	dBm/ 9.36MHz	-68.52 + TT	-68.52 + TT	-68.52 + TT
	Config 3	dBm/ 18.36MHz	-65.61 + TT	-65.61 + TT	-65.61 + TT
	Config 4	dBm/ 9.36MHz	-68.52 + TT	-68.52 + TT	-68.52 + TT
PRS $\hat{E}_s/I_{ot}$		dB	-6 + TT	-13 + TT	-13 + TT
Propagation Condition			AWGN		

NOTE 1: OCNG shall be used such that active cells (all, except Cell 3 in T2) are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.

NOTE 2: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.

NOTE 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

The RSTD measurement time without FH for RedCap fulfils the requirements specified in clause 14.4.8.3.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 14.4.8.3 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be higher than the time duration above because of the uncertainty in acquiring the first available PRACH occasion to transition to RRC_CONNECTED state to report the measurements.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in clause 10.1A.16.3, i.e., between RSTD_0000000 and RSTD_1970049.

14.4.8 NR RSTD measurement reporting delay test case in FR2 for Redcap UE without Rx FH

Editor's Note: This test case is incomplete in following aspects:

- TT analysis is missing.

14.4.8.1 Test purpose

The purpose of the test is to verify that the RSTD measurement for RedCap UE without FH in RRC INACTIVE state meets the requirements specified in TS 38.331 [50] clause 5.6A.4.5 in an environment with AWGN propagation conditions in FR2 in standalone scenario when single positioning frequency layer is configured.

14.4.8.2 Test applicability

This test applies to NR FR2 RedCap UEs release 18 onwards that support DL-TDOA positioning.

14.4.8.3 Minimum conformance requirements

Same as in clause 14.4.7.3.

14.4.8.4 Test description

14.4.8.4.1 Initial conditions

The supported test configurations are listed in Table 14.4.8.4.1-1.

Table 14.4.8.4.1-1: Supported test configurations for NR RSTD

Configuration	Description
1	120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.4.8.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.4.8.5-1, Table 14.4.8.5-2 and Table 14.4.8.5-3.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.4.8.4.3
5. In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR2.

14.4.8.4.2 Test procedure

Same test procedure as defined in clause 14.4.7.4.2 with following exceptions:

The UE is configured with DRX cycle of 0.64s.

Table 14.4.8.5-1 replaces Table14.4.7.5-1, Table 14.4.8.5-2 replaces Table14.4.7.5-2, Table 14.4.8.5-3 replaces Table14.4.7.5-3.

14.4.8.4.3 Message contents

Same message contents as defined in clause 14.4.7.4.3, with the following exceptions:

Table 14.4.8.4.3-1 replaces Table 14.4.7.4.3-7 and Table 14.4.8.4.3-2 replaces Table 14.4.7.4.3-8.

14.4.8.5 Test requirement

Table 14.4.8.5-1 to Table 14.4.8.5-3 defines the primary level settings including test tolerances for the test.

Table 14.4.8.5-1: General test parameters for RSTD measurement reporting delay

Parameter		Unit	Value	Comment
Reference cell			Cell 1	Reference cell is the cell in the DL-TDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 38.215 [57] and TS 37.355 [49]. The reference cell is the PCell in this test case.
Neighbor cells			Cell 2 and Cell 3	Cell 2 and Cell 3 appear at the first and second places in the neighbour cell list in the DL-TDOA assistance data.
$BW_{channel}$		MHz	100: $N_{RB,c}$ = 66	
SSB configuration	Config 1		SSB.2 FR2	
SMTC configuration	Config 1		SMTC.1	
PDSCH RMC configuration	Config 1		SR.1.1 FDD	
RMSI CORESET RMC configuration	Config 1		CR.3.1 TDD	As specified in TS 38.133 [50] clause A.3.1.2.1
Dedicated CORESET RMC configuration	Config 1		CR.1.1 FDD	
PRS Configuration	Config 1		PRS.1.5 FR2	As specified in TS 38.133 [50] clause A.3. 31
Physical cell ID PCI			(PCI of Cell 1 – PCI of Cell 2)mod6=0 and (PCI of Cell 1 – PCI of Cell 3)mod6=0	The cell PCIs are selected such that the relative shifts of PRS patterns among cells are as given by the test parameters
CP length			Normal	
DRX		s	0.64	
Radio frame receive time offset between the cells at the UE antenna connector		µs	Cell 2 to Cell 1: 0 Cell 3 to Cell 1: 3	PRS are transmitted from synchronous cells
Expected RSTD		µs	Cell 2: 3 Cell 3: 3 Other neighbour cells: randomly between -3 and 3	The expected RSTD is what is expected at the receiver. The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD indicator
Expected RSTD uncertainty for all neighbour cells		µs	5	The corresponding parameter in the DL-TDOA assistance data specified in TS 37.355 [49] is the expectedRSTD-Uncertainty index
Number of cells provided in DL-TDOA assistance data			3	Including the reference cell

PRS muting info		Cell 1: '10' Cell 2: '01' Cell 3: '10'	Correponds to prs-MutingInfo defined in TS 37.355 [49]
PRS resource RE offset		Cell 1: 0 Cell 2: 0 Cell 3: 1	Cell 1 and Cell 3 are configured with different resource offsets
T1	s	3	The length of the time interval from the beginning of each test
T2	s	1.28	The length of the time interval that follows immediately after time interval T1
AoA setup		Setup 1	As defined in TS 38.133 [50] clause A.3.15.1
Beam assumption		Rough	Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation

Table 14.4.8.5-2: Cell-specific test parameters for RSTD measurement reporting delay during T1

Parameter		Unit	Cell 1	Cell 2	Cell 3
NR RF Channel Number			1	1	1
Positiong frequency layer			1	1	1
Correlation Matrix and Antenna Configuration			1x2 Low	1x2 Low	1x2 Low

PRS $\hat{E}_s/I_{ot}$		dB	-6 + TT	-13 + TT	-13 + TT
Propagation Condition			AWGN		

NOTE 1: OCNG shall be used such that active cells (all, except Cell 3 in T2) are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
NOTE 2: The resources for uplink transmission are assigned after the end of time period T2 to UEs that do not support SDT for measurement reporting.
NOTE 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

The RSTD measurement time without FH for RedCap fulfils the requirements specified in clause 14.4.8.3.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 14.4.8.3 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be higher than the time duration above because of the uncertainty in acquiring the first available PRACH occasion to transition to RRC_CONNECTED state to report the measurements.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in clause 10.1A.16.3, i.e., between RSTD_0000000 and RSTD_1970049.

14.5 NR RSTD measurement accuracy test case in RRC_INACTIVE

14.5.1 NR RSTD measurement accuracy test case for single positioning frequency layer in FR1 SA

14.5.1.1 Test purpose

The purpose of the test is to verify that the RSTD measurement in RRC_INACTIVE state meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions in FR1 in standalone scenario when single positioning frequency layer is configured.

14.5.1.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning and DL-PRS measurement in RRC_INACTIVE.

14.5.1.3 Minimum conformance requirements

The accuracy requirements for RSTD measurement shall be within ±(X+Y+Z+Δ) T_c.

X is defined in TS 38.133[50] Table 10.1.23.2-1 for AWGN channel and TS 38.133[50] Table 10.1.23.2-3 for fading channel for FR1, provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to Annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE does not perform positioning measurement with reduced number of samples.

…

X is defined in Table TS 38.133[50]10.1.23.2-7 for AWGN channel in FR1 provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to Annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

If the UE doesn't support Rx TEG reporting for RSTD measurement or when the measurements of reference cell and neighbour cell belong to different Rx TEGs, Y, Z and Δ are defined as follows:

- When UE measures RSTD on PRS resources belonging to same PFL, Y=32 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 160 ms.
- When UE measures RSTD on PRS resources belonging different PFLs, Y=256 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 1280 ms.
- Z is defined in TS 38.133[50] Table 10.1.23.2-5 for FR1.
- Δ is zero for single PFL, and is defined in TS 38.133[50] Table 10.1.23.2-5a for FR1, respectively, for dual PFL.

NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of the reference resource and the measured neighbour resource i.
NOTE 2: Minimum number of PRS resource repetitions among the reference resource and the measured neighbour resource i. $T_{\text{rep}}^{\text{PRS}}$, L_{PRS}, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: Void

14.5.1.4 Test description

The supported test configurations in listed in Table 14.5.1.4-1

Table 14.5.1.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode

3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

14.5.1.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.5.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 14.5.1.5-1 and Table 14.5.1.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.5.1.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR1. The UE is configured with DRX cycle of 0.64s.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.5.1.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration, PRS.1.1 FR1 and PRS.1.2 FR1. The test consists of a set-up period and a measurement period. During the set-up period, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During the measurement period UE shall be in RRC_INACTIVE state and all cells start to transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The NR-DL-TDOA-RequestLocationInformation message and the DL-TDOA assistance data as defined in clause 14.5.1.4.3 shall be provided to the UE during the set-up period. The beginning of the measurement period shall be aligned with the first DRX cycle containing a DL PRS resource(s).

0. Configure the Cell for RA-SDT with SIB1 configured according to TS 38.508-1 [45], clause 4.6.1 with condition SDT.
1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set parameters other than PRSconfiguration according to the Table 14.5.1.5-1 and Table 14.5.1.5-2. Propagation conditions are set according to clause 4.15.2.
4. Set-up period starts.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE

message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of measurement period, where ΔT = 50 ms.
11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
12. When set-up period ends, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and set the PRS parameters as specified in Table 14.5.1.5-1 and Table 14.5.1.5-2.
13. Wait for the UE monitors for occurrence of the periodic event requested.
14. The UE shall transmit the UE transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the RRCResumeRequest message and then go to step 17.
15. The SS transmits an *RRCResume* message.
16. The UE transmits an *RRCResumeComplete* message.
17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3) plus the maximum RRC processing time 10ms between *RRCResume* message and *RRCResumeComplete* message.
18. If the UE message at step 17 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
19. The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 14.5.1.5-3.
20. Repeat steps 2-19 in Table 14.5.1.4-1 until the confidence level according to Annex D is achieved.
21. Repeat step 2-20 for the other sub-test defined in Table 14.5.1.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

14.5.1.4.3 Message contents

As defined in clause 14.4.1.4.3, with the following exceptions:

Table 14.5.1.4.3-1 replaces Table 14.4.1.4.3-6, Table 14.5.1.4.3-2 replaces Table 14.4.1.4.3-7 and Table 14.5.1.4.3-3 replaces Table 14.4.1.4.3-11.

Propagation condition	1~3	-	AWGN		AWGN	
Antenna configuration	1~3		1x2		1x2	

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Void.

RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.5.1.3.

The value of the LPP Time IE depends on the UE capabilities

Calculations for RSTD accuracy is as mentioned in below Table 14.5.1.5-2:

Table 14.5.1.5-2: RSTD accuracy requirements for the reported values

Test Configuration	Subtest	Lowest reported value [T_c]	Highest reported value [T_c]
1 & 2	Test 1	5582	6214
	Test 2	5756	6040
3	Test 1	5687	6109
	Test 2	5794	6002

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.5.2 NR RSTD measurement accuracy for single positioning frequency layer with reduced number of samples in FR1 SA

14.5.2.1 Test purpose

The purpose of the test is to verify that the RSTD measurement in RRC_INACTIVE state with reduced number of samples meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions in FR1 in standalone scenario when single positioning frequency layer is configured.

14.5.2.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning, DL-PRS measurement in RRC_INACTIVE and reduced number of samples for PRS measurement in RRC_INACTIVE state.

14.5.2.3 Minimum conformance requirements

The

The accuracy requirements for RSTD measurement shall be within $\pm(X+Y+Z+\Delta)$ T_c.

X is defined in TS 38.133[50] Table 10.1.23.2-1 for AWGN channel and TS 38.133[50] Table 10.1.23.2-3 for fading channel for FR1, provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to Annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE does not perform positioning measurement with reduced number of samples.

…

X is defined in Table TS 38.133[50]10.1.23.2-7 for AWGN channel in FR1 provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to Annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

If the UE doesn't support Rx TEG reporting for RSTD measurement or when the measurements of reference cell and neighbour cell belong to different Rx TEGs, Y, Z and Δ are defined as follows:

- When UE measures RSTD on PRS resources belonging to same PFL, Y=32 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 160 ms.
- When UE measures RSTD on PRS resources belonging different PFLs, Y=256 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 1280 ms.
- Z is defined in TS 38.133[50] Table 10.1.23.2-5 for FR1.
- Δ is zero for single PFL, and is defined in TS 38.133[50] Table 10.1.23.2-5a for FR1, respectively, for dual PFL.

…

14.5.2.4 Test description

The supported test configurations in listed in Table 14.5.2.4-1

Table 14.5.2.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

14.5.2.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.5.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 14.5.2.5-1 and Table 14.5.2.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.5.2.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR2. The UE is configured with DRX cycle of 0.64s.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.5.2.4.2 Test procedure

Same as in clause 14.5.1.4.2.

14.5.2.4.3 Message contents

As defined in clause 14.4.1.4.3, with the following exceptions:

Table 14.5.2.4.3-1 replaces Table 14.4.1.4.3-6, Table 14.5.2.4.3-2 replaces Table 14.4.1.4.3-7 and Table 14.5.2.4.3-3 replaces Table 14.4.1.4.3-11.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Void.

RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.5.2.3.

The value of the LPP Time IE depends on the UE capabilities.

Calculations for RSTD accuracy is as mentioned in below Table 14.5.2.5-2:

Test Configuration	Subtest	Lowest reported value [T_c]	Highest reported value [T_c]
1 & 2	Test 1	5664	6132
	Test 2	5756	6040
3	Test 1	5750	6046
	Test 2	5794	6002

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.5.3 NR RSTD measurement accuracy test case for single positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

14.5.3.1 Test purpose

The purpose of the test is to verify that the RSTD measurement in RRC_INACTIVE state meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions in FR2 in standalone scenario when single positioning frequency layer is configured.

14.5.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning and DL-PRS measurement in RRC_INACTIVE.

14.5.3.3 Minimum conformance requirements

The accuracy requirements for RSTD measurement shall be within ±(X+Y+Z+Δ) T_c.

…

X is defined in Table 10.1.23.2-2 for AWGN channel and Table 10.1.23.2-4 for fading channel for FR2, provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

- Conditions for RSTD measurements are fulfilled according to Annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.

- UE does not perform positioning measurement with reduced number of samples.

…

If the UE doesn't support Rx TEG reporting for RSTD measurement or when the measurements of reference cell and neighbour cell belong to different Rx TEGs, Y, Z and Δ are defined as follows:

- When UE measures RSTD on PRS resources belonging to same PFL, Y=32 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 160 ms.

- When UE measures RSTD on PRS resources belonging different PFLs, Y=256 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 1280 ms.
- Z is defined in Table 10.1.23.2-5 for FR1 and Table 10.1.23.2-6 for FR2, respectively.
- Δ is zero for single PFL, and is defined in Table 10.1.23.2-5a for FR1 and Table 10.1.23.2-6a for FR2, respectively, for dual PFL.

…

Table 10.1.23.2-2: RSTD absolute accuracy in FR2 for AWGN channel

Accuracy	Conditions					
	PRS Ês/Iot	PRS SCS	PRS bandwidth Note 1	PRS resource repetition ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$) Note 2	Io Note 3 range	
					Minimum Io	Maximum Io
Tc Note 4	dB	kHz	PRB		dBm/SCS	dBm/BW$_{Channel}$
35	(PRS Ês/Iot)$_{ref}$ ≥ -6dB	60	≥ 24	≥ 4	Same value as PRS_RP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
24			≥ 64	≥ 1	Note 5	Note 5
11			≥ 132	≥ 1	Note 5	Note 5
24	(PRS Ês/Iot)$_i$ ≥ -13dB	120	≥ 32	≥ 4	Same value as PRS_RP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
13			≥ 64	≥ 1	Note 5	Note 5
6			≥ 128	≥ 1	Note 5	Note 5

NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of the reference resource and the measured neighbour resource i.
NOTE 2: Minimum number of PRS resource repetitions among the reference resource and the measured neighbour resource i. T_{rep}^{PRS}, L_{PRS}, K_{comb}^{PRS} are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 6: Void

…

Table 10.1.23.2-6: Margin for RSTD measurement accuracy in FR2

PRS BW (PRB number)		Margin (Tc)
SCS=60kHz	SCS=120kHz	
≥ 24	N/A	72
≥ 64	≥ 32	32
≥ 132	≥ 64	16
N/A	≥ 128	12

14.5.3.4 Test description

The supported test configurations in listed in Table 14.5.3.4-1

Table 14.5.3.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

14.5.3.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.5.3.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.5.3.5-1 and Table 14.5.3.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.5.3.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR2. The UE is configured with DRX cycle of 0.64s.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.5.3.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration, PRS.1.1 FR2 and PRS.1.2 FR2. The test consists of a set-up period and a measurement period. During the set-up period, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During the measurement period UE shall be in RRC_INACTIVE state and all cells start to transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The NR-DL-TDOA-RequestLocationInformation message and the DL-TDOA assistance data as defined in clause 14.5.3.4.3 shall be provided to the UE during the set-up period. The beginning of the measurement period shall be aligned with the first DRX cycle containing a DL PRS resource(s).

0 Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 14.4.3.4.3-0.

1 Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On,* according to TS 38.508-1 [45] clause 4.5.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set parameters other than PRSconfiguration according to the Table 14.5.3.5-1 and Table 14.5.3.5-2. Propagation conditions are set according to clause 4.15.2.
4. Set-up period starts.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of measurement period, where ΔT = 50 ms.

11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
12. When set-up period ends, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and set the PRS parameters as specified in Table 14.5.3.5-1 and Table 14.5.3.5-2.
13. Wait for the UE monitors for occurrence of the periodic event requested.
14. The UE shall transmit the UE transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 17.
15. The SS transmits an *RRCResume* message.
16. The UE transmits an *RRCResumeComplete* message.
17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3) plus the maximum RRC processing time 10ms between *RRCResume* message and *RRCResumeComplete* message.
18. If the UE message at step 17 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
19. The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 14.5.3.5-3.
20. Repeat steps 2-19 in Table 14.5.3.4-1 until the confidence level according to Annex D is achieved.
21. Repeat step 2-20 for the other sub-test defined in Table 14.5.3.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

14.5.3.4.3 Message contents

As defined in clause 14.4.3.4.3, with the following exceptions:

Table 14.5.3.4.3-1 replaces Table 14.4.3.4.3-7, Table 14.5.3.4.3-2 replaces Table 14.4.3.4.3-9 and Table 14.5.3.4.3-3 replaces Table 14.4.3.4.3-11.

EPRE ratio of PDSCH to PDSCH_DMRS					
EPRE ratio of OCNG DMRS to SSS Note 1					
EPRE ratio of OCNG to OCNG DMRS Note 1					
Propagation conditions		AWGN	AWGN	AWGN	AWGN
Antenna configuration		1x2	1x2	1x2	1x2
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.					

Table 14.5.3.5-2: RSTD accuracy OTA related test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to clause A.3.15.1			
Assumption for UE beams Note 5		Rough		Rough	
N_{oc} Note1	dBm/SCS Note3	-89.1		-89.1	
$\hat{E}_s / N_{oc}$	dB	-5.17	-11.36	-5.17	-11.36
PRS-RSRP Note2	dBm/SCS	-94.2	-100.4	-94.2	-100.4
$\hat{E}_s / I_{ot}$ BB Note4	dB	-5.7	-12.7	-5.7	-12.7
Io Note2	dBm/190.08 MHz Note3	-55.68	-55.68	-55.68	-55.68
Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.					

Note 2:	SSB_RP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 3:	Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 4:	Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.
Note 5:	Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 14.4.3.5 with the following difference: $N_{PRS,i}^{slot} = 2, L_{available_PRS,i} = 0.071$. Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation.

Table 14.5.3.5-3: RSTD accuracy requirements for the reported values

Test Configuration	Lowest reported value	Highest reported value
Sub-test 1	(5898 – 120) T_c converted to RSTD measurement according to clause 4.15.6	(5898 + 120) T_c converted to RSTD measurement according to clause 4.15.6
Sub-test 2	(5898 – 82) T_c converted to RSTD measurement according to clause 4.15.6	(5898 + 82) T_c converted to RSTD measurement according to clause 4.15.6

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.5.4 NR RSTD measurement accuracy for single positioning frequency layer with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

14.5.4.1 Test purpose

The purpose of the test is to verify that the RSTD measurement in RRC_INACTIVE state with reduced number of samples meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23.2 in an environment with AWGN propagation conditions in FR2 in standalone scenario when single positioning frequency layer is configured.

14.5.4.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports DL-TDOA positioning, DL-PRS measurement in RRC_INACTIVE and reduced number of samples for PRS measurement in RRC_INACTIVE state.

14.5.4.3 Minimum conformance requirements

The accuracy requirements for RSTD measurement shall be within ±(X+Y+Z+Δ) T_c.

…

X is defined in Table 10.1.23.2-8 for AWGN channel in FR2 provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to Annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

…

If the UE doesn't support Rx TEG reporting for RSTD measurement or when the measurements of reference cell and neighbour cell belong to different Rx TEGs, Y, Z and Δ are defined as follows:

- When UE measures RSTD on PRS resources belonging to same PFL, Y=32 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 160 ms.
- When UE measures RSTD on PRS resources belonging different PFLs, Y=256 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbour cell, which are used for a single RSTD estimate, is no greater than 1280 ms.
- Z is defined in Table 10.1.23.2-5 for FR1 and Table 10.1.23.2-6 for FR2, respectively.
- Δ is zero for single PFL, and is defined in Table 10.1.23.2-5a for FR1 and Table 10.1.23.2-6a for FR2, respectively, for dual PFL.

…

Table 10.1.23.2-8: RSTD absolute accuracy in FR2 for AWGN channel with reduced number of samples

Accuracy	Conditions					
	PRS $\hat{E}_s/I_{ot}$	PRS SCS	PRS bandwidth Note 1	PRS resource repetition ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$) Note 2	Io Note 3 range	
					Minimum Io	Maximum Io
Tc Note 4	dB	kHz	PRB		dBm/SCS	$dBm/BW_{Channel}$
24	$(\hat{E}_s/I_{ot})_{ref}$ ≥ -3dB	60	≥ 64	≥ 1	Same value as PRS_RP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	Note 5
11			≥ 132	≥ 1	Note 5	Note 5
13	$(\hat{E}_s/I_{ot})_i$ ≥ -6dB	120	≥ 64	≥ 1	Same value as PRS_RP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	Note 5
6			≥ 128	≥ 1	Note 5	Note 5

NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of the reference resource and the measured neighbour resource i.
NOTE 2: Minimum number of PRS resource repetitions among the reference resource and the measured neighbour resource i. T_{rep}^{PRS}, L_{PRS}, K_{comb}^{PRS} are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 6: Void

≥ 24	N/A	72
≥ 64	≥ 32	32
≥ 132	≥ 64	16
N/A	≥ 128	12

14.5.4.4 Test description

The supported test configurations in listed in Table 14.5.4.4-1

Table 14.5.4.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

14.5.4.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.5.4.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.5.4.5-1 and Table 14.5.4.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.5.4.4.3.
5. In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR2. The UE is configured with DRX cycle of 0.64s.
6. The true RSTD (which is the receive time difference for frame 0 between cell 2 and cell 1 as seen at the UE antenna connector) is set to 5898 Tc (about 3 μs)

14.5.4.4.2 Test procedure

Same as in clause 14.5.3.4.2.

14.5.4.4.3 Message contents

As defined in clause 14.4.3.4.3, with the following exceptions:

Table 14.5.4.4.3-1 replaces Table 14.4.3.4.3-7, Table 14.5.4.4.3-2 replaces Table 14.4.3.4.3-9 and Table 14.5.4.4.3-3 replaces Table 14.4.3.4.3-11.

14.5.4.5 Test requirement

The RSTD measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 14.5.4.3.

Table 14.5.4.5-1: RSTD accuracy test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
PRS ARFCN		freq1		freq1	
Duplex mode		TDD		TDD	
TDD configuration		TDDConf.3.1		TDDConf.3.1	
$BW_{channel}$	MHz	200: $N_{RB,c}$ = 132		200: $N_{RB,c}$ = 132	
Downlink initial BWP configuration		DLBWP.0.1	DLBWP.0.1	DLBWP.0.1	DLBWP.0.1
Uplink initial BWP configuration		ULBWP.0.1	-	ULBWP.0.1	-
Uplink dedicated BWP configuration		ULBWP.1.1	-	ULBWP.1.1	-
TRS configuration		TRS.2.1 TDD	-	TRS.2.1 TDD	-
TCI state		TCI.State.0	-	TCI.State.0	-
PDSCH Reference measurement channel		SR.3.1 TDD	-	SR.3.1 TDD	-
RMSI CORESET Reference Channel		CR.3.1 TDD	-	CR.3.1 TDD	-
Control channel RMC		CCR.3.1 TDD	-	CCR.3.1 TDD	-
OCNG Patterns		OP.3	OP.3	OP.3	OP.3
SSB configuration		SSB.3 FR2	SSB.3 FR2	SSB.3 FR2	SSB.3 FR2
SMTC configuration		SMTC.1	SMTC.1	SMTC.1	SMTC.1
PRS configuration		PRS.1.3 FR2	PRS.1.3 FR2	PRS.1.4 FR2	PRS.1.4 FR2
PRS BW		64 PRBs	64 PRBs	128 PRBs	128 PRBs
PRS Resource slot offset	slot	0	4	0	4
Expected RSTD	µs	N/A	3	N/A	3
Expected RSTD uncertainty	µs	N/A	5	N/A	5
Time offset with Cell 1	µs	-	3	-	3
PDSCH/PDCCH subcarrier spacing	kHz	120	120	120	120
EPRE ratio of PSS to SSS	dB	0	0	0	0
EPRE ratio of PBCH_DMRS to SSS					
EPRE ratio of PBCH to PBCH_DMRS					
EPRE ratio of PDCCH_DMRS to SSS					
EPRE ratio of PDCCH to PDCCH_DMRS					
EPRE ratio of PDSCH_DMRS to SSS					
EPRE ratio of PDSCH to PDSCH_DMRS					
EPRE ratio of OCNG DMRS to SSS Note 1					
EPRE ratio of OCNG to OCNG DMRS Note 1					
Propagation conditions		AWGN	AWGN	AWGN	AWGN
Antenna configuration		1x2	1x2	1x2	1x2
Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.					

Table 14.5.4.5-2: RSTD accuracy OTA related test parameters

Parameter	Unit	Test 1		Test 2	
		Cell 1	Cell 2	Cell 1	Cell 2
Angle of arrival configuration		Setup 1 according to TS 38.133 [50] clause A.3.15.1			
Assumption for UE beams Note 5		Rough		Rough	
N_{OC} Note1	dBm/SCS Note3	-91.6		-91.6	

$\hat{E}_s / N_{oc}$	dB	-0.56	-2.72	-0.56	-2.72
PRS-RSRP Note2	dBm/SCS	-92.1	-94.3	-92.1	-94.3
SS-RSRP Note2	dBm/SCS	-90.44	-92.65	-90.44	-92.65
$\hat{E}_s / I_{ot}$ BB Note4	dB	-2.69	-5.68	-2.69	-5.68
Io Note2	dBm/190.08 MHz Note3	-55.74	-55.74	-55.74	-55.74
Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.					
Note 2: SSB_RP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.					
Note 3: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone					
Note 4: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in TS 38.133 [50] clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.					
Note 5: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation					

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 14.4.3.5 with the following difference: $N_{PRS,i}^{slot} = 2, L_{available_PRS,i} = 0.071 \quad N_{sample} = 1$. Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(1 * 1 * 8 * \left\lfloor \frac{2}{N'} \right\rfloor \left\lceil \frac{0.071}{N} \right\rceil * 1 - 1\right) * T_{effect} + T_{last}$$

The resulting value shall be rounded up to the next integer and transmitted in the LPP-RequestLocationInformation.

Table 14.5.4.5-3: RSTD accuracy requirements for the reported values

Test Configuration	Lowest reported value	Highest reported value
Sub-test 1	(5898 – 93) T_c converted to RSTD measurement according to clause 4.15.6	(5898 + 93) T_c converted to RSTD measurement according to clause 4.15.6
Sub-test 2	(5898 – 82) T_c converted to RSTD measurement according to clause 4.15.6	(5898 + 82) T_c converted to RSTD measurement according to clause 4.15.6

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

14.5.5 RSTD measurement accuracy for PRS aggregation in FR1 in RRC_INACTIVE state

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test requirements and test tolerance analysis is incomplete

14.5.5.1 Test purpose

The purpose of the test is to verify that the RSTD measurement with PRS aggregation on two PFLs meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23A.2 in an environment with AWGN propagation conditions.

14.5.5.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports DL-TDOA positioning and *supportOfDL-PRS-BWA-RRC-Inactive-r18*.

14.5.5.3 Minimum conformance requirements

When UE measures RSTD on PRS resources belonging to different PFLs or different PFL combinations, then the RSTD accuracy is defined as the accuracy corresponding to the largest accuracy value among different PFLs or different PFL combinations.

The requirements in this clause for 3-PFL and 2-PFL apply provided that:

- PRS resources linked for aggregation saftisfy all the conditions specified in TS 38.214 [56] clause 5.1.6.5.3.
- The spacing between the center frequencies of adjacent PFLs containing PRS resources linked for aggregation does not exceed the nominal channel spacing for intra-band contiguous CA defined in TS 38.101-1 [18], clause 5.4A.1 for FR1, and in TS 38.101-2, [19] clause 5.4A.1 for FR2-1.

The accuracy requirements for RSTD measurement based on PRS Aggregation shall be within $\pm(X+Y+Z+\Delta)\ T_c$.

X is defined in table 14.5.5.3-1 for AWGN channel and table 14.5.5.3-3 for fading channel for FR1, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to TS 38.133 [50] annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE does not perform positioning measurement with reduced number of samples.

X is defined in table 14.5.5.3-2 for AWGN channel and table 14.5.5.3-4 for fading channel for FR2, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE does not perform positioning measurement with reduced number of samples.

X is defined in table 14.5.5.3-5 for AWGN channel in FR1, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

X is defined in table 14.5.5.3-6 for AWGN channel in FR2, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

NOTE: The requriements for fading channel in this clause are derived based on TDL-A (30 ns delay spread, 5Hz) and TDL-C (60 ns delay spread, 300 Hz) channel models for FR1 and FR2 respectively.

If the UE doesn't support Rx TEG reporting for RSTD measurement or when the measurements of reference cell and neighbour cell belong to different Rx TEGs, Y, Z and Δ are defined as follows:

- When UE measures RSTD on PRS resources belonging to same PFL or same PFL combination, Y=32 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbor cell, which are used for a single RSTD estimate, is no greater than 160 ms.

- When UE measures RSTD on PRS resources belonging different PFLs or different PFL combinations, Y=256 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbor cell, which are used for a single RSTD estimate, is no greater than 1280 ms.

- Z is defined in table 14.5.5.3-7 for FR1 and table 14.5.5.3-9 for FR2, respectively, where the PRS BW refers to the sum of the PRS PRB numbers across the aggregated PFLs.

- Δ is zero when UE measures RSTD on PRS resources belonging to same PFL or same PFL combination and is defined in table 14.5.5.3-8 for FR1 and table 14.5.5.3-10 for FR2, respectively, when UE measures RSTD on PRS resources belonging different PFLs or different PFL combinations, where the PRS BW refers to the sum of the PRS PRB numbers across the aggregated PFLs.

If the measurements of reference cell and neighbour cell belong to the same Rx TEG, i.e. associated and reported with a common Rx TEG ID, then the sum of Y+Z+Δ is equal to the timing error margin of the Rx TEG reported in *nr-UE-RxTEG-TimingErrorMargin*. The timing error margin reported via *nr-UE-RxTEG-TimingErrorMargin* cannot be larger than the value of (Y+Z+Δ) defined when the UE does not associate the measurements with the same Rx TEG.

Table 14.5.5.3-1: RSTD absolute accuracy in FR1 for AWGN channel

Accuracy for 2 PFLs	Accuracy for 3 PFLs	Conditions						
		PRS $\hat{E}_s/I_{ot}$	PRS SCS	PRS bandwidth per PFL Note 1	PRS resource repetition ($T_{rep}^{PRS} * L_{PRS}/K_{comb}^{PRS}$) Note 2	Io Note 3 range

14.5.5.4 Test description

14.5.5.4.1 Initial conditions

The supported test configuration is listed in Table 14.5.5.4.1-1.

Table 14.5.5.4.1-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.5.5.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.15.
2. The general test parameter settings are set up according to Table 14.5.5.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 14.5.5.4.3.
5. In the test there are four synchronous cells: Cell 1, Cell 2, Cell 3 and Cell 4. Cell 1 is the reference as well as the PCell on NR RF channel #1 in FR1. Cell 2 is a neighbour cell on the same NR RF channel as Cell 1. Cell 3 and Cell 4 are neighbor cells in a different NR RF channel #2 in FR1.

14.5.5.4.2 Test procedure

The test consists of a set-up period and a measurement period. During the set-up period, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During the measurement period UE shall be in RRC_INACTIVE state and all cells start to transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The *NR-TDOA-ProvideAssistanceData* and *NR-TDOA-RequestLocationInformation* message as defined in TS 37.355 [49], shall be provided to the UE before the start of the test. The test duration should be larger than the UE measurement period as defined in TS 38.133[50] clause 5.6.2.6. The UE is configured with DRX cycle of 1.28 s.

0. Configure the Cell for RA-SDT with SIB1 configured according to the message content in clause 14.5.5.4.3.
1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.5.5.5-1. Propagation conditions are set according to clause 4.15.2.
4. Set-up period starts.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
6. The UE shall transmit RRCReconfigurationComplete message
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10, The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *nr-DL-PRS-JointMeasurementRequestedPFL-List* in the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of measurement period, where ΔT = 50 ms.
11, The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message
12, When set-up period ends, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and set the PRS parameters as specified in Table 14.5.5.5-1
13, Wait for the UE monitors for occurrence of the periodic event requested
14, The UE shall transmit an RRCResumeRequest message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the RRCResumeRequest message and then go to step 17
15, The SS transmits an RRCResume message.
16, The UE transmits an RRCResumeComplete message
17, The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3) plus the maximum RRC processing time 10ms between *RRCResume* message and *RRCResumeComplete* message.
18, If the UE message at step 17 includes the ackRequested IE set to TRUE, the SS shall send a LPP acknowledgement message.
19, The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 14.5.5.5-1.
20. Repeat steps 2-19 in Table 14.5.5.4.1-1 until the confidence level according to Annex D is achieved.

14.5.5.4.3 Message contents

As defined in clause 14.4.5.4.3, with the following exceptions:

Table 14.5.5.4.3-1 replaces Table 14.4.5.4.3-6, Table 14.5.5.4.3-2 replaces Table 14.4.5.4.3-7 and Table 14.5.5.4.3-3 replaces Table 14.4.1.4.3-11.

PRP Note3	1,2	dBm/SCS	-104 + TT	-111 + TT	-104 + TT	-111 + TT
	3		-101 + TT	-108 + TT	-101 + TT	-108 + TT
Io Note3	1,2	dBm/ 19.08MHz	-65.98 + TT	-66.74 + TT	-65.98 + TT	-66.74 + TT
	3	dBm/ 47.88MHz	-62.00 + TT	-62.76 + TT	-62.00 + TT	-62.76 + TT
PRS $\hat{E}_s/N_{oc}$	1,2,3	dB	-6 + TT	-13 + TT	-6 + TT	-13 + TT
Propagation condition	1,2,3	-	AWGN		AWGN	
Antenna configuration	1,2,3		1x2		1x2	

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the slots with transmitted PRS.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. The Io is calculated based only on the symbols in which PRS is transmitted.
NOTE 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

14.5.6 RSTD measurement accuracy for PRS aggregation in FR2 in RRC_INACTIVE state

Editor's note: This test case is incomplete. The following aspect is either missing or TBD:

- Test requirements and test tolerance analysis is incomplete

14.5.6.1 Test purpose

The purpose of the test is to verify that the RSTD measurement with PRS aggregation on two PFLs meets the accuracy requirements specified in TS 38.133 [50] clause 10.1.23A.2 in an environment with AWGN propagation conditions.

14.5.6.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports DL-TDOA positioning and *supportOfDL-PRS-BWA-RRC-Inactive-r18*.

14.5.6.3 Minimum conformance requirements

Same as in clause 14.5.5.3.

14.5.6.4 Test description

14.5.6.4.1 Initial conditions

The supported test configuration is listed in Table 14.5.6.4.1-1.

Table 14.5.6.4.1-1: Supported test configurations

Configuration	Description
1	120 kHz SSB SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 14.5.6.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 14.5.6.5-1, Table 14.5.6.5-2.
3. Propagation conditions are set according to clause 4.15.2.
4. Message contents are defined in clause 14.5.6.4.3.
5. In the test there are four synchronous cells: Cell 1, Cell 2, Cell 3 and Cell 4. Cell 1 is the reference as well as the PCell on NR RF channel #1 in FR2. Cell 2 is a neighbour cell on the same NR RF channel as Cell 1. Cell 3 and Cell 4 are neighbor cells in a different NR RF channel #2 in FR2.

14.5.6.4.2 Test procedure

The test consists of a set-up period and a measurement period. During the set-up period, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During the measurement period UE shall be in RRC_INACTIVE state and all cells start to transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

The *NR-TDOA-ProvideAssistanceData* and *NR-TDOA-RequestLocationInformation* message as defined in TS 37.355 [49], shall be provided to the UE before the start of the test. The test duration should be larger than the UE measurement period as defined in TS 38.133[50] clause 5.6.2.6.

0. Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 14.4.6.4.3-0.
1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On, according to TS 38.508-1 [45] clause 4.5.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. Set the parameters according to Table 14.5.6.5-1 and Table 14.5.6.5-2. Propagation conditions are set according to clause 4.15.2.
4. Set-up period starts.
5. The SS shall transmit an RRCReconfiguration message with the DRX configuration.

6. The UE shall transmit RRCReconfigurationComplete message
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the DL-TDOA capabilities supported by the UE in the *NR-DL-TDOA-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-DL-TDOA-ProvideAssistanceData* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *nr-DL-PRS-JointMeasurementRequestedPFL-List* in the *NR-DL-TDOA-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of measurement period, where ΔT = 50 ms.
11. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message
12. When set-up period ends, the SS shall transmit an RRCRelease message with SDT configuration to transit the UE to RRC_INACTIVE state and set the PRS parameters as specified in Table 14.5.6.5-1
13. Wait for the UE monitors for occurrence of the periodic event requested
14. The UE shall transmit an RRCResumeRequest message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the RRCResumeRequest message and then go to step 17
15. The SS transmits an RRCResume message.
16. The UE transmits an RRCResumeComplete message
17. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-DL-TDOA-ProvideLocationInformation* IE within the response time (see clause 4.15.3) plus the maximum RRC processing time 10ms between *RRCResume* message and *RRCResumeComplete* message.
18. If the UE message at step 17 includes the ackRequested IE set to TRUE, the SS shall send a LPP acknowledgement message.
19. The SS shall check the nr-RSTD-r16 value for Cell 2 in the nr-DL-TDOA-SignalMeasurementInformation-r16 according to Table 14.5.6.5-1.
20. Repeat steps 2-19 in Table 14.5.6.4.1-1 until the confidence level according to Annex D is achieved.

14.5.6.4.3 Message contents

As defined in clause 14.4.6.4.3, with the following exceptions:

Table 14.5.6.4.3-1 replaces Table 14.4.6.4.3-1, Table 14.5.6.4.3-2 replaces Table 14.4.6.4.3-2; Table 14.5.6.4.3-3 replaces Table 14.4.5.4.3-11.

Propagation conditions		AWGN			
Antenna configuration		1x2			
Note 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.					

Table 14.5.6.5-2: RSTD accuracy OTA related test parameters

Parameter	Unit	Cell 1	Cell 2	Cell 3	Cell 4
Angle of arrival configuration		Setup 1 according to TS 38.133 [50] clause A.3.15.1			
Assumption for UE beams Note 5		Rough		Rough	
N_{oc} Note1	dBm/SCS Note3	-89		-89	
$\hat{E}_s / N_{oc}$	dB	-5.7+TT	-11.9+TT	-5.7+TT	-11.9+TT
PRS-RSRP Note2	dBm/SCS	-94.7+TT	-100.9+TT	-94.7+TT	-100.9+TT
$\hat{E}_s / I_{ot}$ BB Note4	dB	-6+TT	-13+TT	-6+TT	-13+TT
Io Note2	dBm/190.08 MHz Note3	-55.75+TT	-55.75+TT	-55.75+TT	-55.75+TT
Note 1: Where used, interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.					
Note 2: SSB_RP, Es/Iot and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.					
Note 3: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.					
Note 4: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 36.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.					
Note 5: Information about types of UE beam is given in clause B.2.1.3, and does not limit UE implementation or test system implementation					

15 UE Rx-Tx time difference measurement requirements

15.1 General

This clause defines the minimum performance requirements for Multi-RTT NR UEs.

15.2 UE Rx-Tx time difference measurement period test cases in RRC_CONNECTED

15.2.1 UE Rx-Tx time difference measurement period for single positioning frequency layer in FR1 SA

15.2.1.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement period meets the requirements specified in TS 38.133 [50] clause 9.9.4.5 in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.2.1.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports Multi-RTT positioning.

15.2.1.3 Minimum conformance requirements

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [49], UE shall be able to measure multiple (up to the UE capability specified in TS 38.133 [50] clause 9.9.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4] in configured positioning frequency layers within the measurement period $T_{UERxTx,Total}$ ms.

$$T_{UERxTx,\ Total} = \sum_{i=1}^{L} T_{UERxTx,i} + (L-1) * \max\left(T_{effect,i}\right).$$

where i is the index of positioning frequency layer,

$T_{UERxTx,i}$ is the measurement period for UE Rx-Tx time difference measurements in positioning frequency layer i as further defined in this clause,

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer i as defined further in this clause.

$$T_{UERxTx,i} = \left(CSSF_i * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where

$CSSF_i$ is the carrier-specific scaling factor for NR PRS-based measurement in the positioning frequency layer i as defined in TS 38.133 [50] clause 9.1.5.2,

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer i is in FR1 and $N_{RxBeam,i}$=8 if positioning frequency layer i is in FR2,

$L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer i, to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of

TS 38.214 [56]. For calculation of $L_{available_PRS,\mathrm{i}}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,\mathrm{i}}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [49] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [49] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in clause 4.2.7.2 of TS 37.355 [49],

N′ is UE capability for number of DL PRS resources that it can process in a slot corresponding to *maxNumOfDL-PRS-ResProcessedPerSlot* as specified in clause 6.4.3 of TS 37.355 [49],

N_{sample} is the number of UE Rx-Tx time difference measurement samples and N_{sample} = 4,

$T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time, $T_{last,i} = T_i + T_{available_PRS,i}$,

$T_{effect,\mathrm{i}}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{effect,\mathrm{i}} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

where

T_{i} corresponds to durationOfPRS-ProcessingSymbolsInEveryTms in TS 37.355 [49],

$T_{available_PRS,\mathrm{i}} = LCM(T_{PRS,\mathrm{i}}, MGRP_{\mathrm{i}})$, the least common multiple between $T_{PRS,\mathrm{i}}$ and $MGRP_{\mathrm{i}}$

$MGRP_{\mathrm{i}}$ is the measurement gap repetition periodicity in positioning frequency layer i.

$T_{PRS,\mathrm{i}}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,\mathrm{i}}$, where

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

Note: For the purpose of calculating $T_{PRS,\mathrm{i}}$, only the PRS resources fully or partially covered by the MG are considered.

The time $T_{UERxTx,Total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data after both the *NR-Multi-RTT-RequestLocationInformation* message and *NR-Multi-RTT-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

Note: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

The UE Rx-Tx time difference measurement period is restarted if HO occurs during the measurement period and after SRS reconfiguration on the target cell is complete.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,\mathrm{i}}$ or

- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The normative reference for this requirement is TS 38.133 [50] clause 9.9.4.5.

15.2.1.4 Test description

The test defines three possible test configurations; specified in Table 15.2.1.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.2.1.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

15.2.1.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.2.1.5-1 and Table 15.2.1.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.1.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

15.2.1.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. Cell 1 and Cell 2 mute PRS transmission during T1 and transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources. The UE is configured to transmit SRS during T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
5. T1 starts.
6. The SS shall transmit an RRCReconfiguration message with the SRS configuration.
7. The UE shall transmit RRCReconfigurationComplete message.
8. The SS shall transmit an LPP REQUEST CAPABILITIES message.
9. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE such that the UE receives the message ΔT ms before the start of T2, where $\Delta T = 50$ MS. If the UE message at step 9 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

11. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *NR-Multi-RTT-RequestLocationInformation* IE.

12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 15.2.1.5-2.

13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.2.1.4.3). The UE shall perform and report the UE rx-tx time difference measurements for Cell 1 and Cell 2. If the UE transmits an *NR-Multi-RTT-ProvideLocationInformation* IE including the nr-UE-RxTxTimeDiff field for Cell 1 and Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-Multi-RTT-ProvideLocationInformation* IE with both the nr-UE-RxTxTimeDiff field included within the response time then the number of failure tests is increased by one.

14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

15. Repeat steps 1-14 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

	dBm/47.88 MHz	3		-60.58		-60.58
Propagation Condition		1, 2, 3	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.1.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(CSSF_i * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $CSSF_{PRS,i} = 1$, $N_{RxBeam,i} = 1$, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 1.142$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_j}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{1.142}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 0.648s and 102.56s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 15.2.1.4.3-5. The LPP time IE ranges between 1s and 103s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 103.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.1.5-3, Table 15.2.1.5-4 and Table 15.2.1.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.2 UE Rx-Tx time difference measurement period for dual positioning frequency layer in FR1 SA

15.2.2.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement period meets the requirements specified in TS 38.133 [50] clause 9.9.4.5 in AWGN propagation condition in FR1 in standalone scenario when dual positioning frequency layers are configured.

15.2.2.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports Multi-RTT positioning.

15.2.2.3 Minimum conformance requirements

Same as defined in clause 15.2.1.3.

15.2.2.4 Test description

The test defines three possible test configurations; specified in Table 15.2.2.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.2.2.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

15.2.2.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Low Range for Cell 1 and High Range for Cell2, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.2.2.5-1 and Table 15.2.2.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.2.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). Cell 1 and Cell2 are on different RF channels in FR1.

15.2.2.4.2 Test procedure

Same as defined in clause 15.2.1.4.2.

15.2.2.4.3 Message contents

	dBm/47.88 MHz	3		-61.00		-62.73
Propagation Condition		1, 2, 3	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.2.2.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,\,Total} = T_{UERxTx,\,1} + T_{UERxTx,\,2} + Max(T_{effect,i}).$$

$$T_{UERxTx,i} = \left(CSSF_i * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $CSSF_{PRS,i} = 1$, $N_{RxBeam,i} = 1$, $N_{PRS,i}^{slot} = 1$, $L_{available_PRS,i} = 0.571$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{0.571}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 1.456s and 52.8s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next

multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 15.2.2.4.3-5. The LPP time IE ranges between 2s and 53s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 53.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.2.5-3, Table 15.2.2.5-4 and Table 15.2.2.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.3 UE Rx-Tx time difference measurement period for single positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.2.3.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement period meets the requirements specified in TS 38.133 [50] clause 9.9.4.5 in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.2.3.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports Multi-RTT positioning.

15.2.3.3 Minimum conformance requirements

Same as defined in clause 15.2.1.3.

15.2.3.4 Test description

The supported test configurations in listed in Table 15.2.3.4-1.

Table 15.2.3.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

15.2.3.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.3.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.2.3.5-1 and Table 15.2.3.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.3.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

15.2.3.4.2 Test procedure

Same as defined in clause 15.2.1.4.2.

15.2.3.4.3 Message contents

Io	dBm/190.08 MHz	1	N/A	-55.89	N/A	-55.89
Propagation Condition		1	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone

Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.3.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(CSSF_i * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $CSSF_{PRS,i} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.142$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.142}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 5.128s and 164s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.1.4.3-3. The LPP time IE ranges between 6s and 170s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 170.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.3.5-3, Table 15.2.3.5-4 and Table 15.2.3.5-5 for reference.

Table 15.2.3.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.4 UE Rx-Tx time difference measurement period for dual positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.2.4.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement period meets the requirements specified in TS 38.133 [50] clause 9.9.4.5 in AWGN propagation condition in FR2 in standalone scenario when dual positioning frequency layers are configured.

15.2.4.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports Multi-RTT positioning.

15.2.4.3 Minimum conformance requirements

Same as defined in clause 15.2.1.3.

15.2.4.4 Test description

The supported test configurations in listed in Table 15.2.4.4-1.

Table 15.2.4.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

15.2.4.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Low Range for Cell 1 and High Range for Cell2, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.4.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.2.4.5-1 and Table 15.2.4.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.4.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). Cell 1 and Cell2 are on different RF channels in FR2.

15.2.4.4.2 Test procedure

Same as defined in clause 15.2.1.4.2.

Propagation Condition		1	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.4.2.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$\mathrm{T_{UERxTx,i}} = \left(\mathrm{CSSF_i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,\mathrm{i}}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,\mathrm{i}}}{N} \right\rceil * N_{sample} - 1\right) * \mathrm{T_{effect,i}} + \mathrm{T_{last,i}}$$

Where $\mathrm{CSSF_{PRS,i}} = 1, N_{RxBeam,i} = 8, N_{PRS,i}^{slot} = 1, L_{available_PRS,\mathrm{i}} = 0.071, N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $\mathrm{T_{last,i}} = T_{\mathrm{i}} + T_{available_PRS,\mathrm{i}}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$

$T_{available_PRS,i} = LCM\left(T_{PRS,i}, MGRP_i\right)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(8 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 11s and 84s. The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 15.2.4.4.3-5.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 11.3s and 84.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.4.5-3, Table 15.2.4.5-4 and Table 15.2.4.5-5 for reference.

Table 15.2.4.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.5 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA

15.2.5.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement meets the requirements specified in TS 38.133 [50] clause 9.9.4.5 with Nsample = 1 in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured

15.2.5.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

15.2.5.3 Minimum conformance requirements

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4] in configured positioning frequency layers within the measurement period $T_{UERxTx,Total}$ ms.

$$T_{UERxTx,\ Total} = \sum_{i=1}^{L} T_{UERxTx,i} + (L-1) * \max(T_{effect,i}).$$

where i is the index of positioning frequency layer,

$T_{UERxTx,i}$ is the measurement period for UE Rx-Tx time difference measurements in positioning frequency layer i as further defined in this clause,

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer i as defined further in this clause.

$$T_{UERxTx,i} = \left(k_{multiTEG,i} * CSSF_i * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where

$CSSF_i$ is the carrier-specific scaling factor for NR PRS-based measurement in the positioning frequency layer *i* as defined in clause 9.1.5.2,

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*;

otherwise,

$k_{multiTEG,i}$ =$N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG,i}$ =$\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs or RxTx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 and if positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-Multi-RTT-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in clause 4.2.7.2 of TS 37.355 [34],

N' is UE capability for number of DL PRS resources that it can process in a slot corresponding to *maxNumOfDL-PRS-ResProcessedPerSlot* as specified in clause 6.4.3 of TS 37.355 [34],

N_{sample} is the number of UE Rx-Tx time difference measurement samples:

- N_{sample} = 1 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* defined in [34] and LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34] and the following conditions are met:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* defined in [34] and the LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34] but the following conditions are not met:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 4 otherwise.

$T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time, $T_{last,i} = T_i + T_{available_PRS,i}$,

$T_{effect,i}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

where

T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$, the least common multiple between $T_{PRS,i}$ and $MGRP_i$

$MGRP_i$ is the measurement gap repetition periodicity in positioning frequency layer *i*.

$T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$

15.2.5.4 Test description

15.2.5.4.1 Initial conditions

The supported test configuration is listed in Table 15.2.5.4-1.

Table 15.2.5.4-1: Test Configuration

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.5.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.2.5.5-1 and Table 15.2.5.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.5.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

15.2.5.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. Cell 1 and Cell 2 mute PRS transmission during T1 and transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources. The UE is configured to transmit SRS during T2.

The UE is configured with measurement gap pattern ID # 24 or #13 before T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
5. T1 starts.
6. The SS shall transmit an RRCReconfiguration message with the SRS configuration.
7. The UE shall transmit RRCReconfigurationComplete message.
8. The SS shall transmit an LPP REQUEST CAPABILITIES message.
9. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* in the *NR-DL-PRS-ProcessingCapability* IE and the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 9 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
11. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the reducedDL-PRS-ProcessingSamples-r17 in the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where $\Delta T = 50$ ms.

12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 15.2.5.5-2.

13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.2.5.4.3). The UE shall perform and report the UE rx-tx time difference measurements for Cell 1 and Cell 2. If the UE transmits an *NR-Multi-RTT-ProvideLocationInformation* IE including the nr-UE-RxTxTimeDiff field for Cell 1 and Cell 2 within the response time, then the number of successful tests is increased by one. If the UE fails to report the *NR-Multi-RTT-ProvideLocationInformation* IE with the nr-UE-RxTxTimeDiff field included within the response time then the number of failure tests is increased by one.

14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

15. Repeat steps 1-14 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

	dBm/47.88 MHz	3		-57.07		-57.07
Propagation Condition		1, 2, 3	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP and PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE Rx-Tx time difference measurement time fulfils the requirements specified in clause 9.9.4.5 with Nsample=1.

The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2 within the specified UE Rx-Tx time difference measurement time starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported UE Rx-Tx measurement for each correct event shall be within the UE Rx-Tx reporting range specified in clause 10.1.25.3.1.

$$T_{UERxTx,i} = \left(k_{multiTEG,i} * CSSF_i * ceil(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Since the test case is for single positioning frequency layer, i = 1 and L = 1, so $T_{UERxTx,\,Total} = T_{UERxTx,\,1}$.

Analysing the equation for $T_{UERxTx,i}$:

$CSSF_{PRS,i} = 1$

$N_{RxBeam,i} = 1$

$k_{multiTEG,i}=1$

$(K_{p,PRS,i}=1$

$N_{PRS,i}^{slot} = 4$

$N_{sample}= 1.$

$T_{last,i} = T_i + T_{available_PRS,i}$

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 0.168s and 51.36s.

For SCS 30KHz The LPP time IE ranges between 0.168s and 25.7s.

The LPP time IE ranges between 1s and 52s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 52.3

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.5.5-3, Table 15.2.5.5-4, Table 15.2.5.5-4 and Table 15.2.5.5-6 for reference.

15.2.6 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer without measurement gap in FR1 SA

15.2.6.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement meets the requirements specified in TS 38.133 [50] clause 9.9.4.6 in AWGN propagation condition in FR1 in standalone scenario.

15.2.6.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and prs Processing Window.

15.2.6.3 Minimum conformance requirements

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4] in configured positioning frequency layers within the measurement period $T_{UERxTx_wo_gap,Total}$ ms.

$T_{UERxTx_wo_gap,\ Total} = \sum_{i=1}^{L} T_{UERxTx_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the positioning frequency layers are in Case 1, or

$T_{UERxTx_wo_gap,\ Total} = \max(T_{UERxTx_wo_gap,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2.

Where,

i is the index of positioning frequency layer, and

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{UERxTx_wo_gap,\ Total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{UERxTx_wo_gap,i}$ is the measurement period for UE Rx-Tx time difference measurement in positioning frequency layer *i* as specified below.

$$T_{UERxTx_wo_gap,i} = \left(k_{multiTEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where

$T_{effect,i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer *i* as defined further in this clause.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not supported *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*;

otherwise,

$k_{multiTEG,i} = N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG,i} = \left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs or RxTx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*, and in case 'n0' is

indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1. If positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-Multi-RTT-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$,

only the unmuted PRS resources that meet the applicability conditions and fully or partially overlapped with PRS processing window are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

- N′ is UE capability for number of DL PRS resources that it can process in a slot corresponding to *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* as specified in clause 6.4.3 of TS 37.355 [34],

- N_{sample} is the number of UE Rx-Tx time difference measurement samples:

  - N_{sample} = 4 if the UE is not capable of *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* defined in [34].

  - N_{sample} = 1 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* defined in [34] and LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34] and the following conditions are met:

    - PRS bandwidth is within the active BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 2 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* defined in [34] and the LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34] but the following conditions are not met:

    - PRS bandwidth is within the active BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 4 otherwise.

- $T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time.

  If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

- $T_{effect,i}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_{PRS},i}} \right\rceil * T_{available_{PRS},i}$$

where

T_i corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$, the least common multiple between $T_{PRS,i}$ and $PPWRP_i$

$PPWRP_i$ is the PRS processing window repetition periodicity in positioning frequency layer *i*.

$T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$

15.2.6.4 Test description

15.2.6.4.1 Initial conditions

The supported test configuration is listed in Table 15.2.6.4-1.

Table 15.2.6.4-1: Test Configuration

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.6.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.2.6.5-1 and Table 15.2.6.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.6.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

15.2.6.4.2 Test procedure

The test consists of two sub-tests; Sub-test 1 is for Nsample = 4 and sub-test 2 is for Nsample = 1. Sub-test 2 is only conducted when UE also supporting supportedDL-PRS-ProcessingSamples-RRC-CONNECTED. The test consists of two consecutive time intervals, with duration of T1 and T2. Cell 1 and Cell 2 mute PRS transmission during T1 and transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources. The UE is configured to transmit SRS during T2.

The UE is configured with measurement gap pattern ID # 24 or #13 before T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.

4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.

5. T1 starts.

6. The SS shall transmit an LPP REQUEST CAPABILITIES message.

7. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.

8. The SS shall transmit an RRCReconfiguration message with SRS configuration and PPW configuration.

9. The UE shall transmit RRCReconfigurationComplete message.

10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 7 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

11. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.

12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 15.2.6.5-2.

13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.2.6.4.3). The UE shall perform and report the UE rx-tx time difference measurements for Cell 1 and Cell 2. If the UE transmits an *NR-Multi-RTT-ProvideLocationInformation* IE including the nr-UE-RxTxTimeDiff field for Cell 1 and Cell 2 within the response time, then the number of successful tests is increased by one. If the UE fails to report the *NR-Multi-RTT-ProvideLocationInformation* IE with the nr-UE-RxTxTimeDiff field included within the response time then the number of failure tests is increased by one.

14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

15. Repeat steps 1-14 until the confidence level according to Annex D is achieved.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

15.2.6.5 Test requirement

Table 15.2.6.5-1 and Table 15.2.6.5-2 define the primary level settings including test tolerances for the test.

Table 15.2.6.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Active cell		1, 2, 3	Cell 1	Cell 1 is the PCell in NR-Multi-RTT-ProvideAssistanceData [34].

Neighbour cell		1, 2, 3	Cell 2	Cell 2 is a neighbour cell in NR-Multi-RTT-ProvideAssistanceData [34].
RF Channel Number		1, 2, 3	1	For both Cell 1 and Cell 2
$BW_{channel}$	MHz	1	20: $N_{RB,c}$ = 106	
		2	20: $N_{RB,c}$ = 106	
		3	50: $N_{RB,c}$ = 133	
SSB configuration		1	SSB.1 FR1	
		2	SSB.1 FR1	
		3	SSB.2 FR1	
SMTC configuration		1	SMTC.2	
		2	SMTC.1	
		3	SMTC.1	
PRS processing window		1,2,3	PPW.1	As defined in A.3.33
CP length		1, 2, 3	Normal	
DRX		1, 2, 3	OFF	
Time offset between serving and neighbour cells	µs	1	3 Note1	
		2	3 Note1	
		3	3 or 2.34 Note1	
Expected RSTD	µs	1,2,3	0	
Expected RSTD uncertainty	µs	1,2,3	Same as time offset between serving and neighbour cells	
Number of cells provided in assistance data		1, 2, 3	4	Including the reference cell
T1	s	1, 2, 3	5	
T2	s	1, 2, 3	10	
NOTE 1: The value is up to the UE capability. The possible UE capability value: (1/4 symbol, 1/2 symbol, CP length, half of slot). When the UE reported value is > 3us, the time offset between serving and neighbour cells is set to 3us; when the UE reported value is < 3us, the time offset between serving and neighbour cells is set to the UE reported value.				

Table 15.2.6.5-2: Cell specific test parameters

	dBm/47.88 MHz	3	-57.07	-60.59	-57.07	-60.59
Propagation Condition		1, 2, 3	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE Rx-Tx time difference measurement time fulfils the requirements specified in clause 9.9.4.6.

The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2 within the specified UE Rx-Tx time difference measurement time starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported UE Rx-Tx measurement for each correct event shall be within the UE Rx-Tx reporting range specified in clause 10.1.25.3.1.

$T_{UERxTx_wo_gap,\ Total} = \sum_{i=1}^{L} T_{UERxTx_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the positioning frequency layers are in Case 1, or

$T_{UERxTx_wo_gap,\ Total} = \max(T_{UERxTx_wo_gap,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2.

$N_{RxBeam,i}$ = 1

$k_{multiTEG,i}$=1

$N_{PRS,i}^{slot} = 4$

N_{sample}= 4.

$T_{last,i}$ = T_i +PPWL

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$; where Tprs = 160 ms, and the repetition periodicity $PPWRP_i$=160ms. Therefore, $T_{available_PRS,i} = 160$

Solving for Case 1:

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 0.491s and 204.4s.

For SCS 30KHz The LPP time IE ranges between 0.491s and 102.4s.

The LPP time IE ranges between 1s and 205s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 205.3

Solving for Case 2:

Where the remaining parameters depend on the UE capabilities.

For SCS 15KHz The LPP time IE ranges between 0.491s and 25.4s.

For SCS 30KHz The LPP time IE ranges between 0.491s and 12.6s.

The LPP time IE ranges between 1s and 26s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and 26.3

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.6.5-3, Table 15.2.6.5-4, Table 15.2.6.5-4 and Table 15.2.6.5-6 for reference.

15.2.7 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with RxTx TEG in FR1 SA

15.2.7.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement meets the requirements specified in TS 38.133 [50] clause 9.9.4.5 in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured, and when UE is requested to measure a PRS resource with RxTx TEG.

15.2.7.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and nr-UE-RxTxTEG-ID-MaxSupport-r17.

15.2.7.3 Minimum conformance requirements

Same as defined in clause 15.2.5.3.

15.2.7.4 Test description

15.2.7.4.1 Initial conditions

The supported test configuration is listed in Table 15.2.7.4-1.

Table 15.2.7.4-1: Test Configuration

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.7.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.2.7.5-1 and Table 15.2.7.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.7.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

15.2.7.4.2 Test procedure

Same as defined in clause 15.2.5.4.2.

15.2.7.4.3 Message contents

15.2.7.5 Test requirement

Table 15.2.7.5-1 and Table 15.2.7.5-2 define the primary level settings including test tolerances for the test.

Table 15.2.7.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Active cell		1, 2, 3	Cell 1	Cell 1 is the PCell in NR-Multi-RTT-ProvideAssistanceData [34].

Neighbour cell		1, 2, 3	Cell 2	Cell 2 is a neighbour cell in NR-Multi-RTT-ProvideAssistanceData [34].
RF Channel Number		1, 2, 3	1	For both Cell 1 and Cell 2
$BW_{channel}$	MHz	1	20: $N_{RB,c}$ = 106	
		2	20: $N_{RB,c}$ = 106	
		3	50: $N_{RB,c}$ = 133	
SSB configuration		1	SSB.1 FR1	
		2	SSB.1 FR1	
		3	SSB.2 FR1	
SMTC configuration		1	SMTC.2	
		2	SMTC.1	
		3	SMTC.1	
Measurement gap		1, 2, 3	GP#24 or GP#0 Note 1	
CP length		1, 2, 3	Normal	
DRX		1, 2, 3	OFF	
Time offset between serving and neighbour cells	μs	1, 2, 3	3	Synchronous cells
Number of cells provided in assistance data		1, 2, 3	4	Including the reference cell
T1	s	1, 2, 3	5	
T2	s	1, 2, 3	10	
Note 1: GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

	dBm/47.88 MHz	3		-60.59		-60.59
Propagation Condition		1, 2, 3	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.1.3.

The UE Rx-Tx time difference measurement time fulfils the requirements specified in clause 9.9.4.5, with $k_{multiTEG}$=2 if UE does not support or indicate value 'n1' for *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*, and $k_{multiTEG}$=1 otherwise.

The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2 within the specified UE Rx-Tx time difference measurement time starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported UE Rx-Tx measurement for each correct event shall be within the UE Rx-Tx reporting range specified in clause 10.1.25.3.1.

$$T_{UERxTx,i} = \left(k_{multiTEG,i} * CSSF_i * ceil(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Analysing the equation for $T_{UERxTx_wo_gap,i}$:

$N_{RxBeam,i}$ = 1

$N_{PRS,i}^{slot} = 4$

N_{sample}= 4.

Case 1 :$k_{multiTEG,i} = N_{TEG,i}$

Case 2: $k_{multiTEG,i} = \left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$

$T_{last,i} = T_i + T_{available_PRS,i}$

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$

Case 1:

Where the remaining parameters depend on the UE capabilities.For SCS 15KHz The LPP time IE ranges between 1.28s and 1638.5s. For SCS 30KHz The LPP time IE ranges between 1.28s and 819.6s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.7.4.3-3. The LPP time IE ranges between 2s and 1640s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and (1638.3sec)164ten-s.

Case 2:

Where the remaining parameters depend on the UE capabilities.For SCS 15KHz The LPP time IE ranges between 0.648s and 1638.5s. For SCS 30KHz The LPP time IE ranges between 0.64s and 819.6s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 14.2.7.4.3-3. The LPP time IE ranges between 1s and 431s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 1.3s and (1638.3sec)164ten-s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.7.5-4, Table 15.2.7.5-5 , Table 15.2.7.5-6 and Table 15.2.7.5-7 for reference.

Table 15.2.7.5-3: N' based on maxNumOfDL-PRS-ResProcessedPerSlot

n160	160	320
n320	320	480
n640	640	800
n1280	1280	1440

The test tolerances are defined in clauses C.1.6, C 2.5 and C4.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.8 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.2.8.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement meets the requirements specified in TS 38.133 [50] clause 9.9.4.5 with Nsample = 1 in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured

15.2.8.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

15.2.8.3 Minimum conformance requirements

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4] in configured positioning frequency layers within the measurement period $T_{UERxTx,Total}$ ms.

$$T_{UERxTx,\ Total} = \sum_{i=1}^{L} T_{UERxTx,i} + (L-1) * \max(T_{effect,i}).$$

where i is the index of positioning frequency layer,

$T_{UERxTx,i}$ is the measurement period for UE Rx-Tx time difference measurements in positioning frequency layer i as further defined in this clause,

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer i as defined further in this clause.

$$T_{UERxTx,i} = \left(k_{multiTEG,i} * CSSF_i * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where

$CSSF_i$ is the carrier-specific scaling factor for NR PRS-based measurement in the positioning frequency layer i as defined in clause 9.1.5.2,

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*;

otherwise,

$k_{multiTEG}=N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG}=\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs or RxTx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule.

Requirements do not apply if $N_{available}$ =0.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 and if positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in clause 4.2.7.2 of TS 37.355 [34],

N' is UE capability for number of DL PRS resources that it can process in a slot corresponding to *maxNumOfDL-PRS-ResProcessedPerSlot* as specified in clause 6.4.3 of TS 37.355 [34],

N_{sample} is the number of UE Rx-Tx time difference measurement samples:

- N_{sample} = 4 if the UE is not capable of *supportedDL-PRS-ProcessingSamples* defined in [34].

- N_{sample} = 1 if the UE is capable of *supportedDL-PRS-ProcessingSamples* defined in [34] and LMF requests the UE to perform positioning measurements with reduced number of samples by *requestedDL-PRS-ProcessingSamples* [34] and the following conditions are met:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE is capable of *supportedDL-PRS-ProcessingSamples* defined in [34] and the LMF requests the UE to perform positioning measurements with reduced number of samples by *requestedDL-PRS-ProcessingSamples* [34] but the following conditions are not met:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 4 otherwise.

$T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time, $T_{last,i} = T_i + T_{available_PRS,i}$,

$T_{effect,i}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

where

T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$, the least common multiple between $T_{PRS,i}$ and $MGRP_i$

$MGRP_i$ is the measurement gap repetition periodicity in positioning frequency layer *i*.

$T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$

15.2.8.4 Test description

15.2.8.4.1 Initial conditions

The supported test configuration is listed in Table 15.2.8.4-1.

Table 15.2.8.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.8.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.2.8.5-1 and Table 15.2.8.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.8.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

15.2.8.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. Cell 1 and Cell 2 mute PRS transmission during T1 and transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources. The UE is configured to transmit SRS during T2.

The UE is configured with measurement gap pattern ID # 24 or #13 before T2.

2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
5. T1 starts.
6. The SS shall transmit an RRCReconfiguration message with the SRS configuration.
7. The UE shall transmit RRCReconfigurationComplete message.
8. The SS shall transmit an LPP REQUEST CAPABILITIES message.
9. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* in the *NR-DL-PRS-ProcessingCapability* IE and the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 9 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
11. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the reducedDL-PRS-ProcessingSamples-r17 in the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where $\Delta T = 50$ ms.
12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 15.2.8.5-2.
13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.2.8.4.3). The UE shall perform and report the UE rx-tx time difference measurements for Cell 1 and Cell 2. If the UE transmits an *NR-Multi-RTT-ProvideLocationInformation* IE including the nr-UE-RxTxTimeDiff field for Cell 1 and Cell 2 within the response time, then the number of successful tests is increased by one. If the UE fails to report the *NR-Multi-RTT-ProvideLocationInformation* IE with the nr-UE-RxTxTimeDiff field included within the response time then the number of failure tests is increased by one.
14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
15. Repeat steps 1-14 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

Propagation Condition		1	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: SS-RSRP, PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7: Information about types of UE beam is given TS 38.133 [50] in B.2.1.3, and does not limit UE implementation or test system implementation
Note 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMBP from TS 38.101-2 [55] Table 6.2.1.3-4.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.8.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(k_{multiTEG,i} * CSSF_i * ceil(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $CSSF_{PRS,i} = 1$, $K_{p,PRS,i} = 1$, $N_{RxBeam,i} = 8$, $CSSF_{PRS,i} = 1$, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.071$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 2.408s and 20.64s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 15.2.8.4.3-5. The LPP time IE ranges between 3s and 21s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 3.3s and 21.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.8.5-3, Table 15.2.8.5-4 and Table 15.2.8.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.9 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer without measurement gap in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.2.9.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement meets the requirements specified in TS 38.133 [50] clause 9.9.4.6 in AWGN propagation condition in FR2 in standalone scenario.

15.2.9.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and prs Processing Window.

15.2.9.3 Minimum conformance requirements

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4] in configured positioning frequency layers within the measurement period $T_{UERxTx_wo_gap,Total}$ ms.

$T_{UERxTx_wo_gap,\ Total} = \sum_{i=1}^{L} T_{UERxTx_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the positioning frequency layers are in Case 1, or

$T_{UERxTx_wo_gap,\ Total} = \max(T_{UERxTx_wo_gap,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2.

Where,

i is the index of positioning frequency layer, and

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{UERxTx_wo_gap,\ Total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{UERxTx_wo_gap,i}$ is the measurement period for UE Rx-Tx time difference measurement in positioning frequency layer *i* as specified below.

$$T_{UERxTx_wo_gap,i} = \left(k_{multiTEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where

$T_{effect,i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer *i* as defined further in this clause.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not supported *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*;

otherwise,

$k_{multiTEG}$=$N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG}$=$\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs or RxTx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*, and in case 'n0' is

indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1. If positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$,

only the unmuted PRS resources that meet the applicability conditions and fully or partially overlapped with PRS processing window are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

- N′ is UE capability for number of DL PRS resources that it can process in a slot corresponding to *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* as specified in clause 6.4.3 of TS 37.355 [34],

- N_{sample} is the number of UE Rx-Tx time difference measurement samples:

  - N_{sample} = 4 if the UE is not capable of *supportedDL-PRS-ProcessingSamples* defined in [34].

  - N_{sample} = 1 if the UE is capable of *supportedDL-PRS-ProcessingSamples* defined in [34] and LMF requests the UE to perform positioning measurements with reduced number of samples by *requestedDL-PRS-ProcessingSamples* [34] and the following conditions are met:

    - PRS bandwidth is within the active BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 2 if the UE is capable of *supportedDL-PRS-ProcessingSamples* defined in [34] and the LMF requests the UE to perform positioning measurements with reduced number of samples by *requestedDL-PRS-ProcessingSamples* [34] but the following conditions are not met:

    - PRS bandwidth is within the active BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 4 otherwise.

- $T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time.

  If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

- $T_{effect,i}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_{PRS,i}}} \right\rceil * T_{available_{PRS,i}}$$

where

T_i corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$, the least common multiple between $T_{PRS,i}$ and $PPWRP_i$

$PPWRP_i$ is the PRS processing window repetition periodicity in positioning frequency layer *i*.

$T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where

T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$

15.2.9.4 Test description

15.2.9.4.1 Initial conditions

The supported test configuration is listed in Table 15.2.9.4-1.

Table 15.2.9.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.9.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.2.9.5-1 and Table 15.2.9.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.9.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

15.2.9.4.2 Test procedure

The test consists of two sub-tests; Sub-test 1 is for Nsample = 4 and sub-test 2 is for Nsample = 1. Sub-test 2 is only conducted when UE also supporting supportedDL-PRS-ProcessingSamples-RRC-CONNECTED. The test consists of two consecutive time intervals, with duration of T1 and T2. Cell 1 and Cell 2 mute PRS transmission during T1 and transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources. The UE is configured to transmit SRS during T2.

The UE is configured with measurement gap pattern ID # 24 or #13 before T2.

3. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.

4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.

5. T1 starts.

6. The SS shall transmit an LPP REQUEST CAPABILITIES message.

7. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.

8. The SS shall transmit an RRCReconfiguration message with SRS configuration and PPW configuration.

9. The UE shall transmit RRCReconfigurationComplete message.

10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 7 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

11. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.

12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 15.2.9.5-2.

13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.2.9.4.3). The UE shall perform and report the UE rx-tx time difference measurements for Cell 1 and Cell 2. If the UE transmits an *NR-Multi-RTT-ProvideLocationInformation* IE including the nr-UE-RxTxTimeDiff field for Cell 1 and Cell 2 within the response time, then the number of successful tests is increased by one. If the UE fails to report the *NR-Multi-RTT-ProvideLocationInformation* IE with the nr-UE-RxTxTimeDiff field included within the response time then the number of failure tests is increased by one.

14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

15. Repeat steps 1-14 until the confidence level according to Annex D is achieved.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

15.2.9.5 Test requirement

Table 15.2.9.5-1 and Table 15.2.9.5-2 define the primary level settings including test tolerances for the test.Table 15.2.9.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Active cell		1	Cell 1	Cell 1 is the PCell in NR-Multi-RTT-ProvideAssistanceData [49].
Neighbour cell		1	Cell 2	Cell 2 is a neighbour cell in NR-Multi-RTT-ProvideAssistanceData [49].
RF Channel Number		1	1	For both Cell 1 and Cell 2
$BW_{channel}$	MHz	1	200: $N_{RB,c}$ = 132	
SSB configuration		1	SSB.3 FR2	
SMTC configuration		1	SMTC.1	
PRS processing window		1	TS 38.133 [50] Table A.3.33-1: Reference PPW configuration	As defined in TS 38.133 [50] A.3.33
CP length		1	Normal	
DRX		1	OFF	
Time offset between serving and neighbour cells	µs	1	0.58, 2.25 or 3 Note 1	
Expected RSTD	µs	1	0	
Expected RSTD uncertainty	µs	1	Same as time offset between serving and neighbour cells	
Number of cells provided in assistance data		1	4	Including the reference cell
T1	s	1	5	
T2	s	1	20	

NOTE 1: The value is up to the UE capability. The possible UE capability value: (1/4 symbol, 1/2 symbol, CP length, half of slot). When the UE reported value is > 3us, the time offset between serving and neighbour cells is set to 3us; when the UE reported value is < 3us, the time offset between serving and neighbour cells is set to the UE reported value.

PRS-RSRP Note 3	dBm/SCS kHz	1	-90.4	-92.1	-94.2	-100.1
Io	dBm/95.04 MHz	1	-55.73	-55.69	-55.73	-55.69
Propagation Condition		1	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone

Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

Note 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.9.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(k_{multiTEG,i} * CSSF_i * ceil(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $CSSF_{PRS,i} = 1$, $K_{p,PRS,i} = 1$, $N_{RxBeam,i} = 8$, $CSSF_{PRS,i} = 1$, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.071$, $N_{sample} = 1$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 2.408s and 20.64s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 15.2.9.4.3-5. The LPP time IE ranges between 3s and 21s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 3.3s and 21.3s.

For sub-test 2, N_sample= 4. Finally, it results in the following equation:

$$\left(1 * 1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 5.128s and 82.08s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 15.2.9.4.3-5. The LPP time IE ranges between 6.3s and 83.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.9.5-3, Table 15.2.9.5-4 and Table 15.2.9.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.10 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with RxTx TEG in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.2.10.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement meets the requirements specified in TS 38.133 [50] clause 9.9.4.5 in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured, and when UE is requested to measure a PRS resource with RxTx TEG.

15.2.10.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and nr-UE-RxTxTEG-ID-MaxSupport-r17.

15.2.10.3 Minimum conformance requirements

Same as defined in clause 15.2.8.3.

15.2.10.4 Test description

15.2.10.4.1 Initial conditions

The supported test configuration is listed in Table 15.2.10.4-1.

Table 15.2.10.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.10.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.

2. The general test parameter settings are set up according to Table 15.2.10.5-1 and Table 15.2.10.5-2.

3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.10.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

15.2.10.4.2 Test procedure

Same as defined in clause 15.2.8.4.2.

15.2.10.4.3 Message contents

15.2.10.5 Test requirement

Table 15.2.10.5-1 and Table 15.2.10.5-2 define the primary level settings including test tolerances for the test.

Table 15.2.10.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Active cell		1	Cell 1	Cell 1 is the PCell in NR-Multi-RTT-ProvideAssistanceData [49].
Neighbour cell		1	Cell 2	Cell 2 is a neighbour cell in NR-Multi-RTT-ProvideAssistanceData [49].
RF Channel Number		1	1	For both Cell 1 and Cell 2
$BW_{channel}$	MHz	1	200: $N_{RB,c}$ = 132	
SSB configuration		1	SSB.3 FR2	
SMTC configuration		1	SMTC.1	
Measurement gap		1	GP#24 or GP#13 Note 1	
CP length		1	Normal	
DRX		1	OFF	
Time offset between serving and neighbour cells	µs	1	3	Synchronous cells
Number of cells provided in assistance data		1	4	Including the reference cell
T1	s	1	5	
T2	s	1	20	
NOTE 1: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.				

Table 15.2.10.5-2: Cell specific test parameters

Parameter	Unit	Test configuration	Cell 1		Cell 2	
			T1	T2	T1	T2
AoA setup		1	Setup 1 as specified in TS 38.133 [50] clause A.3.15			
Beam Assumption Note 7		1	Rough		Rough

SRS configuration		1	POS-SRS.3		N/A	
N_{oc} Note 2	dBm/SCS	1	-90.1			
N_{oc} Note 2	dBm/15 kHz	1	-99.1			
PRS $\hat{E}_s/I_{ot}$	dB	1	-Infinity	-2.68	-Infinity	-12.30
PRS $\hat{E}_s/N_{oc}$	dB	1	-Infinity	-2	-Infinity	-10
PRS-RSRP Note 3	dBm/SCS kHz	1	-Infinity	-92.1	-Infinity	-100.1
Io	dBm/190.08 MHz	1	N/A	-55.69	N/A	-55.69
Propagation Condition		1	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone

Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation

Note 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.10.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(k_{multiTEG,i} * CSSF_i * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $CSSF_{PRS,i} = 1$, $K_{p,PRS,i} = 2$, $N_{RxBeam,i} = 8$, $CSSF_{PRS,i} = 1$, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.071$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where Tprs = 160 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 160$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 2 * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 10.248s and 164s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 15.2.10.4.3-5. The LPP time IE ranges between 11s and 170s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 11.3s and 170.3s.

Table 15.2.10.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

maxNumOfDL-PRS-ResProcessedPerSlot	$\left\lceil \frac{2}{N'} \right\rceil$

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.11 UE Rx-Tx time difference measurement reporting delay test case for PRS aggregation in FR1 SA

15.2.11.1 Test purpose

The purpose of the test is to verify the measurement requirements specified in TS 38.133 [50] clause 9.9.4.9 for UE Rx-Tx measurements with PRS bandwidth aggregation. The tests are conducted under AWGN propagation condition with

the UE operating in FR1 stand-alone mode and configured to perform UE Rx-Tx measurements by aggregating two intra-band contiguous positioning frequency layers (PFLs) in FR1.

15.2.11.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports Multi-RTT positioning and DL-PRS bandwidth aggregation in RRC_CONNECTED.

15.2.11.3 Minimum conformance requirements

When UE physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [49] with a request to perform measurement by aggregating PRS resources from multiple PFLs via *nr-DL-PRS-JointMeasurementRequestedPFL-List*, the UE shall be able to perform UE Rx-Tx time difference measurement by aggregating PRS resources from multiple PFLs (up to the UE capability specified in clause 9.9.2.3) defined in TS 38.215 [4], during the measurement period $T_{UE_RxTx_aggregated,\ Total}$ defined as:

$$T_{UE_RxTx_aggregated,\ Total} = T_{non\text{-}aggregate_RxTx} + T_{aggregated_RxTx} + T_{margin},$$

where,

$T_{non_aggregate_RxTx}$ is the total measurement period for UE Rx-Tx time difference measurement on PFLs that do not contain PRS resources for aggregation.

Calculation of $T_{non_aggregate}$ is based on clause 9.9.4.5 with the following exceptions,

- only PFLs containing resource set(s) not linked to any other resource set(s) are considered in L
- on each PFL i, only resource set(s) not linked to any other resource set(s) are considered in $T_{available_PRS,i}$, $N_{PRS,i}^{slot}$ and $L_{available_PRS,i}$
- $N_{sample} = 2$ if the UE supports the capability of positioning measurements with reduced number of samples as indicated by *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* specified in TS 37.355 [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples,
- $(L-1) * \max(T_{effect,i})$ is replaced by $(L-1) * T'_{margin}$.

$T_{non_aggregate_RxTx}$ is equal to zero if UE is not configured to perform non-aggregated measurements by the LMF.

$T_{aggregate_RxTx}$ is the total measurement period for UE Rx-Tx time difference measurements performed by UE by aggregating PRS resources from multiple PFLs as defined in TS 38.214 [26].

If UE is configured to perform measurements on PFLs that contain PRS resources for aggregation and on PFLs that do not contain PRS resources for aggregation, $T_{margin} = T'_{margin}$ is delay margin to account for delay between Rx-Tx time difference measurement performed by UE on PFLs that contain PRS resources for aggregation and Rx-Tx time difference measurement performed by UE on PFLs that do not contain PRS resources for aggregation.

If UE is only configured to perform measurements on PFLs that contain PRS resources for aggregation or if UE is only configured to perform measurements on PFLs that do not contain PRS resources for aggregation, then $T_{margin} = 0$.

$T'_{margin} = \max(Teffect, i)$, by considering both aggregated PFLs and non-aggregated PFLs configured for positioning measurement.

If UE is capable of performing latency reduced positioning measurements and is configured to perform latency reduced positioning measurement by LMF via *reducedDL-PRS-ProcessingSamples-r17* [34], then $N_{sample} = 2$ shall be considered in calculations of $T_{aggregate_RxTx}$ and $T_{non\text{-}aggregate_RxTx}$.

If UE is not capable to perform latency reduced positioning measurements or is not configured to perform latency reduced positioning measurement by LMF via *reducedDL-PRS-ProcessingSamples-r17* [34], then $N_{sample} = 4$ shall be considered in calculations of $T_{aggregate_RxTx}$ and $T_{non\text{-}aggregate_RxTx}$.

$T_{aggregate_RxTx}$, total measurement period for UE Rx-Tx time difference measurements performed by UE by aggregating PRS resources from multiple PFLs as defined in TS 38.214 [26], is defined as:

$$T_{aggregate_RxTx} = \sum_{i=1}^{G} T_{RxTx_aggregate,i} + (G-1) * T'_{margin} \quad ,$$

where

i is the index of effective PFL, corresponding to the group of PFLs containing linked PRS resource sets to be aggregated for UE Rx-Tx time difference measurement,

G denotes the number of effective PFLs that UE is configured to perform aggregated measurements on. G is configured by LMF and is provisioned to UE via *nr-DL-PRS-AggregationInfo.*

$T_{RxTx_aggregate,i}$ is the measurement period for UE Rx-Tx time difference measurement in the effective positioning frequency layer *i* as specified below:

$$T_{RxTx_aggregate,i} = \left(k_{multiTEG_agg,i} \times CSSF_{PRS_agg,i} \times ceil(K_{p,PRS_agg,i}) \times N_{RxBeam_agg,i} \times \left\lceil \frac{N^{slot}_{PRS_agg,i}}{N'_{agg}} \right\rceil \left\lceil \frac{L_{available_PRS_agg,i}}{N_{agg}} \right\rceil \times N_{sample_agg} - 1\right) \times T_{effect_agg,i} + T_{last_agg,i} \ ,$$

where:

$N_{RxBeam,i}$ is the UE Rx beam sweeping factor.

In FR1, $N_{RxBeam,i}$ = 1.

In FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing effective positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-Multi-RTT-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$CSSF_{PRS_agg,i}$ is the carrier-specific scaling factor for NR PRS-based positioning measurements in effective positioning frequency layer i as defined in clause 9.1.5.2.

$k_{multiTEG_agg,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$ = 1 if UE is not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*;

Otherwise,

$k_{multiTEG,i} = N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG,i} = \left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure aggregated PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$K_{p,PRS_agg,i}$ is a scaling factor for effective positioning frequency layer i to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS_agg,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS_agg,i}$ = 1 for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS_agg,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the effective positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

- N_{total} is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and
- $N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

- Requirements do not apply if $N_{available} = 0$.

$N^{slot}_{PRS_agg,i}$ is the maximum number of DL PRS resources in effective positioning frequency layer i configured in a slot.

$L_{available_PRS_agg,i}$ is the time duration of available PRS in the effective positioning frequency layer i to be measured during $T_{available_PRS_agg,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS_agg,i}$, only the PRS resources unmuted and fully or partially overlapped with MG and satisfying the conditions for PRS BW aggregation are considered.

N_{sample_agg} is the number of UE Rx-Tx time difference measurement samples.

$T_{last_agg,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the effective positioning frequency layer i, including the sampling time and processing time. If all of the PRS resources to be measured are available in the same MG occasion during $T_{availabe_agg}$, $T_{last_agg,i} = T_{agg,i}$ + MGL. Otherwise, $T_{last_agg,i} = T_{agg,i} + T_{available_PRS_agg,i}$,

$T_{effect_agg,i}$ is the periodicity of the UE Rx-Tx time difference measurement in the effective positioning frequency layer i defined as:

$$T_{effect_agg,i} = \left\lceil \frac{T_{agg,i}}{T_{available_PRS_agg,i}} \right\rceil \times T_{available_PRS_agg,i}$$

where,

$T_{available_PRS_agg,i} = LCM(T_{PRS_agg,i}, MGRP_i)$, the least common multiple between $T_{PRS_agg,i}$ and $MGRP_i$. $MGRP_i$ is the repetition periodicity of the measurement gap applicable for measurement in the effective PRS frequency layer i.

$T_{PRS_agg,i}$ is the periodicity of DL PRS resources meeting the bandwidth aggregation conditions with muting on effective positioning frequency layer i. If more than one PRS periodicities are configured in effective positioning frequency layer i, the least common multiple of PRS periodicities $T^{PRS\ with\ muting}_{per_agg}$ among all DL PRS resource sets in the effective positioning frequency layer is used to derive $T_{PRS_agg,i}$, where,

$T^{PRS\ with\ muting}_{per_agg} = N_{muting} \times T^{PRS}_{per_agg}$, is the PRS periodicity with muting per PRS resource configured for aggregation,

$T^{PRS}_{per_agg}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T^{PRS_agg}_{muting} \times L_{muting}$, where $T^{PRS_agg}_{muting}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

Note: For the purpose of calculating $T_{PRS_agg,i}$, only the PRS resources fully or partially covered by the MG and PRS resources that satisfy the conditions for PRS BW aggregation are considered.

$\{N_{agg}, T_{agg,i}\}$ is UE capability combination per band to aggregate PRS resources from multiple PFLs within an effective PFL where N_{agg} is a duration of DL PRS symbols in ms corresponding to *prs-durationOfTwoPRS-BWA-ProcessingSymbolsN* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsN* in TS 37.355 [34] processed every $T_{agg,i}$ ms corresponding to *prs-durationOfTwoPRS-BWA-ProcessingSymbolsT* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsT* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding

to *maximumOfTwoAggregatedDL-PRS-Bandwidth* or *maximumOfThreeAggregatedDL-PRS-Bandwidth* in TS 37.355 [34]

N'_{agg} is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfAggregatedDL-PRS-ResourcePerSlot* specified in TS 37.355 [34].

The normative reference for this requirement is TS 38.133 [50] clause 9.9.4.9.

15.2.11.4 Test description

The test defines three possible test configurations; specified in Table 15.2.11.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.2.11.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

15.2.11.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.11.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.2.11.5-1 and Table 15.2.11.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.11.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.2.11.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. Cell 1 and Cell 2 mute PRS transmission during T1 and transmit PRS during T2. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources. The UE is configured to transmit SRS during T2.

2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
5. T1 starts.
6. The SS shall transmit an RRCReconfiguration message with the SRS configuration.
7. The UE shall transmit RRCReconfigurationComplete message.
8. The SS shall transmit an LPP REQUEST CAPABILITIES message.

9. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.

10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE and *NR-DL-PRS-AggregationInfo-r18* linking each PRS resource in PFL1 to the corresponding PRS resource in PFL2 such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 MS. If the UE message at step 9 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

11. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the NR-Multi-RTT-RequestLocationInformation IE and nr-DL-PRS-JointMeasurementRequest-r18 IE.

12. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 15.2.11.5-2.

13. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.2.11.4.3). The UE shall perform and report the UE rx-tx time difference measurements for Cell 1 and Cell 2. If the UE transmits an *NR-Multi-RTT-ProvideLocationInformation* IE including the nr-UE-RxTxTimeDiff field for Cell 1 and Cell 2 within the response time then the number of successful tests is increased by one. If the UE fails to report the *NR-Multi-RTT-ProvideLocationInformation* IE with both the nr-UE-RxTxTimeDiff field included within the response time then the number of failure tests is increased by one.

14. If the UE message at step 13 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

15. Repeat steps 1-14 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

	dBm/19.08 MHz	2		-64.57		-64.57
	dBm/47.88 MHz	3		-60.59		-60.59
Propagation Condition		1, 2, 3	AWGN			

NOTE 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved on all OFDM symbols except those in which PRS is allocated.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

NOTE 3: PRP and Io levels have been derived from other parameters and they are provided for information only. They are not settable parameters themselves.

NOTE 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.11.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{RxTx_aggregate,i} = \left(k_{multiTEG_agg,i} \times CSSF_{PRS_agg,i} \times ceil(K_{p,PRS_agg,i}) \times N_{RxBeam_agg,i} \times \left\lceil \frac{N_{PRS_agg,i}^{slot}}{N'_{agg}} \right\rceil \left\lceil \frac{L_{available_PRS_agg,i}}{N_{agg}} \right\rceil \times N_{sample_agg} - 1\right) \times T_{effect_agg,i} + T_{last_agg,i},$$

Where $k_{multiTEG_agg,i} = 1$, $CSSF_{PRS_agg,i} = 1$, $K_{p,PRS_agg,i} = 1$, $N_{RxBeam_agg,i} = 1$, $N_{PRS_agg,i}^{slot} = 1$, $L_{avavailable_PRS_agg,,i} = 0.285$, $N_{sample_agg} = 4$. N'_{agg} is the parameter maxNumOfAggregatedDL-PRS-ResourcePerSlot from TS 37.355 [49], Nagg is the parameter prs-durationOfTwoPRS-BWA-ProcessingSymbolsN or prs-durationOfThreePRS-BWA-ProcessingSymbolsN from TS 37.355 [49], $T_{last_agg,i} = Tagg,i + T_{available_PRS_agg,i}$ and $T_{effect_agg,i} = \left\lceil \frac{T_{agg,i}}{T_{available_PRS_agg,i}} \right\rceil \times T_{available_PRS_agg,i}$.

$T_{available_PRS_agg,i} = LCM(T_{PRS_agg,i}, MGRP_i)$; where $T_{PRS_agg,i}$ = 320 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $T_{available_PRS_agg,i} = 320$ ms.

Finally, it results in the following equation:

$$(1 \times 1 \times 1 \times 1 \times \left\lceil \frac{1}{N'_{agg}} \right\rceil \left\lceil \frac{0.285}{N_{agg}} \right\rceil \times 4\text{-}1) \times T_{effect_agg,i} + T_{last_agg,i}$$

Depending on the UE Buffering defined in clause 5.1.6.5 of TS 38.214 [26]:

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 15kHz the LPP time IE ranges between 1.288s and 25.92s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should

be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 2s and 26s.

Similarly for Type 2 Buffering, Best Case result of 1.288s is 2s and for the worst-case result of 41280ms, rounded to the next second, the final value is 42s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 42.3s.

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 30kHz the LPP time IE ranges between 1.288s and 15.68s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 2s and 16s.

Similarly for Type 2 Buffering, Best Case result of 1.288s is 1s and for the worst-case result of 20800ms, rounded to the next second, the final value is 21s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 21.3s.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.12 UE Rx-Tx time difference measurement reporting delay test case for PRS aggregation in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz15.2.12.1 Test purpose

The purpose of the test is to verify the measurement requirements specified in TS 38.133 [50] clause 9.9.4.9 for UE Rx-Tx measurements with PRS bandwidth aggregation. The tests are conducted under AWGN propagation condition with the UE operating in FR2 stand-alone mode and configured to perform UE Rx-Tx measurements by aggregating two intra-band contiguous positioning frequency layers (PFLs) in FR2.

15.2.12.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports Multi-RTT positioning and DL-PRS bandwidth aggregation in RRC_CONNECTED.

15.2.12.3 Minimum conformance requirements

Same as defined in clause 15.2.11.3.

15.2.12.4 Test description

The supported test configuration is listed in Table 15.2.12.4-1.

Table 15.2.12.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

15.2.12.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.12.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.2.12.5-1 and Table 15.2.12.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.12.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.2.12.4.2 Test procedure

Same as defined in clause 15.2.11.4.2.

15.2.12.4.3 Message contents

As defined in clause 15.2.11.4.3, with the following exceptions:

Table 15.2.12.4.3-1 replaces Table 15.2.11.4.3-3, Table 15.2.12.4.3-2 replaces Table 15.2.11.4.3-7 and Table 15.2.12.4.3-3 replaces Table 15.2.11.4.3-8.

15.2.12.5 Test requirement

Table 15.2.12.5-1 and Table 15.2.12.5-2 define the primary level settings including test tolerances for the test.

Table 15.2.12.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Active cell		1	Cell 1	Cell 1 is the PCell in *NR-Multi-RTT-ProvideAssistanceData* [49].
Neighbour cell		1	Cell 2	Cell 2 is a neighbour cell in *NR-Multi-RTT-ProvideAssistanceData* [49].
RF Channel Number		1	1	For both Cell 1 and Cell 2, all signals/channels except PRS in PFL2 are allocated within this channel.
			2	For both Cell 1 and Cell 2, only PRS in PFL2 is allocated within this channel.
$BW_{channel}$	MHz	1	200: $N_{RB,c}$ = 132	For both RF channels
SSB configuration		1	SSB.2 FR2	
SMTC configuration		1	SMTC.1	
Measurement gap		1	GP#24 or GP#13 Note 1	
CP length		1	Normal	
DRX		1	OFF	
Time offset between serving and neighbour cells	μs	1	3	Synchronous cells/TRPs
Expected RSTD	μs	1	3	

Expected RSTD uncertainty	µs	1	5	
T1	s	1	5	
T2	s	1	20	
Note 1: GP#24 is configured if the UE supports it, otherwise GP#13 is configured.

SRS configuration		1	POS-SRS.3		N/A	
N_{oc} Note 2	dBm/SCS	1	-89	-90.1	-89	-90.1
N_{oc} Note 2	dBm/15 kHz	1	-98	-99.1	-98	-99.1
PRS $\hat{E}_s / I_{ot}$	dB	1	-Infinity	-2.69	-Infinity	-12.1
PRS $\hat{E}_s / N_{oc}$	dB	1	-Infinity	-2	-Infinity	-9.8
PRP Note 3	dBm/SCS kHz	1	-Infinity	-92.1	-Infinity	-99.9
Io Note 3 (on symbols where PRS is not allocated)	dBm/190.08 MHz	1	N/A	-55.68	N/A	-55.68
Propagation Condition		1	AWGN			

Note 1:	OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved on all OFDM symbols except those in which PRS is allocated.
Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	PRP and Io levels have been derived from other parameters and they are provided for information only. They are not settable parameters themselves.
Note 4:	The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 5:	Information about types of UE beam is given in clause TS 38.133 clause B.2.1.3, and does not limit UE implementation or test system implementation
Note 6:	Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] table 6.2.1.3-4.
Note 7:	Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
Note 8:	As observed with 0 dBi gain antenna at the centre of the quiet zone.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.12.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{RxTx_aggregate,i} = \left(k_{multiTEG_agg,i} \times CSSF_{PRS_agg,i} \times ceil(K_{p,PRS_agg,i}) \times N_{RxBeam_agg,i} \times \left\lceil \frac{N_{PRS_agg,i}^{slot}}{N'_{agg}} \right\rceil \left\lceil \frac{L_{available_PRS_agg,i}}{N_{agg}} \right\rceil \times N_{sample_agg} - 1\right) \times T_{effect_agg,i} + T_{last_agg,i},$$

Where $k_{multiTEG_agg,i} = 1$, $CSSF_{PRS_agg,i} = 1$, $K_{p,PRS_agg,i} = 1$, $N_{RxBeam_agg,i} = 8$, $N_{PRS_agg,i}^{slot} = 1$, $L_{avavailable_PRS_agg,,i} = 0.142$, $N_{sample_agg} = 4$. N'_{agg} is the parameter maxNumOfAggregatedDL-PRS-ResourcePerSlot from TS 37.355 [49], Nagg is the parameter prs-durationOfTwoPRS-BWA-ProcessingSymbolsN or prs-durationOfThreePRS-BWA-ProcessingSymbolsN from TS 37.355 [49], $T_{last_agg,i}$ = Tagg,i + $T_{available_PRS_agg,i}$ and $T_{effect_agg,i} = \left\lceil \frac{T_{agg,i}}{T_{available_PRS_agg,i}} \right\rceil \times T_{available_PRS_agg,i}$.

$T_{available_PRS_agg,i} = LCM(T_{PRS_agg,i}, MGRP_i)$; where $T_{PRS_agg,i}$ = 640 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS_agg,i} = 640$ ms.

Finally, it results in the following equation:

$$(1 \times 1 \times 1 \times 8 \times \left\lceil \frac{1}{N'_{agg}} \right\rceil \left\lceil \frac{0.142}{N_{agg}} \right\rceil \times 4\text{-}1) \times T_{effect_agg,i} + T_{last_agg,i}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 41.646s and 166.4s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 15.2.12.4.3-5. The LPP time IE ranges between 42s and 170s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 42.3s and 85.3s.

15.2.13 UE Rx-Tx time difference measurement reporting delay test case in FR1 for Redcap UE without Rx FH

15.2.13.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement without RX FH reported by the RedCap UE meets the requirements specified in TS 38.133 [50] clause 9.9A.4.5 in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured. The measurement reporting delay test defined in this clause is valid for both 1 Rx and 2 Rx RedCap UEs.

15.2.13.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method.

15.2.13.3 Minimum conformance requirements

Same as defined in clause 15.2.11.3.

15.2.13.4 Test description

The test defines three possible test configurations; specified in Table 15.2.13.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.2.13.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

15.2.13.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.13.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.2.13.5-1 and Table 15.2.13.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.13.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.2.13.4.2 Test procedure

Same as defined in clause 15.2.11.4.2.

15.2.13.4.3 Message contents

As defined in clause 15.2.11.4.3, with the following exceptions:

Table 15.2.13.4.3-1 replaces Table 15.2.11.4.3-3, Table 15.2.13.4.3-2 replaces Table 15.2.11.4.3-5, Table 15.2.13.4.3-3 replaces Table 15.2.11.4.3-7, Table 15.2.13.4.3-4 replaces Table 15.2.11.4.3-8 and Table 15.2.13.4.3-5 replaces Table 15.2.11.4.3-9.

Propagation Condition		1,2,3,4	AWGN			
NOTE 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.						
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.						
NOTE 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.						
NOTE 4: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.						

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.13.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$\mathrm{T_{UERxTx,i}} = \left(k_{multiTEG,i} * \mathrm{CSSF_i} * \mathrm{ceil}(\mathrm{K_{p,PRS,i}}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,\mathrm{i}}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,\mathrm{i}}}{N} \right\rceil * N_{sample} - 1 \right) * \mathrm{T_{effect,i}} + \mathrm{T_{last,i}}$$

Where $\mathrm{CSSF_{PRS,i}} = 1$, $\mathrm{K_{p,PRS,i}} = 1$, $N_{RxBeam,i} = 1$, $\mathrm{CSSF_{PRS,i}} = 1$, $N_{PRS,i}^{slot} = 1$, $L_{available_PRS,\mathrm{i}} = 1.142$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $\mathrm{T_{last,i}} = T_i + T_{available_PRS,\mathrm{i}}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where $T_{PRS,i}$ = 320 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 320$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 1 * 1 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{1.142}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 15kHz the LPP time IE ranges between 1.288s and 51.52s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 2s and 52s.

Similarly for Type 2 Buffering, Best Case result of 1.288s is 2s and for the worst-case result of 82240ms, rounded to the next second, the final value is 83s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 83.3s.

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 30kHz the LPP time IE ranges between 1.288s and 82.24s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 2s and 83s.

Similarly for Type 2 Buffering, Best Case result of 1.288s is 2s and for the worst-case result of 41280ms, rounded to the next second, the final value is 42s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 42.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.13.5-3, Table 15.2.13.5-4 and Table 15.2.13.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.14 UE Rx-Tx time difference measurement reporting delay test case in FR2 for Redcap UE without Rx FH

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.2.14.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement without RX FH in RRC_CONNECTED mode meets the requirements specified in TS 38.133 [50] clause 9.9A.4.5 in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured. The measurement reporting delay test defined in this clause is valid for both 1 Rx and 2 Rx RedCap UEs.

15.2.14.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method.

15.2.14.3 Minimum conformance requirements

Same as defined in clause 15.2.11.3.

15.2.14.4 Test description

The supported test configuration is listed in Table 15.2.14.4-1.

Table 15.2.14.4-1: Test Configuration

Config	Description
1	120 kHz SSB and PRS SCS, 100 MHz bandwidth, TDD duplex mode

15.2.14.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.14.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.2.14.5-1 and Table 15.2.14.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.14.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.2.14.4.2 Test procedure

Same as defined in clause 15.2.11.4.2.

15.2.14.4.3 Message contents

As defined in clause 15.2.11.4.3, with the following exceptions:

Table 15.2.14.4.3-1 replaces Table 15.2.11.4.3-3, Table 15.2.14.4.3-2 replaces Table 15.2.11.4.3-5, Table 15.2.14.4.3-3 replaces Table 15.2.11.4.3-7, Table 15.2.14.4.3-4 replaces Table 15.2.11.4.3-8 and Table 15.2.14.4.3-5 replaces Table 15.2.11.4.3-9.

Propagation Condition		1	AWGN			

NOTE 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over sub-carriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
NOTE 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
NOTE 7: Information about types of UE beam is given in TS 38.133 annex B.2.1.3, and does not limit UE implementation or test system implementation
NOTE 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] table 6.2.1.3-4.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.14.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(k_{multiTEG,i} * CSSF_i * ceil(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $k_{multiTEG,i} = 1$, $K_{p,PRS,i} = 1$, $N_{RxBeam,i} = 8$, $CSSF_{PRS,i} = 1$, $N_{PRS,i}^{slot} = 1$, $L_{available_PRS,i} = 0.035$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355[49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where $T_{PRS,i}$ = 320 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 320$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355[49]

Finally, it results in the following equation:

$$\left(1 * 1 * 1 * 8 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{0.035}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

For Type 1 duration calculation with UE symbol level buffering capability, the LPP time IE ranges between 10.248s and 41.28s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 11s and 42s.

Similarly for Type 2 Buffering, Best Case result of 10.248s is 11s and for the worst-case result of 41280ms, rounded to the next second, the final value is 42s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 11.3s and 42.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.14.5-3, Table 15.2.14.5-4 and Table 15.2.14.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.15 UE Rx-Tx time difference measurement reporting delay test case in FR1 for Redcap UE with Rx FH

15.2.15.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement with Rx FH in RRC_CONNECTED state meets the requirements specified in TS 38.133 [50] clause 9.9A.4.8 in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.2.15.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method and maximumPRS-BandwidthAcrossAllHopsFR1 for at least one band and PRS frequency hopping measurement and report

15.2.15.3 Minimum conformance requirements

The requirements in this clause apply when a RedCap UE is requested by the LMF to perform measurements with FH, and UE reports measurement based on multiple hops.

The requirements in clause 9.9A.4.5 shall apply with the following modifications.

- N_{sample} = 2 if the UE supports the capability of positioning measurements with reduced number of samples as indicated by *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* specified in TS 37.355 [49], and the LMF requests the UE to perform positioning measurements with reduced number of samples. Otherwise, N_{sample} = 4.

- A measurement sample with FH is defined as a PRS measurement over multiple hops within a single measurement gap.

- $L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$, where

  - $N_{hop,i,j}$ is the number of hops that UE can do in an MG occasion *j* as defined in the following, and

  - $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in MG instance *j* during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{per-hop,i,j}$, only the PRS resources unmuted and fully or partially overlapped with the sampling duration in each hop are considered;

  - *J* is the number of MG instance during $T_{available_PRS,i}$.

The sampling window per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, T_{hop} is the applicable length per hop as defined in table 9.9A.4.8-1, and RRT_{FH} is the retuning time between Rx hops as reported by UE in *rf-RxRetunTimeFR1* or *rf-RxRetunTimeFR2* via *NR-DL-PRS-ProcessingCapability* specified in TS 37.355 [49]. The first hop within a MG instance starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the MG instance taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

Table 9.9A.4.8-1: Applicable number of hops per slot and applicable length of each hop

RRT_{FH}	(comb size, Number of PRS symbols)	Applicable number of hops per slot (N_{hops}^{slot})	Applicable length per hop (T_{hop}) in number of symbols
$RRT_{FH} \leq 2$ symbols	(2, 12) with SCS 15 kHz, 30 kHz, 60 kHz in FR2, 120 kHz	2	7
	All others	1	14
2 symbols $< RRT_{FH} \leq 6$ symbols	(≤ 6, any)	1	14
	(12, 12)	½	28
$RRT_{FH} > 6$ symbols	Any combination	½	28

The number of hops within a single MG occasion $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right)$$

where

- $N_{hop,max}$ is the maximum number of Rx hops signaled by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* as specified in TS 37.355 [49] for positioning frequency layer *i*

- $N3_i$ is indicated via UE capability *processingPRS-SymbolsDurationN3-r18* for positioning frequency layer *i*

- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a MG instance,

- $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot} = 2$,

- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1$,

- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} > 1$,

- $N_{hops,effect,i,j} = \left\lfloor \frac{(N_{rep}^{PRS}-1)}{2} \right\rfloor + 1$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} = 1$,

- where N_{rep}^{PRS} is the number of inter-slot PRS repetitions within the MG occasion excluding the gap retuning times, which are unmuted and fully or partially overlapped with the sampling duration within each hop. M_{rep}^{PRS} is the PRS repetition interval configured by *dl-PRS-ResourceTimeGap* and N_{hops}^{slot} is the applicable number of hops per slot as defined in table 9.9A.4.8-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions $\left(N_{rep}^{PRS}\right)$ within an MG instance and the same PRS repetition interval $\left(M_{rep}^{PRS}\right)$, otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of BW_{total} defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop,i,j} * BW_{per-hop} - \left(N_{hop} - 1\right) * BW_{overlap}\right)$$

where

- BW_{PRS} is the minimum among
- configured PRS BW, and
- UE capability of maximum PRS BW across all hops indicated via *maximumPRS-BandwidthAcrossAllHopsFR1-r18* or *maximumPRS-BandwidthAcrossAllHopsFR2-r18*, and
- total BW of all hops requested by LMF via *nr-DL-PRS-RxHoppingTotalBandwidth-r18* as specified in TS 37.355 [49],

  $N_{hop,i,j}$ is number of hops within a single MG occasion as define above,

  $BW_{per-hop}$ is the UE capability on PRS BW per hop indicated via *supportedBandwidthPRS-r16* as specified in TS 37.355 [49],

  $BW_{overlap}$ is the UE capability on BW of the overlapping RB indicated via *numOfOverlappingPRB-r18* as specified in TS 37.355 [49].

The normative reference for this requirement is TS 38.133 [50] clause 9.9A.4.8.

15.2.15.4 Test description

The test defines three possible test configurations; specified in Table 15.2.15.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.2.15.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, cell bandwidth 50 MHz, FDD duplex mode
2	15 kHz SSB SCS, cell bandwidth 50 MHz, TDD duplex mode
3	30 kHz SSB SCS, cell bandwidth 100 MHz, TDD duplex mode
4	15 kHz SSB SCS, cell bandwidth 50 MHz, HD-FDD duplex mode
NOTE 1: The RedCap UE is only required to be tested in one of the supported test configurations. NOTE 2: This test case is applicable to the UE supporting per hop bandwidth ≥ 10 MHz for SCS 15 kHz. NOTE 3: This test case is applicable to the UE supporting per hop bandwidth = 20 MHz for SCS 30 kHz.	

15.2.15.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.15.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.2.15.5-1 and Table 15.2.15.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.15.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.2.15.4.2 Test procedure

Same as defined in clause 15.2.11.4.2.

15.2.15.4.3 Message contents

As defined in clause 15.2.11.4.3, with the following exceptions:

Table 15.2.15.4.3-1 replaces Table 15.2.11.4.3-3, Table 15.2.15.4.3-2 replaces Table 15.2.11.4.3-5, Table 15.2.15.4.3-3 replaces Table 15.2.11.4.3-7, Table 15.2.15.4.3-4 replaces Table 15.2.11.4.3-8 and Table 15.2.15.4.3-5 replaces Table 15.2.11.4.3-9.

Propagation Condition		1, 2, 3, 4	AWGN			

NOTE 1: The resources for uplink transmission are assigned to the RedCap UE prior to the start of time period T2.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.15.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(k_{multiTEG,i} * CSSF_i * ceil(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $k_{multiTEG,i} = 1$, $K_{p,PRS,i} = 1$, $N_{RxBeam,i} = 1$, $CSSF_{PRS,i} = 1$, $N_{PRS,i}^{slot} = 1$, , $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where $T_{PRS,i}$ = 320 ms, and MGRP is 80 (for GP#24) or 40 (for GP#0) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 320$ ms. T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

$$L_{available_{PRS},i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$$

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i} \right)$$

$N3_i$ depends on UE parameter processingPRS-SymbolsDurationN3-r18 from TS 37.355 [49]. $N_{hop,max}$ depends on UE parameter maximumFH-Hops from TS 37.355 [49].

For configuration 1, for type 1 duration calculation, we can get the minimum $L_{available_{PRS},i} = 1.14$ ms and the maximum $L_{available_{PRS},i} = 13.68$ ms. For type 2 duration calculation, we can get the minimum $L_{available_{PRS},i} = 1$ ms and the maximum $L_{available_{PRS},i} = 48$ ms.

For configuration 3, for type 1 duration calculation, we can get the minimum $L_{available_{PRS},i} = 0.568$ ms and the maximum $L_{available_{PRS},i} = 6.816$ ms. For type 2 duration calculation, we can get the minimum $L_{available_{PRS},i} = 2$ ms and the maximum $L_{available_{PRS},i} = 24$ ms.

Finally, it results in the following equation:

$$\left(1 * 1 * 1 * 1 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

For configuration 1, for Type 1 duration calculation with UE symbol level buffering capability, the LPP time IE ranges between 1.288s and 563.52s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 2s and 570s.

Similarly for Type 2 Buffering, Best Case result of 1.288s is 2s and for the worst-case result of 328ms, rounded to the next second, the final value is 330s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 570.3s.

For configuration 3, for Type 1 duration calculation with UE symbol level buffering capability, the LPP time IE ranges between 1.288s and 281.92s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 2s and 290s.

Similarly for Type 2 Buffering, Best Case result of 1.288s is 2s and for the worst-case result of 983.36ms, rounded to the next second, the final value is 990s.The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 990.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.15.5-3, Table 15.2.15.5-4 and Table 15.2.15.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.2.16 UE Rx-Tx time difference measurement reporting delay test case in FR2 for Redcap UE with Rx FH

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.2.16.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement with Rx FH in RRC_CONNECTED state meets the requirements specified in TS 38.133 [50] clause 9.9A.4.8 in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.2.16.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method and maximumPRS-BandwidthAcrossAllHopsFR2 for at least one band and PRS frequency hopping measurement and report

15.2.16.3 Minimum conformance requirements

Same as defined in clause 15.2.15.3.

15.2.16.4 Test description

The supported test configuration is listed in Table 15.2.16.4-1.

Table 15.2.16.4-1: Test Configuration

Configuration	Description
1	120 kHz SSB SCS, cell bandwidth 400 MHz, TDD duplex mode
NOTE 1: This test case is applicable to the UE supporting per hop bandwidth = 100 MHz for SCS 120 kHz.	

15.2.16.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.2.16.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.2.16.5-1 and Table 15.2.16.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.2.16.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.2.16.4.2 Test procedure

Same as defined in clause 15.2.11.4.2.

15.2.16.4.3 Message contents

As defined in clause 15.2.11.4.3, with the following exceptions:

Table 15.2.16.4.3-1 replaces Table 15.2.11.4.3-3, Table 15.2.16.4.3-2 replaces Table 15.2.11.4.3-5, Table 15.2.16.4.3-3 replaces Table 15.2.11.4.3-7, Table 15.2.16.4.3-4 replaces Table 15.2.11.4.3-8 and Table 15.2.16.4.3-5 replaces Table 15.2.11.4.3-9.

Propagation Condition		1	AWGN			

NOTE 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
NOTE 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
NOTE 7: Information about types of UE beam is given in TS 38.133 annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] table 6.2.1.3-4.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.2.16.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(k_{multiTEG,i} * CSSF_i * ceil(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $k_{multiTEG,i} = 1$, $K_{p,PRS,i} = 1$, $N_{RxBeam,i} = 8$, $CSSF_{PRS,i} = 1$, $N_{PRS,i}^{slot} = 1$,, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$; where $T_{PRS,i}$ = 320 ms, and MGRP is 80 (for GP#24) or 40 (for GP#13) depending on UE capabilities. Therefore, $T_{available_PRS,i} = 320$ ms. T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

$$L_{available_{PRS},i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$$

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i} \right)$$

$N3_i$ depends on UE parameter processingPRS-SymbolsDurationN3-r18 from TS 37.355 [49]. $N_{hop,max}$ depends on UE parameter maximumFH-Hops from TS 37.355 [49].

For type 1 duration calculation, we can get the minimum $L_{available_{PRS},i} = 0.28$ ms and the maximum $L_{available_{PRS},i} = 0.84$ ms.

For type 2 duration calculation, we can get the minimum $L_{available_{PRS},i} = 0.5$ ms and the maximum $L_{available_{PRS},i} = 7$ ms.

Finally, it results in the following equation:

$$\left(1 * 1 * 1 * 8 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS},i}}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

For Type 1 duration calculation with UE symbol level buffering capability, the LPP time IE ranges between 10.248s and 205.12s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 11s and 210s.

Similarly for Type 2 Buffering, Best Case result of 10.248s is 11s and for the worst-case result of 328000ms, rounded to the next second, the final value is 330s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 11.3s and 330.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.16.5-3, Table 15.2.16.5-4 and Table 15.2.16.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.3 UE Rx-Tx time difference measurement accuracy test cases in RRC_CONNECTED

15.3.1 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR1 SA

15.3.1.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25.2. The test is conducted in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.3.1.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports Multi-RTT positioning.

15.3.1.3 Minimum conformance requirements

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

N_{TA_offset} defined in Table 7.1.2-2 changes during the UE Rx-Tx measurement period or

if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within [-160, 160] msec of at least one DL PRS resource of each of the TRPs in the assistance data.

FFS: whether UE Rx-Tx time difference measurement accuracy requirements in this clause shall also apply if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1.2.

The UE shall continue and complete a UE Rx-Tx measurement while meeting UE Rx-Tx measurement accuracy requirements defined in this clause when a serving cell change occurs during the UE Rx-Tx measurement provided that the serving cell change does not impact the SRS configuration for the UE Rx-Tx measurement.

Note: The requirements for fading channel in this clause are derived based on TDL-A (30 ns delay spread, 5Hz) and TDL-C (60 ns delay spread, 300 Hz) channel models for FR1 and FR2 respectively.

The accuracy requirements in Table 10.1.25.2-1 for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to Annex B.2.14 for a corresponding Band.

AWGN propagation condition.

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: $T_{\mathrm{rep}}^{\mathrm{PRS}}$, L_{PRS}, $K_{\mathrm{comb}}^{\mathrm{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from Table 10.1.25.2-5.

…

…

Table 10.1.25.2-5: Margin for UE Rx-Tx time difference measurement accuracy in FR1

Min(PRS BW, SRS BW) (PRB)			Margin (Tc [Note 1])
SCS = 15 kHz	SCS = 30 kHz	SCS = 60 kHz	
≥ 24	N/A	N/A	160
≥ 52	≥ 24	N/A	80
≥ 104	≥ 48	≥ 24	56
N/A	≥ 132	≥ 64	24
N/A	N/A	≥ 132	24

NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.

15.3.1.4 Test description

The test defines three possible test configurations; specified in Table 15.3.1.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.3.1.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

15.3.1.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.3.1.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.1.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

15.3.1.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The NR-Multi-RTT-ProvideAssistanceData and NR-Multi-RTT-RequestLocationInformation as defined in clause 15.3.1.4.3 shall be provided to the UE during the set-up period. The last TTI containing the NR-Multi-RTT-RequestLocationInformation message shall be provided to the UE ΔT ms before the start of the measurement period, where ΔT = 50 ms is the maximum processing time of the NR-Multi-RTT-RequestLocationInformation message and the Multi-RTT assistance data in the UE.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command T_A = 31 which indicates a timing advance adjustment value N_{TA} = 0 T_c.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. The SS adjusts the downlink timing for Cell 1 to a delay of +512 T_c, compared to the current value.
4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
5. The SS shall transmit an RRCReconfiguration message with the SRS configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE.If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.

11. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE.

12. As soon as possible after step 11 the SS shall measure the transmit timing of the UE using the transmitted SRS, relative to the current downlink timing.

13. If the UE message at step 11 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

14. The SS shall check the reported value of nr-UE-RxTxTimeDiff in the *NR-Multi-RTT-SignalMeasurementInformation* IE provided by the UE in step 11 and compare it with the value measured in step 12. The SS shall check that the reported value is within the limits specified in table 15.3.1.5-2 compared to the measured value. If the reported value is within the limits the number of successful results is increased by one. If the reported value is not within the limits or the UE reports an error in the LPP PROVIDE LOCATION INFORMATION message in step 11, or does not respond at step 11 within the time given by the *time* IE in the *CommonIEsRequestLocationInformation* IE in step 10, then the number of unsuccessful results for is increased by one.

15. Repeat steps 1-14 until the confidence level according to Annex D is achieved.

16. Repeat step 1-15 for the other sub-test defined in Table 15.3.1.4-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

	dBm/38.16 MHz	3	-60.55	-60.55	-60.55	-60.55
Propagation Condition		1, 2, 3	AWGN		AWGN	

Note 1: Void.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 15.2.1.5, with the following difference: $N_{PRS,i}^{slot}$= 2. Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(\left\lceil\frac{2}{N'}\right\rceil\left\lceil\frac{L_{available_{PRS,i}}}{N}\right\rceil * 4 - 1\right) * T_{\text{effect}} + \text{T}_{\text{last}}$$

Table 15.3.1.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1	Sub-test 1	(Measured value from step 12 - 270) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 270) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	Sub-test 2	(Measured value from step 12 - 118) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 118) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
2	Sub-test 1	(Measured value from step 12 - 270) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 270) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

	Sub-test 2	(Measured value from step 12 - 118) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 118) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
3	Sub-test 1	(Measured value from step 12 - 169) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 169) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	Sub-test 2	(Measured value from step 12 - 71) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 71) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.3.1.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.3.2 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR2 SA

15.3.2.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25.2. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.3.2.2 Test applicability

This test applies to all types of NR UE release 16 onwards that supports Multi-RTT positioning.

15.3.2.3 Minimum conformance requirements

Same as in clause 15.3.1.3.

15.3.2.4 Test description

The supported test configurations in listed in Table 15.3.2.4-1.

Table 15.3.2.4-1: Test Configurations

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 100 MHz bandwidth, TDD duplex mode

15.3.2.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.3.2.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.2.4.3.

5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

15.3.2.4.2 Test procedure

Same as in clause 15.3.1.4.2.

15.3.2.4.3 Message contents

PRS $\hat{E}_s/N_{oc}$	dB	1	-2	-10	-2	-10

PRP Note 3	dBm/SCS kHz	1	-91	-99	-91	-99
Io	dBm/190.08 MHz	1	-54.59	-54.59	-54.59	-54.59
Propagation Condition		1	AWGN		AWGN	

Note 1: Void.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7: Information about types of UE beam is given in TS 38.133[]B.2.1.3, and does not limit UE implementation or test system implementation
Note 8: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.

Table 15.3.2.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1	Sub-test 1	(Measured value from step 12 - 76) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 76) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	Sub-test 2	(Measured value from step 12 - 56) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 56) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.3.2.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.3.3 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with reduced number of samples in FR1 SA

15.3.3.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy with reduced number of samples is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25.2. The test is conducted in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.3.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

15.3.3.3 Minimum conformance requirements

The accuracy requirements in Table 10.1.25.2-1 for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to Annex B.2.14 for a corresponding Band

Number of measurement samples is less than 4

AWGN propagation condition.

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: $T_{\text{rep}}^{\text{PRS}}$, L_{PRS}, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34].

NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from Table 10.1.25.2-5.

…

Table 10.1.25.2-6: Margin for UE Rx-Tx time difference measurement accuracy in FR1

Min(PRS BW, SRS BW) (RB)			Margin (Tc Note 1)
SCS = 15 kHz	SCS = 30 kHz	SCS = 60 kHz	
≥ 24	N/A	N/A	160
≥ 52	≥ 24	N/A	80
≥ 104	≥ 48	≥ 24	56
N/A	≥ 132	≥ 64	24
N/A	N/A	≥ 132	24
NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6]. NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.			

15.3.3.4 Test description

15.3.3.4.1 Initial conditions

The supported test configuration is listed in Table 15.3.3.4-1.

Table 15.3.3.4-1: Test Configuration

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.3.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.3.3.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.3.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

15.3.3.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The *NR-Multi-RTT-ProvideAssistanceData* and *NR-Multi-RTT-RequestLocationInformation* shall be provided to the UE during the set-up period.

The UE is configured with measurement gap pattern ID # 24 or #13 before the test.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
5. The SS shall transmit an RRCReconfiguration message with the SRS configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* in the *NR-DL-PRS-ProcessingCapability* IE and the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the reducedDL-PRS-ProcessingSamples-r17 in the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where $\Delta T = 50$ ms.
11. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.3.3.4.3).
12. If the UE message at step 11 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
13. The SS shall check nr-UE-RxTxTimeDiff-r16 value for Cell 2 in the NR-Multi-RTT-SignalMeasurementInformation according to Table 15.3.3.5-2.
14. Repeat steps 1-13 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

Propagation Condition		1, 2, 3	AWGN	

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

Table 15.3.3.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1&2	cell 1	(Measured value from step 13 - 171) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 13 + 171) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	cell 2	(Measured value from step 13 - 187) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 13 + 187) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
3	cell 1	(Measured value from step 13 – 118) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 13 + 118) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	cell 2	(Measured value from step 13 - 127) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 13 + 127) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.3.3.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.3.4 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with RxTx TEG in FR1 SA

15.3.4.1 Test purpose

The purpose of the test is to verify that the relative UE Rx-Tx time difference measurement accuracy when the two measurements are within the same RxTx TEG is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25.2. The test is conducted in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.3.4.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and nr-UE-RxTxTEG-ID-MaxSupport-r17.

15.3.4.3 Minimum conformance requirements

The relative accuracy requirements in Table 10.1.25.2-1 for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to Annex B.2.14 for a corresponding Band

AWGN propagation condition.

the two UE Rx-Tx time difference measurements are associated with the same RxTx TEG

Table 10.1.25.2-3b: UE Rx-Tx time difference relative measurement accuracy in FR1 in AWGN with TEG reporting

Accuracy	Conditions

24 + Δ			≥ 64	≥ 1	Note 6	Note 6	Note 6
10 + Δ			≥ 132	≥ 1	Note 6	Note 6	Note 6

NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of resource j and resource i.
NOTE 2: Minimum number of PRS resource repetitions among resource j and resource i. $T_{\text{rep}}^{\text{PRS}}$, L_{PRS}, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: Δis the value of the timing error margin for the RxTx TEG, reported via *nr-UE-RxTxTEG-TimingErrorMargin*. Δ cannot be larger than the sum of the margins in table 10.1.25.2-5 (dependent on PRS/SRS BW) for any pair of individual UE Rx-Tx time difference measurements associated with the RxTx TEG. .

…

Table 10.1.25.2-6: Margin for UE Rx-Tx time difference measurement accuracy in FR1

Min(PRS BW, SRS BW) (RB)			Margin (Tc Note 1)
SCS = 15 kHz	SCS = 30 kHz	SCS = 60 kHz	
≥ 24	N/A	N/A	160
≥ 52	≥ 24	N/A	80
≥ 104	≥ 48	≥ 24	56
N/A	≥ 132	≥ 64	24
N/A	N/A	≥ 132	24
NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6]. NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.			

15.3.4.4 Test description

15.3.4.4.1 Initial conditions

The supported test configuration is listed in Table 15.3.4.4-1.

Table 15.3.4.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 100 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.4.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.3.4.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.4.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

15.3.4.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration, PRS.1.1 FR1 and PRS.1.2 FR1. The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during

the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The *NR-Multi-RTT-ProvideAssistanceData* and *NR-Multi-RTT-RequestLocationInformation* shall be provided to the UE during the set-up period.

The UE is configured with measurement gap pattern ID # 24 or #13 before T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
5. The SS shall transmit an RRCReconfiguration message with the SRS configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-UE-RxTxTEG-Request-r17 in the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where $\Delta T = 50$ ms.
11. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.3.4.4.3).
12. If the UE message at step 11 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
13. The SS shall check nr-UE-RxTxTimeDiff-r16 value for Cell 2 in the NR-Multi-RTT-SignalMeasurementInformation according to Table 15.3.4.5-3.
14. Repeat steps 1-13 until the confidence level according to Annex D is achieved.
15. Repeat step 1-14for the other sub-test defined in Table 15.3.4.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

	dBm/47.88 MHz	3	-60.59	-60.59	-60.59	-60.59
Propagation Condition		1, 2, 3	AWGN		AWGN	

Note 1: Void.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

Table 15.3.4.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1	Sub-test 1	(Measured value from step 13 - 324) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 13 + 324) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	Sub-test 2	(Measured value from step 13 - 130) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 13 + 130) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
2	Sub-test 1	(Measured value from step 13 - 324) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 13 + 324) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	Sub-test 2	(Measured value from step 13 - 130) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 13 + 130) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
3	Sub-test 1	(Measured value from step 13 - 187) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 13 + 187) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	Sub-test 2	(Measured value from step 13 - 80) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 13 + 80) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.3.4.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.3.5 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with reduced number of samples in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

15.3.5.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy with reduced number of samples is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25.2. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.3.5.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and supportedDL-PRS-ProcessingSamples-RRC-CONNECTED.

15.3.5.3 Minimum conformance requirements

The accuracy requirements in Table 10.1.25.2-3a for FR2 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

PRP|$_{dBm}$ according to Annex B.2.14 for a corresponding Band

Number of measurement samples is less than 4

AWGN propagation condition.

Table 10.1.25.2-3a: UE Rx-Tx time difference measurement accuracy in FR2 in AWGN with reduced measurement samples

Accuracy	Conditions					
	PRS Ês/Iot	Minimum PRS bandwidth	PRS SCS	PRS resource repetition ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$ Note 3	Io Note 4 range	
					Minimum Io Note 1	Maximum Io
Tc Note 5	dB	PRB	kHz		dBm / SCS_{PRS}	dBm/$BW_{Channel}$
± 15+δ	0	≥64	60	≥1	Same value as PRP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	NOTE 6
± 7+δ		≥132		≥1	NOTE 6	NOTE 6
± 7+δ		≥64	120	≥1	Same value as PRP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	NOTE 6
± 4+δ		≥128		≥1	NOTE 6	NOTE 6
± 15+δ	-6	≥64	60	≥1	NOTE 6	NOTE 6
± 7+δ		≥132		≥1	NOTE 6	NOTE 6
± 9+δ		≥64	120	≥1	NOTE 6	NOTE 6
± 4+δ		≥128		≥1	NOTE 6	NOTE 6

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: T_{rep}^{PRS}, L_{PRS}, K_{comb}^{PRS} are configured by higher layer parameter dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from Table 10.1.25.2-6.

…

Table 10.1.25.2-6: Margin for UE Rx-Tx time difference measurement accuracy in FR2

Min(PRS BW, SRS BW) (MHz)		Margin (Tc Note 1)
SCS = 60 kHz	SCS = 120 kHz	
≥ 24	N/A	76
≥ 64	≥ 32	32
≥ 132	≥ 64	24
N/A	≥ 128	20

NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.

15.3.5.4 Test description

15.3.5.4.1 Initial conditions

The supported test configuration is listed in Table 15.3.5.4-1.

Table 15.3.5.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, e200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.5.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.3.5.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.5.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

15.3.5.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The *NR-Multi-RTT-ProvideAssistanceData* and *NR-Multi-RTT-RequestLocationInformation* shall be provided to the UE during the set-up period.

The UE is configured with measurement gap pattern ID # 24 or #13 before the test.

2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
5. The SS shall transmit an RRCReconfiguration message with the SRS configuration.
6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* in the *NR-DL-PRS-ProcessingCapability* IE and the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the reducedDL-PRS-ProcessingSamples-r17 in the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.

11. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.3.5.4.3).

12. If the UE message at step 11 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

13. The SS shall check nr-UE-RxTxTimeDiff-r16 value for Cell 2 in the NR-Multi-RTT-SignalMeasurementInformation according to Table 15.3.5.5-3.

14. Repeat steps 1-13 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

EPRE ratio of OCNG to OCNG DMRS Note 1				
EPRE ratio of PRS to SSS				
TRS Configuration		1	TRS.2.1 TDD	N/A
Initial BWP configuration		1	DLBWP.0.1 ULBWP.0.1	N/A
Active DL BWP configuration		1	DLBWP.1.1	N/A
Active UL BWP configuration		1	ULBWP.1.1	N/A
PRS configuration		1	PRS.1.1 FR2	PRS.1.1 FR2
PRS BW		1	64 PRBs	64 PRBs
PRS Resource slot offset	slot	1	0	2
SRS configuration		1	POS-SRS.3	N/A

N_{oc} Note 2	dBm/SCS	1	-94	
N_{oc} Note 2	dBm/15 kHz	1	-103	
PRS $\hat{E}_s/I_{ot}$	dB	1	0.32	-5.64
PRS $\hat{E}_s/N_{oc}$	dB	1	3. 56	-0.28
PRP Note 3	dBm/SCS kHz	1	-90.4	-94.2
Io	dBm/190.08 MHz	1	-55.73	-55.73
Propagation Condition		1	AWGN	

Note 1: Void.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation
Note 8: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.
Note 9: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

The UE Rx – Tx time difference measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 15.3.5.3.

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 15.2.8.5 Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(1 * 1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 1 - 1\right)$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 12.88s and 21.92s.

Table 15.3.5.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Lowest reported value	Highest reported value
test 1	(5898 – 65) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(5898 + 65) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.3.6 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer with RxTx TEG in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

15.3.6.1 Test purpose

The purpose of the test is to verify that the relative UE Rx-Tx time difference measurement accuracy when the two measurements are within the same RxTx TEG is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25.2. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.3.6.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and nr-UE-RxTxTEG-ID-MaxSupport-r17.

15.3.6.3 Minimum conformance requirements

The relative accuracy requirements in Table 10.1.25.2-3b for FR2 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to Annex B.2.14 for a corresponding Band

AWGN propagation condition.

the two UE Rx-Tx time difference measurements are associated with the same RxTx TEG

Table 10.1.25.2-3b: UE Rx-Tx time difference relative measurement accuracy in FR2 in AWGN with TEG reporting

Accuracy	Conditions					
	PRS Ês/Iot	PRS SCS	PRS bandwidth Note 1	PRS resource repetition ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$) Note 2	Io Note 3 range	
					Minimum Io	Maximum Io
Tc Note 4	dB	kHz	RB		dBm/SCS	$dBm/BW_{Channel}$
35 + Δ Note 6	(PRS Ês/Iot)$_j$ ≥ -6dB	60	≥ 24	≥ 4	Same value as PRS_RP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
24 + Δ			≥ 64	≥ 1	Note 5	Note 5
11 + Δ			≥ 132	≥ 1	Note 5	Note 5
24+ Δ	(PRS Ês/Iot)$_i$ ≥ -13dB	120	≥ 32	≥ 4	Same value as PRS_RP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
13 + Δ			≥ 64	≥ 1	Note 5	Note 5
6 + Δ			≥ 128	≥ 1	Note 5	Note 5

NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of resource j and resource i.
NOTE 2: Minimum number of PRS resource repetitions among resource j and resource i. T_{rep}^{PRS}, L_{PRS}, K_{comb}^{PRS} are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest RB number for the corresponding SCS.
NOTE 6: Δis the value of the timing error margin for the RxTx TEG, reported via *nr-UE-RxTxTEG-TimingErrorMargin*. Δ cannot be larger than the sum of the margins in table 10.1.25.2-6 (dependent on PRS/SRS BW) for any pair of individual UE Rx-Tx time difference measurements associated with the RxTx TEG.

…

Table 10.1.25.2-6: Margin for UE Rx-Tx time difference measurement accuracy in FR2

Min(PRS BW, SRS BW) (MHz)		Margin (Tc [Note 1])
SCS = 60 kHz	SCS = 120 kHz	
≥ 24	N/A	76
≥ 64	≥ 32	32
≥ 132	≥ 64	24
N/A	≥ 128	20
NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6]. NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.		

15.3.6.4 Test description

15.3.6.4.1 Initial conditions

The supported test configuration is listed in Table 15.3.6.4-1.

Table 15.3.6.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.6.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.3.6.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.6.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

15.3.6.4.2 Test procedure

The test consists of two sub-tests; the difference between the sub-tests is the PRS configuration, PRS.1.1 FR2 and PRS.1.2 FR2. The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The *NR-Multi-RTT-ProvideAssistanceData* and *NR-Multi-RTT-RequestLocationInformation* shall be provided to the UE during the set-up period.

The UE is configured with measurement gap pattern ID # 24 or #13 before T2.

2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
5. The SS shall transmit an RRCReconfiguration message with the SRS configuration.

6. The UE shall transmit RRCReconfigurationComplete message.
7. The SS shall transmit an LPP REQUEST CAPABILITIES message.
8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the nr-UE-RxTxTEG-Request-r17 in the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.
11. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.3.6.4.3).
12. If the UE message at step 11 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
13. The SS shall check nr-UE-RxTxTimeDiff-r16 value for Cell 2 in the NR-Multi-RTT-SignalMeasurementInformation according to Table 15.3.6.5-3.
14. Repeat steps 1-13 until the confidence level according to Annex D is achieved.
15. Repeat step 1-14for the other sub-test defined in Table 15.3.6.5-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

PRP Note 3	dBm/SCS kHz	1	-94.2	-100.4	-94.2	-100.4
Io	dBm/190.08 MHz	1	-55.68	-55.68	-55.68	-55.68
Propagation Condition		1	AWGN		AWGN	

Note 1: Void.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation
Note 8: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.
Note 9: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

The UE Rx-Tx time difference measurement accuracy for Cell 2 shall fulfil the absolute requirement in clause 15.3.6.3.

The value of the LPP Time IE depends on the UE capabilities. The calculation is the same as in clause 15.2.10.5 Therefore, the value of the LPP Time IE is given by the following equation:

$$\left(k_{multiTEG} * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 4 - 1\right)$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 10.248s and 164s.

Table 15.3.6.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Lowest reported value	Highest reported value
Sub-test 1	(5898 – 88) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(5898 + 88) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
Sub-test 2	(5898 – 58) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(5898 + 58) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.3.7 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR1 SA

15.3.7.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25A. The tests are conducted under AWGN propagation condition with the UE operating in FR1 stand-alone mode and configured to perform UE Rx-Tx measurements by aggregating two intra-band contiguous positioning frequency layers (PFLs) in FR1.

15.3.7.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports Multi-RTT positioning and DL-PRS bandwidth aggregation in RRC_CONNECTED.

15.3.7.3 Minimum conformance requirements

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

N_{TA_offset} defined in table 7.1.2-2 changes during the UE Rx-Tx measurement period or

if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within -160, 160 msec of at least one DL PRS resource of each of the TRPs in the assistance data.
- PRS resources linked for aggregation saftisfy all the conditions specified in TS 38.214 [26] clause 5.1.6.5.3.
- the spacing between the center frequencies of adjacent PFLs containing PRS resources linked for aggregation does not exceed the nominal channel spacing for intra-band contiguous CA defined in TS 38.101-1 [18], clause 5.4A.1 for FR1 and in TS 38.101-2 [19], clause 5.4A.1 for FR2-1.

If the uplink transmission timing changes during the UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1.2 then:

- UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in clause 7.1.1) for SRS transmission even if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.
- UE Rx-Tx measurement accuracy requirements shall not apply for a cell, which is not the downlink reference cell (defined in clause 7.1.1) for SRS transmission, if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

When a serving cell change occurs during the UE Rx-Tx measurement period, the UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx measurement.

The accuracy requirements in table 10.1.25A.2-1 for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.

AWGN propagation condition.

Table 10.1.25A.2-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN

Accuracy for	Accuracy for	Conditions

±4+δ	±3+δ		≥ 132		≥1	NOTE 6	NOTE 6	NOTE 6

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: $T_{\text{rep}}^{\text{PRS}}$, L_{PRS}, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from table 10.1.25A.2-5, where the PRS BW refers to the sum of the PRS PRB numbers across the aggregated PFLs.

…

The accuracy requirements in table 10.1.25A.2-3 for FR2 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.

AWGN propagation condition.

Table 10.1.25A.2-3: UE Rx-Tx time difference measurement accuracy in FR2 in AWGN

Accuracy for 2 PFLs	Accuracy for 3 PFLs	Conditions					
		PRS Ês/Iot	PRS bandwidth per PFL	PRS SCS	PRS resource repetition ($T_{\text{rep}}^{\text{PRS}} * L_{\text{PRS}} / K_{\text{comb}}^{\text{PRS}}$ Note 3	Io Note 4 range	
						Minimum Io Note 1	Maximum Io
Tc Note 5	Tc Note 5	dB	PRB	kHz		dBm / SCS_{PRS}	dBm/$BW_{Channel}$
±6+δ	±3+δ	-3	≥64	60	≥1	Same value as PRP in table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
±3+δ	±2+δ		≥132		≥1	NOTE 6	NOTE 6
±3+δ	±2+δ		≥64	120	≥1	Same value as PRP in table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
±2+δ	±1+δ		≥128		≥1	NOTE 6	NOTE 6
±9+δ	±4+δ	-13	≥64	60	≥1	NOTE 6	NOTE 6
±4+δ	±3+δ		≥132		≥1	NOTE 6	NOTE 6
±4+δ	±3+δ		≥64	120	≥1	NOTE 6	NOTE 6
±2+δ	±1+δ		≥128		≥1	NOTE 6	NOTE 6

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: $T_{\text{rep}}^{\text{PRS}}$, L_{PRS}, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from table 10.1.25A.2-6, where the PRS BW refers to the sum of the PRS PRB numbers across the aggregated PFLs.

…

Table 10.1.25A.2-5: Margin for UE Rx-Tx time difference measurement accuracy in FR1

Min(PRS BW, SRS BW) (PRB)			Margin (Tc [Note 1])
SCS = 15 kHz	SCS = 30 kHz	SCS = 60 kHz	
≥ 104	N/A	N/A	56
N/A	≥ 132	≥ 64	24
N/A	N/A	≥ 132	24
NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6]. NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.			

Table 10.1.25A.2-6: Margin for UE Rx-Tx time difference measurement accuracy in FR2

Min(PRS BW, SRS BW) (PRB)		Margin (Tc [Note 1])
SCS = 60 kHz	SCS = 120 kHz	
≥ 64	N/A	32
≥ 132	≥ 64	24
N/A	≥ 128	20
NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6]. NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.		

The normative reference for this requirement is TS 38.133 [50] clause 10.1.25A.

15.3.7.4 Test description

The test defines three possible test configurations; specified in Table 15.3.7.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.3.7.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

15.3.7.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.7.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.3.7.5-1 and Table 15.3.7.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.7.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.3.7.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning

occasion in the reference cell. The NR-Multi-RTT-ProvideAssistanceData and NR-Multi-RTT-RequestLocationInformation as defined in clause 15.3.7.4.3 shall be provided to the UE during the set-up period. The last TTI containing the NR-Multi-RTT-RequestLocationInformation message shall be provided to the UE ΔT ms before the start of the measurement period, where ΔT = 50 ms is the maximum processing time of the NR-Multi-RTT-RequestLocationInformation message and the Multi-RTT assistance data in the UE. The UE is configured with measurement gap pattern ID #0 or ID #24 before the start of the test.

2. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.

2. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

3. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.

4. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.

5. The SS shall transmit an RRCReconfiguration message with the SRS configuration.

6. The UE shall transmit RRCReconfigurationComplete message.

7. The SS shall transmit an LPP REQUEST CAPABILITIES message.

8. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.

9. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the NR-Multi-RTT-ProvideAssistanceData IE and NR-DL-PRS-AggregationInfo-r18 linking each PRS resource in PFL1 to the corresponding PRS resource in PFL2.If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

10. The SS shall send a LPP REQUEST LOCATION INFORMATION message, including the NR-Multi-RTT-RequestLocationInformation IE and nr-DL-PRS-JointMeasurementRequest-r18 IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.

11. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the NR-Multi-RTT-ProvideLocationInformation IE.

12. As soon as possible after step 11 the SS shall measure the transmit timing of the UE using the transmitted SRS, relative to the current downlink timing.

13. If the UE message at step 11 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

14. The SS shall check the reported value of nr-UE-RxTxTimeDiff in the NR-Multi-RTT-SignalMeasurementInformation IE provided by the UE in step 11 and compare it with the value measured in step 12. The SS shall check that the reported value is within the limits specified in table 15.3.7.5-2 compared to the measured value. If the reported value is within the limits the number of successful results is increased by one. If the reported value is not within the limits or the UE reports an error in the LPP PROVIDE LOCATION INFORMATION message in step 11, or does not respond at step 11 within the time given by the time IE in the CommonIEsRequestLocationInformation IE in step 10, then the number of unsuccessful results for is increased by one.

15. Repeat steps 1-14 until the confidence level according to Annex D is achieved.

16. Repeat step 1-15 for the other sub-test defined in Table 15.3.7.4-1 as appropriate.

If all (applicable) sub-tests pass, the whole test passes. If one (applicable) sub-test fails, the whole test fails.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

15.3.7.5 Test requirement

Table 15.3.7.5-1 and Table 15.3.7.5-2 define the primary level settings including test tolerances for the test.

Table 15.3.7.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Active cell		1, 2, 3	Cell 1	Cell 1 is the PCell in *NR-Multi-RTT-ProvideAssistanceData* [49].
Neighbour cell		1, 2, 3	Cell 2	Cell 2 is a neighbour cell in *NR-Multi-RTT-ProvideAssistanceData* [49].
RF Channel Number		1, 2, 3	1	For both Cell 1 and Cell 2, all signals/channels except PRS in PFL2 are allocated within this channel.
			2	For both Cell 1 and Cell 2, only PRS in PFL2 is allocated within this channel.
$BW_{channel}$	MHz	1	20: $N_{RB,c}$ = 106	For both RF channels
		2	20: $N_{RB,c}$ = 106	
		3	50: $N_{RB,c}$ = 133	
SSB configuration		1	SSB.1 FR1	
		2	SSB.1 FR1	
		3	SSB.2 FR1	
SMTC configuration		1	SMTC.2	
		2	SMTC.1	
		3	SMTC.1	
Measurement gap		1, 2, 3	GP#24 or GP#0 Note 1	
CP length		1, 2, 3	Normal	
DRX		1, 2, 3	OFF	
Time offset between serving and neighbour cells	µs	1, 2, 3	3	Synchronous cells/TRPs
Expected RSTD	µs	1, 2, 3	3	
Expected RSTD uncertainty	µs	1, 2, 3	5	
T1	s	1, 2, 3	5	
T2	s	1, 2, 3	10	
NOTE 1: GP#24 is configured if the UE supports it, otherwise GP#0 is configured.

	dBm/19.08 MHz	2		-64.57		-64.57
	dBm/47.88 MHz	3		-60.59		-60.59
Propagation Condition		1, 2, 3	AWGN			

NOTE 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved on all OFDM symbols except those in which PRS is allocated.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

NOTE 3: PRP and Io levels have been derived from other parameters and they are provided for information only. They are not settable parameters themselves.

NOTE 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Table 15.3.7.5-3: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1&2	NR cell 1	(Measured value from step 12 - 70) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 70) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 72) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 72) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
3	NR cell 1	(Measured value from step 12 - 62) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 62) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 64) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 64) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.3.7.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.3.8 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz15.3.8.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25A. The tests are conducted under AWGN propagation condition with the UE operating in FR2 stand-alone mode and configured to perform UE Rx-Tx measurements by aggregating two intra-band contiguous positioning frequency layers (PFLs) in FR2.

15.3.8.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports Multi-RTT positioning and DL-PRS bandwidth aggregation in RRC_CONNECTED.

15.3.8.3 Minimum conformance requirements

Same as defined in clause 15.3.7.3.

15.3.8.4 Test description

The supported test configuration is listed in Table 15.3.8.4-1.

Table 15.3.8.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

15.3.8.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.8.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.3.8.5-1 and Table 15.3.8.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.8.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.3.8.4.2 Test procedure

Same as defined in clause 15.3.7.4.2.

15.3.8.4.3 Message contents

As defined in clause 15.3.7.4.3, with the following exceptions:

Table 15.3.8.4.3-1 replaces Table 15.3.7.4.3-3, Table 15.3.8.4.3-2 replaces Table 15.3.8.4.3-7 and Table 15.3.8.4.3-3 replaces Table 15.3.7.4.3-8.

Active BWP configuration		1	DLBWP.1.1 ULBWP.1.1	N/A
PRS configuration (for both PFL1 and PFL2)		1	PRS.1.2 FR2	PRS.1.2 FR2

PRS Resource slot offset (for both PFL1 and PFL2)	slot	1	0	4
SRS configuration		1	POS-SRS.3	N/A
N_{oc} Note 2	dBm/SCS	1	-90.1	
PRS $\hat{E}_s/I_{ot}$	dB	1	-2.69	-12.10
PRS $\hat{E}_s/N_{oc}$	dB	1	-2	-9.8
PRP Note 3	dBm/SCS kHz	1	-91	-99
Io Note 3 (on symbols where PRS is not allocated)	dBm/190.08 MHz	1	-54.59	-54.59
Propagation Condition		1	AWGN	

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved on all OFDM symbols except those in which PRS is allocated.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRP and Io levels have been derived from other parameters and they are provided for information only. They are not settable parameters themselves.
Note 4: Information about types of UE beam is given in TS 38.133 clause B.2.1.3, and does not limit UE implementation or test system implementation
Note 5: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [33], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [33] table 6.2.1.3-4.
Note 6: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
Note 7: As observed with 0 dBi gain antenna at the centre of the quiet zone.

Table 15.3.8.5-3: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1	NR cell 1	(Measured value from step 12 - 54) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 54) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 54) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 54) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.3.8.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.3.9 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE without Rx FH

15.3.9.1 Test purpose

The purpose of the test is to verify that the accuracy of the UE Rx-Tx time difference measurement without RX FH reported by the RedCap UE is within the specified limits in TS 38.133 [50] clause 10.1A.18.2. The test is conducted in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.3.9.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method.

15.3.9.3 Minimum conformance requirements

For UE Rx-Tx time difference measurement performed by 2RX RedCap UE without RX FH, the accuracy requirements corresponding to the PRS bandwidth supported by the RedCap UE for PRS measurement without RX FH in clause 10.1.25.2 shall apply.

The accuracy requirements in table 10.1A.18.2.2-1 for FR1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- AWGN propagation condition.

Table 10.1A.18.2.2-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN

Accuracy	Conditions

±32+δ		104		≥1	NOTE 6	NOTE 6	NOTE 6
±55+δ		≥24	30	≥4	NOTE 6	NOTE 6	NOTE 6
±34+δ		48		≥1	NOTE 6	NOTE 6	NOTE 6
±31+δ		24	60	≥4	NOTE 6	NOTE 6	NOTE 6

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: $T_{\text{rep}}^{\text{PRS}}$, L_{PRS}, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from table 10.1A.18.2.2-3.

Table 10.1A.18.2.2-3: Margin for UE Rx-Tx time difference measurement accuracy in FR1

Min(PRS BW, SRS BW) (PRB)			Margin (Tc [Note 1])
SCS = 15 kHz	SCS = 30 kHz	SCS = 60 kHz	
≥ 24	N/A	N/A	160
≥ 52	≥ 24	N/A	80
104	48	24	56

NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.

15.3.9.4 Test description

The test defines three possible test configurations; specified in Table 15.3.9.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.3.9.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

15.3.9.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.9.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.3.9.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.9.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.3.9.4.2 Test procedure

Same as defined in clause 15.3.7.4.2.

15.3.9.4.3 Message contents

As defined in clause 15.3.7.4.3, with the following exceptions:

Table 15.3.9.4.3-1 replaces Table 15.3.7.4.3-3, Table 15.3.9.4.3-2 replaces Table 15.3.7.4.3-7, Table 15.3.9.4.3-3 replaces Table 15.3.7.4.3-8 and Table 15.3.9.4.3-4 replaces Table 15.3.7.4.3-5.

Propagation Condition		1,2,3,4	AWGN	

NOTE 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: PRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.
NOTE 6: GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

Table 15.3.9.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Cell	Lowest reported value	Highest reported value
1&2&4 (15kHz)	NR cell 1	(Measured value from step 12 - 270) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 270) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 281) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 281) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 293) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 293) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 290) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 290) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
3 (30kHz)	NR cell 1	(Measured value from step 12 - 169) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 169) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6

		(Measured value from step 12 – 161) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 161) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 170) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 170) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 167) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 167) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.3.9.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.3.10 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE without Rx FH

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

15.3.10.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy without RX FH in RRC_CONNECTED state is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1A.18.2. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.3.10.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method.

15.3.10.3 Minimum conformance requirements

For UE Rx-Tx time difference measurement performed by 2RX RedCap UE without RX FH, the accuracy requirements corresponding to the PRS bandwidth supported by the RedCap UE for PRS measurement without RX FH in clause 10.1.25.2 shall apply.

The normative reference for this requirement is TS 38.133 [50] clause 10.1A.18.2.

15.3.10.4 Test description

The supported test configuration is listed in Table 15.3.10.4-1.

Table 15.3.10.4-1: Test Configuration

Config	Description
1	120 kHz SSB and PRS SCS, 100 MHz bandwidth, TDD duplex mode

15.3.10.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.10.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.3.10.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.10.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.3.10.4.2 Test procedure

Same as defined in clause 15.3.7.4.2.

15.3.10.4.3 Message contents

As defined in clause 15.3.7.4.3, with the following exceptions:

Table 15.3.10.4.3-1 replaces Table 15.3.7.4.3-3, Table 15.3.10.4.3-2 replaces Table 15.3.7.4.3-7, Table 15.3.10.4.3-3 replaces Table 15.3.7.4.3-8 and Table 15.3.10.4.3-4 replaces Table 15.3.7.4.3-5.

PRS $\hat{E}_s/I_{ot}$	dB	1	-2.41	-12.12
PRS $\hat{E}_s/N_{oc}$	dB	1	-2	-10
PRP Note 2	dBm/SCS kHz	1	-91	-99
Io	dBm/92.16 MHz	1	-57.6	-57.6
Propagation Condition		1	AWGN	

NOTE 1: Interference from other cells and noise sources not specified in the test is assumed to be constant over sub-carriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 2: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 3: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
NOTE 5: As observed with 0 dBi gain antenna at the centre of the quiet zone
NOTE 6: Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 7: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.
NOTE 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.

Table 15.3.10.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1	NR cell 1	(Measured value from step 12 - 63) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 63) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 65) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 65) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.3.10.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.3.11 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE with Rx FH

15.3.11.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy in RRC_CONNECTED with FH by a RedCap UE is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1A.18.2.3 and 10.1A.18.2.4. The test is conducted in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.3.11.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method and maximumPRS-BandwidthAcrossAllHopsFR1 for at least one band and PRS frequency hopping measurement and report.

15.3.11.3 Minimum conformance requirements

The accuracy requirements in table 10.1A.18.2.3-1 for FR1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- AWGN propagation condition.
- The BW_{total} as defined in clause 9.9A.4.8 for RRC_CONNECTED and in clause 5.6A.6.6 for RRC_INACTIVE is no less than the "Total PRS bandwidth after FH".

Table 10.1A.18.2.3-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN

Accuracy	Conditions

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 6: δ is the margin determined from table 10.1A.18.2.3-5.

The accuracy requirements in table 10.1A.18.2.3-3 for FR2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- AWGN propagation condition.
- The BW_{total} as defined in clause 9.9A.4.8 for RRC_CONNECTED and in clause 5.6A.6.6 for RRC_INACTIVE is no less than the "Total PRS bandwidth after FH".

Table 10.1A.18.2.3-3: UE Rx-Tx time difference measurement accuracy in FR2 in AWGN

Accuracy	Conditions					
	PRS Ês/Iot	Minimum PRS bandwidth per hop	PRS SCS	Total PRS bandwidth after FH	Io[Note 4] range	
					Minimum Io[Note 1]	Maximum Io
Tc[Note 5]	dB	PRB	kHz	PRB	dBm / SCS_{PRS}	$dBm/BW_{Channel}$
±11+δ	-3	≥64	60	264	Same value as PRP in table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
±7+δ		64	120	264	Same value as PRP in table B.2.14-2, according to UE Power class, operating band and angle of arrival	-50
±33+δ	-13	≥64	60	264	NOTE 5	NOTE 5
±27+δ		64	120	264	NOTE 5	NOTE 5

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 6: δ is the margin determined from table 10.1A.18.2.3-6.

Table 10.1A.18.2.3-5: Margin for UE Rx-Tx time difference measurement accuracy in FR1 with FH

Min(PRS BW, SRS BW) (PRB)			Margin (Tc [Note 1])
SCS = 15 kHz	SCS = 30 kHz	SCS = 60 kHz	
≥ 52	N/A	N/A	80
N/A	48	24	56
NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6]. NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies. NOTE 3: PRS BW and SRS BW refer to BW per hop.			

Table 10.1A.18.2.3-6: Margin for UE Rx-Tx time difference measurement accuracy in FR2 with FH

Min(PRS BW, SRS BW) (PRB)		Margin (Tc [Note 1])
SCS = 60 kHz	SCS = 120 kHz	
≥ 64	N/A	32
N/A	64	24
NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6]. NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies. NOTE 3: PRS BW and SRS BW refer to BW per hop.		

…

The accuracy requirements in table 10.1A.18.2.4-1 for FR1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- AWGN propagation condition.

Table 10.1A.18.2.4-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN

NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 6: δ is the margin determined from table 10.1A.18.2.3-5.

15.3.11.4 Test description

The test defines three possible test configurations; specified in Table 15.3.11.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.3.11.4-1: Test Configurations

Config	Description
1	NR 15 kHz SSB SCS, cell bandwidth 50 MHz, FDD duplex mode
2	NR 15 kHz SSB SCS, cell bandwidth 50 MHz, TDD duplex mode
3	NR 30 kHz SSB SCS, cell bandwidth 100 MHz, TDD duplex mode
4	NR 15 kHz SSB SCS, cell bandwidth 50 MHz, HD-FDD duplex mode

NOTE 1: The UE is only required to be tested in one of the supported test configurations in each supported band.
NOTE 2: This test case is applicable to the UE supporting per hop bandwidth ≥ 10 MHz for SCS 15 kHz.
NOTE 3: This test case is applicable to the UE supporting per hop bandwidth = 20 MHz for SCS 30 kHz.

15.3.11.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.11.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.3.11.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.11.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.3.11.4.2 Test procedure

Same as defined in clause 15.3.7.4.2.

15.3.11.4.3 Message contents

As defined in clause 15.3.7.4.3, with the following exceptions:

Table 15.3.11.4.3-1 replaces Table 15.3.7.4.3-3, Table 15.3.11.4.3-2 replaces Table 15.3.7.4.3-5, Table 15.3.11.4.3-3 replaces Table 15.3.7.4.3-7 and Table 15.3.11.4.3-4 replaces Table 15.3.7.4.3-8.

Propagation Condition		1, 2, 3, 4	AWGN	

NOTE 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

NOTE 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

NOTE 4: GP#24 is configured if UE supports MG#24, otherwise GP#0 is configured.

Table 15.3.11.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Cell	Lowest reported value	Highest reported value
1&2&4 (15kHz)	NR cell 1	(Measured value from step 12 - 135) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 135) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 135) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 135) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 166) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 166) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 172) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 172) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
3 (30kHz)	NR cell 1	(Measured value from step 12 - 105) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 105) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 102) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 102) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 126) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 126) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 130) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 130) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.3.11.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.3.12 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE with Rx FH

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

15.3.12.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy with FH by a RedCap UE in RRC_CONNECTED is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1A.18.2.3 and 10.1A.18.2.4. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.3.12.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method and maximumPRS-BandwidthAcrossAllHopsFR2 for at least one band and PRS frequency hopping measurement and report.

15.3.12.3 Minimum conformance requirements

Same as defined in clause 15.2.15.3.

15.3.12.4 Test description

The supported test configuration is listed in Table 15.3.12.4-1.

Table 15.3.12.4-1: Test Configuration

Configuration	Description
1	120 kHz SSB SCS, cell bandwidth 400 MHz, TDD duplex mode
NOTE 1: This test case is applicable to the UE supporting per hop bandwidth = 100 MHz for SCS 120 kHz.	

15.3.12.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.3.12.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.3.12.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.3.12.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.3.12.4.2 Test procedure

Same as defined in clause 15.3.7.4.2.

15.3.12.4.3 Message contents

As defined in clause 15.3.7.4.3, with the following exceptions:

Table 15.2.16.4.3-1 replaces Table 15.2.11.4.3-3, Table 15.2.16.4.3-2 replaces Table 15.2.11.4.3-5, Table 15.2.16.4.3-3 replaces Table 15.2.11.4.3-7, Table 15.2.16.4.3-4 replaces Table 15.2.11.4.3-8 and Table 15.2.16.4.3-5 replaces Table 15.2.11.4.3-9.

Io	dBm/380.16MHz	1	-55.66	-55.66
Propagation Condition		1	AWGN	

NOTE 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
NOTE 6: As observed with 0 dBi gain antenna at the centre of the quiet zone.
NOTE 7: Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 8: GP#24 is configured if UE supports MG#24, otherwise GP#13 is configured.
NOTE 9: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [19], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [19] table 6.2.1.3-4.

Table 15.3.12.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Cell	Lowest reported value	Highest reported value
1	NR cell 1	(Measured value from step 12 - 63) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 63) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 83) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 83) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.3.12.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.4 UE Rx-Tx time difference measurement period test cases in RRC_INACTIVE

15.4.1 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer in FR1 SA

15.4.1.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement in RRC_INACTIVE state meets the requirements specified in TS 38.133 [50] clause 5.6.4 in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.4.1.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and supports DL-PRS measurement in RRC_INACTIVE state.

15.4.1.3 Minimum conformance requirements

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4] in configured positioning frequency layers within the measurement period $T_{UERxTx,Total}$ ms.

$$T_{UERxTx,\ Total} = \sum_{i=1}^{L} T_{UERxTx,i} + (L-1) * \max\left(T_{effect,i}\right)$$

Where:

- i is the index of positioning frequency layer,
- $T_{UERxTx,i}$ is the measurement period for UE Rx-Tx time difference measurements in positioning frequency layer *i* as further defined in this clause,
- L is total number of positioning frequency layers,
- $T_{effect,i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer *i* as defined further in this clause.

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where:

- $K_{carrier_PRS}$ =1 if the UE is capable of *parallelPRS-MeasRRC-Inactive-r17* defined in [34].
- $K_{carrier_PRS} = N_{layer} + 1$ if the UE is not capable of *parallelPRS-MeasRRC-Inactive-r17* defined in [34] and if Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$; where $N_{layer}$is defined in clause 4.2.2.7.
- $K_{carrier_PRS} = K_{carrier} + 1$ if the UE is not capable of *parallelPRS-MeasRRC-Inactive-r17* defined in [34] and if Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$; where $K_{carrier}$is defined in clause 4.2.2.4.
- $N_{RxBeam,i}$ is the scaling factor for UE Rx beam sweeping:
  - $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1, and if positioning frequency layer *i* is in FR2.
    - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-Multi-RTT -RequestLocationInformation*.
    - $N_{RxBeam,i}$ equals to 8, otherwise.

$N_{RxTx,TEG,i}$ is the Rx TEG specific scaling factor:

- $N_{RxTx,TEG,i}$ = 1 if UE is not configured by LMF with *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* or measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17 [34].

Otherwise,

- $N_{RxTx,TEG,i} = N_{TEG,i}$, if UE is not capable of measuring same DL PRS resource simultaneously from multiple Rx TEGs, where $N_{TEG,i}$ is the number of Rx TEGs or RxTx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34], and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*.

- $N_{RxTx,TEG,i} = \left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$, if UE is capable of measuring same DL PRS resource simultaneously from multiple Rx TEGs, where $k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

- $L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.

- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

- {N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in clause 4.2.7.2 of TS 37.355 [34],

- N′ is UE capability for number of DL PRS resources that it can process in a slot corresponding to *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* as specified in clause 6.4.3 of TS 37.355 [34],

- N_{sample} is the number of UE Rx-Tx time difference measurement samples:

  - N_{sample} = 4 if the UE is not capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [34] or not configured to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [34].

  - N_{sample} = 1 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [34] and LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [34] and the following conditions are met:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 2 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [34] and the LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [34] but the following conditions are not met:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - $T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time, $T_{last,i} = T_i + T_{available_PRS,i}$,

- $T_{effect,i}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{\text{effect,i}} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where:

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34],
- $T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$, the least common multiple between $T_{PRS,i}$ and T_{DRX}.
- T_{DRX} is the DRX cycle of the UE in the serving cell.
- $T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where:
  - T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.
  - N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$

15.4.1.4 Test description

15.4.1.4.1 Initial conditions

The test defines three possible test configurations; specified in Table 15.4.1.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.4.1.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.1.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.4.1.5-1 and Table 15.4.1.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.1.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

15.4.1.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During T2 UE shall be in RRC_INACTIVE state and all cells transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

3. Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 15.4.1.4.3-1.
4. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
5. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
6. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
7. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
6. Set the parameters for T1 according to Table 15.4.1.5-1 and Table 15.4.1.5-2.
7. T1 starts.
8. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
9. The UE shall transmit RRCReconfigurationComplete message.
10. The SS shall transmit an LPP REQUEST CAPABILITIES message.
11. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilitie* IE.
12. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 11 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
13. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.
14. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
15. When T1 expires, the SS shall transmit an RRCRelease message with the UL configuration and SDT configuration to transit the UE to RRC_INACTIVE state.
16. Switch the power setting from T1 to T2 as specified in Table 15.4.1.5-1 and Table 15.4.1.5-2.
17. Wait for the UE monitors for occurrence of the periodic event requested.
18. The UE shall transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 21.
18. The SS transmits an *RRCResume* message.
19. The UE transmits an *RRCResumeComplete* message.
20. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.4.1.4.3) plus the maximum RRC processing time 10ms between *RRCResume* message and *RRCResumeComplete* message.
21. The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2. If the UE transmits an *NR-Multi-RTT-ProvideLocationInformation* IE including the nr-UE-RxTxTimeDiff field for Cell 1 and Cell 2 within the response time, then the number of successful tests is increased by one. If the UE fails to report the *NR-Multi-RTT-ProvideLocationInformation* IE with the nr-UE-RxTxTimeDiff field included within the response time then the number of failure tests is increased by one.
22. If the UE message at step 20 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.
23. UE shall be released and moved to RRC_IDLE.

24. Repeat steps 1-23 in Tables 15.4.1.4-1 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

Propagation Condition		1, 2, 3	AWGN			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2 within the specified UE Rx-Tx time difference measurement time starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported UE Rx-Tx measurement for each correct event shall be within the UE Rx-Tx reporting range specified in clause TS 38.133 clause 10.1.25.3.1.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period. The UE Rx-Tx time difference measurement period follows the equation:

$$\mathrm{T_{UERxTx,i}} = \left(\mathrm{K_{carrier_PRS}} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,\mathrm{i}}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,\mathrm{i}}}{N} \right\rceil * N_{sample} - 1 \right) * \mathrm{T_{effect,i}} + \mathrm{T_{last,i}}$$

Where $K_{\mathrm{carrier_PRS}} = 1$, $N_{Rx,TEG,i} = 1, N_{RxBeam,i} = 1$, $N_{PRS,i}^{slot} = 0.285, L_{available_PRS,\mathrm{i}} = 0.071, N_{sample} = 4$. N is the parameter *durationOfPRS-ProcessingSymbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive* from TS 37.355 [49], $\mathrm{T_{last,i}} = T_{\mathrm{i}} + T_{available_PRS,\mathrm{i}}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$\mathrm{T_{available_PRS,i}} = \mathrm{LCM}(\mathrm{T_{PRS,i}}, \mathrm{T_{DRX}})$, where Tprs = 160 ms, and $\mathrm{T_{DRX}}$= 1280ms depending on UE capabilities. Therefore, $\mathrm{T_{available_PRS,i}} = 1280$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 1 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.285}{N} \right\rceil * 4 - 1\right) * T_{effect} + \mathrm{T_{last}}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 5.128s and 32s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 21s and 83s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 32s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.4.1.5-3, Table 15.4.1.5-4 and Table 15.4.1.5-5 for reference.

Table 15.4.1.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive*

n320	1280	1600
n640	1280	1920
n1280	1280	2560

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.2 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer with reduced number of samples in FR1 SA

15.4.2.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement in RRC_INACTIVE state meets the requirements specified in TS 38.133 [50] clause 5.6.4 in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.4.2.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning, supports DL-PRS measurement in RRC_INACTIVE state and supportedDL-PRS-ProcessingSamples-RRC-Inactive.

15.4.2.3 Minimum conformance requirements

Same as clause 15.4.1.3.

15.4.2.4 Test description

15.4.2.4.1 Initial conditions

The test defines three possible test configurations; specified in Table 15.4.2.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.4.2.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.2.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.4.2.5-1 and Table 15.4.2.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.2.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

15.4.2.4.2 Test procedure

Same as clause 15.4.1.4.2.

15.4.2.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.4.2.4.3-1 replaces Table 15.4.1.4.3-11.

Table 15.4.2.4.3-1: LPP RequestLocationInformation

	dBm/47.88 MHz	3		-57.24		-57.24
Propagation Condition		1, 2, 3	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. Io levels apply only for symbols where PRS is transmitted.

Note 4: OCNG shall be used such that all active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols, except for slots where PRS is transmitted by any of the cells.

Note 5: Void.

The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2 within the specified UE Rx-Tx time difference measurement time starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported UE Rx-Tx measurement for each correct event shall be within the UE Rx-Tx reporting range specified in clause TS 38.133 clause 10.1.25.3.1.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{Rx,TEG,i} = 1, N_{RxBeam,i} = 1$, $N_{PRS,i}^{slot} = 0.285, L_{available_PRS,i} = 0.071, N_{sample} = 1$. N is the parameter *durationOfPRS-ProcessingSymbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive* from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$, where Tprs = 160 ms, and T_{DRX}= 1280ms depending on UE capabilities. Therefore, $T_{available_PRS,i} = 1280$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 1 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.285}{N} \right\rceil * 1 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 1.288s and 8.96s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 2s and 9s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 9.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.4.2.5-3, Table 15.4.2.5-4 and Table 15.4.2.5-5 for reference.

Table 15.4.2.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive*

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.3 UE Rx-Tx time difference measurement reporting delay test case for single positioning frequency layer in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.4.3.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement in RRC_INACTIVE state meets the requirements specified in TS 38.133 [50] clause 5.6.4 in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.4.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and supports DL-PRS measurement in RRC_INACTIVE state.

15.4.3.3 Minimum conformance requirements

Same as clause 15.4.1.3.

15.4.3.4 Test description

15.4.3.4.1 Initial conditions

The supported test configurations in listed in Table 15.4.3.4.1-1

Table 15.4.3.4.1-1: Supported test configurations

Config	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.3.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.

2. The general test parameter settings are set up according to Table 15.4.3.5-1 and Table 15.4.3.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.3.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

15.4.3.4.2 Test procedure

Same as clause 15.4.1.4.2.

15.4.3.4.3 Message contents

Io	dBm/190.08 MHz	1	N/A	-55.89	N/A	-55.89
Propagation Condition		1	AWGN			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation
Note 8: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

The UE Rx-Tx time difference measurement time fulfils the requirements specified in clause 15.4.3.3.

The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2 within the specified UE Rx-Tx time difference measurement time starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported UE Rx-Tx measurement for each correct event shall be within the UE Rx-Tx reporting range specified in clause TS 38.133 clause 10.1.25.3.1.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{Rx,TEG,i} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.071$, $N_{sample} = 4$. N is the parameter *durationOfPRS-ProcessingSymbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive* from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$, where Tprs = 160 ms, and T_{DRX}= 640ms depending on UE capabilities. Therefore, $T_{available_PRS,i} = 640$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 20.488s and 82.56s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 21s and 83s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 21.3s and 83.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.4.3.5-3, Table 15.4.3.5-4 and Table 15.4.3.5-5 for reference.

Table 15.4.3.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive*

maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive	$\left\lceil \frac{2}{N'} \right\rceil$

Io	dBm/190.08 MHz	1	N/A	-55.73	N/A	-55.73
Propagation Condition		1	AWGN			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: SS-RSRP/PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. Io levels apply only for symbols where PRS is transmitted.
Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7: Information about types of UE beam is given in TS 38.133 [50] B.2.1.3, and does not limit UE implementation or test system implementation
Note 8: OCNG shall be used such that all active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols, except for slots where PRS is transmitted by any of the cells.
Note 9: Void.

The UE Rx-Tx time difference measurement time fulfils the requirements specified in clause 15.4.4.3.

The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2 within the specified UE Rx-Tx time difference measurement time starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported UE Rx-Tx measurement for each correct event shall be within the UE Rx-Tx reporting range specified in clause TS 38.133 clause 10.1.25.3.1.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{Rx,TEG,i} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.035$, $N_{sample} = 1$. N is the parameter *durationOfPRS-ProcessingSymbols* from TS 37.355 [49], N' is the parameter *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive* from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$, where Tprs = 160 ms, and T_{DRX}= 640ms depending on UE capabilities. Therefore, $T_{available_PRS,i} = 640$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.035}{N} \right\rceil * 1 - 1\right) * T_{effect} + T_{last}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 5.128s and 21.12s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 22s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 22.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.4.4.5-3, Table 15.4.4.5-4 and Table 15.4.4.5-5 for reference.

Table 15.4.4.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive*

n160	640	800
n320	640	960
n640	640	1280

n1280	1280	1920

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.5 UE Rx-Tx time difference measurement reporting delay for PRS aggregation in FR1 SA

15.4.5.1 Test purpose

The purpose of the test is to verify the measurement requirements specified in TS 38.133 [50] clause 5.6.4.6 for UE Rx-Tx measurements with PRS bandwidth aggregation. The tests are conducted under AWGN propagation condition with the UE operating in FR1 stand-alone mode and configured to perform UE Rx-Tx measurements by aggregating two intra-band contiguous positioning frequency layers (PFLs) in FR1.

15.4.5.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports Multi-RTT positioning and DL-PRS bandwidth aggregation in RRC_INACTIVE.

15.4.5.3 Minimum conformance requirements

The requirements in this clause apply provided that UE receives requests from LMF to perform PRS measurement on aggregated positioning frequency layers (PFLs) via *nr-DL-PRS-JointMeasurementRequestedPFL-List* [49].

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [49], the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.4.3) UE Rx-Tx time difference measurements, defined in TS 38.215 [57], during the measurement period $T_{UERxTx,Total}$ defined as:

$$T_{UERxTx,total} = T_{UERxTx,aggr} + T_{UERxTx,non-aggr} + T_{margin}$$

Where:

- $T_{UERxTx,aggr}$ is the total measurement period for aggregated measurements as defined in this clause, and
- $T_{UERxTx,non-aggr}$ is the total measurement period for non-aggregates measurements as defined in this clause, and
- $T_{margin} = T'_{margin}$ is $\max(T_{effect,j})$, if both $T_{UERxTx,aggr}$ and $T_{UERxTx,non-aggr}$ are non-zero, and $T_{margin} = 0$ otherwise, where $T'_{margin} = \max(T_{effect,j})$ and $T_{effect,j}$ is the T_{effect} from both PFL combination(s) and non-aggregated PFL(s) which are configured for positioning measurement.

$T_{UERxTx,non-aggr}$ is zero if every resource set on every PFL is linked for aggregation with at least one other resource set on another PFL. Otherwise, $T_{UERxTx,non-aggr}$ is as defined in TS 38.133 [50] clause 5.6.4.5 with the following exceptions,

- only PFLs containing resource set(s) not linked to any other resource set(s) are considered in L
- on each PFL i, only resource set(s) not linked to any other resource set(s) are considered in $T_{available_PRS,i}$, $N^{slot}_{PRS,i}$ and $L_{available_PRS,i}$
- N_{sample} = 2 if the UE supports the capability of positioning measurements with reduced number of samples as indicated by *supportedDL-PRS-ProcessingSamples-RRC-Inactive* specified in TS 37.355 [49], and the LMF requests the UE to perform positioning measurements with reduced number of samples,
- $(L-1) * \max(T_{effect,i})$ is replace by $(L-1) * T'_{margin}$.

$T_{UERxTx,aggr}$ is zero if no resourse sets on any PFL are linked for aggregation with other resource sets on other PFLs. Otherwise, $T_{UERxTx,aggr}$ is defined as

$T_{UERxTx,aggr} = \sum_{m=1}^{M} T_{UERxTx,aggr,m} + (M-1) * T'_{margin}$,

where:

- m is the index of PFL combination,
- M is total number of PFL combinations,
- $T_{effect,aggr,m}$ is the periodicity of the PRS measurement in PFL combination m as defined in this clause,
- $T_{UERxTx,aggr,m}$ is the measurement period for UE Rx-Tx time difference measurement in PFL combination m as specified below.

$$T_{UERxTx,aggr,m} = \left(K_{carrier,aggr} * N_{Rx,TEG,aggr,m} * N_{RxBeam,aggr,m} * \left\lceil \frac{N_{PRS,aggr,m}^{slot}}{N'_{aggr,m}} \right\rceil * \left\lceil \frac{L_{available_{PRS},aggr,m}}{N_{aggr,m}} \right\rceil * N_{sample} - 1 \right) * T_{effect,aggr,m} + T_{last,aggr,m}$$

where:

- $K_{carrier,aggr}$ is a scaling factor for PRS measurements in RRC_INACTIVE, and is defined as:
  - $K_{carrier,aggr} = 1$ if the UE supports *parallelPRS-MeasRRC-Inactive-r17*,
  - Otherwise,
    - If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, $K_{carrier,aggr} = K_{carrier} + 1$, where $K_{carrier}$ is defined in TS 38.133 [50] clause 4.2.2.4
    - If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, $K_{carrier,aggr} = N_{layers} + 1$, where N_{layers} is defined in TS 38.133 [50] clause 4.2.2.7.
- $N_{Rx,TEG,aggr,m}$ is a scaling factor for PRS measurements with multiple Rx TEGs, and is defined as:
  - $N_{Rx,TEG,aggr,m}$ =1 if the UE is not configured by the LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49].
  - $N_{Rx,TEG,aggr,m}$ is defined as follows if the UE is configured by the LMF with *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] to perform measurement on same DL PRS resource of a TRP using different Rx TEGs in *NR-DL-TDOA-RequestLocationInformation* [49]:
    - $N_{Rx,TEG,i} = P$, if the UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, where P is the number of UE Rx TEGs that the UE is requested by LMF to measure the same DL-PRS Resource of a TRP indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* in [49], and in case 'n0' is indicated, P is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*.
    - $N_{Rx,TEG,i} = \left\lceil \frac{P}{Q} \right\rceil$, if the UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs, where Q is the number of UE Rx TEGs for measuring the same DL-PRS Resource simultaneously indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul-r17* in [49].
- $N_{RxBeam,aggr,m}$ is a scaling factor for PRS measurements with multiple Rx beams, and is defined as
  - $N_{RxBeam,aggr,m}$ = 1 if PFL combination m is in FR1,
  - $N_{RxBeam,aggr,m}$ is defined as follows if PFL combination m is in FR2
    - $N_{RxBeam,aggr,m}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing PFL combination *m*, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*,
    - $N_{RxBeam,aggr,m}$ equals to 8 otherwise

- $N_{PRS,aggr,m}^{slot}$ is the maximum number of DL PRS resources in PFL combination *m* configured in a slot, and only the PRS resources in resource set(s) linked to other resource set in PFL combination *m* are counted

- $N'_{aggr,m}$ is the UE capability on maximum number of DL PRS resources that can be processed in a slot for PFL combination *m* as indicated by *maxNumOfAggregatedDL-PRS-ResourcePerSlot-FR1-r18* for FR1 and *maxNumOfAggregatedDL-PRS-ResourcePerSlot-FR2-r18* for FR2 specified in TS 37.355 [49].

- $L_{available_{PRS},aggr,m}$ is the time duration of available PRS resources in PFL combination *m* to be measured during $T_{PRS,aggr,m}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{available_{PRS},aggr,m}$, only unmuted PRS resources in resource set(s) linked to other resource set in PFL combination *m* and that are not fully overlapped with other higher-priority DL signals/channels are considered.

- $N_{aggr,m}$ is the UE capability on duration of DL PRS resources in ms for PFL combination *m* as indicated by *prs-durationOfTwoPRS-BWA-ProcessingSymbolsN-r18* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsN-r18* specified in TS 37.355 [49].

- N_{sample} is number of PRS measurement samples,

  - N_{sample} = 2 if the UE supports the capability of positioning measurements with reduced number of samples as indicated by *reducedNumOfSampleInMeasurementWithPRS-BWA-RRC-IdleAndInactive* specified in TS 37.355 [49], and the LMF requests the UE to perform positioning measurements with reduced number of samples,

  - N_{sample} = 4 otherwise.

- $T_{effect,aggr,m}$ is the periodicity of the PRS measurement in PFL combination m,

$$T_{effect,aggr,m} = \left\lceil \frac{T_{aggr,m}}{T_{available,PRS,aggr,m}} \right\rceil * T_{available,PRS,aggr,m}$$

  - $T_{aggr,m}$ is the UE capability on time for processing of DL PRS resources in ms for PFL combination *m* as indicated by *prs-durationOfTwoPRS-BWA-ProcessingSymbolsT-r18* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsT* specified in TS 37.355 [49].

  - $T_{available,PRS,aggr,m} = LCM(T_{PRS,aggr,m}, T_{DRX})$, the least common multiple between $T_{PRS,aggr,m}$ and the DRX cycle length T_{DRX}, where $T_{PRS,aggr,m}$ is the periodicity of DL PRS resource with muting on PFL combination m.

    - If more than one PRS periodicities are configured in PFL combination m, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets that are linked to other resource set in PFL combination m, is used to derive $T_{PRS,aggr,m}$, and for each applicable PRS resource set,

      - $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource, and

      - T_{per}^{PRS} is the periodicity of PRS resource set given by the higher-layer parameter *DL-PRS-Periodicity*, and

      - N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

- $T_{last,aggr,m}$ is the measurement duration for the last PRS sample in PFL combination m, including the sampling time and processing time, $T_{last,aggr,m} = T_{aggr,m} + T_{available,PRS,aggr,m}$.

The normative reference for this requirement is TS 38.133 [50] clause 5.6.4.6.

15.4.5.4 Test description

The test defines three possible test configurations; specified in Table 15.4.5.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.4.5.4-1: Test Configurations

Test Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

15.4.5.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.5.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.4.5.5-1 and Table 15.4.5.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.5.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.4.5.4.2 Test procedure

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During T2 UE shall be in RRC_INACTIVE state and all cells transmit PRS resources within initial DL BWP of the UE and with the same numerology as the initial DL BWP.

8. Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 15.4.5.4.3-1.
9. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
10. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
11. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.
12. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
6. Set the parameters for T1 according to Table 15.4.5.5-1 and Table 15.4.5.5-2.
7. T1 starts.
8. The SS shall transmit an RRCReconfiguration message with the DRX configuration.
9. The UE shall transmit RRCReconfigurationComplete message.
10. The SS shall transmit an LPP REQUEST CAPABILITIES message.
11. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilitie* IE.
12. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE and *NR-DL-PRS-AggregationInfo-r18* linking each PRS resource in PFL1 to the corresponding PRS resource in PFL2. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 11 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

13. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-Multi-RTT-RequestLocationInformation* IE and and nr-DL-PRS-JointMeasurementRequest-r18 IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.

14. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.

15. When T1 expires, the SS shall transmit an RRCRelease message with the UL configuration and SDT configuration to transit the UE to RRC_INACTIVE state.

16. Switch the power setting from T1 to T2 as specified in Table 15.4.5.5-1 and Table 15.4.5.5-2.

17. Wait for the UE monitors for occurrence of the periodic event requested.

18. The UE shall transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 21.

18. The SS transmits an *RRCResume* message.

19. The UE transmits an *RRCResumeComplete* message.

20. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.4.5.4.3) plus the maximum RRC processing time 10ms between *RRCResume* message and *RRCResumeComplete* message.

21. The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2. If the UE transmits an *NR-Multi-RTT-ProvideLocationInformation* IE including the nr-UE-RxTxTimeDiff field for Cell 1 and Cell 2 within the response time, then the number of successful tests is increased by one. If the UE fails to report the *NR-Multi-RTT-ProvideLocationInformation* IE with the nr-UE-RxTxTimeDiff field included within the response time then the number of failure tests is increased by one.

22. If the UE message at step 20 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

24. UE shall be released and moved to RRC_IDLE.

24. Repeat steps 1-23 in Tables 15.4.5.4-1 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

15.4.5.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.4.5.4.3-1 replaces Table 15.4.1.4.3-7, Table 15.4.5.4.3-2 replaces Table 15.4.1.4.3-8, Table 15.4.5.4.3-3 replaces Table 15.4.1.4.3-12 and Table 15.4.5.4.3-4 replaces Table 15.4.1.4.3-13.

Propagation Condition		1, 2, 3	AWGN			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.4.5.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,aggr,m} = \left(K_{carrier,aggr} * N_{Rx,TEG,aggr,m} * N_{RxBeam,aggr,m} * \left\lceil \frac{N_{PRS,aggr,m}^{slot}}{N'_{aggr,m}} \right\rceil * \left\lceil \frac{L_{available_{PRS},aggr,m}}{N_{aggr,m}} \right\rceil * N_{sample} - 1 \right) * T_{effect,aggr,m} + T_{last,aggr,m}$$

Where $K_{carrier,aggr} = 1$, $N_{Rx,TEG,aggr,m} = 1{,}1$, $N_{RxBeam,aggr,m} = 1$, $N_{sample_agg} = 4$. $N_{PRS,aggr,m}^{slot} = 1$, $L_{avavailable_PRS_agg,i} = 0.285\text{ms}$ for type 1 duration calculation and $L_{avavailable_PRS_agg,i} = 1\text{ms}$ for type 2 duration calculation. $N'_{aggr,m}$ is the parameter maxNumOfAggregatedDL-PRS-ResourcePerSlot from TS 37.355 [49], $N_{aggr,m}$ is the parameter prs-durationOfTwoPRS-BWA-ProcessingSymbolsN or prs-durationOfThreePRS-BWA-ProcessingSymbolsN from TS 37.355 [49]. $T_{last,aggr,m} = T_{aggr,m} + T_{available,PRS,aggr,m}$ and $T_{effect,aggr,m} = \left\lceil \frac{T_{aggr,m}}{T_{available,PRS,aggr,m}} \right\rceil * T_{available,PRS,aggr,m}$.

$T_{available,PRS,aggr,m} = LCM(T_{PRS,aggr,m}, T_{DRX})$; $T_{DRX} = 1280\text{ms}$. Therefore, $T_{available,PRS,aggr,m} = 1280$ ms.

Finally, it results in the following equation:

$$(1 \times 1 \times 1 \times \left\lceil \frac{1}{N'_{aggr,m}} \right\rceil \left\lceil \frac{0.285}{N_{aggr,m}} \right\rceil \times 4\text{-}1) T_{effect,aggr,m} + T_{last,aggr,m}$$

Depending on the UE Buffering defined in clause 5.1.6.5 of TS 38.214 [26]:

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 15kHz the LPP time IE ranges between 11.536s and 34.56s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 35s.

Similarly for Type 2 Buffering, Best Case result of 11.536s is 12s and for the worst-case result of 85760ms, rounded to the next second, the final value is 86s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 86.3s.

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 30kHz the LPP time IE ranges between 11.536s and 24.32s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 12s and 25s.

Similarly for Type 2 Buffering, Best Case result of 11.536s is 12s and for the worst-case result of 44880ms, rounded to the next second, the final value is 45s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 12.3s and 45.3s.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.6 UE Rx-Tx time difference measurement reporting delay for PRS aggregation in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.4.6.1 Test purpose

The purpose of the test is to verify the measurement requirements specified in TS 38.133 [50] clause 5.6.4.6 for UE Rx-Tx measurements with PRS bandwidth aggregation. The tests are conducted under AWGN propagation condition with the UE operating in FR2 stand-alone mode and configured to perform UE Rx-Tx measurements by aggregating two intra-band contiguous positioning frequency layers (PFLs) in FR2.

15.4.6.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports Multi-RTT positioning and DL-PRS bandwidth aggregation in RRC_INACTIVE.

15.4.6.3 Minimum conformance requirements

Same as clause 15.4.5.3.

15.4.6.4 Test description

The supported test configurations in listed in Table 15.4.6.4.1-1

Table 15.4.6.4.1-1: Supported test configurations

Config	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.6.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.4.6.5-1 and Table 15.4.6.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.6.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

15.4.6.4.2 Test procedure

Same as clause 15.4.5.4.2.

15.4.6.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.4.6.4.3-1 replaces Table 15.4.1.4.3-4, Table 15.4.6.4.3-2 replaces Table 15.4.1.4.3-7, Table 15.4.6.4.3-3 replaces Table 15.4.1.4.3-8, Table 15.4.6.4.3-4 replaces Table 15.4.1.4.3-11, Table 15.4.6.4.3-5 replaces Table 15.4.1.4.3-12 and Table 15.4.6.4.3-6 replaces Table 15.4.1.4.3-13.

15.4.6.5 Test requirement

Table 15.4.6.5-1 and Table 15.4.6.5-2 define the primary level settings including test tolerances for the test.

Table 15.4.6.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Active cell		1	Cell 1	Cell 1 is the PCell in *NR-Multi-RTT-ProvideAssistanceData* [49].
Neighbour cell		1	Cell 2	Cell 2 is a neighbour cell in *NR-Multi-RTT-ProvideAssistanceData* [49].
RF Channel Number		1	1	For both Cell 1 and Cell 2, all signals/channels except PRS in PFL2 are allocated within this channel.
			2	For both Cell 1 and Cell 2, only PRS in PFL2 is allocated within this channel.
$BW_{channel}$	MHz	1	200: $N_{RB,c}$ = 132	For both RF channels
SSB configuration		1	SSB.2 FR2	
SMTC configuration		1	SMTC.1	
CP length		1	Normal	
DRX	s	1	0.64	
Time offset between serving and neighbour cells	µs	1	3	Synchronous cells/TRPs
Expected RSTD	µs	1	3	
Expected RSTD uncertainty	µs	1	5	
T1	s	1	5	
T2	s	1	20	

Table 15.4.6.5-2: Cell specific test parameters

Parameter	Unit	Test configuration	Cell 1		Cell 2	
			T1	T2	T1	T2
AoA setup		1	Setup 1 as specified in clause TS 38.133 A.3.15			
Beam Assumption[Note 5]		1	Rough		Rough

PRP [Note 3]	dBm/SCS kHz	1	-Infinity	-92.1	-Infinity	-99.9
Io [Note 3] (on symbols where PRS is not allocated)	dBm/190.08 MHz	1	N/A	-55.68	N/A	-55.68
Propagation Condition		1	AWGN			
NOTE 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved on all OFDM symbols except those in which PRS is allocated.						

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP and Io levels have been derived from other parameters and they are provided for information only. They are not settable parameters themselves.
NOTE 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
NOTE 5: Information about types of UE beam is given in TS 38.133 clause B.2.1.3, and does not limit UE implementation or test system implementation
NOTE 6: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] table 6.2.1.3-4.
NOTE 7: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
NOTE 8: As observed with 0 dBi gain antenna at the centre of the quiet zone.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.4.6.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,aggr,m} = \left(K_{carrier,aggr} * N_{Rx,TEG,aggr,m} * N_{RxBeam,aggr,m} * \left\lceil \frac{N_{PRS,aggr,m}^{slot}}{N'_{aggr,m}} \right\rceil * \left\lceil \frac{L_{available_{PRS},aggr,m}}{N_{aggr,m}} \right\rceil * N_{sample} - 1 \right) * T_{effect,aggr,m} + T_{last,aggr,m}$$

Where $K_{carrier,aggr} = 1$, $N_{Rx,TEG,aggr,m} = 1{,}1$, $N_{RxBeam,aggr,m} = 8$, $N_{sample_agg} = 4$. $N_{PRS,aggr,m}^{slot} = 1$, $L_{avavailable_PRS_agg,i} = 0.071\text{ms}$ for type 1 duration calculation and $L_{avavailable_PRS_agg,i} = 0.25\text{ms}$ for type 2 duration calculation. $N'_{aggr,m}$ is the parameter maxNumOfAggregatedDL-PRS-ResourcePerSlot from TS 37.355 [49], $N_{aggr,m}$ is the parameter prs-durationOfTwoPRS-BWA-ProcessingSymbolsN or prs-durationOfThreePRS-BWA-ProcessingSymbolsN from TS 37.355 [49]. $T_{last,aggr,m} = T_{aggr,m} + T_{available,PRS,aggr,m}$ and $T_{effect,aggr,m} = \left\lceil \frac{T_{aggr,m}}{T_{available,PRS,aggr,m}} \right\rceil * T_{available,PRS,aggr,m}$.

$T_{available,PRS,aggr,m} = LCM(T_{PRS,aggr,m}, T_{DRX})$; $T_{DRX} = 640\text{ms}$, $T_{PRS_agg,i} = 640$ ms. Therefore, $T_{available,PRS,aggr,m} = 640$ ms.

Finally, it results in the following equation:

$$(1 \times 1 \times 8 \times \left\lceil \frac{1}{N'_{aggr,m}} \right\rceil \left\lceil \frac{0.071}{N_{aggr,m}} \right\rceil \times 4\text{-}1) T_{effect,aggr,m} + T_{last,aggr,m}$$

Where the remaining parameters depend on the UE capabilities. The LPP time IE ranges between 20.488s and 82.56s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation in Table 15.2.12.4.3-5. The LPP time IE ranges between 21s and 83s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 21.3s and 83.3s.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.7 UE Rx-Tx time difference measurement reporting delay in FR1 for Redcap UE without Rx FH

15.4.7.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement without RX FH reported by the RedCap UE meets the requirements specified in TS 38.133 [50] clause 5.6A.6.5 in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured. The measurement reporting delay test defined in this lause is valid for both 1 Rx and 2 Rx RedCap UEs.

15.4.7.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning and DL-PRS measurement in RRC_INACTIVE.

15.4.7.3 Minimum conformance requirements

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [49], UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [57] in configured positioning frequency layers within the measurement period $T_{UERxTx,Total}$ ms.

$$T_{UERxTx,\ Total} = \sum_{i=1}^{L} T_{UERxTx,i} + (L-1) * \max\left(T_{effect,i}\right)$$

Where:

- i is the index of positioning frequency layer,
- $T_{UERxTx,i}$ is the measurement period for UE Rx-Tx time difference measurements in positioning frequency layer i as further defined in this clause,
- L is total number of positioning frequency layers,
- $T_{effect,i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer i as defined further in this clause.

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where:

- $K_{carrier_PRS}$=1 if the UE is capable of *parallelPRS-MeasRRC-Inactive-r17* defined in [34].
- $K_{carrier_PRS} = N_{layer} + 1$ if the UE is not capable of *parallelPRS-MeasRRC-Inactive-r17* defined in [49] and if Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$; where $N_{layer}$is defined in clause 4.2.2.7.
- $K_{carrier_PRS} = K_{carrier} + 1$ if the UE is not capable of *parallelPRS-MeasRRC-Inactive-r17* defined in [49] and if Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$; where $K_{carrier}$is defined in clause 4.2.2.4.
- $N_{RxBeam,i}$ is the scaling factor for UE Rx beam sweeping:
  - $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1, and if positioning frequency layer *i* is in FR2.
    - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-Multi-RTT -RequestLocationInformation*.
    - $N_{RxBeam,i}$ equals to 8, otherwise.

  $N_{RxTx,TEG,i}$ is the Rx TEG specific scaling factor:

  - $N_{RxTx,TEG,i}$ = 1 if UE is not configured by LMF with *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49].

  Otherwise,

  - $N_{RxTx,TEG,i} = N_{TEG,i}$, if UE is not capable of measuring same DL PRS resource simultaneously from multiple Rx TEGs, where $N_{TEG,i}$ is the number of Rx TEGs or RxTx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49], and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*.
  - $N_{RxTx,TEG,i} = \left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$, if UE is capable of measuring same DL PRS resource simultaneously from multiple Rx TEGs, where $k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.
- $L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{available_PRS,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,
- {N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [49] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [49] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in clause 4.2.7.2 of TS 37.355 [49],
- N' is UE capability for number of DL PRS resources that it can process in a slot corresponding to *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* as specified in clause 6.4.3 of TS 37.355 [49],
- N_{sample} is the number of UE Rx-Tx time difference measurement samples:
  - N_{sample} = 4 if the UE is not capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [49] or not configured to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [49].

- N_{sample} = 1 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [34] and LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [49] and the following conditions are met:
  - PRS bandwidth is within the initial BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- N_{sample} = 2 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [49] and the LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [49] but the following conditions are not met:
  - PRS bandwidth is within the initial BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
- $T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time, $T_{last,i} = T_i + T_{available_PRS,i}$,

- $T_{effect,i}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where:

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [49],
- $T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$, the least common multiple between $T_{PRS,i}$ and T_{DRX}.
  - When UE is configured with RAN eDRX ≤ 10.24 s:
    - T_{DRX} is defined as T in TS 38.304 [1] when CN eDRX ≤ 10.24 s.
    - T_{DRX} is the maximum of the T inside and outside of the CN PTW when CN eDRX > 10.24 s, where T inside and outside of the CN PTW are defined in TS 38.304 [1].
  - When UE is configured with RAN eDRX > 10.24 s:
    - T_{DRX} is the maximum of the DRX cycles within the CN PTW and the RAN PTW.
- Otherwise, T_{DRX} is the DRX cycle of the UE in the serving cell.
- $T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where:
  - T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.
  - N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$

15.4.7.4 Test description

The test defines three possible test configurations; specified in Table 15.4.7.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.4.7.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

15.4.7.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.7.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.4.7.5-1 and Table 15.4.7.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.7.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.4.7.4.2 Test procedure

Same as defined in clause 15.4.1.4.2.

15.4.7.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.4.7.4.3-1 replaces Table 15.4.1.4.3-7, Table 15.4.7.4.3-2 replaces Table 15.4.1.4.3-8, Table 15.4.7.4.3-3 replaces Table 15.4.1.4.3-12 and Table 15.4.7.4.3-4 replaces Table 15.4.1.4.3-13.

	dBm/18.72 MHz	3		-64.67		-64.67
Propagation Condition		1,2,3,4	AWGN			

NOTE 1: OCNG shall be used such that active cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted PRS.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.4.7.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxTx,TEG,i} = 1$, $N_{RxBeam,i} = 1$, $N_{PRS,i}^{slot} = 1$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$; where $T_{PRS,i}$ = 160 ms, and and T_{DRX} = 1280ms. Therefore, $T_{available_PRS,i}$ = 1280 ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 1 * \left\lceil \frac{1}{N'} \right\rceil * \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * 4 - 1\right)$$

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 15kHz the LPP time IE ranges between 5.128s and 26.88s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 27s.

Similarly for Type 2 Buffering, Best Case result of 5.128s is 6s and for the worst-case result of 83200ms, rounded to the next second, the final value is 84s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 84.3s.

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 30kHz the LPP time IE ranges between 5.128s and 16.64s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 17s.

Similarly for Type 2 Buffering, Best Case result of 5.128s is 6s and for the worst-case result of 42240ms, rounded to the next second, the final value is 43s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 43.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.2.13.5-3, Table 15.2.13.5-4 and Table 15.2.13.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.8 UE Rx-Tx time difference measurement reporting delay in FR2 for Redcap UE without Rx FH

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.4.8.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement without RX FH in RRC_INACTIVE state meets the requirements specified in clause TS 38.133 [50] 5.6A.4.5 in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.4.8.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning and DL-PRS measurement in RRC_INACTIVE.

15.4.8.3 Minimum conformance requirements

Same as clause 15.4.7.3.

15.4.8.4 Test description

The supported test configuration is listed in Table 15.4.8.4-1.

Table 15.4.8.4-1: Test Configuration

Config	Description
1	120 kHz SSB and PRS SCS, 100 MHz bandwidth, TDD duplex mode

15.4.8.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.8.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.4.8.5-1 and Table 15.4.8.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.8.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.4.8.4.2 Test procedure

Same as defined in clause 15.4.1.4.2.

15.4.8.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.4.8.4.3-1 replaces Table 15.4.1.4.3-4, Table 15.4.8.4.3-2 replaces Table 15.4.1.4.3-7, Table 15.4.8.4.3-3 replaces Table 15.4.1.4.3-8, Table 15.4.8.4.3-4 replaces Table 15.4.1.4.3-11, Table 15.4.8.4.3-5 replaces Table 15.4.1.4.3-12 and Table 15.4.8.4.3-5 replaces Table 15.4.1.4.3-13.

Io	dBm/92.16 MHz	1	N/A	-57.6	N/A	-57.6
Propagation Condition		1	AWGN			

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: PRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
NOTE 6: As observed with 0 dBi gain antenna at the centre of the quiet zone.
NOTE 7: Information about types of UE beam is given in TS 38.133 annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 8: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.4.8.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxTx,TEG,i} = 1$, $N_{RxBeam,i} = 8$, $N_{PRS,i}^{slot} = 2$, $L_{available_PRS,i} = 0.071$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$; where $T_{PRS,i}$ = 320 ms, and T_{DRX} = 640 ms. Therefore, $T_{available_PRS,i} = 640$ ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{2}{N'} \right\rceil \left\lceil \frac{0.071}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

For Type 1 duration calculation with UE symbol level buffering capability, the LPP time IE ranges between 20.488s and 80.56s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 21s and 83s.

Similarly for Type 2 Buffering, Best Case result of 20.488s is 11s and for the worst-case result of 80.56ms.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 21.3s and 83.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.4.8.5-3, Table 15.4.8.5-4 and Table 15.4.8.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.9 UE Rx-Tx time difference measurement reporting delay in FR1 for Redcap UE with Rx FH

15.4.9.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement with Rx FH in RRC_INACTIVE state meets the requirements specified in TS 38.133 [50] clause 5.6A.6.6 in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.4.9.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method and DL-PRS measurement in RRC_INACTIVE and maximumPRS-BandwidthAcrossAllHopsFR1 for at least one band and PRS frequency hopping measurement and report.

15.4.9.3 Minimum conformance requirements

When physical layer receives *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [49], and UE is configured to perform PRS-RSRP measurement with RX FH via *nr-DL-PRS-RxHoppingRequest-r18* as defined in TS 37.355 [49], the RedCap UE shall be able to measure multiple (up to the RedCap UE capability specified in clause 5.6A.6.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [57], during the measurement period $T_{UE\ RxTx,Total}$ defined in clause 5.6.4.5 with using the following definition for N_{sample} and $L_{available_PRS,\mathrm{i}}$:

N_{sample} is the number of PRS RSTD measurement samples, where

- N_{sample} = 2 if the RedCap UE supports *reducedNumOfSampleForMeasurementWithFH-RRC-IdleAndInactive* [49], and the LMF requests the UE to perform positioning measurements with reduced number of samples.
- N_{sample} = 4 otherwise.

A measurement sample under RX FH is defined as a PRS measurement over multiple hops.

$L_{available_PRS,\mathrm{i}}$ is the time duration of available PRS in the positioning frequency layer i to be measured, and is calculated by:
$L_{available_PRS,\mathrm{i}}$ is the time duration of available PRS in the positioning frequency layer i to be measured, and is calculated by:

$$L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j} \quad ,$$

where

- $N_{hop,i,j}$ is the number of hops that UE can perform within a time window occasion *j* as defined in the following, and
- $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in time window occasion *j* during $T_{available_PRS,\mathrm{i}}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{per-hop,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered;
- *J* is the number of time window occasions during $T_{available_PRS,\mathrm{i}}$.

The sampling duration per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, T_{hop} is the applicable length per hop as defined in table 5.6A.6.6-1, and RRT_{FH} is the retuning time between Rx hops indicated by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability* [49]. The first hop starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the measurement time window, defined in clause 5.6A.1, taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

Table 15.4.9.3-1: Applicable number of hops per slot and applicable length of each hop

RRT_{FH}	(comb size, Number of PRS symbols)	Applicable number of hops per slot $\left(N_{hops}^{slot}\right)$	Applicable length per hop ($T_{per-hop}$) in number of symbols
$RRT_{FH} \leq 2$ symbols	(2, 12) with SCS 15kHz, 30kHz in FR1, and 60kHz, 120kHz in FR2	2	7
	All others	1	14
2 symbols $< RRT_{FH} \leq 6$ symbols	(≤ 6, any)	1	14
	(12, 12)	½	28
$RRT_{FH} > 6$ symbols	Any combination	½	28

The number of hops within a single time window $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right),$$

where

- $N_{hop,max,i}$ is the maximum number of Rx hops as reported by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* as specified in [49] for positioning frequency layer *i* ,
- $N3_i$ is indicated via UE capability *processingPRS-SymbolsDurationN3-r18* for positioning frequency layer *i*,
- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a single time window occasion *j*,
  - $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot} = 2$,
  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1$,
  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} > 1$,
  - $N_{hops,effect,i,j} = \left\lfloor \frac{(N_{rep}^{PRS}-1)}{2} \right\rfloor + 1$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} = 1$,
  - where N_{rep}^{PRS} is the number of inter-slot PRS repetitions within a single time window, which are unmuted and fully or partially overlapped with the sampling duration within each hop. M_{rep}^{PRS} is the PRS repetition interval configured by *dl-PRS-ResourceTimeGap*, N_{hops}^{slot} is the applicable number of hops per slot as defined in table 5.6A.6.6-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions $\left(N_{rep}^{PRS}\right)$ within a time window instance and the same PRS repetition interval $\left(M_{rep}^{PRS}\right)$, otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of BW_{total} defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop,i,j} * BW_{per-hop} - \left(N_{hop,i,j} - 1\right) * BW_{overlap}\right),$$

where

BW_{PRS} is the minimum among:

- configured PRS BW, and
- UE capability of maximum PRS BW across all hops indicated via *maximumPRS-BandwidthAcrossAllHopsFR1-r18* or *maximumPRS-BandwidthAcrossAllHopsFR2-r18* as specified in [49], and
- total BW of all hops requested by LMF via *nr-DL-PRS-RxHoppingTotalBandwidth-r18* as specified in [49],

$N_{hop,i,j}$ is number of hops within a single time window as define above,

$BW_{per-hop}$ is the UE capability on PRS BW per hop indicated via *supportedBandwidthPRS-r16* as specified in [49],

$BW_{overlap}$ is the UE capability on BW of the overlapping RB indicated via *numOfOverlappingPRB-r18* as specified in [34].

15.4.9.4 Test description

The test defines three possible test configurations; specified in Table 15.4.9.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.4.9.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, cell bandwidth 50 MHz, FDD duplex mode
2	15 kHz SSB SCS, cell bandwidth 50 MHz, TDD duplex mode
3	30 kHz SSB SCS, cell bandwidth 100 MHz, TDD duplex mode
4	15 kHz SSB SCS, cell bandwidth 50 MHz, HD-FDD duplex mode
NOTE 1: The RedCap UE is only required to be tested in one of the supported test configurations. NOTE 2: This test case is applicable to the UE supporting per hop bandwidth ≥ 10 MHz for SCS 15 kHz. NOTE 3: This test case is applicable to the UE supporting per hop bandwidth = 20 MHz for SCS 30 kHz.	

15.4.9.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.9.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.4.9.5-1 and Table 15.4.9.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.9.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.4.9.4.2 Test procedure

Same as defined in clause 15.4.1.4.2.

15.4.9.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.4.9.4.3-1 replaces Table 15.4.1.4.3-7, Table 15.4.9.4.3-2 replaces Table 15.4.1.4.3-8, Table 15.4.9.4.3-3 replaces Table 15.4.1.4.3-12 and Table 15.4.9.4.3-4 replaces Table 15.4.1.4.3-13.

	dBm/98.28MHz	3		-57.46		-57.46
Propagation Condition		1, 2, 3, 4	AWGN			

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.4.9.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxTx,TEG,i} = 1$, $N_{RxBeam,i} = 1$,, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_j}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$; where $T_{PRS,i}$ = 320 ms and $T_{DRX} = 1280$ ms. Therefore, $T_{available_PRS,i} = 1280$ ms. T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

$$L_{available_{PRS},i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$$

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i} \right)$$

$N3_i$ depends on UE parameter processingPRS-SymbolsDurationN3-r18 from TS 37.355 [49]. $N_{hop,max}$ depends on UE parameter maximumFH-Hops from TS 37.355 [49].

For configuration 1, for type 1 duration calculation, we can get the minimum $L_{available_{PRS},i} = 1.14$ ms and the maximum $L_{available_{PRS},i} = 13.68$ ms. For type 2 duration calculation, we can get the minimum $L_{available_{PRS},i} = 1$ ms and the maximum $L_{available_{PRS},i} = 48$ ms.

For configuration 3, for type 1 duration calculation, we can get the minimum $L_{available_{PRS,i}} = 0.568$ ms and the maximum $L_{available_{PRS,i}} = 6.816$ ms. For type 2 duration calculation, we can get the minimum $L_{available_{PRS,i}} = 2$ ms and the maximum $L_{available_{PRS,i}} = 24$ ms.

Finally, it results in the following equation:

$$\left(1 * 1 * 1 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

For configuration 1, for Type 1 duration calculation with UE symbol level buffering capability, the LPP time IE ranges between 1.288s and 563.52s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 2s and 570s.

Similarly for Type 2 Buffering, Best Case result of 1.288s is 2s and for the worst-case result of 328ms, rounded to the next second, the final value is 330s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 570.3s.

For configuration 3, for Type 1 duration calculation with UE symbol level buffering capability, the LPP time IE ranges between 1.288s and 281.92s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 2s and 290s.

Similarly for Type 2 Buffering, Best Case result of 1.288s is 2s and for the worst-case result of 983.36ms, rounded to the next second, the final value is 990s.The test tolerance for the response time is 300ms. Therefore, the response time ranges between 2.3s and 990.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.4.9.5-3, Table 15.4.9.5-4 and Table 15.4.9.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.10 UE Rx-Tx time difference measurement reporting delay in FR2 for Redcap UE with Rx FH

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.4.10.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx measurement with Rx FH meets the requirements specified in TS 38.133 [50] clause 5.6A.6.6 in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.4.10.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning method and DL-PRS measurement in RRC_INACTIVE and maximumPRS-BandwidthAcrossAllHopsFR2 for at least one band and PRS frequency hopping measurement and report.

15.4.10.3 Minimum conformance requirements

Same as clause 15.4.9.3.

15.4.10.4 Test description

The supported test configuration is listed in Table 15.4.10.4-1.

Table 15.4.10.4-1: Test Configuration

Configuration	Description
1	120 kHz SSB SCS, cell bandwidth 400 MHz, TDD duplex mode
NOTE 1: This test case is applicable to the UE supporting per hop bandwidth = 100 MHz for SCS 120 kHz.	

15.4.10.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.10.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.4.10.5-1 and Table 15.4.10.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.10.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.4.10.4.2 Test procedure

Same as defined in clause 15.4.1.4.2.

15.4.10.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.4.10.4.3-1 replaces Table 15.4.1.4.3-7, Table 15.4.10.4.3-2 replaces Table 15.4.1.4.3-8, Table 15.4.10.4.3-3 replaces Table 15.4.1.4.3-11, Table 15.4.10.4.3-4 replaces Table 15.4.1.4.3-12, and Table 15.4.10.4.3-5 replaces Table 15.4.1.4.3-13.

Propagation Condition		1	AWGN			

NOTE 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
NOTE 6: As observed with 0 dBi gain antenna at the centre of the quiet zone.
NOTE 7: Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMBP from TS 38.101-2 [55] table 6.2.1.3-4.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.4.10.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxTx,TEG,i} = 1$, $N_{RxBeam,i} = 8$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$; where $T_{PRS,i}$ = 320 ms and $T_{DRX} = 1280$ ms. Therefore, $T_{available_PRS,i} = 1280$ ms. T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

$$L_{available_{PRS},i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$$

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right)$$

$N3_i$ depends on UE parameter processingPRS-SymbolsDurationN3-r18 from TS 37.355 [49]. $N_{hop,max}$ depends on UE parameter maximumFH-Hops from TS 37.355 [49].

For type 1 duration calculation, we can get the minimum $L_{available_{PRS},i} = 0.035$ ms For type 2 duration calculation, we can get the minimum $L_{available_{PRS},i} = 0.125$ms.

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS},i}}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

For Type 1 duration calculation with UE symbol level buffering capability, the LPP time IE ranges between 40.968s and 42.24s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 41s and 43s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 41.3s and 43.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.4.10.5-3, Table 15.4.10.5-4 and Table 15.4.10.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.11 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for normal UE in FR1 SA

15.4.11.1 Test purpose

The purpose of the test is to verify the measurement requirements specified in TS 38.133 [50] clause 5.6.4.5 for UE Rx-Tx measurements in RRC_INACTIVE with eDRX. The tests are conducted under AWGN propagation condition with the UE operating in FR1 stand-alone mode and configured to perform UE Rx-Tx measurements on a single positioning frequency layer (PFL) in FR1.

15.4.11.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports Multi-RTT positioning and DL-PRS measurement in RRC_INACTIVE and extendedDRX-CycleInactive-r18.

15.4.11.3 Minimum conformance requirements

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [49], UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [57] in configured positioning frequency layers within the measurement period $T_{UERxTx,Total}$ ms.

$$T_{UERxTx,\ Total} = \sum_{i=1}^{L} T_{UERxTx,i} + (L-1) * \max\left(T_{effect,i}\right)$$

Where:

- i is the index of positioning frequency layer,
- $T_{UERxTx,i}$ is the measurement period for UE Rx-Tx time difference measurements in positioning frequency layer i as further defined in this clause,
- L is total number of positioning frequency layers,
- $T_{effect,i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer i as defined further in this clause.

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where:

- $K_{carrier_PRS}$=1 if the UE is capable of *parallelPRS-MeasRRC-Inactive-r17* defined in [49].
- $K_{carrier_PRS} = N_{layer} + 1$ if the UE is not capable of *parallelPRS-MeasRRC-Inactive-r17* defined in [49] and if Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$; where N_{layer} is defined in clause 4.2.2.7.
- $K_{carrier_PRS} = K_{carrier} + 1$ if the UE is not capable of *parallelPRS-MeasRRC-Inactive-r17* defined in [49] and if Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$; where $K_{carrier}$ is defined in clause 4.2.2.4.
- $N_{RxBeam,i}$ is the scaling factor for UE Rx beam sweeping:
  - $N_{RxBeam,i}$=1 if positioning frequency layer i is in FR1, and if positioning frequency layer i is in FR2.
    - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-Multi-RTT -RequestLocationInformation*.
    - $N_{RxBeam,i}$ equals to 8, otherwise.

  $N_{RxTx,TEG,i}$ is the Rx TEG specific scaling factor:

- $N_{RxTx,TEG,i}$ = 1 if UE is not configured by LMF with *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49].

  Otherwise,

- $N_{RxTx,TEG,i} = N_{TEG,i}$, if UE is not capable of measuring same DL PRS resource simultaneously from multiple Rx TEGs, where $N_{TEG,i}$ is the number of Rx TEGs or RxTx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [49], and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*.

- $N_{RxTx,TEG,i} = \left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$, if UE is capable of measuring same DL PRS resource simultaneously from multiple Rx TEGs, where $k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

- $L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [56]. For calculation of $L_{available_PRS,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.

- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

- {N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [49] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in clause 4.2.7.2 of TS 37.355 [49],

- N' is UE capability for number of DL PRS resources that it can process in a slot corresponding to *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* as specified in clause 6.4.3 of TS 37.355 [49],

- N_{sample} is the number of UE Rx-Tx time difference measurement samples:

  - N_{sample} = 4 if the UE is not capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [49] or not configured to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [49].

  - N_{sample} = 1 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [49] and LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [49] and the following conditions are met:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 2 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [49] and the LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [49] but the following conditions are not met:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - $T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time, $T_{last,i} = T_i + T_{available_PRS,i}$,

- $T_{effect,i}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where:

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [49],
- $T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$, the least common multiple between $T_{PRS,i}$ and T_{DRX}.
  - When UE is configured with RAN eDRX ≤ 10.24 s:
    - T_{DRX} is defined as T in TS 38.304 [1] when CN eDRX ≤ 10.24 s.
    - T_{DRX} is the maximum of the T inside and outside of the CN PTW when CN eDRX > 10.24 s, where T inside and outside of the CN PTW are defined in TS 38.304 [1].
  - When UE is configured with RAN eDRX > 10.24 s:
    - T_{DRX} is the maximum of the DRX cycles within the CN PTW and the RAN PTW.
- Otherwise, T_{DRX} is the DRX cycle of the UE in the serving cell.
- $T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where:
  - T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.
  - N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$

If the following conditions are met, the time $T_{UERxTx,\ Total}$ starts from the first DL PRS resource(s) instances inside a PTW after both the *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message are delivered from LMF to the UE via LPP [49].

- UE is configured with RAN eDRX > 10.24 s, and
- periodic PRS measurement reporting is configured, and
- RAN eDRX cycle is smaller or equal to the PRS measurement reporting periodicity configured via higher layer parameter *reportingInterval* in TS 37.355 [49], and
- there is one or more PRS resources occurring in PTW.

15.4.11.4 Test description

The test defines three possible test configurations; specified in Table 15.4.11.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.4.11.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB and PRS SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB and PRS SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB and PRS SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

15.4.11.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.11.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.4.11.5-1 and Table 15.4.11.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.11.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.4.11.4.2 Test procedure

Same as defined in clause 15.4.1.4.2.

15.4.11.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.4.11.4.3-1 replaces Table 15.4.1.4.3-10, Table 15.4.11.4.3-2 replaces Table 15.4.1.4.3-12 and Table 15.4.11.4.3-3 replaces Table 15.4.1.4.3-13.

Propagation Condition		1, 2, 3	AWGN			

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.4.11.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxTx,TEG,i} = 1$, $N_{RxBeam,i} = 1$, $N_{PRS,i}^{slot} = 1$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$; where $T_{PRS,i}$ = 160 ms, and and T_{DRX} = 1280ms. Therefore, $T_{available_PRS,i}$ = 1280 ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 1 * \left\lceil \frac{1}{N'} \right\rceil * \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * 4 - 1\right)$$

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 15kHz the LPP time IE ranges between 5.128s and 16.64s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 17s.

Similarly for Type 2 Buffering, Best Case result of 5.128s is 6s and for the worst-case result of 42240ms, rounded to the next second, the final value is 43s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 43.3s.

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 30kHz the LPP time IE ranges between 5.128s and 11.52s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 12s.

Similarly for Type 2 Buffering, Best Case result of 5.128s is 6s and for the worst-case result of 21760ms, rounded to the next second, the final value is 22s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 22.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.4.11.5-3, Table 15.4.11.5-4 and Table 15.4.11.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.12 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for RedCap UE in FR1 SA

15.4.12.1 Test purpose

The purpose of the test is to verify the measurement requirements specified in TS 38.133 [50] clause 5.6A.6.5 for UE Rx-Tx measurements in RRC_INACTIVE with eDRX. The tests are conducted under AWGN propagation condition with the UE operating in FR1 stand-alone mode and configured to perform UE Rx-Tx measurements on a single positioning frequency layer (PFL) in FR1.

15.4.12.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning and DL-PRS measurement in RRC_INACTIVE and extendedDRX-CycleInactive-r18.

15.4.12.3 Minimum conformance requirements

Same as clause 15.4.7.3.

15.4.12.4 Test description

The test defines three possible test configurations; specified in Table 15.4.12.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.4.11.4-1: Test Configurations

Config	Description
1	NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	NR 30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	NR 15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations in each supported band	

15.4.12.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.12.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.4.121.5-1 and Table 15.4.12.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.12.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.4.12.4.2 Test procedure

Same as defined in clause 15.4.1.4.2.

15.4.12.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.4.12.4.3-1 replaces Table 15.4.1.4.3-7, Table 15.4.12.4.3-2 replaces Table 15.4.1.4.3-8, Table 15.4.12.4.3-3 replaces Table 15.4.1.4.3-10, Table 15.4.12.4.3-4 replaces Table 15.4.1.4.3-12 and Table 15.4.12.4.3-5 replaces Table 15.4.1.4.3-13.

	dBm/18.36 MHz	3		-64.67		-64.67
Propagation Condition		1, 2, 3, 4	AWGN			

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.4.12.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxTx,TEG,i} = 1$, $N_{RxBeam,i} = 1$, $N_{PRS,i}^{slot} = 1$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$; where $T_{PRS,i}$ = 160 ms, and and T_{DRX} = 1280ms. Therefore, $T_{available_PRS,i}$ = 1280 ms.

T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

Finally, it results in the following equation:

$$\left(1 * 1 * 1 * \left\lceil \frac{1}{N'} \right\rceil * \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * 4 - 1\right)$$

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 15kHz the LPP time IE ranges between 5.128s and 26.88s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 27s.

Similarly for Type 2 Buffering, Best Case result of 5.128s is 6s and for the worst-case result of 83200ms, rounded to the next second, the final value is 84s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 84.3s.

For Type 1 duration calculation with UE symbol level buffering capability, for SCS 30kHz the LPP time IE ranges between 5.128s and 16.64s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 6s and 17s.

Similarly for Type 2 Buffering, Best Case result of 5.128s is 6s and for the worst-case result of 42240ms, rounded to the next second, the final value is 43s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 6.3s and 43.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.4.12.5-3, Table 15.4.12.5-4 and Table 15.4.12.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.13 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for normal UE in FR2 SA

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.4.13.1 Test purpose

The purpose of the test is to verify the measurement requirements specified in TS 38.133 [50] clause 5.6.4.5 for UE Rx-Tx measurements in RRC_INACTIVE with eDRX. The tests are conducted under AWGN propagation condition with the UE operating in FR2 stand-alone mode and configured to perform UE Rx-Tx measurements on a single positioning frequency layer (PFL) in FR2.

15.4.13.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports Multi-RTT positioning and DL-PRS measurement in RRC_INACTIVE and extendedDRX-CycleInactive-r18.

15.4.13.3 Minimum conformance requirements

Same as clause 15.4.11.3.

15.4.13.4 Test description

The supported test configuration is listed in Table 15.4.13.4-1.

Table 15.4.13.4-1: Test Configuration

Config	Description
1	120 kHz SSB and PRS SCS, 100 MHz bandwidth, TDD duplex mode

15.4.13.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.13.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.4.13.5-1 and Table 15.4.13.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.13.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.4.13.4.2 Test procedure

Same as defined in clause 15.4.1.4.2.

15.4.13.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.4.13.4.3-1 replaces Table 15.4.1.4.3-4, Table 15.4.13.4.3-2 replaces Table 15.4.1.4.3-7, Table 15.4.13.4.3-3 replaces Table 15.4.1.4.3-8, Table 15.4.13.4.3-4 replaces Table 15.4.1.4.3-11, Table 15.4.13.4.3-5 replaces Table 15.4.1.4.3-10, Table 15.4.13.4.3-6 replaces Table 15.4.1.4.3-12 and Table 15.4.13.4.3-7 replaces Table 15.4.1.4.3-13.

Io	dBm/380.16MHz	1	N/A	-57.6	N/A	-57.6
Propagation Condition		1	AWGN			

NOTE 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

NOTE 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

NOTE 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

NOTE 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

NOTE 6: As observed with 0 dBi gain antenna at the centre of the quiet zone.
NOTE 7: Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMBP from TS 38.101-2 [55] table 6.2.1.3-4.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.4.13.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxTx,TEG,i} = 1$, $N_{RxBeam,i} = 8$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$; where $T_{PRS,i}$ = 320 ms and $T_{DRX} = 640$ ms. Therefore, $T_{available_PRS,i}$ = 640 ms. T_i depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

For type 1 duration calculation, we can get the $= 0.035$ ms For type 2 duration calculation, we can get the $L_{available_{PRS,i}} = 0.125$ms.

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

For duration calculation with UE symbol level buffering capability, the LPP time IE ranges between 20.488s and 41.6s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 21s and 42s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 21.3s and 42.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.4.13.5-3, Table 15.4.13.5-4 and Table 15.4.13.5-5 for reference.

Table 15.4.13.5-3: value of N' based on *maxNumOfDL-PRS-ResProcessedPerSlot*

maxNumOfDL-PRS-ResProcessedPerSlot	$\left\lceil \frac{1}{N'} \right\rceil$
>=n1	1

n1280	1280	1920

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.4.14 UE Rx-Tx time difference measurement reporting delay test case for case 2 when eDRX > 10.24s for RedCap UE in FR2 SA

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for test frequencies > 40.8 GHz

15.4.14.1 Test purpose

The purpose of the test is to verify the measurement requirements specified in TS 38.133 [50] clause 5.6A.6.5 for UE Rx-Tx measurements in RRC_INACTIVE with eDRX. Refer to clause A.7.8.3.3.1 for test configuration and procedure.

15.4.14.2 Test applicability

This test applies to all types of NR Redcap UE release 18 onwards that supports Multi-RTT positioning and DL-PRS measurement in RRC_INACTIVE and extendedDRX-CycleInactive-r18.

15.4.14.3 Minimum conformance requirements

Same as clause 15.4.7.3.

15.4.14.4 Test description

The supported test configuration is listed in Table 15.4.14.4-1.

Table 15.4.14.4-1: Test Configuration

Config	Description
1	120 kHz SSB and PRS SCS, 100 MHz bandwidth, TDD duplex mode

15.4.14.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.4.14.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.4.14.5-1 and Table 15.4.14.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.4.14.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.4.14.4.2 Test procedure

Same as defined in clause 15.4.1.4.2.

15.4.14.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.4.14.4.3-1 replaces Table 15.4.1.4.3-4, Table 15.4.14.4.3-2 replaces Table 15.4.1.4.3-7, Table 15.4.14.4.3-3 replaces Table 15.4.1.4.3-8, Table 15.4.14.4.3-4 replaces Table 15.4.1.4.3-11, Table 15.4.14.4.3-5 replaces Table 15.4.1.4.3-10, Table 15.4.14.4.3-6 replaces Table 15.4.1.4.3-12 and Table 15.4.14.4.3-7 replaces Table 15.4.1.4.3-13.

Io	dBm/380.16MHz	1	N/A	-57.6	N/A	-57.6
Propagation Condition		1	AWGN			

NOTE 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
NOTE 6: As observed with 0 dBi gain antenna at the centre of the quiet zone.
NOTE 7: Information about types of UE beam is given in annex B.2.1.3, and does not limit UE implementation or test system implementation.
NOTE 8: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMBP from TS 38.101-2 [55] table 6.2.1.3-4.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.4.14.3.

The response time is equal to the LPP time IE value plus the test tolerance. The LPP time IE value is derived from the UE Rx-Tx time difference measurement period plus ΔT, where ΔT = 50ms. The UE Rx-Tx time difference measurement period follows the equation:

$$T_{UERxTx,i} = \left(K_{carrier_PRS} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where $K_{carrier_PRS} = 1$, $N_{RxTx,TEG,i} = 1$, $N_{RxBeam,i} = 8$, $N_{sample} = 4$. N is the parameter durationOfPRS-ProcessingSysmbols from TS 37.355 [49], N' is the parameter maxNumOfDL-PRS-ResProcessedPerSlot from TS 37.355 [49], $T_{last,i} = T_i + T_{available_PRS,i}$ and $T_{effect,i} = \left\lceil \frac{T_j}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$.

$T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$; where $T_{PRS,i}$ = 320 ms and $T_{DRX} = 640$ ms. Therefore, $T_{available_PRS,i}$ = 640 ms. T_j depends on the UE parameter durationOfPRS-ProcessingSymbolsInEveryTms from TS 37.355 [49]

$$L_{available_{PRS},i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$$

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i} \right)$$

$N3_i$ depends on UE parameter processingPRS-SymbolsDurationN3-r18 from TS 37.355 [49]. $N_{hop,max}$ depends on UE parameter maximumFH-Hops from TS 37.355 [49].

For type 1 duration calculation, we can get the minimum $L_{available_{PRS},i} = 0.035$ ms For type 2 duration calculation, we can get the minimum $L_{available_{PRS},i} = 0.125$ms.

Finally, it results in the following equation:

$$\left(1 * 1 * 8 * \left\lceil \frac{1}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS},i}}{N} \right\rceil * 4 - 1\right) * T_{effect} + T_{last}$$

For duration calculation with UE symbol level buffering capability, the LPP time IE ranges between 20.488s and 41.6s. The value of the LPP time IE is rounded up to the next second (if the value is >128s, it should be rounded up to the next multiple of ten seconds). The result is transmitted in the response time IE in the LPP-RequestLocationInformation. The LPP time IE ranges between 21s and 42s.

The test tolerance for the response time is 300ms. Therefore, the response time ranges between 21.3s and 42.3s.

The values of N', N and Ti and the effect in the response time equation are defined in Table 15.4.14.5-3, Table 15.4.14.5-4 and Table 15.4.14.5-5 for reference.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.5 UE Rx-Tx time difference measurement accuracy test cases in RRC_INACTIVE

15.5.1 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR1 SA

15.5.1.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25.2. The test is conducted in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.5.1.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and *supportedDL-PRS-ProcessingSamples-RRC-Inactive*. In addition, this test shall be verified with either SDT or non-SDT supporting UEs.

15.5.1.3 Minimum conformance requirements

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

N_{TA_offset} defined in Table 7.1.2-2 changes during the UE Rx-Tx measurement period or

if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within [-160, 160] msec of at least one DL PRS resource of each of the TRPs in the assistance data.

If the uplink transmission timing changes during the UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1.2 of TS38.133 [50] then:

- UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in section 7.1.1 of TS38.133 [50]) for SRS transmission even if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

- UE Rx-Tx measurement accuracy requirements shall not apply for a cell, which is not the downlink reference cell (defined in section 7.1.1 of TS38.133 [50]) for SRS transmission, if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

When a serving cell change occurs during the UE Rx-Tx measurement period, the UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx measurement.

The relative UE Rx-Tx measurement accuracy in this clause is defined as accuracy of the difference between two UE Rx-Tx measurements.

The accuracy requirements in Table 15.5.1.3-2 for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [55] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to Annex B.2.14 of TS38.133 [50] for a corresponding Band.

AWGN propagation condition.

Table 15.5.1.3-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN

± 16+δ		≥ 64		≥1	NOTE 6	NOTE 6	NOTE 6
± 8+δ		≥ 132		≥1	NOTE 6	NOTE 6	NOTE 6

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: $T_{\text{rep}}^{\text{PRS}}$, L_{PRS} , $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from Table 10.1.25.2-5.

Table 15.5.1.3-2: Margin for UE Rx-Tx time difference measurement accuracy in FR1

Min(PRS BW, SRS BW) (RB)			Margin (Tc [Note 1])
SCS = 15 kHz	SCS = 30 kHz	SCS = 60 kHz	
≥ 24	N/A	N/A	160
≥ 52	≥ 24	N/A	80
≥ 104	≥ 48	≥ 24	56
N/A	≥ 132	≥ 64	24
N/A	N/A	≥ 132	24

NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.

15.5.1.4 Test description

15.5.1.4.1 Initial conditions

The supported test configuration is listed in Table 15.5.1.4.1.-1.

Table 15.5.1.4.1-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.5.1.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.5.1.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.5.1.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). Both cells are on the same RF channel in FR1.

15.5.1.4.2 Test procedure

The test consists of a set-up period and a measurement period. The *NR-Multi-RTT-ProvideAssistanceData* and *NR-Multi-RTT-RequestLocationInformation* shall be provided to the UE during the set-up period. During the measurement period, UE shall be in RRC_INACTIVE state.

1. Configure the Cell for RA-SDT with SIB1 configured according to the message contents 15.5.1.4.3.
2. State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command T_A = 31 which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
3. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
4. The SS adjusts the downlink timing for Cell 1 to a delay of +512 T_c, compared to the current value.
5. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
6. The SS shall transmit an *RRCReconfiguration* message with DRX configuration.
7. The UE shall transmit *RRCReconfigurationComplete* message.
8. The SS shall transmit an LPP REQUEST CAPABILITIES message.
9. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* in the *NR-DL-PRS-ProcessingCapability* IE and the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

11. The SS shall send a LCS Periodic-Triggered Invoke Request message with LPP LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.

12. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.

13. The SS transmits an *RRCRelease* message including UL configuration and SDT configuration to transit the UE to RRC_INACTIVE state.

14. Wait for the UE as it monitors for occurrence of the periodic event requested.

15. The UE shall transmit an *RRCResumeRequest* message. If the UE supports SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 19.

16. The SS transmits an *RRCResume* message

17. The UE transmits an *RRCResumeComplete* message.

18. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.5.1.4.3) and *RRCResumeComplete* message.

19. If the UE message at step 15 or 18 includes the *ackRequested* IE set to TRUE, the SS shall send LPP acknowledgment message.

20. The SS shall check nr-UE-RxTxTimeDiff-r16 value for Cell 2 in the *NR-Multi-RTT-SignalMeasurementInformation* according to Table 15.5.1.5-2.

21. UE shall be released and moved to RRC_IDLE.

22. Repeat steps 1-21 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

15.5.1.4.3 Message contents

Message contents are the same as in 15.4.1.5.4.3 with the following exceptions:

The UE Rx-Tx time difference measurement period fulfills the requirements specified in clause 15.5.1.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

15.5.2 UE Rx-Tx time difference measurement accuracy with reduced number of samples in FR1 SA

15.5.2.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy with reduced number of samples in RRC_INACTIVE state is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25.2. The test is conducted in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.5.2.2 Test applicability

This test applies to all types of NR UE release 17 onwards that support Multi-RTT positioning and *supportedDL-PRS-ProcessingSamples-RRC-Inactive*. In addition, this test shall be verified with either SDT or non-SDT supporting UEs.

15.5.2.3 Minimum conformance requirements

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

N_{TA_offset} defined in Table 7.1.2-2 in TS38.133 [50] changes during the UE Rx-Tx measurement period or

if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within [-160, 160] msec of at least one DL PRS resource of each of the TRPs in the assistance data.

If the uplink transmission timing changes during the UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1.2 of TS38.133 [50] then:

- UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in section 7.1.1 of TS38.133 [50]) for SRS transmission even if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

- UE Rx-Tx measurement accuracy requirements shall not apply for a cell, which is not the downlink reference cell (defined in section 7.1.1 of TS38.133 [50]) for SRS transmission, if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

When a serving cell change occurs during the UE Rx-Tx measurement period, the UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx measurement.

The relative UE Rx-Tx measurement accuracy in this clause is defined as accuracy of the difference between two UE Rx-Tx measurements.

The accuracy requirements in Table 15.5.2.3-1 for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [55] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to Annex B.2.14 of TS38.133 [50] for a corresponding Band

Number of measurement samples is less than 4.

AWGN propagation condition.

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: T_{rep}^{PRS}, L_{PRS}, K_{comb}^{PRS} are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from Table 10.1.25.2-5.

Table 15.5.2.3-2: Margin for UE Rx-Tx time difference measurement accuracy in FR1

Min(PRS BW, SRS BW) (PRB)			Margin (Tc [Note 1])
SCS = 15 kHz	SCS = 30 kHz	SCS = 60 kHz	
≥ 24	N/A	N/A	160
≥ 52	≥ 24	N/A	80
≥ 104	≥ 48	≥ 24	56
N/A	≥ 132	≥ 64	24
N/A	N/A	≥ 132	24
NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6]. NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.			

15.5.2.4 Test description

15.5.2.4.1 Initial conditions

The supported test configuration is listed in Table 15.5.2.4.1-1.

Table 15.5.2.4.1-1: Supported test configurations

Configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.5.2.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.5.2.4-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.5.2.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR1.

15.5.2.4.2 Test procedure

The test consists of a set-up period and a measurement period. During the set-up period, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During the measurement period UE shall be in RRC_INACTIVE state.

The beginning of the measurement period shall be aligned with the first DRX cycle containing a DL PRS resource(s). The *NR-Multi-RTT-ProvideAssistanceData* and *NR-Multi-RTT-RequestLocationInformation* shall be provided to the UE during the set-up period.

1. Configure the Cell for RA-SDT with SIB1 configured according to the message contents 15.5.2.4.3.
2. State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command T_A = 31 which indicates a timing advance adjustment value N_{TA} = 0 T_c.
3. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

4. The SS adjusts the downlink timing for Cell 1 to a delay of +512 T_c, compared to the current value.
5. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
6. The SS shall transmit an *RRCReconfiguration* message with DRX configuration.
7. The UE shall transmit *RRCReconfigurationComplete* message.
8. The SS shall transmit an LPP REQUEST CAPABILITIES message.
9. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* in the *NR-DL-PRS-ProcessingCapability* IE and the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
11. The SS shall send a LCS Periodic-Triggered Invoke Request message with LPP LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the reducedDL-PRS-ProcessingSamples-r17 in the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.
12. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
13. The SS transmits an *RRCRelease* message including the UL configuration and SDT configuration to transit the UE to RRC_INACTIVE state.
14. Wait for the UE as it monitors for occurrence of the periodic event requested.
15. The UE shall transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 19.
16. The SS transmits an *RRCResume* message.
17. The UE transmits an *RRCResumeComplete* message.
18. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.5.2.4.3) and *RRCResumeComplete* message.
19. If the UE message at step 15 or 18 includes the *ackRequested* IE set to TRUE, the SS shall send LPP acknowledgment message.
20. The SS shall check nr-UE-RxTxTimeDiff-r16 value for Cell 2 in the *NR-Multi-RTT-SignalMeasurementInformation* according to Table 15.5.2.5-2.
21. UE shall be released and moved to RRC_IDLE.
22. Repeat steps 1-21 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

15.5.2.4.3 Message contents

Message contents are the same as 15.5.1.4.3 with following exceptions:

Propagation Condition		1, 2, 3	AWGN	

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Table 15.5.2.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1&2	cell 1	(Measured value from step 12 - 171) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 171) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	cell 2	(Measured value from step 12 - 187) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 187) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
3	cell 1	(Measured value from step 12 – 118) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 118) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	cell 2	(Measured value from step 12 - 127) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 127) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

The UE Rx-Tx time difference measurement period fulfills the requirements specified in clause 15.5.2.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.5.3 UE Rx-Tx time difference measurement accuracy for single positioning frequency layer in FR2 SA

15.5.3.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25.2. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.5.3.2 Test applicability

This test applies to all types of NR UE release 17 onwards that supports Multi-RTT positioning and *supportedDL-PRS-ProcessingSamples-RRC-Inactive*. In addition, this test shall be verified with either SDT or non-SDT supporting UEs.

15.5.3.3 Minimum conformance requirements

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

N_{TA_offset} defined in Table 7.1.2-2 changes during the UE Rx-Tx measurement period or

if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within [-160, 160] msec of at least one DL PRS resource of each of the TRPs in the assistance data.

If the uplink transmission timing changes during the UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1.2 of TS38.133 [50] then:

- UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in section 7.1.1 of TS38.133 [50]) for SRS transmission even if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

- UE Rx-Tx measurement accuracy requirements shall not apply for a cell, which is not the downlink reference cell (defined in section 7.1.1 of TS38.133 [50]) for SRS transmission, if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

When a serving cell change occurs during the UE Rx-Tx measurement period, the UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx measurement.

The relative UE Rx-Tx measurement accuracy in this clause is defined as accuracy of the difference between two UE Rx-Tx measurements.

The accuracy requirements in Table 15.5.3.3-2 for FR2 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [55] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to Annex B.2.14 of TS38.133 [50] for a corresponding Band.

AWGN propagation condition.

Table 15.5.3.3-1: UE Rx-Tx time difference measurement accuracy in FR2 in AWGN

Accuracy	Conditions				
					Io[Note 4] range

	PRS Ês/Iot	Minimum PRS bandwidth	PRS SCS	PRS resource repetition $(T_{\text{rep}}^{\text{PRS}} * L_{\text{PRS}} / K_{\text{comb}}^{\text{PRS}}$ Note 3	Minimum Io Note 1	Maximum Io
Tc Note 5	dB	PRB	kHz		dBm / SCS_{PRS}	dBm/$BW_{Channel}$
± 22+δ	-3	≥24	60	≥4	Same value as PRP in Table B.2.14-2 of TS38.133[50], according to UE Power class, operating band and angle of arrival	-50
± 15+δ		≥64		≥1	NOTE 6	NOTE 6
± 7+δ		≥132		≥1	NOTE 6	NOTE 6
± 12+δ		≥32	120	≥14	Same value as PRP in Table B.2.14-2 of TS38.133[50], according to UE Power class, operating band and angle of arrival	-50
± 7+δ		≥64		≥1	NOTE 6	NOTE 6
± 4+δ		≥128		≥1	NOTE 6	NOTE 6
± 35+δ	-13	≥24	60	≥1	NOTE 6	NOTE 6
± 15+δ		≥64		≥1	NOTE 6	NOTE 6
± 7+δ		≥132		≥1	NOTE 6	NOTE 6
± 14+δ		≥32	120	≥4	NOTE 6	NOTE 6
± 9+δ		≥64		≥1	NOTE 6	NOTE 6
± 4+δ		≥128		≥1	NOTE 6	NOTE 6

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5 of TS38.133[50].
NOTE 3: $T_{\text{rep}}^{\text{PRS}}$, L_{PRS}, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [49].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [53].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from Table 15.5.3.3-2.

Table 15.5.3.3-2: Margin for UE Rx-Tx time difference measurement accuracy in FR2

Min(PRS BW, SRS BW) (MHz)		Margin (Tc Note 1)
SCS = 60 kHz	SCS = 120 kHz	
≥ 24	N/A	76
≥ 64	≥ 32	32
≥ 132	≥ 64	24
N/A	≥ 128	20

NOTE 1: Tc is the basic timing unit defined in TS 38.211 [53].
NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.

15.5.3.4 Test description

15.5.3.4.1 Initial conditions

The supported test configuration is listed in Table 15.5.3.4.1.-1.

Table 15.5.3.4.1-1: Supported test configurations

Config	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.5.3.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.5.3.5-1.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.5.3.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). Both cells are on the same RF channel in FR2.

15.5.3.4.2 Test procedure

The test consists of a set-up period and a measurement period. The *NR-Multi-RTT-ProvideAssistanceData* and *NR-Multi-RTT-RequestLocationInformation* shall be provided to the UE during the set-up period. During the measurement period, UE shall be in RRC_INACTIVE state.

7. Configure the Cell for RA-SDT with SIB1 configured according to the message contents 15.5.3.4.3.
8. State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command T_A = 31 which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
9. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
10. The SS adjusts the downlink timing for Cell 1 to a delay of +512 T_c, compared to the current value.
11. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
12. The SS shall transmit an *RRCReconfiguration* message with DRX configuration.
13. The UE shall transmit *RRCReconfigurationComplete* message.
14. The SS shall transmit an LPP REQUEST CAPABILITIES message.
15. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* in the *NR-DL-PRS-ProcessingCapability* IE and the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
16. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
17. The SS shall send a LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.
18. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
19. The SS transmits an *RRCRelease* message including UL configuration and SDT configuration to transit the UE to RRC_INACTIVE state.
20. Wait for the UE as it monitors for occurrence of the periodic event requested.
21. The UE shall transmit an *RRCResumeRequest* message. If the UE supports SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 19.
22. The SS transmits an *RRCResume* message

23. The UE transmits an *RRCResumeComplete* message.

24. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.5.3.4.3) and *RRCResumeComplete* message.

25. If the UE message at step 15 or 18 includes the *ackRequested* IE set to TRUE, the SS shall send LPP acknowledgment message.

26. The SS shall check nr-UE-RxTxTimeDiff-r16 value for Cell 2 in the *NR-Multi-RTT-SignalMeasurementInformation* according to Table 15.5.3.5-2.

27. UE shall be released and moved to RRC_IDLE.

28. Repeat steps 1-21 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

15.5.3.4.3 Message contents

Message contents are the same as in 15.4.1.5.4.3 with the following exceptions:

15.5.3.5 Test requirement

The UE Rx-Tx time difference accuracy test parameters are given in Table 15.5.3.5-1.

Table 15.5.3.5-1: UE Rx-Tx time difference measurement accuracy test parameters

Parameter	Unit	Test configuration	Test 1		Test 2	
			Cell 1	Cell 2	Cell 1	Cell 2
AoA setup		1	Setup 1 as specified in clause A.3.15 of TS38.133 [50]		Setup 1 as specified in clause A.3.15 of TS38.133 [50]	
Beam Assumption[Note 7]		1	Rough	Rough	Rough	Rough
DRX	s	1	0.64		0.64	
Time offset with Cell 1	µs	1	N/A	3	N/A	3
TDD configuration		1	TDDConf.3.1	TDDConf.3.1	TDDConf.3.1	TDDConf.3.1
PDSCH RMC configuration		1	SR.3.1 TDD	N/A	SR.3.1 TDD	N/A

RMSI CORESET RMC configuration		1	CR.3.1 TDD	N/A	CR.3.1 TDD	N/A
Dedicated CORESET RMC configuration		1	CCR.3.1 TDD	N/A	CCR.3.1 TDD	N/A
OCNG Patterns		1	OP.1	OP.1	OP.1	OP.1
Initial BWP configuration		1	DLBWP.0.1 ULBWP.0.1	N/A	DLBWP.0.1 ULBWP.0.1	N/A
PRS configuration		1	PRS.1.1 FR2	PRS.1.2 FR2	PRS.1.1 FR2	PRS.1.2 FR2
PRS Resource slot offset	slot	1	0	4	0	4
SRS configuration		1	POS-SRS.3	N/A	POS-SRS.3	N/A
N_{oc} Note 2	dBm/SCS	1	-89		-89	
N_{oc} Note 2	dBm/15 kHz	1	-98		-98	
PRS $\hat{E}_s/I_{ot}$	dB	1	-2.62	-12.26	-2.62	-12.26
PRS $\hat{E}_s/N_{oc}$	dB	1	-2	-10	-2	-10
PRS-RSRP Note 3	dBm/SCS kHz	1	-91	-99	-91	-99
Io	dBm/190.08 MHz	1	-54.59	-54.59	-54.59	-54.59
Propagation Condition		1	AWGN		AWGN	

Note 1: Void.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7: Information about types of UE beam is given in B.2.1.3 of TS38.133[50], and does not limit UE implementation or test system implementation
Note 8: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 36.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

Table 15.5.3.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1	Sub-test 1	(Measured value from step 12 - 33) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 33) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	Sub-test 2	(Measured value from step 12 - 33) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 +33) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.5.3.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

15.5.4 UE Rx-Tx time difference measurement accuracy with reduced number of samples in FR2 SA

15.5.4.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy with reduced number of samples in RRC_INACTIVE state is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25.2. The test is conducted in AWGN propagation condition in FR2 in standalone scenario when single positioning frequency layer is configured.

15.5.4.2 Test applicability

This test applies to all types of NR UE release 17 onwards that support Multi-RTT positioning and *supportedDL-PRS-ProcessingSamples-RRC-Inactive*. In addition, this test shall be verified with either SDT or non-SDT supporting UEs.

15.5.4.3 Minimum conformance requirements

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

N_{TA_offset} defined in Table 7.1.2-2 in TS38.133 [50] changes during the UE Rx-Tx measurement period or

if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within [-160, 160] msec of at least one DL PRS resource of each of the TRPs in the assistance data.

If the uplink transmission timing changes during the UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1.2 of TS38.133 [50] then:

- UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in section 7.1.1 of TS38.133 [50]) for SRS transmission even if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

- UE Rx-Tx measurement accuracy requirements shall not apply for a cell, which is not the downlink reference cell (defined in section 7.1.1 of TS38.133 [50]) for SRS transmission, if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

When a serving cell change occurs during the UE Rx-Tx measurement period, the UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx measurement.

The relative UE Rx-Tx measurement accuracy in this clause is defined as accuracy of the difference between two UE Rx-Tx measurements.

The accuracy requirements in Table 15.5.4.3-1 for FR2 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [55] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to Annex B.2.14 of TS38.133 [50] for a corresponding Band

Number of measurement samples is less than 4.

AWGN propagation condition.

Table 15.5.4.3-1: UE Rx-Tx time difference measurement accuracy in FR2 in AWGN with reduced measurement samples

Accuracy	Conditions				
					Io[Note 4] range

	PRS Ês/Iot	Minimum PRS bandwidth	PRS SCS	PRS resource repetition ($T_{\text{rep}}^{\text{PRS}} * L_{\text{PRS}} / K_{\text{comb}}^{\text{PRS}}$ Note 3	Minimum Io Note 1	Maximum Io
Tc Note 5	dB	PRB	kHz		dBm / SCS_{PRS}	dBm/$BW_{Channel}$
± 15+δ	0	≥64	60	≥1	Same value as PRP in Table B.2.14-2 of TS38.133[50], according to UE Power class, operating band and angle of arrival	NOTE 6
± 7+δ		≥132		≥1	NOTE 6	NOTE 6
± 7+δ		≥64	120	≥1	Same value as PRP in Table B.2.14-2 of TS38.133[50], according to UE Power class, operating band and angle of arrival	NOTE 6
± 4+δ		≥128		≥1	NOTE 6	NOTE 6
± 15+δ	-6	≥64	60	≥1	NOTE 6	NOTE 6
± 7+δ		≥132		≥1	NOTE 6	NOTE 6
± 9+δ		≥64	120	≥1	NOTE 6	NOTE 6
± 4+δ		≥128		≥1	NOTE 6	NOTE 6

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5 of TS38.133[50]
NOTE 3: $T_{\text{rep}}^{\text{PRS}}$, L_{PRS}, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN defined in TS 37.355 [49].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [53].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from Table 15.5.4.3-2

Table 15.5.4.3-2: Margin for UE Rx-Tx time difference measurement accuracy in FR2

Min(PRS BW, SRS BW) (MHz)		Margin (Tc Note 1)
SCS = 60 kHz	SCS = 120 kHz	
≥ 24	N/A	76
≥ 64	≥ 32	32
≥132	≥ 64	24
N/A	≥ 128	20

NOTE 1: Tc is the basic timing unit defined in TS 38.211 [53].
NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.

15.5.4.4 Test description

15.5.4.4.1 Initial conditions

The supported test configuration is listed in Table 15.5.4.4.1-1.

Table 15.5.4.4.1-1: Supported test configurations

Config	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.5.4.4.1-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.5.4.4-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.5.4.4.3.
5. In the test there are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). All cells are on the same RF channel in FR2.

15.5.4.4.2 Test procedure

The test consists of a set-up period and a measurement period. During the set-up period, the UE shall be in RRC_CONNECTED state and shall not have any timing information of Cell 2. During the measurement period UE shall be in RRC_INACTIVE state.

The beginning of the measurement period shall be aligned with the first DRX cycle containing a DL PRS resource(s). The *NR-Multi-RTT-ProvideAssistanceData* and *NR-Multi-RTT-RequestLocationInformation* shall be provided to the UE during the set-up period.

1. Configure the Cell for RA-SDT with SIB1 configured according to the message contents 15.5.4.4.3.
2. State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command T_A = 31 which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.
3. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.
4. The SS adjusts the downlink timing for Cell 1 to a delay of +512 T_c, compared to the current value.
5. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.
6. The SS shall transmit an *RRCReconfiguration* message with DRX configuration.
7. The UE shall transmit *RRCReconfigurationComplete* message.
8. The SS shall transmit an LPP REQUEST CAPABILITIES message.
9. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* in the *NR-DL-PRS-ProcessingCapability* IE and the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilities* IE.
10. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the *NR-Multi-RTT-ProvideAssistanceData* IE. The position of neighbour Cell 2 is described in 3GPP TS 37.571-5 [20]. If the UE message at step 8 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.
11. The SS shall send a LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the reducedDL-PRS-ProcessingSamples-r17 in the *NR-Multi-RTT-RequestLocationInformation* IE such that the UE receives the message ΔT ms before the start of the measurement period, where ΔT = 50 ms.
12. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.
13. The SS transmits an *RRCRelease* message including the UL configuration and SDT configuration to transit the UE to RRC_INACTIVE state.
14. Wait for the UE as it monitors for occurrence of the periodic event requested.
15. The UE shall transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 19.
16. The SS transmits an *RRCResume* message.

17. The UE transmits an *RRCResumeComplete* message.

18. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.5.4.4.3) and *RRCResumeComplete* message.

19. If the UE message at step 15 or 18 includes the *ackRequested* IE set to TRUE, the SS shall send LPP acknowledgment message.

20. The SS shall check nr-UE-RxTxTimeDiff-r16 value for Cell 2 in the *NR-Multi-RTT-SignalMeasurementInformation* according to Table 15.5.4.5-2.

21. UE shall be released and moved to RRC_IDLE.

22. Repeat steps 1-21 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

EPRE ratio of PDSCH DMRS to SSS				
EPRE ratio of PDSCH to PDSCH DMRS				
EPRE ratio of OCNG DMRS to SSS Note 1				
EPRE ratio of OCNG to OCNG DMRS Note 1				
EPRE ratio of PRS to SSS				
TRS Configuration		1	TRS.2.1 TDD	N/A
Initial BWP configuration		1	DLBWP.0.1 ULBWP.0.1	N/A
PRS configuration		1	PRS.1.1 FR2	PRS.1.1 FR2
PRS BW		1	64 PRBs	64 PRBs
PRS Resource slot offset	slot	1	0	4
SRS configuration		1	POS-SRS.3	N/A
N_{oc} Note 2	dBm/SCS	1	-94	
N_{oc} Note 2	dBm/15 kHz	1	-103	
PRS $\hat{E}_s / I_{ot}$	dB	1	0.32	-5.64
PRS $\hat{E}_s / N_{oc}$	dB	1	3.56	-0.28
PRP Note 3	dBm/SCS kHz	1	-90.4	-94.2
Io	dBm/190.08 MHz	1	-55.73	-55.73
Propagation Condition		1	AWGN	

Note 1: Void.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: PRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone
Note 7: Information about types of UE beam is given in B.2.1.3, and does not limit UE implementation or test system implementation
Note 8: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [55], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [55] Table 6.2.1.3-4.

Table 15.5.4.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Lowest reported value	Highest reported value
1	(5898 - 33) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(5898 + 33) Tc converted to UE Rx-Tx time difference measurement according to clause 4.14.6

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.5.4.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

The rate of successful tests during repeated tests shall be at least 90% with a confidence level of 95%.

15.5.5 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR1 SA

15.5.5.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25A. The tests are conducted under AWGN propagation condition with the UE operating in FR1 stand-alone mode and configured to perform UE Rx-Tx measurements by aggregating two intra-band contiguous positioning frequency layers (PFLs) in FR1.

15.5.5.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports Multi-RTT positioning and DL-PRS bandwidth aggregation in RRC_INACTIVE.

15.5.5.3 Minimum conformance requirements

Same as clause 15.3.7.3.

15.5.5.4 Test description

The test defines three possible test configurations; specified in Table 15.5.5.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.5.5.4-1: Test Configurations

PCell configuration	Description
1	15 kHz SSB SCS, 20 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 50 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

15.5.5.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.5.5.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.5.5.5-1 and Table 15.5.5.5-2.
3. Propagation conditions are set according to clause 4.14.2.

4. Message contents are defined in clause 15.5.5.4.3.

5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.5.5.4.2 Test procedure

The test consists of a set-up period and a measurement period. Cell 1 and Cell 2 are both active during the complete test. The beginning of the measurement period shall be aligned with the first PRS positioning subframe of a positioning occasion in the reference cell. The NR-Multi-RTT-ProvideAssistanceData and NR-Multi-RTT-RequestLocationInformation as defined in clause 15.5.5.4.3 shall be provided to the UE during the set-up period. The last TTI containing the NR-Multi-RTT-RequestLocationInformation message shall be provided to the UE ΔT ms before the start of the measurement period, where ΔT = 50 ms is the maximum processing time of the NR-Multi-RTT-RequestLocationInformation message and the Multi-RTT assistance data in the UE.

13. Configure the Cell for RA-SDT with SIB1 configured according to the message content Table 15.5.5.4.3-1.

14. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On*, according to TS 38.508-1 [45] clause 4.5. Note that in the remainder of the test the timing advance command $T_A = 31$ which indicates a timing advance adjustment value $N_{TA} = 0\ T_c$.

15. The SS shall send a RESET UE POSITIONING STORED INFORMATION message.

16. The SS adjusts the downlink timing for Cell 1 to a delay of $+512\ T_c$, compared to the current value.

17. Wait for 1.6 s to allow for the possibility that the UE makes autonomous timing adjustments.

6. Set the parameters for T1 according to Table 15.5.5.5-1 and Table 15.5.5.5-2.

7. T1 starts.

8. The SS shall transmit an RRCReconfiguration message with the DRX configuration.

9. The UE shall transmit RRCReconfigurationComplete message.

10. The SS shall transmit an LPP REQUEST CAPABILITIES message.

11. The UE shall transmit an LPP PROVIDE CAPABILITIES message indicating the Multi-RTT capabilities supported by the UE in the *NR-Multi-RTT-ProvideCapabilitie* IE.

12. The SS shall send a LPP PROVIDE ASSISTANCE DATA message, including the NR-Multi-RTT-ProvideAssistanceData IE and NR-DL-PRS-AggregationInfo-r18 linking each PRS resource in PFL1 to the corresponding PRS resource in PFL2.If the UE message at step 11 includes the ackRequested IE set to TRUE, then the SS shall send an acknowledgment in the LPP PROVIDE ASSISTANCE DATA message.

13. The SS shall transmit LCS Periodic-Triggered Invoke Request message with LPP REQUEST LOCATION INFORMATION embedded to start the periodic reporting procedure, including the NR-Multi-RTT-RequestLocationInformation IE and nr-DL-PRS-JointMeasurementRequest-r18 IE such that the UE receives the message ΔT ms before the start of T2, where ΔT = 50 ms.

14. The UE shall transmit an LCS Periodic-Triggered Invoke Return Result message.

15. When set-up period expires, the SS shall transmit an RRCRelease message with the UL configuration and SDT configuration to transit the UE to RRC_INACTIVE state.

16. Wait for the UE monitors for occurrence of the periodic event requested.

17. The UE shall transmit an *RRCResumeRequest* message. If the UE also supporting SDT feature, the UE shall include LPP PROVIDE LOCATION INFORMATION message in the *RRCResumeRequest* message and then go to step 21.

18. The SS transmits an *RRCResume* message.

19. The UE transmits an *RRCResumeComplete* message.

20. The UE shall transmit a LPP PROVIDE LOCATION INFORMATION message including the *NR-Multi-RTT-ProvideLocationInformation* IE within the response time (see clause 15.5.5.4.3) plus the maximum RRC processing time 10ms between *RRCResume* message and *RRCResumeComplete* message.

21. The UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2. If the UE transmits an *NR-Multi-RTT-ProvideLocationInformation* IE including the nr-UE-RxTxTimeDiff field for Cell 1 and Cell 2 within the response time, then the number of successful tests is increased by one. If the UE fails to report the *NR-Multi-RTT-ProvideLocationInformation* IE with the nr-UE-RxTxTimeDiff field included within the response time then the number of failure tests is increased by one.

22. If the UE message at step 20 includes the *ackRequested* IE set to TRUE, the SS shall send a LPP acknowledgement message.

25. UE shall be released and moved to RRC_IDLE.

24. Repeat steps 1-23 in Tables 15.5.5.4-1 until the confidence level according to Annex D is achieved.

NOTE: To avoid a large divergence between the sent TA and the set downlink timing, the SS may reset the downlink timing for Cell 1 to its initial value after a certain amount of loops. The loop during the reset does not count for the result statistics.

15.5.5.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.5.5.4.3-1 replaces Table 15.4.1.4.3-7, Table 15.5.5.4.3-2 replaces Table 15.4.1.4.3-8, Table 15.5.5.4.3-3 replaces Table 15.4.1.4.3-12 and Table 15.5.5.4.3-4 replaces Table 15.4.1.4.3-13.

15.5.5.5 Test requirement

Table 15.5.5.5-1 and Table 15.5.5.5-2 define the primary level settings including test tolerances for the test.

Table 15.5.5.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Active cell		1, 2, 3	Cell 1	Cell 1 is the PCell in *NR-Multi-RTT-ProvideAssistanceData* [49].
Neighbour cell		1, 2, 3	Cell 2	Cell 2 is a neighbour cell in *NR-Multi-RTT-ProvideAssistanceData* [49].
RF Channel Number		1, 2, 3	1	For both Cell 1 and Cell 2, all signals/channels except PRS in PFL2 are allocated within this channel.
			2	For both Cell 1 and Cell 2, only PRS in PFL2 is allocated within this channel.
$BW_{channel}$	MHz	1	20: $N_{RB,c}$ = 106	For both RF channels
		2	20: $N_{RB,c}$ = 106	
		3	50: $N_{RB,c}$ = 133	
SSB configuration		1	SSB.1 FR1	
		2	SSB.1 FR1	
		3	SSB.2 FR1	
SMTC configuration		1	SMTC.2	
		2	SMTC.1	
		3	SMTC.1	
CP length		1, 2, 3	Normal	
DRX cycle	s	1, 2, 3	1.28	
Time offset between serving and neighbour cells	µs	1, 2, 3	3	Synchronous cells/TRPs
Expected RSTD	µs	1, 2, 3	3	
Expected RSTD uncertainty	µs	1, 2, 3	5

Io Note 3 (on symbols where PRS is not allocated)	dBm/19.08 MHz	1	-64.57	-64.57
	dBm/19.08 MHz	2	-64.57	-64.57
	dBm/47.88 MHz	3	-60.59	-60.59
Propagation Condition		1, 2, 3	AWGN	

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved on all OFDM symbols except those in which PRS is allocated.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: PRP and Io levels have been derived from other parameters and they are provided for information only. They are not settable parameters themselves.

Table 15.5.5.5-3: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1&2	NR cell 1	(Measured value from step 12 - 70) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 70) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 72) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 72) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
3	NR cell 1	(Measured value from step 12 - 62) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 62) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

	NR cell 2	(Measured value from step 12 - 64) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 64) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.5.5.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.5.6 UE Rx-Tx time difference measurement accuracy test case for PRS aggregation in FR2 SA

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

15.5.6.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1.25A. The tests are conducted under AWGN propagation condition with the UE operating in FR2 stand-alone mode and configured to perform UE Rx-Tx measurements by aggregating two intra-band contiguous positioning frequency layers (PFLs) in FR2.

15.5.6.2 Test applicability

This test applies to all types of NR UE release 18 onwards that supports Multi-RTT positioning and DL-PRS bandwidth aggregation in RRC_INACTIVE.

15.5.6.3 Minimum conformance requirements

Same as defined in clause 15.3.7.3.

15.5.6.4 Test description

The supported test configuration is listed in Table 15.5.6.4-1.

Table 15.5.6.4-1: Test Configuration

Test Configuration	Description
1	120 kHz SSB and PRS SCS, 200 MHz bandwidth, TDD duplex mode

15.5.6.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.5.6.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.

2. The general test parameter settings are set up according to Table 15.5.6.5-1 and Table 15.5.6.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.5.6.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.5.6.4.2 Test procedure

Same as defined in clause 15.5.5.4.2.

15.5.6.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.5.6.4.3-1 replaces Table 15.4.1.4.3-4, Table 15.5.6.4.3-2 replaces Table 15.4.1.4.3-7, Table 15.5.6.4.3-3 replaces Table 15.4.1.4.3-8, Table 15.5.6.4.3-4 replaces Table 15.4.1.4.3-11, Table 15.5.6.4.3-5 replaces Table 15.4.1.4.3-12 and Table 15.5.6.4.3-6 replaces Table 15.4.1.4.3-13.

15.5.6.5 Test requirement

Table 15.5.6.5-1 and Table 15.5.6.5-2 define the primary level settings including test tolerances for the test.

Table 15.5.6.5-1: General test parameters

Parameter	Unit	Test configuration	Value	Comment
Active cell		1	Cell 1	Cell 1 is the PCell in *NR-Multi-RTT-ProvideAssistanceData* [49].
Neighbour cell		1	Cell 2	Cell 2 is a neighbour cell in *NR-Multi-RTT-ProvideAssistanceData* [49].
RF Channel Number		1	1	For both Cell 1 and Cell 2, all signals/channels except PRS in PFL2 are allocated within this channel.
			2	For both Cell 1 and Cell 2, only PRS in PFL2 is allocated within this channel.
$BW_{channel}$	MHz	1	200: $N_{RB,c}$ = 132	For both RF channels
SSB configuration		1	SSB.2 FR2	
SMTC configuration		1	SMTC.1	
CP length		1	Normal	
DRX	s	1	0.64	
Time offset between serving and neighbour cells	µs	1	3	Synchronous cells/TRPs
Expected RSTD	µs	1	3	
Expected RSTD uncertainty	µs	1	5	

Table 15.5.6.5-2: Cell specific test parameters

Parameter	Unit	Test configuration	Cell 1		Cell 2	
			T1	T2	T1	T2
AoA setup		1	Setup 1 as specified in TS 38.133 clause A.3.15			
Beam Assumption[Note 4]		1	Rough		Rough	
TDD configuration		1	TDDConf.3.1		TDDConf.3.1	
PDSCH RMC configuration		1	SR.3.1 TDD		N/A	
RMSI CORESET RMC configuration		1	CR.3.1 TDD		N/A	
Dedicated CORESET RMC configuration		1	CCR.3.1 TDD		N/A	
OCNG Patterns[Note 1]		1	OP.1		OP.1	
EPRE ratio of PSS to SSS	dB	1	0		0	
EPRE ratio of PBCH DMRS to SSS						
EPRE ratio of PBCH to PBCH DMRS						
EPRE ratio of PDCCH DMRS to SSS						
EPRE ratio of PDCCH to PDCCH DMRS						
EPRE ratio of PDSCH DMRS to SSS						
EPRE ratio of PDSCH to PDSCH DMRS						
EPRE ratio of OCNG DMRS to SSS[Note 1]						
EPRE ratio of OCNG to OCNG DMRS [Note 1]						
EPRE ratio of PRS to SSS						

TRS Configuration		1	TRS.2.1 TDD	N/A
Initial BWP configuration		1	DLBWP.0.1 ULBWP.0.1	N/A
Active BWP configuration		1	DLBWP.1.1 ULBWP.1.1	N/A
PRS configuration (for both PFL1 and PFL2)		1	PRS.1.2 FR2	PRS.1.2 FR2
PRS Resource slot offset (for both PFL1 and PFL2)	slot	1	0	4
SRS configuration		1	POS-SRS.3	N/A
N_{oc} Note 2	dBm/SCS	1	-90.1	
PRS $\hat{E}_s/I_{ot}$	dB	1	-2.69	-12.10
PRS $\hat{E}_s/N_{oc}$	dB	1	-2	-9.8
PRP Note 3	dBm/SCS kHz	1	-92.1	-99.9
Io Note 3 (on symbols where PRS is not allocated)	dBm/190.08 MHz	1	-55.68	-55.68
Propagation Condition		1	AWGN	

Note 1: OCNG shall be used such that active cell (Cell 1) is fully allocated and a constant total transmitted power spectral density is achieved on all OFDM symbols except those in which PRS is allocated.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: PRP and Io levels have been derived from other parameters and they are provided for information only. They are not settable parameters themselves.
Note 4: Information about types of UE beam is given in clause B.2.1.3, and does not limit UE implementation or test system implementation.
Note 5: Calculation of Es/Iot includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [33], and an allowance of 1dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [33] table 6.2.1.3-4.
Note 6: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
Note 7: As observed with 0 dBi gain antenna at the centre of the quiet zone.

Table 15.5.6.5-3: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Subtest	Lowest reported value	Highest reported value
1	NR cell 1	(Measured value from step 12 - 54) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 54) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 54) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 54) T_c converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.5.6.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.5.7 UE Rx-Tx time difference measurement accuracy test case in FR1 for Redcap UE without Rx FH

15.5.7.1 Test purpose

The purpose of the test is to verify that the accuracy of the UE Rx-Tx time difference measurement without RX FH reported by the RedCap UE is within the specified limits in TS 38.133 [50] clause 10.1A.18.2. The test is conducted in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured.

15.5.7.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning and DL-PRS measurement in RRC_INACTIVE.

15.5.7.3 Minimum conformance requirements

Same as defined in clause 15.3.9.3.

15.5.7.4 Test description

The test defines three possible test configurations; specified in Table 15.5.7.4-1. The UE is only required to be tested in one of the supported test configurations.

Table 15.5.7.4-1: Test Configurations

Configuration	Description
1	15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode
2	15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode
3	30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode
4	15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode
NOTE: The UE is only required to be tested in one of the supported test configurations.	

15.5.7.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.5.7.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.13.
2. The general test parameter settings are set up according to Table 15.5.7.5-1 and Table 15.5.7.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.5.7.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.5.7.4.2 Test procedure

Same as defined in clause 15.5.1.4.2.

15.5.7.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.5.7.4.3-1 replaces Table 15.4.1.4.3-7, Table 15.5.7.4.3-2 replaces Table 15.4.1.4.3-8, Table 15.5.7.4.3-3 replaces Table 15.4.1.4.3-12 and Table 15.5.7.4.3-4 replaces Table 15.4.1.4.3-13.

N_{oc} Note 2	dBm/SCS	1,4	-98	
		2	-98	
		3	-95	
PRS $\hat{E}_s/I_{ot}$	dB	1,4	-2.41	-12.12
		2		
		3		
PRS $\hat{E}_s/N_{oc}$	dB	1,4	-2	-10
		2		
		3		
PRP Note 3	dBm/SCS kHz	1,4	-100	-108
		2	-100	-108
		3	-97	-105
Io	dBm/9.36 MHz	1,4	-67.67	-67.67
	dBm/9.36 MHz	2	-67.67	-67.67
	dBm/18.36 MHz	3	-64.75	-64.75
Propagation Condition		1,2,3,4	AWGN	

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Table 15.5.7.5-2: UE Rx – Tx time difference measurement accuracy requirements

Test Configuration	Cell	Lowest reported value	Highest reported value
1&2&4 (15kHz)	NR cell 1	(Measured value from step 12 - 270) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 270) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 281) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 281) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 293) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 293) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 290) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 290) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
3 (30kHz)	NR cell 1	(Measured value from step 12 - 169) T_c for 2RX redcap UE converted to UE Rx-Tx	(Measured value from step 12 + 169) T_c for 2RX redcap UE converted to UE Rx-Tx time

		time difference measurement according to clause 4.14.6	difference measurement according to clause 4.14.6
		(Measured value from step 12 – 161) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 161) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
	NR cell 2	(Measured value from step 12 - 170) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 170) T_c for 2RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6
		(Measured value from step 12 – 167) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6	(Measured value from step 12 + 167) T_c for 1RX redcap UE converted to UE Rx-Tx time difference measurement according to clause 4.14.6

For the overall test to pass, the ratio of successful reported values in each sub-test shall be more than 90% with a confidence level of 95%.

The UE Rx-Tx time difference measurement period fulfils the requirements specified in clause 15.5.7.3.

The test tolerances are defined in clauses C.1.6 and C.2.5.

15.5.8 UE Rx-Tx time difference measurement accuracy test case in FR2 for Redcap UE without Rx FH

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3

This test case is incomplete for UE power classes other than PC3

15.5.8.1 Test purpose

The purpose of the test is to verify that the UE Rx-Tx time difference measurement accuracy without RX FH in RRC_INACTIVE mode is within the specified limits. This test will verify the requirements in TS 38.133 [50] clause 10.1A.18.2. The test is conducted in AWGN propagation condition in FR2 in standalone scenario.

15.5.8.2 Test applicability

This test applies to all types of NR redcap UE release 18 onwards that supports Multi-RTT positioning and DL-PRS measurement in RRC_INACTIVE.

15.5.8.3 Minimum conformance requirements

Same as clause 15.3.9.3.

15.5.8.4 Test description

The supported test configuration is listed in Table 15.5.8.4-1.

Table 15.5.8.4-1: Test Configuration

Config	Description
1	120 kHz SSB and PRS SCS, 100 MHz bandwidth, TDD duplex mode

15.5.8.4.1 Initial conditions

Test Environment: Normal, as defined in TS 38.508-1 [45] clause 4.1.

Frequencies to be tested: Mid-Range, as defined in TS 38.508-1 [45] clause 4.3.1.

Channel bandwidth to be tested: are specified in Table 15.5.8.4-1.

1. Connect the SS and AWGN noise sources to the UE antenna connector or antenna connectors as shown in Annex A, Figure A.14.
2. The general test parameter settings are set up according to Table 15.5.8.5-1 and Table 15.5.8.5-2.
3. Propagation conditions are set according to clause 4.14.2.
4. Message contents are defined in clause 15.5.8.4.3.
5. There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2).

15.5.8.4.2 Test procedure

Same as defined in clause 15.5.1.4.2.

15.5.8.4.3 Message contents

As defined in clause 15.4.1.4.3, with the following exceptions:

Table 15.5.8.4.3-1 replaces Table 15.4.1.4.3-4, Table 15.5.8.4.3-2 replaces Table 15.4.1.4.3-7, Table 15.5.8.4.3-3 replaces Table 15.4.1.4.3-8, Table 15.5.8.4.3-4 replaces Table 15.4.1.4.3-11, Table 15.5.8.4.3-5 replaces Table 15.4.1.4.3-12 and Table 15.5.8.4.3-6 replaces Table 15.4.1.4.3-13.
